CENTRAL ARKANSAS WATER
JACK H WILSON WATER TREATMENT PLANT
WILSON RENEWAL AND RESLIENCY PROJECT
ADDENDUM NO. 4
JANUARY 23, 2025

This Addendum forms part of the Contract Documents and modifies the Specifications and Drawings as noted below. Acknowledge receipt of the Addendum in the space provided on the Bid Proposal. Failure to acknowledge receipt of the Addendum may subject the Bidder to disqualification.

This Addendum consists of 121 pages, including attachments.

A. SPECIFICATIONS

1. Section 40 05 59.23 – FABRICATED STAINLESS-STEEL SLIDE GATES

    a. Modify Paragraph 1.03.A.3 to the following:

        i. “Design calculations demonstrating anchor bolt sizing and spacing in compliance with AWWA C561, gate structural design calculations, and stem design calculations. All calculations shall be sealed by a Professional Engineer registered in the state of gate manufacture.”

    b. Modify Paragraph 2.01.A with following addition:

        i. Add “RW Gate” to the list of acceptable manufacturers.

    c. Add Paragraph 1.03.A.4 as follows:

        i. “Finite element analysis (FEA):

            a. Shall be performed on any gate where the gate width × design head exceeds 80 ft^2.

            b. Shall be performed on the gate, including the slide, frame, and yoke to verify the slide gate members are within the design limits set forth by the latest version of AWWA C561, or as modified herein.”

2. Section 40 06 20 – PROCESS PIPE, VALVE, AND GATE SCHEDULE

a. Remove 14” FILTER GALLERY – WASHWATER SUPPLY PUMP SUCTION butterfly valve from this specification.

b. Stop Plate Schedule:

i. Modify “No. of Plate Guide Assemblies” to “1”.

3. Section 40 61 96 – PROCESS CONTROL DESCRIPTIONS

a. Modify Paragraph 3.08.A.2.a to the following:

i. “Plant PLC: CP-WIL-BLWR in the Blower Building”

b. Modify Paragraph 3.08.D.1 to the following:

i. “The existing and new blower include an inlet throttling valve for controlling blower output. The inlet throttling valves are motor actuated to control intake to the blowers. Inlet throttling valves shall be provided and installed by the Contractor.”

c. Modify Paragraph 3.08.D.2.k to the following:

i. “Blower flow rate shall be measured in SCFM by thermal mass flow meter and displayed as a digital readout.”

d. Add Paragraph 3.08.D.2.l:

i. “Discharge pressure indications with impending warning and trip functions and levels displayed as digital readouts.”

e. Modify Paragraph 3.08.D.3.h to the following:

i. “Blower flow rate shall be measured in SCFM by thermal mass flow meter and displayed as a digital readout.”

f. Add Paragraph 3.08.D.3.i:

i. “Discharge pressure indications with impending warning and trip functions and levels displayed as digital readouts.”

4. Section 40 61 91 – PROCESS CONTROL SYSTEM INSTRUMENT LIST

a. Replace specification 40 61 91 – PROCESS CONTROL SYSTEM INSTRUMENT LIST in its entirety with the one attached to this addendum.

5. Section 40 61 93 – PROCESS CONTROL SYSTEM INPUT-OUTPUT LIST
    a. Replace specification 40 61 91 – PROCESS CONTROL SYSTEM INPUT-OUTPUT LIST in its entirety with the one attached to this addendum.
6. Section 43 11 18 – MULTISTAGE CENTRIFUGAL BLOWERS
    a. Replace specification 43 11 18 – MULTISTAGE CENTRIFUGAL BLOWERS in its entirety with the one attached to this addendum.

B. DRAWINGS

1. Drawing M3004 FILTER BUILDING MECHANICAL ENLARGED BOTTOM PLAN - CROSS GALLERY DEMOLITION
    a. Replace Drawing M3004 FILTER BUILDING MECHANICAL ENLARGED BOTTOM PLAN - CROSS GALLERY DEMOLITION in its entirety with the one attached to this addendum.
2. Drawing M3020 FILTER BUILDING MECHANICAL ENLARGED BOTTOM PLAN AND SAMPLE PUMP DETAIL – CROSS GALLERY
    a. Replace Drawing M3020 FILTER BUILDING MECHANICAL ENLARGED BOTTOM PLAN AND SAMPLE PUMP DETAIL – CROSS GALLERY in its entirety with the one attached to this addendum.
3. Drawing M3201 AIR SCOUR BLOWER BUILDING MECHANICAL PLAN AND SECTIONS

a. Replace drawing M3201 AIR SCOUR BLOWER BUILDING MECHANICAL PLAN AND SECTIONS in its entirety with the one attached to this addendum.

4. Drawing A0004 ARCHITECTURAL – ENLARGED SITE PLAN - ENTRY & TOUR ACCESSIBLITY
    a. Replace drawing A0004 ARCHITECTURAL – ENLARGED SITE PLAN - ENTRY & TOUR ACCESSIBLITY in its entirety with the one attached to this addendum.
5. Drawing A0007 ARCHITECTURAL CODE SUMMARY AND LIFE SAFETY PLAN - FILTER CROSS GALLERY
    a. Replace drawing A0007 ARCHITECTURAL CODE SUMMARY AND LIFE SAFETY PLAN - FILTER CROSS GALLERY in its entirety with the one attached to this addendum.
6. Drawing A0012 ARCHITECTURAL SCHEDULE – ROOM FINISHES AND APPLIANCE SCHEDULE
    a. Replace drawing A0012 ARCHITECTURAL SCHEDULE – ROOM FINISHES AND APPLIANCE SCHEDULE in its entirety with the one attached to this addendum.
7. Drawing A0013 ARCHITECTURAL SCHEDULE - DOORS
    a. Replace drawing A0013 ARCHITECTURAL SCHEDULE - DOORS in its entirety with the one attached to this addendum.
8. Drawing A3006 FILTER BUILDING ARCHITECTURAL ENLARGED GROUND FLOOR PLAN – CHEMICALS FEED / CROSS GALLERY NEW CONSTRUCTION
    a. Replace drawing A3006 FILTER BUILDING ARCHITECTURAL ENLARGED GROUND FLOOR PLAN – CHEMICALS FEED /

CROSS GALLERY NEW CONSTRUCTION in its entirety with the one attached to this addendum.

9. Drawing A3020 FILTER BUILDING ARCHITECTURAL INTERIOR ELEVATIONS – CROSS GALLERY
    a. Replace drawing A3020 FILTER BUILDING ARCHITECTURAL INTERIOR ELEVATIONS – CROSS GALLERY in its entirety with the one attached to this addendum.
10. Drawing A8003 ADMINISTRATION BUILDING ARCHITECTURAL FIRST FLOOR PLAN – NEW CONSTRUCTION
    a. Replace drawing A8003 ADMINISTRATION BUILDING ARCHITECTURAL FIRST FLOOR PLAN – NEW CONSTRUCTION in its entirety with the one attached to this addendum.
11. Drawing E3000 FILTER BUILDING ELECTRICAL ENLARGED BOTTOM PLAN – CROSS GALLERY DEMOLITION
    a. Replace Drawing E3000 FILTER BUILDING ELECTRICAL ENLARGED BOTTOM PLAN – CROSS GALLERY DEMOLITION in its entirety with the one attached to this addendum.
12. Drawing E3010 FILTER BUILDING ELECTRICAL ENLARGED BOTTOM PLAN - CROSS GALLERY
    a. Replace drawing E3010 FILTER BUILDING ELECTRICAL ENLARGED BOTTOM PLAN - CROSS GALLERY in its entirety with the one attached to this addendum.
13. Drawing E3201 AIR SCOUR BLOWER BUILDING ELECTRICAL POWER PLAN

a. Replace drawing E3201 AIR SCOUR BLOWER BUILDING ELECTRICAL POWER PLAN in its entirety with the one attached to this addendum.

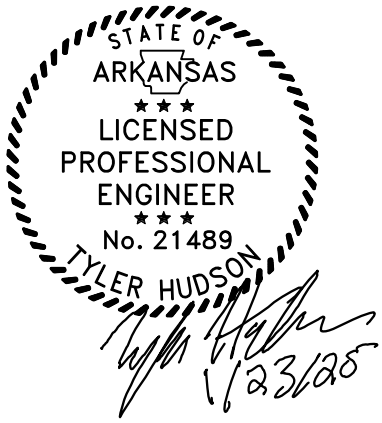
14. Drawing E3203 AIR SCOUR BLOWER BUILDING ELECTRICAL PANEL SCHEDULE RISER DIAGRAM AND CONTROL BLOCK DIAGRAM
    a. Replace drawing E3203 AIR SCOUR BLOWER BUILDING ELECTRICAL PANEL SCHEDULE RISER DIAGRAM AND CONTROL BLOCK DIAGRAM in its entirety with the one attached to this addendum.
15. Drawing E3205 AIR SCOUR BLOWER BUILDING ELECTRICAL CONDUIT AND WIRE SCHEDULE
    a. Replace drawing E3205 AIR SCOUR BLOWER BUILDING ELECTRICAL CONDUIT AND WIRE SCHEDULE in its entirety with the one attached to this addendum.
16. Drawing I1008 INSTRUMENTATION CONTROL SYSTEM BLOCK DIAGRAM SHEET 4
    a. Replace drawing I1008 INSTRUMENTATION CONTROL SYSTEM BLOCK DIAGRAM SHEET 4 in its entirety with the one attached to this addendum.
17. Drawing I3003 INSTRUMENTATION WASHWATER SUPPLY AND BACKWASH P&ID
    a. Modify as follows:
        i. Washwater supply pump suction valves (typ. of 2) to be shown as existing instead of proposed.
18. Drawing I3200 INSTRUMENTATION AIR SCOUR BLOWERS P&ID

a. Replace drawing I3200 INSTRUMENTATION AIR SCOUR BLOWERS P&ID in its entirety with the one attached to this addendum.

C. ATTACHMENTS

1. Section 40 61 91 – PROCESS CONTROL SYSTEM INSTRUMENT LIST
2. Section 40 61 93 – PROCESS CONTROL SYSTEM INPUT-OUTPUT LIST
3. Section 43 11 18 – MULTISTAGE CENTRIFUGAL BLOWERS
4. Drawing M3004 FILTER BUILDING MECHANICAL ENLARGED BOTTOM PLAN - CROSS GALLERY DEMOLITION
5. Drawing M3020 FILTER BUILDING MECHANICAL ENLARGED BOTTOM PLAN AND SAMPLE PUMP DETAIL - CROSS GALLERY
6. Drawing M3201 AIR SCOUR BLOWER BUILDING MECHANICAL PLAN AND SECTIONS
7. Drawing A0004 ARCHITECTURAL CODE SUMMARY AND LIFE SAFETY PLAN - FILTER CROSS GALLERY
8. Drawing A0007 ARCHITECTURAL CODE SUMMARY AND LIFE SAFETY PLAN - FILTER CROSS GALLERY
9. Drawing A0012 ARCHITECTURAL SCHEDULE – ROOM FINISHES AND APPLIANCE SCHEDULE
10. Drawing A0013 ARCHITECTURAL SCHEDULE - DOORS
11. Drawing A3006 FILTER BUILDING ARCHITECTURAL ENLARGED GROUND FLOOR PLAN – CHEMICALS FEED / CROSS GALLERY NEW CONSTRUCTION
12. Drawing A3020 FILTER BUILDING ARCHITECTURAL INTERIOR ELEVATIONS – CROSS GALLERY

13. Drawing A8003 ADMINISTRATION BUILDING ARCHITECTURAL FIRST FLOOR PLAN – NEW CONSTRUCTION
14. Drawing E3000 FILTER BUILDING ELECTRICAL ENLARGED BOTTOM PLAN – CROSS GALLERY DEMOLITION
15. Drawing E3010 FILTER BUILDING ELECTRICAL ENLARGED BOTTOM PLAN-CROSS GALLERY
16. Drawing E3201 AIR SCOUR BLOWER BUILDING ELECTRICAL POWER PLAN
17. Drawing E3203 AIR SCOUR BLOWER BUILDING ELECTRICAL PANEL SCHEDULE RISER DIAGRAM AND CONTROL BLOCK DIAGRAM
18. Drawing E3205 AIR SCOUR BLOWER BUILDING ELECTRICAL CONDUIT AND WIRE SCHEDULE
19. Drawing I1008 INSTRUMENTATION CONTROL SYSTEM BLOCK DIAGRAM SHEET 4
20. Drawing I3200 INSTRUMENTATION AIR SCOUR BLOWERS P&ID
21. Bidder Questions and Responses



HAZEN AND SAWYER

Inline Magnetic Flow Meters - Section 40 71 13.13

SECTION 43 11 18
MULTISTAGE CENTRIFUGAL BLOWERS

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. The Contractor shall furnish, install, test, and place in satisfactory operation one electric motor-driven multistage centrifugal blower unit including electric motors, steel bases, inlet filter, inlet throttling valves with electric motor operators, check valves, discharge butterfly valves, control panels, and all necessary auxiliary equipment as specified herein and shown on the Drawings or as required for a complete installation of the system.

B. Equipment shall be provided in accordance with the requirements of Section 46 00 00 – Equipment General Provisions.

C. The completed installation is to be free from excessive vibration, noise, or oil leaks.

D. All equipment specified in this Section shall be designed and furnished by the blower manufacturer, who shall be responsible for the suitability and compatibility of all included equipment.

1.02 RELATED WORK SPECIFIED ELSEWHERE

A. Division 01 – General Requirements

B. Section 09 90 00 – Painting

C. Section 46 00 00 – Equipment General Provisions

D. Division 26 – Electrical

E. Section 26 05 61 – Medium Voltage Electric Motors

F. Division 40 – Process Interconnections

1.03 SUBMITTALS

A. The Contractor shall submit complete Shop Drawings, Operation and Maintenance Manual, Instructions, and other information for the blower systems and all equipment specified herein in accordance with Section 01 33 00 – Submittal Procedures.

B. Shop Drawings shall include full descriptive information of materials used, method of fabrication, sizes, enclosures, ratings and layout dimensions, etc. to demonstrate full compliance with the Contract Documents.

C. Shop Drawings shall include weights of all system components and total weight of the operating blowers.

D. The performance characteristic curves for the blower shall be submitted with the shop drawings. Performance curves shall be developed in terms of standard conditions of 14.7 psia, 68°F, and 36% relative humidity as well as the design criteria specified in Paragraph 2.02, and the curves shall show horsepower draw over the range of SCFM flow rates. Additional operational data for the blowers shall be submitted including recommended vibration alarm settings and operational limits.

E. A complete description of the protective coating system to be used for all components, prior to shipment and after installation, shall be submitted with the shop drawings.

F. A listing of spare parts furnished shall be submitted with the shop drawings.

G. Blower manufacturer shall submit installation instructions in accordance with Section 01 33 00 – Submittal Procedures. Installation instructions shall be complete including unloading, check-out following shipment, storage, handling, assembly, anchorage, and start-up instructions and shall be submitted prior to delivery of the blower.

H. Electronic certified test reports including all details of apparatus, procedure, and results and all required calculations shall be submitted for each shop test conducted. Reports for shop tests shall be approved by the Engineer prior to shipment.

I. A detailed shop test plan shall be submitted with the Shop Drawings. The shop test plan shall fully describe the manufacturer's test facilities and the test procedure to be used.

J. Motor literature, illustrations, specifications and engineering data.

K. Instruments including product data sheets, manufacturer’s catalog information, and performance/operation criteria and requirements.

L. Panel, console, and cabinet layout drawings, component product information, wiring diagrams, field wiring requirements, and operator interface graphic layouts specific to the project.

M. Blower control system block diagram, input/output information, hardware layout drawings, interconnection diagrams, and point-to-point interconnection wiring diagrams for field wiring.

1.04 SERVICES OF MANUFACTURER'S REPRESENTATIVE

A. The Contractor shall arrange for the manufacturer to furnish the services of a qualified service person with at least three years of experience, who is regularly involved in the inspection, operation, and maintenance of centrifugal blowers and blower systems of the size and type being furnished. The service persons shall:

1. Inspect the installed equipment to verify that installation is in accordance with the blower manufacturer's requirements

2. Witness and check final adjustments and alignments

3. Witness and check start-up of each blower system

4. Assist the Contractor in performing field testing and prepare a written report as specified below.

5. Troubleshoot and correct any mechanical problems with the system that are noted during initial operation.

6. Submit written certification signed by the service person that the system has been properly installed, tested, and adjusted; that the system operates as specified or as required, including date of field test, as well as a listing of all persons present during the tests.

7. Investigate and supervise correction of any operating problems that may arise during the guarantee period of the equipment.

8. Coordinate communications with plant control system via the PLC network connection.

B. The services of a qualified manufacturer's technical representative shall be furnished at no additional cost to the Owner and shall be provided in accordance with Section 46 00 00 – Equipment General Provisions. Field services shall include as a minimum the site visits listed below. Any additional time required to achieve successful installation and operation shall be at the expense of the Contractor.

Service	Number of Trips	Number of Days/Trip
Installation and Testing	**1**	**2**
Startup and Training	**1**	**1**
Services after Startup	**1**	**1**

C. The manufacturer's service person shall sign in and out every day on-site and shall comply with all Owner requirements for visiting the site.

1.05 QUALITY ASSURANCE

A. The materials covered by the Specifications are intended to be standard equipment of proven reliability and as manufactured by reputable manufacturers having experience in the production of such equipment. The equipment furnished shall be designed, constructed, and installed in accordance with the best practices and methods and shall

operate satisfactorily when installed as shown on the Drawings and operated per the manufacturer's recommendations.

B. All materials shall be new, and both workmanship and materials shall be of the very best quality, entirely suitable for the service to which the units are to be subjected and shall conform to all applicable Sections of these Specifications. All parts of duplicate machines shall be interchangeable without modification. The construction of the blowers shall be such that the blowers will not be damaged during continuous operation and will not have undue vibration above the blower's surge limit. The design and construction of the blowers shall not cause any unbalanced floor loadings.

C. The Contractor shall protect blower system components at the project site and during installation. Contractor shall be required to place blowers onto their pads within 24 hours after arrival of the blowers at the site. The Contractor shall be responsible for scheduling and coordinating deliveries of blowers with the manufacturer to minimize the time that blowers are on-site and not installed. The Contractor shall be responsible for any additional cost incurred for storage of blowers. The Contractor shall connect space/strip heaters and manually rotate shafts as recommended by the manufacturer.

1.06 WARRANTY

A. All blower system components specified herein, including but not limited to multistage centrifugal blowers, motors, control panels, valves, and accessories, are to be warranted to be free of defects in materials and quality for a period of not less than two years from the date of acceptance. Warranty and Guarantee shall be as specified in Section 46 00 00 – Equipment General Provisions.

PART 2 – PRODUCTS

2.01 GENERAL

A. The aeration blower shall be multistage, vertically-split, centrifugal type. The blower shall be driven at the inlet end by direct coupled electric motors with flexible couplings and guards as specified herein.

B. The blower shall be Model 1604-ADOI with 28" impellers as manufactured by Gardner Denver, Inc.; or Model ZM 8 04-412 with 29" impellers and 30" impellers as manufactured by Atlas Copco. No substitutions shall be permitted. The model, number and type of impellers shall be verified by the blower manufacturer. Any modifications of the requirements presented herein shall be at the expense of the Contractor and shall be submitted to the Engineer for review, comment and acceptance.

C. The Contractor shall make all alterations required to structures, equipment, piping, controls, or other work shown in the Contract Drawings that may be required for the blower systems ultimately furnished. Any kind of modification required for the installation

of the blower system shall be at the expense of the Contractor and shall be approved by the Engineer during shop drawing review.

2.02 PERFORMANCE REQUIREMENTS

A. The proposed blower shall satisfy the conditions of service and requirements listed below. Standard cubic feet per minute (SCFM) is defined as the delivered airflow rate at the blower discharge in terms of standard conditions (68°F, 14.7 psia and 36% relative humidity). The blower shall be capable of delivering the specified design flow rate per blower (in SCFM) at the specified discharge pressure at the minimum inlet pressure, design maximum air temperature and relative humidity at the design maximum temperature as specified for the blower primary design point below. The design air temperatures and inlet pressure listed shall be at the inlet to the blower and do not include the impacts of inlet throttling. Motor horsepower shall not exceed the maximum rated motor horsepower specified. The blower shall be capable of turndown to the minimum flow rate specified below at the minimum design temperature and humidity specified.

Ambient Conditions	
Site Elevation, ft	**543**
Ambient Barometric Pressure, psia	**14.58**
Ambient Temperature Range, °F	**0 - 100**
Ambient Relative Humidity Range, %	**40 - 100**
Design Inlet Conditions

B. Surge volume of the blower shall be less than the minimum flow rates indicated in the table above under the range of ambient temperature conditions shown. Surge volume is defined herein as the airflow rate at which the discharge throttled blower exhibits the first indication of pressure pulsations or flow reversal.

C. The blower shall not draw more than 250 horsepower at any flow rate for any temperature in the range of 0°F to 100°F and the inlet pressure specified. The blower shall have a "non-overloading" characteristic through the use of backward leaning impellers.

D. The blower system will be designed to deliver varying airflow rates by throttling at the blower suction. Control of minimum airflow delivery and inlet valve throttling shall be based on measurements from the thermal mass flow meter.

2.03 BLOWER MOTORS

A. The blower manufacturer shall be responsible for furnishing the electric motor for the blower. Maximum rated horsepower for each blower is specified in Paragraph 2.02. The manufacturer shall be responsible for the proper selection, testing, installation, and operation of the motors and for coordinating the motors with the compressor equipment. Motors shall be new and both materials and quality shall be of the very best quality. Motors shall be IEEE841 complaint, manufactured by ABB Baldor/Reliance Electric Company; Toshiba Industrial and Power Systems, Inc.; Siemens Energy & Automation, Inc.; Ideal Electric Company; or TECO Westinghouse.

B. Motors shall be horizontal squirrel cage induction motors designed in accordance with the latest ANSI, NEMA, and IEEE standards. Motors shall be 2300 volts, 3 phase, 60 Hz. Motors shall be designed and manufactured for continuous duty for operation under the following conditions:

1. Altitude below 3,300 ft.

2. Ambient temperature ranging from 0 F to 100F.

3. Voltage variations of plus or minus 10 percent.

4. Frequency variation of plus or minus 5 percent.

5. Combined voltage and frequency variation of plus or minus 10 percent with frequency variation not exceeding plus or minus 5 percent.

C. The motor shall provide a service factor of 1.15. Motor horsepower shall be equal to or greater than the load over the full range of operating conditions. Motor speed shall not exceed 3600 rpm.

D. Motor torque characteristics shall be at least 20 percent greater than the maximum full load torque requirements over the full range of operating conditions from start-up to full load.

E. Motor shall be in TEFC enclosures and shall be designed for quiet operation. Motor sound pressure shall not exceed nominal 87 dBA, measured 3 feet from the motor.

F. Motors shall provide premium efficiencies and power factors throughout their operating range. The power factors specified shall be achieved without the use of power factor correction capacitors.

G. Motor insulation and leads shall have Class H insulation; however, temperature rise shall be limited to that of Class B insulation. Manufacturer's premium grade insulation shall be used.

H. The stator shall be assembled from high grade electrical sheet steel laminations adequately secured together. Motor laminate stack shall be C5 grade. Stator windings and end turn connections shall be fully braced to withstand all mechanical, electrical, and thermal stresses. The shaft shall be made of high-grade machine steel or steel forging and of size and design adequate to withstand the load stresses. The rotor shall be constructed using copper rotor bars. Motor core shall be M-22 grade with losses no greater than 1.8 watts per pound at 60 Hz. The balance grade of the rotor shall be ISO 2.5 or better.

I. Bearings shall be grease lubricated ball bearings. The bearings should have a grease purge and a remote greasing capability.

J. Motor leads shall be suitably marked and identified. Each motor shall be provided with an oversized terminal box with space for full stress cone terminations and shall be constructed of cast iron or fabricated steel, neoprene gasketed and bolted. The three stator phase leads shall be provided with 2-hole pad connectors for the incoming cables.

K. Motors shall be designed and manufactured for operation in the direction required for the blowers. The phase sequence shall be marked permanently and plainly inside the stator lead junction box.

L. Motors shall have breather and drain plugs to allow for drainage of any moisture from inside.

M. Motor Winding Temperature Monitors: Each motor shall be provided with six (two per phase) platinum resistance temperature detectors (RTDs) embedded in the stator winding. RTDs shall be 100-ohm, platinum, 3 wire type having a stability of better than

0.2 percent of maximum exposed temperature for one year of service, or 0.25°C, whichever is greater. Two detectors per phase are required and shall be placed at locations determined by the manufacturer to give close approximation of the hottest spot temperatures.

N. Motor Bearing Temperature Monitoring: Each motor shall be furnished with two platinum motor bearing resistance temperature detectors (RTDs) for connection to the respective blower local control panel PLC input/output interface. Motor bearing RTDs shall be mounted in Type 316 stainless steel thermowells coordinated and furnished by the blower Supplier. Locations shall be coordinated with the blower manufacturer.

O. Motor Bearing Vibration Monitoring: Each blower shall be furnished with two motor bearing vibration sensors for connection to the respective blower local control panel PLC input/output interface. Locations shall be coordinated with the blower manufacturer. Each bearing drive end (DE) and opposite drive end (ODE) should be fitted with Horizontal and Vertical vibration detection.

P. The CONTRACTOR shall furnish, install and test all requisite conduit and wiring and terminations between all supplied instruments and each local blower control panel, as necessary.

Q. Motors shall be supplied with space heaters for 120V operation. Starters shall include circuitry and 120-volt power supply to automatically power the space heaters when the motors are not running and vice-versa.

R. Motor power supply shall be connected to an oversized junction box mounted on the motor housing.

S. Motors shall comply with Division 26 requirements, except where modified herein.

T. Glass fiber composite plastic or laminate fans are not allowed. A steel hub with an injection molded fan is not an acceptable alternate. Fan cover shall be steel or cast iron.

2.04 BASES

A. A welded steel fabricated base shall be provided for mounting the blower, electric drive and driver base. The base shall be of a rigid box section shape. The box section shall be properly ribbed for stiffness and present large bearing areas for carrying the load on the foundation and shall include lifting lugs. The base shall be rigid to prevent deflection during start-up and normal operation that would affect alignment. Rubber vibration isolation pads shall be provided between the concrete mounting and the base of the blower unit. The base shall have machined surfaces at blower and motor installation pads.

2.05 HOUSING AND HEADS

A. The housing, inlet and outlet heads shall be constructed of close-grained cast iron sections, ASTM A48, fitted with babbitt joints held securely by steel tierods and able to withstand the operating pressures. Heads shall be provided with mounting legs. Approved eye bolts or lugs shall be provided for lifting. Where the blower shaft passes through both the inlet and outlet heads, non-contact labyrinth seals with babbitt inserts or carbon ring seals shall be provided to prevent air leakage and to assure non-contamination of the bearing lubricant. Internal seals between stages shall be of the labyrinth type to restrict inter-stage leakage. Inlet and outlet flange connections shall be ANSI Standard 125-pound drilled through bolt pattern and will be an integral part of the heads.

B. Air passage shall be finished by hand or other means to obtain smooth surfaces and minimize friction losses. Casing shall be accurately machined to gauge, where necessary, to ensure interchangeability of all parts.

C. The compressors shall be built from parts cast in patterns from which previous units have been built and tested. The compressor shall be of the manufacturer's standard design.

2.06 IMPELLERS AND SHAFTS

A. Impellers shall be cast aluminum alloy, keyed to the shaft and held by a lock nut. Hubs of the impellers shall butt against each other directly or through one-piece metal spacers. Impellers shall be individually precisely machine balanced. Impellers shall be individually replaceable without requiring dynamic rebalancing of the entire rotating assembly to maintain factory vibration specifications. Vibration shall not exceed 1.25 mils in the vertical plane measured at the blower bearing housing.

B. Shaft shall be of sufficient diameter to operate below the first critical speed and be made of high grade hot-rolled steel. Shaft speed shall not exceed 3,600 rpm.

2.07 BEARINGS

A. The blower shall have two oil lubricated ball bearings which can be lubricated, inspected or replaced without disconnecting piping or disassembling the blower. The bearings shall be contained in outboard bearing housings designed to isolate the bearings from blower temperature.

B. A balance piston will be integrally shaft mounted on the discharge end of the blower. The balance piston will reduce the thrust load on the thrust bearing by 75 percent.

C. Lubrication shall be accomplished by means of an oil slinger that circulates lubrication oil from an inner reservoir through the bearing and returns the oil to the outer reservoir. Oil

recirculation shall be at the rate of at least 1.5 pints per minute. The oil level in the bearings housings shall be viewable through a sight glass.

D. Blower Bearing Temperature Monitoring: The blower shall be furnished with two platinum motor bearing resistance temperature detectors (RTDs) for connection to the respective blower local control panel PLC input/output interface. Blower bearing RTDs shall be mounted in Type 316 stainless steel thermowells coordinated and furnished by the blower manufacturer

E. Blower Bearing Vibration Monitoring: The blower shall be furnished with two motor bearing vibration sensors for connection to the respective blower local control panel PLC input/output interface. Locations shall be coordinated by the blower manufacturer.

F. The CONTRACTOR shall furnish, install and test all requisite conduit and wiring and terminations between all supplied instruments and each blower local control panel as necessary.

2.08 COUPLINGS

A. A flexible, disc spacer coupling of an approved type shall be furnished for connecting the blower and motor. The coupling design shall take care of inaccuracies of alignment and permit axial adjustment. The coupling shall have a minimum service factor of 1.35 over motor nameplate horsepower. Spacer coupling shall have a minimum length of seven inches. The construction of the couplings shall be such that either hub of a unit may be removed without disturbing adjustment of the blower or motor. A factory laser alignment shall be conducted prior to shipment to facilitate alignment in the field.

B. The manufacturer shall provide a suitable steel or “OrangePeel” aluminum coupling guard for the coupling between blower and motor. The guard shall have a sheet metal top covering and expanded metal front and be designed to meet current OSHA requirements.

C. The manufacturer shall provide a torsional critical speed analysis to ensure that the blower, motor, and coupling are properly designed and to ensure that there are no torsional critical speeds within the operating range of the unit.

2.09 PRESSURE, TEMPERATURE AND POWER MONITORING

A. Temperature Indicating Transmitters: Each new and existing blower shall be provided with inlet and discharge thermowells and temperature indicating transmitter assemblies on the suction and discharge sides as shown on the Contract Drawings and located as recommended by the blower manufacturer.

B. Temperature indicating transmitters shall be mounted in Type 316 stainless steel thermowells coordinated and furnished by the blower Supplier. Thermowell locations on piping shall be coordinated by the blower manufacturer.

C. Pressure Indicating Transmitter: Each new and existing blower shall be provided with a pressure indicating transmitter on the discharge side as shown on the Contract Drawings and located as recommended by the blower manufacturer.

D. Differential Pressure Transmitter: Shall be provided at the discharge of the filter/silencer unit, as shown on the Contract Drawings. Vacuum and pressure taps shall be provided by the Contractor at locations selected for stable measurement and accurate evaluation of pressure loss across the filter.

E. Instrumentation shall comply with the requirements of Division 40.

F. Instrumentation shall withstand temperatures up to 300ºF

G. The Contractor shall furnish and install all requisite conduit, wiring, testing and terminations from new field instruments to the blower local control panels as necessary.

H. The blower manufacturer shall provide current monitoring devices (CTs) to be installed in the RVSS starters by the electrical subcontractor and/or RVSS manufacturer. The blower control panel PLC shall receive motor current signals from the CTs for hardwired blower surge protection as shown on the drawings. Coordinate requirements with Division 26 – Electrical.

2.10 BLOWER CONTROL PANELS

A. The blower supplier shall furnish a NEMA 4X blower control panel for the new and existing blowers. Each blower control panel shall include a PLC for monitoring, displaying, and protecting the blowers, including a PLC operator interface panel with touchscreen. Blower control panel shall be suitable for wall-mounted installation by the Contractor within the blower electrical building. Each blower control panel shall contain controls for blower motor starting and stopping, surge and overload detection, alarm and emergency shutdown systems, and for the inlet throttling valve. The panel shall be supplied with a disconnect switch on the 120-volt power supply to the panel.

B. Each new blower control panel shall be furnished with a PLC. A PLC panel shall be provided for the existing blower. PLC shall be Allen Bradley CompactLogix (see Section 40 63 43 – Programmable Logic Controllers). The PLC shall be provided complete with rack, power supply, I/O cards, special function cards, instructions, memory, input/output capacity, operator interface unit (see Section 40 62 63 – Operator Interface Terminals) and appurtenances to provide all required features and functions.

1. Additional communication ports shall be provided for the Operator Interface and other devices as required.

2. Each blower control panel shall include a UPS to provide uninterruptible power to the PLCs for a minimum of 30 minutes in the event of an electrical power failure.

3. Each blower PLC system shall be provided with an Ethernet network switch for communications with the Plant SCADA System

C. The blower control panel for the new blower shall be furnished with a minimum 10-inch color touchscreen operator interface mounted on the front of the NEMA 12 enclosure. The operator interface shall be Allen Bradley PanelView Plus 7 series or equal. The operator interface shall provide the following functions at a minimum:

1. Surge and overload protection with impending warning and trip functions in amperage and horsepower (calculated) displayed as digital readouts.

2. Blower bearings vibration level indication with impending warning and trip functions and levels displayed as digital readouts. A warning shall be activated through the monitor when vibration exceeds 0.2 inches/sec. An alarm and shutdown shall be provided when vibration exceeds 0.4 inches/sec. Blower system manufacturer to confirm final settings.

3. Blower bearings temperature indication with impending warning and trip functions and levels displayed as digital readouts.

4. Blower “Run” Light (Red)

5. Common Warning Light (Amber)

6. Common Fault Alarm Light (Amber)

7. Motor windings temperature indications with impending warning and trip functions and levels displayed as digital readouts.

8. Inlet butterfly valve position indication with automatic/manual control functions, status monitoring (% open, fault status, available status (power on and in remote)) with % open and set-point displayed as digital readouts.

9. Inlet and discharge air temperature indications with impending warning and trip functions and levels displayed as digital readouts.

10. Discharge pressure indications with impending warning and trip functions and levels displayed as digital readouts.

11. Inlet filter differential pressure indications with impending warning and trip functions and level displayed as digital readouts.

12. Blower flow rate shall be measured in SCFM by thermal mass flow meter and displayed as digital readout.

D. The blower control panel for the existing blower shall be furnished with a minimum 10-inch color touchscreen operator interface mounted on the front of the NEMA 12

enclosure. The operator interface shall be Allen Bradley PanelView Plus 7 series or equal. The operator interface shall provide the following functions at a minimum:

1. Surge and overload protection with impending warning and trip functions in amperage and horsepower (calculated) displayed as digital readouts.

2. Blower “Run” Light (Red)

3. Common Warning Light (Amber)

4. Common Fault Alarm Light (Amber)

5. Inlet butterfly valve position indication with automatic/manual control functions, status monitoring (% open, fault status, available status (power on and in remote)) with % open and set-point displayed as digital readouts.

6. Inlet and discharge air temperature indications with impending warning and trip functions and levels displayed as digital readouts.

7. Discharge pressure indications with impending warning and trip functions and levels displayed as digital readouts.

8. Inlet filter differential pressure indications with impending warning and trip functions and level displayed as digital readouts.

9. Blower flow rate shall be measured in SCFM by thermal mass flow meter and displayed as digital readout.

E. Adjustable time delays shall be incorporated to allow uninterrupted motor starts and stops to prevent nuisance shutdowns.

F. All trip functions shall be frozen upon a shutdown so that shutdown status can be determined and the values at shutdown preserved. The PLC shall store and display the 50 most recent shutdown alarms including identification of alarms, time and date of occurrence, and value on trip.

G. The control panel shall be completely pre-wired and tested at the factory by the blower system manufacturer.

H. An as-built diagram of the completed panel shall be encased in plastic inside the panel.

I. Engraved plastic nameplates shall be securely mounted on the front and inside of each blower panel to designate the blower served and to identify the various devices, instruments, etc. Nameplates shall have white letters on a black background.

J. Panel layout and wiring diagrams shall be submitted with the submittal drawings.

K. Alarms shall not be annunciated under normal start-up and shut-down conditions.

L. Motor and blower bearing vibration and temperature warning and alarm/shutdown settings and blower inlet/discharge air temperature warning and alarm/shutdown settings shall be as recommended by the blower supplier (except for inlet air temperature, which will be for indication only).

M. The surge protection system shall prevent surge conditions by use of both motor horsepower and amperage. Adjustable time delays shall be incorporated to prevent nuisance shutdowns. Initial setting for the blower shall be XXX horsepower (or equivalent current) for overload shutdown and XXX horsepower (or equivalent current) for low horsepower (surge) shutdown. The Contractor shall coordinate the range and calibration information between the blower manufacturer and electrical subcontractor.

N. The PLC shall provide a common failure relay output activated by any of the shutdown conditions. Another relay output shall be wired into the motor control circuit in the blower motor starter to shut down the blower.

O. Panel shall be prewired with a master terminal strip to accommodate all inputs and outputs. A UL label is required. Each end of each wire shall be identified by a unique wire number printed on a heat shrunk sleeve marker.

P. All wiring external to control components within the panel shall be multi-strand copper no smaller than 14 gauge with each end properly numbered according to the manufacturer's drawings. Wiring will be done in a professional quality manner and run in covered trays. All wires that attach to door mounted components shall be neatly bundled and tied. All external connections shall terminate on a common terminal strip with at least 20% spare connection points.

2.11 REQUIREMENTS FOR INTERFACE WITH THE PLANT SCADA SYSTEM

A. The Blower Manufacturer shall provide the application program for all blower control and monitoring programs in native format to enable the Owner to reload all necessary programming onto a new blower PLC in the event of PLC failure.

B. The Contractor shall provide all coordination required for communication of information between the blower control panels and the Plant SCADA System. The blower manufacturer will make available in separate registers the required digital and analog information to the Plant SCADA System through network communication. The blower manufacturer shall submit copies of the graphic displays for approval. The Contractor shall coordinate with the control system Subcontractor under Division 40 to develop the graphic displays in the existing Plant SCADA System display format protocol. The Plant SCADA System (by the Owner under Division 40) is to receive all necessary information from each blower control panel PLC to be able to do the following:

1. Log all monitored points for trend analysis

2. View real time trends

3. View historical information

4. Display graphs and charts

5. Date/time history of alarms including surge

2.12 BLOWER START-UP AND SHUTDOWN SEQUENCE CONTROL PROGRAMS

A. The blower start-up and shutdown sequence control programs shall be provided by the blower manufacturer in each blower control panel PLC as follows:

1. A blower may be called to start or stop in either of the following ways:

a. Manually at the blower control panels through the operator interface panel.

b. Remotely through the Plant SCADA System (remote-manual)

2. When a blower is called to start, a "Blower #__ Start-up Sequence Initiated" message shall be shown on the blower local control panel display and on the Plant SCADA System display. All messages to be displayed on all blower PLC operator interfaces shall be provided by the Plant SCADA System through the communication network. Status of delay timers showing countdown time shall be displayed during a start-up and shutdown sequence.

3. Automatic control of the inlet throttling valves by the Plant SCADA System during a start-up sequence shall be discontinued until completion of the start-up sequence.

4. A "Blower #___ Start-up Sequence in Progress" message shall be shown on the blower local control panel display and on the Plant SCADA System display and shall remain on the screen in flashing mode until the start-up sequence is completed.

5. The Plant SCADA System or the operator through the operator interface at the blower control panel shall provide a command to the blower control panel to start its respective blower. The blower control panel PLC shall confirm that no alarm conditions exist and that the blower is available for starting. In the case of a blower failure or if a blower is locked out by a PLC-based "permissive", the Plant SCADA System shall prompt the operator to start the next available blower according to the control program in the Plant SCADA System. Indication of the next blower to be started and the next blower to be shut down through the strategy shall be provided on the Plant SCADA System graphic displays.

6. The blower control panel PLC shall move the inlet throttling valve on the blower to be started to the "Start-up" position. The Plant PLC System will provide a command to the PLCs of blowers already operating to move inlet butterfly valves

to their start-up position. The blower control panel PLC will use continuous 4-20 mA position set-point and position feedback information from the operators for the inlet throttling valves to monitor position for start-up. Indication that the PLC is "Positioning the Inlet Throttling Valves" shall be provided on the blower local control panel display and on the Plant PLC System display. Failure of any of the valves to move to their required positions within the time required shall initiate a "Start-up Sequence/Valve Failure" alarm through the blower control panel PLC, shall terminate the start-up sequence, and shall provide alarm indication on the blower local control panel display and on the Plant SCADA System display.

7. The blower control panel PLC shall provide a start (dry contact) signal to the Blower Motor Starter to energize the drive motor. The blower control panel PLC shall receive a feedback signal from the starter confirming that the main drive motor starter has been energized via the motor starter auxiliary contact. If the start verification is not received in 20 seconds, the start sequence is terminated on a “No Motor Feedback Alarm (Sequence Failure).” After the motor feedback signal is received, the inlet throttling valves shall be positioned by the Plant PLC System according (see Division 1740). A “Blower #____ Start-up Sequence Completed” message shall be displayed on the blower local control panel display and on the Plant SCADA System display.

8. When a blower is called to stop either through the Plant SCADA System or the local operator interface, a "Blower #___ Shutdown Sequence Initiated" message shall be shown on the blower local control panel display and on the Plant SCADA System display.

9. After the command is received from the Plant SCADA System to shut down the blower (or a blower shutdown is initiated manually through the touch screen), the blower control panel PLC shall stop the blower and shall move the inlet throttling valve to the start-up position. A "Blower # ____ Stopped" message shall be shown on the blower local control panel display and on the Plant SCADA System display.

10. Emergency Stop capability shall be provided at the blower, through the local blower control panel, at the motor starter and through the Plant SCADA System through a single-click function. Emergency Stop shall de-energize all equipment on the blower base. The blower will not be permitted to be reset or reactivated until the maintained Emergency Stop has been manually released.

11. The blower control panel for the new blower shall include protective shutdown interlocks to protect the blower from abnormal operating conditions including:

    a. Motor High Bearing/Winding Temperature

    b. High Discharge Air Temperature

    c. High Motor Horsepower

d. Surge

e. No Run Status Contact Feedback from Starter During Starting

f. Loss of Run Status Contact Feedback from Starter

g. Sequence Failure

h. Motor/Blower High Vibration

i. Pushing Emergency Stop Pushbutton

j. PLC Failure

k. Blower Bearing High Temperature

l. Inlet Throttling Valve Fault or “Not Available”

12. The blower control panel for the existing blower shall include protective shutdown interlocks to protect the blower from abnormal operating conditions including:

a. High Discharge Air Temperature

b. High Motor Horsepower

c. Surge

d. No Run Status Contact Feedback from Starter During Starting

e. Loss of Run Status Contact Feedback from Starter

f. Sequence Failure

g. Pushing Emergency Stop Pushbutton

h. PLC Failure

i. Inlet Throttling Valve Fault or “Not Available”

2.13 BLOWER MACHINE MONITORING PROGRAMS

A. The Blower monitoring programs shall be provided by the blower manufacturer in each blower control panel as follows:

1. Monitoring and protection of the blowers from abnormal operating conditions shall be provided through the PLC.

2. Current inputs to each PLC shall be from a current transformer provided in the motor starter.

3. Provide monitoring of all analog inputs. The PLC shall shut down the blower if inputs are not within the acceptable range. Hold-out circuitry shall be provided in the PLC programming to prevent shut-down on alarm condition while the blower is being started.

B. The following is a general listing of the minimum data link, analog, CT and RTD inputs to the PLC at the blower control panel for the new blower. Data link, analog, CT and RTD inputs shall be monitored/displayed at the local blower control panel and monitored/logged/displayed through the Plant Distributed PLC System via network communication.

1. Blower RTD Drive-End Bearing Temperature

2. Blower RTD Non-Drive-End Bearing Temperature

3. Blower Inlet Air Temperature

4. Blower Discharge Air Temperature

5. Blower Discharge Pressure

6. Blower Drive-End Bearing Vibration

7. Blower Non-Drive-End Bearing Vibration

8. Blower Amperage (from CTs)

9. Inlet Throttling Valve Position

10. Motor RTD Winding Temperatures

11. Motor RTD Drive-End Bearing Temperature

12. Motor RTD Non-Drive-End Bearing Temperature

13. Motor Drive-End Bearing Vibration

14. Motor Non-Drive-End Bearing Vibration

15. Inlet Filter Differential Pressure

C. The following is a general listing of the minimum data link, analog, CT and RTD inputs to the PLC at the blower control panel for the existing blower. Data link, analog, CT and RTD inputs shall be monitored/displayed at the local blower control panel and

monitored/logged/displayed through the Plant Distributed PLC System via network communication.

1. Blower Inlet Air Temperature
2. Blower Discharge Air Temperature
3. Blower Discharge Pressure
4. Blower Amperage (from CTs)
5. Inlet Throttling Valve Position
6. Inlet Filter Differential Pressure

D. The blower control panel PLC shall include programming to report the order in which alarm conditions are received, such that operators can determine the alarm that caused blower shut-down.

E. Discrete inputs to each blower PLC shall include:

1. Blower motor run status (from starters)
2. Electrical malfunction alarm (from starters)
3. Inlet throttling valve operator in local
4. Inlet throttling valve operator “available” (power on and in remote)
5. Inlet throttling valve operator fault
6. Surge Indication Alarm

F. Discrete outputs from the blower control panel PLC shall include:

1. Blower Start (to starter)
2. Blower Stop (to starter)
3. Impending surge indication (not a discrete output but displayed on OIT)

G. Analog outputs from the blower PLC shall include:

1. Inlet Throttling Valve Position Set-point (to valve)

H. Discrete and analog inputs to the blower control panel PLCs from the Plant Distributed PLC System shall be as shown on the Drawings and generally include, but are not limited to, the following:

1. Blower start command

2. Blower stop command

3. Inlet Throttling Valve Position Set-point

2.14 EQUIPMENT IDENTIFICATION

A. Each blower shall be provided with a substantial stainless steel nameplate, securely fastened in a conspicuous place and clearly inscribed with the manufacturer's name, year of manufacture, serial number, and principal rating data (flow in scfm, discharge pressure, speed and design inlet conditions).

2.15 PRESSURE GAUGES

A. Inlet pressure gauges shall be provided on the suction of each blower. Vacuum and pressure tap locations shall be selected for stable measurement and accurate evaluation of pressure rise across the blower.

B. The inlet vacuum gauge shall be located upstream of the inlet throttling valve and shall be a bellows gauge with a range of 0-15 inches water vacuum. Scale shall be a 270° arc. Dial size shall be 4-1/2 inches with black phenolic case. Gauge tap shall be 1/4 inch minimum.

C. Gauges shall have an accuracy of ±1 percent. All gauges shall be by the same manufacturer and meet the requirements of Section 40 73 13 – Pressure and Differential Pressure Gauges except where specified herein.

2.16 EXPANSION AND FLEXIBLE COUPLINGS

A. Inlet and discharge-filled, single arch expansion joints shall be provided for each new blower as shown on the Drawings. Each expansion joint shall be capable of withstanding the vacuum and pressure under all operating conditions and shall be rated for 300°F continuous service. Expansion joints shall provide a minimum of 2-1/4 inches of movement in compression, 1-1/2 inches of elongation, and 1-1/4 inches of lateral movement. Expansion joints shall be Maxi-Joint Style 1101 as manufactured by General Rubber Corporation or equal.

2.17 CHECK VALVES

A. The blower manufacturer shall furnish discharge check valves for the blower as shown on the drawings. Check valves shall be a wafer type discharge check valve of the dual, flat-plate type with center hinge, metallic center post, spring or non-spring closure, steel or cast iron body, Viton-B seal, aluminum-bronze plates, Inkonel 600 springs, and rated for temperatures up to 300°F. Check valve shall be Crane Duo Check II, Flexi-Hinge Type 518, or equal. The check valves shall be installed by the Contractor as shown on the Drawings. The Contractor shall perform any piping modifications necessary to

incorporate the check valve provided by the blower manufacturer at no cost to the Owner. Check valves shall be installed in the horizontal position.

2.18 INLET FILTER AND SILENCER

A. The manufacturer shall provide a combination inlet filter/silencer for the blower as shown on the drawings and specified herein. Inlet filter/silencers shall be of the free standing, flanged, removable cartridge filter type with attached silencing section capable of a minimum 20 dBA noise attenuation on the midrange octave band (500 to 1000 Hz). Filters shall be constructed of mild steel with polyester powder coated interior and exterior (no liquid or oil-based paint). The filter silencer housings shall be single-stage, cartridge-style, and suitable for outdoor service. Flanges shall be 125# ANSI flange, sized to match blower inlet piping as shown on the drawings.

B. Maximum clean filter pressure drop of the inlet filter/silencer with the elements installed shall not exceed 2-inches WG (0.07 psi) at the design airflow specified in Paragraph 2.02 when measured at the filter silencer outlet. Maximum pressure drop with dirty inlet filters shall be 12-inches WG (0.43 psig) at the design airflow specified in Paragraph 2.02 when measured at the filter silencer outlet. Filter silencer pressure loss rating shall include total restriction, including losses induced by filter housing and filter elements.

C. Filter element face velocity shall not exceed 75 fpm at rated flow, and allowable final differential pressure shall be rated not less than 12-inches WG.

D. Filter medium shall be synthetic, self-supporting, not require a support scrim, and shall not be affected by relative humidity. Filters shall have a minimum efficiency of 98% at 10-micron (nominal). Filter element changes shall not require hand tools and filter element weight shall not exceed 25 lbs. Filter elements shall be cleanable.

E. Filter silencer shall be Endustra Tri-Vent® P09 Series w/ Enduralast® Hi-Flow Synthetic Medium or approved equal.

2.19 SPARE PARTS

A. The blower manufacturer shall submit a list of recommended spare parts with long lead items clearly identified.

B. The blower manufacturer shall provide spare parts only for items that will be consumed during startup and testing including sufficient quantities of recommended lubricants.

C. One spare filter element shall be provided for each blower intake filter/silencer.

2.20 PAINTING

A. Blowers, base, and motor shall have prime and finish painting done at the factory using the manufacturer’s premium grade paint specifications. Paint system shall be submitted

for approval with the shop drawings. A color chart shall be submitted with the shop drawings for Owner selection of color for the blower and motor.

PART 3 – EXECUTION

3.01 INSTALLATION

A. All equipment specified herein shall be installed in accordance with the manufacturer's instructions and checked by the respective manufacturers' representative, in conformity with the applicable Sections of this Specification. After installation, the equipment shall be aligned and adjusted as required for proper operation.

3.02 SHOP TEST

A. Factory testing of the blowers and components prior to shop performance tests is required. Impellers shall be statically and dynamically balanced and over-sped to 115% of rated speed. Dimension checks shall be made throughout fabrication.

B. Shop running and performance tests for each blower shall be made by the manufacturer and certified curves and reports shall be submitted for approval.

C. After approval of preliminary performance tests, each blower shall be factory performance tested in accordance with the most recent edition of the ASME Power Test Code for Centrifugal Compressors and Exhausters (PTC-10) and as specified herein. Test results shall be reported in accordance with the same code and as specified herein and the results submitted prior to shipment.

D. Factory performance tests are to be conducted with the job specific motor where possible. Calibrated shop motors are acceptable for the witness test according to the most recent edition of the ASME Power Test.

E. The factory performance tests shall be conducted for each blower to demonstrate compliance with all performance requirements. Performance tests shall include a minimum of six (6) points to determine the blower flow-pressure-horsepower characteristic with inlet valve wide open over the full range of specified conditions. Test points shall include points to define the blower surge limit (with inlet modulating valve wide open). Tolerances allowable in testing shall be as approved by the Engineer.

F. A calibrated torque meter shall measure the shaft input horsepower as per Paragraph 4.35 of the Code to verify shaft power draw measurements. Compressor net delivered flow rate and discharge pressure shall be guaranteed with no negative tolerance. There shall be no other tolerances or measuring uncertainties used in reporting test results (i.e., the tests shall be reported with ±zero percent tolerance).

1. The capacity of the blower shall be defined as per Paragraph 4.26 of the ASME PTC-10 Power Test Code. Specifically, capacity is defined as, "the net rate of flow

compressed and delivered, expressed in terms of cubic feet per minute at the prevailing inlet temperature and pressure. It shall be measured in a suitable manner to exclude effectively all external leakage losses from sources such as shaft seals." That is, air flow shall be measured on the discharge side of the compressor at zero percent tolerance.

2. Complete instrumentation layout and manufacturer's information for all instrumentation used during testing shall be submitted including the arrangement and device for flow measurement, conversion tables/graphs, and accuracies over the specified flow range. All test equipment shall be calibrated and certified by an independent test agency no more than twelve (12) months prior to the test date. Certificates shall show the stability of calibration over a period of at least one year per ISO 9001, Paragraph 4.1.1.

3. Velocity vibration versus frequency levels shall be recorded within 10-1,000 and 10-10,000 Hz frequency range.

G. In case of failure of any unit to meet the test requirements, the manufacturer, at their own expense, shall make such alterations as are necessary and the tests shall be repeated without additional cost to OWNER until the equipment is satisfactory.

H. The Supplier shall prepare and submit test results, performance curves, and all calculations with a statement certifying that shop tests were successfully conducted in accordance with the test requirements and that all specified performance conditions were demonstrated for each blower system. Certified performance curves based on the results of the shop performance test shall be developed in terms of standard conditions of 14.7 psia, 68°F, and 36% relative humidity, as well as the design criteria specified in Paragraph 2.02, at the actual blower speed for each point. SCFM shall be plotted against pressure at both standard and design conditions, and the curve shall show standard horsepower draw over the range of SCFM flow rates.

I. The blower control panel shall be fully tested prior to shipment, including a test of all alarm and trip functions.

3.03 FIELD TESTS

A. Field running tests shall be conducted by the factory service people with assistance of the Contractor.

B. Running tests shall be conducted under actual operating conditions for a period of not less than 8 hours for each blower. Running tests shall demonstrate that the blower is free from all objectionable vibration and noise and overheating throughout the entire range of specified operation. Initial running tests shall demonstrate that all instruments, controls, and protective shutdown interlocks function properly.

C. Each blower shall be run for 4 hours at full load and for 4 hours just above surge. Temperature and vibration readings for all monitored points shall be recorded after 4 hours and at the conclusion of the 8-hour run period for the operating blower(s). Any shutdown of the blower(s) during the test periods shall be recorded and the cause noted. Any defects or operating problems found during running tests shall be promptly corrected.

END OF SECTION

NOTES:

1. REFER TO SPECIFICATION SECTION 01 14 00 COORDINATION WITH OWNERS OPERATIONS FOR DEMOLITION SEQUENCING.
2. ALL EXISTING CHLORINE AND AMMONIA PIPING SHALL BE DEMOLISHED. CONTRACTOR TO FIELD VERIFY FULL EXTENTS OF CHLORINE AND AMMONIA PIPING WITHIN FILTER COMPLEX. CHLORINE PIPING PENETRATING FINISHED CHAMBER WALLS SHALL BE CUT AND CAPPED WITHIN 6" OF WALL EXTERIOR.
3. ALL EXISTING SAMPLE PUMPS & PIPING SHALL BE DEMOLISHED. CONTRACTOR TO FIELD COORDINATE EXTENT OF SAMPLE PIPING WITHIN PIPE GALLERY.
4. EXISTING COMPRESSOR DISCHARGE SHALL BE REROUTED TO THE BULK CHEMICAL BUILDING. SEE CIVIL DRAWINGS FOR PROPOSED ROUTING.

BUILDING CODE ANALYSIS- ARKANSAS
2021 INTERNATIONAL EXISTING BUILDING CODE (IEBC)

SUMMARY OF WORK – 3000 FILTER BUILDING, CROSS GALLERY

- **CH 6 ALTERATION LEVEL 1**
  - BUILDING ELEMENT REPLACEMENT AT CROSS GALLERY
    - **First Floor: 15,951 SF**
      Chemical Storage Room
      Circulation
      Loading Dock
      SCADA – Computer Room
    - **Second Floor: 15,951 SF**
      Control Room
      Breakroom
      Circulation
      Offices
      Small monitor lab
      Restrooms/Showers
      Electrical Room
    - **Third Floor 15,951 SF**
      This space will NOT be occupied at this time.
      Existing storage tanks and machinery to be remove.
      No new use is planned for this area at this time.
  - FINISHES
    - INTERIOR CLEANING
    - NEW WALL PAINT
    - NEW CEILING TREATMENT
    - UPGRADE OF EXISTING LIGHTING
    - NEW FLOOR COATING

APPLIANCE SCHEDULE

CONTROL ROOM

1. **REFRIGERATOR** - FRIGIDAIRE GALLERY 25.6 CU.FT. 36" STANDARD DEPTH SIDE BY SIDE. GRSS2652AF – FIN: STAINLESS STEEL - HEIGHT 69 7/8", WIDTH 36 1/8", DEPTH 35 7/8"
2. **UNDER COUNTER ICE MACHINE:** MANITOWOC ICE CUBE MACHINE – UCP0050 MODEL UCP0050A. 52 LBS./24HRS, 25 LBS. STORAGE. HEIGHT 33.5", WIDTH 14.75", DEPTH 22.75", 115/60/1
3. **OVEN/STOVE:** WHIRLPOOL 30-IN GLASS TOP 5 BURNERS 5.3 CU.FT. STEAM CLEANING FREESTANDING ELECTRIC RANGE. FINGERPRINT RESISTANT STAINLESS STEEL
   MODEL #: WFES3330RZ HEIGHT 47.875", WIDTH 30", DEPTH 27.75"
4. **DISHWASHER:** WHIRLPOOL ECO SERIES LARGE CAPACITY 24" TOP CONTROL BUILT-IN DISHWASHER WITH THIRD RACK, FINGERPRINT RESISTANT STAINLESS STEEL, VERY QUIET SOUND LEVEL 47-DBA.
   MODEL #: WDT750SAKZ
5. **MICROWAVE – COUNTER TOP:** WHIRLPOOL, 25" WIDE 2.2 CU.FT. 1200 WATT FINGERPRINT RESISTANT COUNTERTOP MICROWAVE WITH SENSOR COOKING AND STEAM CLEAN.
   MODEL #: UMCS5022RZ HEIGHT 15", WIDTH 25", DEPTH 20"
6. **UNDER CABINET RANGE HOOD:** BROAN 30-IN CONVERTIBLE 375-CFM STAINLESS STEEL.
   MODEL #:BCSQ130SS DUCTED, 3 SPEED, LED LIGHTS, DISHWASHER SAFE FILTERS.

WEST GALLERY

1. **UNDER COUNTER REFRIGERATOR**: WHIRLPOOL 5.1 CU.FT. BUILT-IN MINI FRIDGE – STAINLESS STEEL. MODEL #: WUR35X24HZ HEIGHT 35", WIDTH 22 ¾", DEPTH 24"

ADMIN. BUILDING LOBBY

1. **PASS THROUGH- UNDER COUNTER REFRIGERATOR:** PERLICK 36" PASS THRU BACK BAR REFRIGERATOR, SELF CONTAINED, 1 DOOR ON EACH SIDE, SWINGING DOOR, STAINLESS STEEL, 2" FOAMED-IN-PLACE INSULATION.
   MODEL #: PTS36 TEMPERATURE 38 DEGREES F. FLAT SHELVING. 120VAC/60HZ/1 PH, 5 YEAR COMPRESSOR WARRANTY

ADMIN. BUILDING 2ND FLOOR BREAKROOM

1. REFRIGERATOR (SAME AS ABOVE)
2. UNDER COUNTER ICE MACHINE (SAME AS ABOVE)
3. MICROWAVE – COUNTER TOP (SAME AS ABOVE)

GMP SUBMITTAL. DO NOT USE FOR CONSTRUCTION.

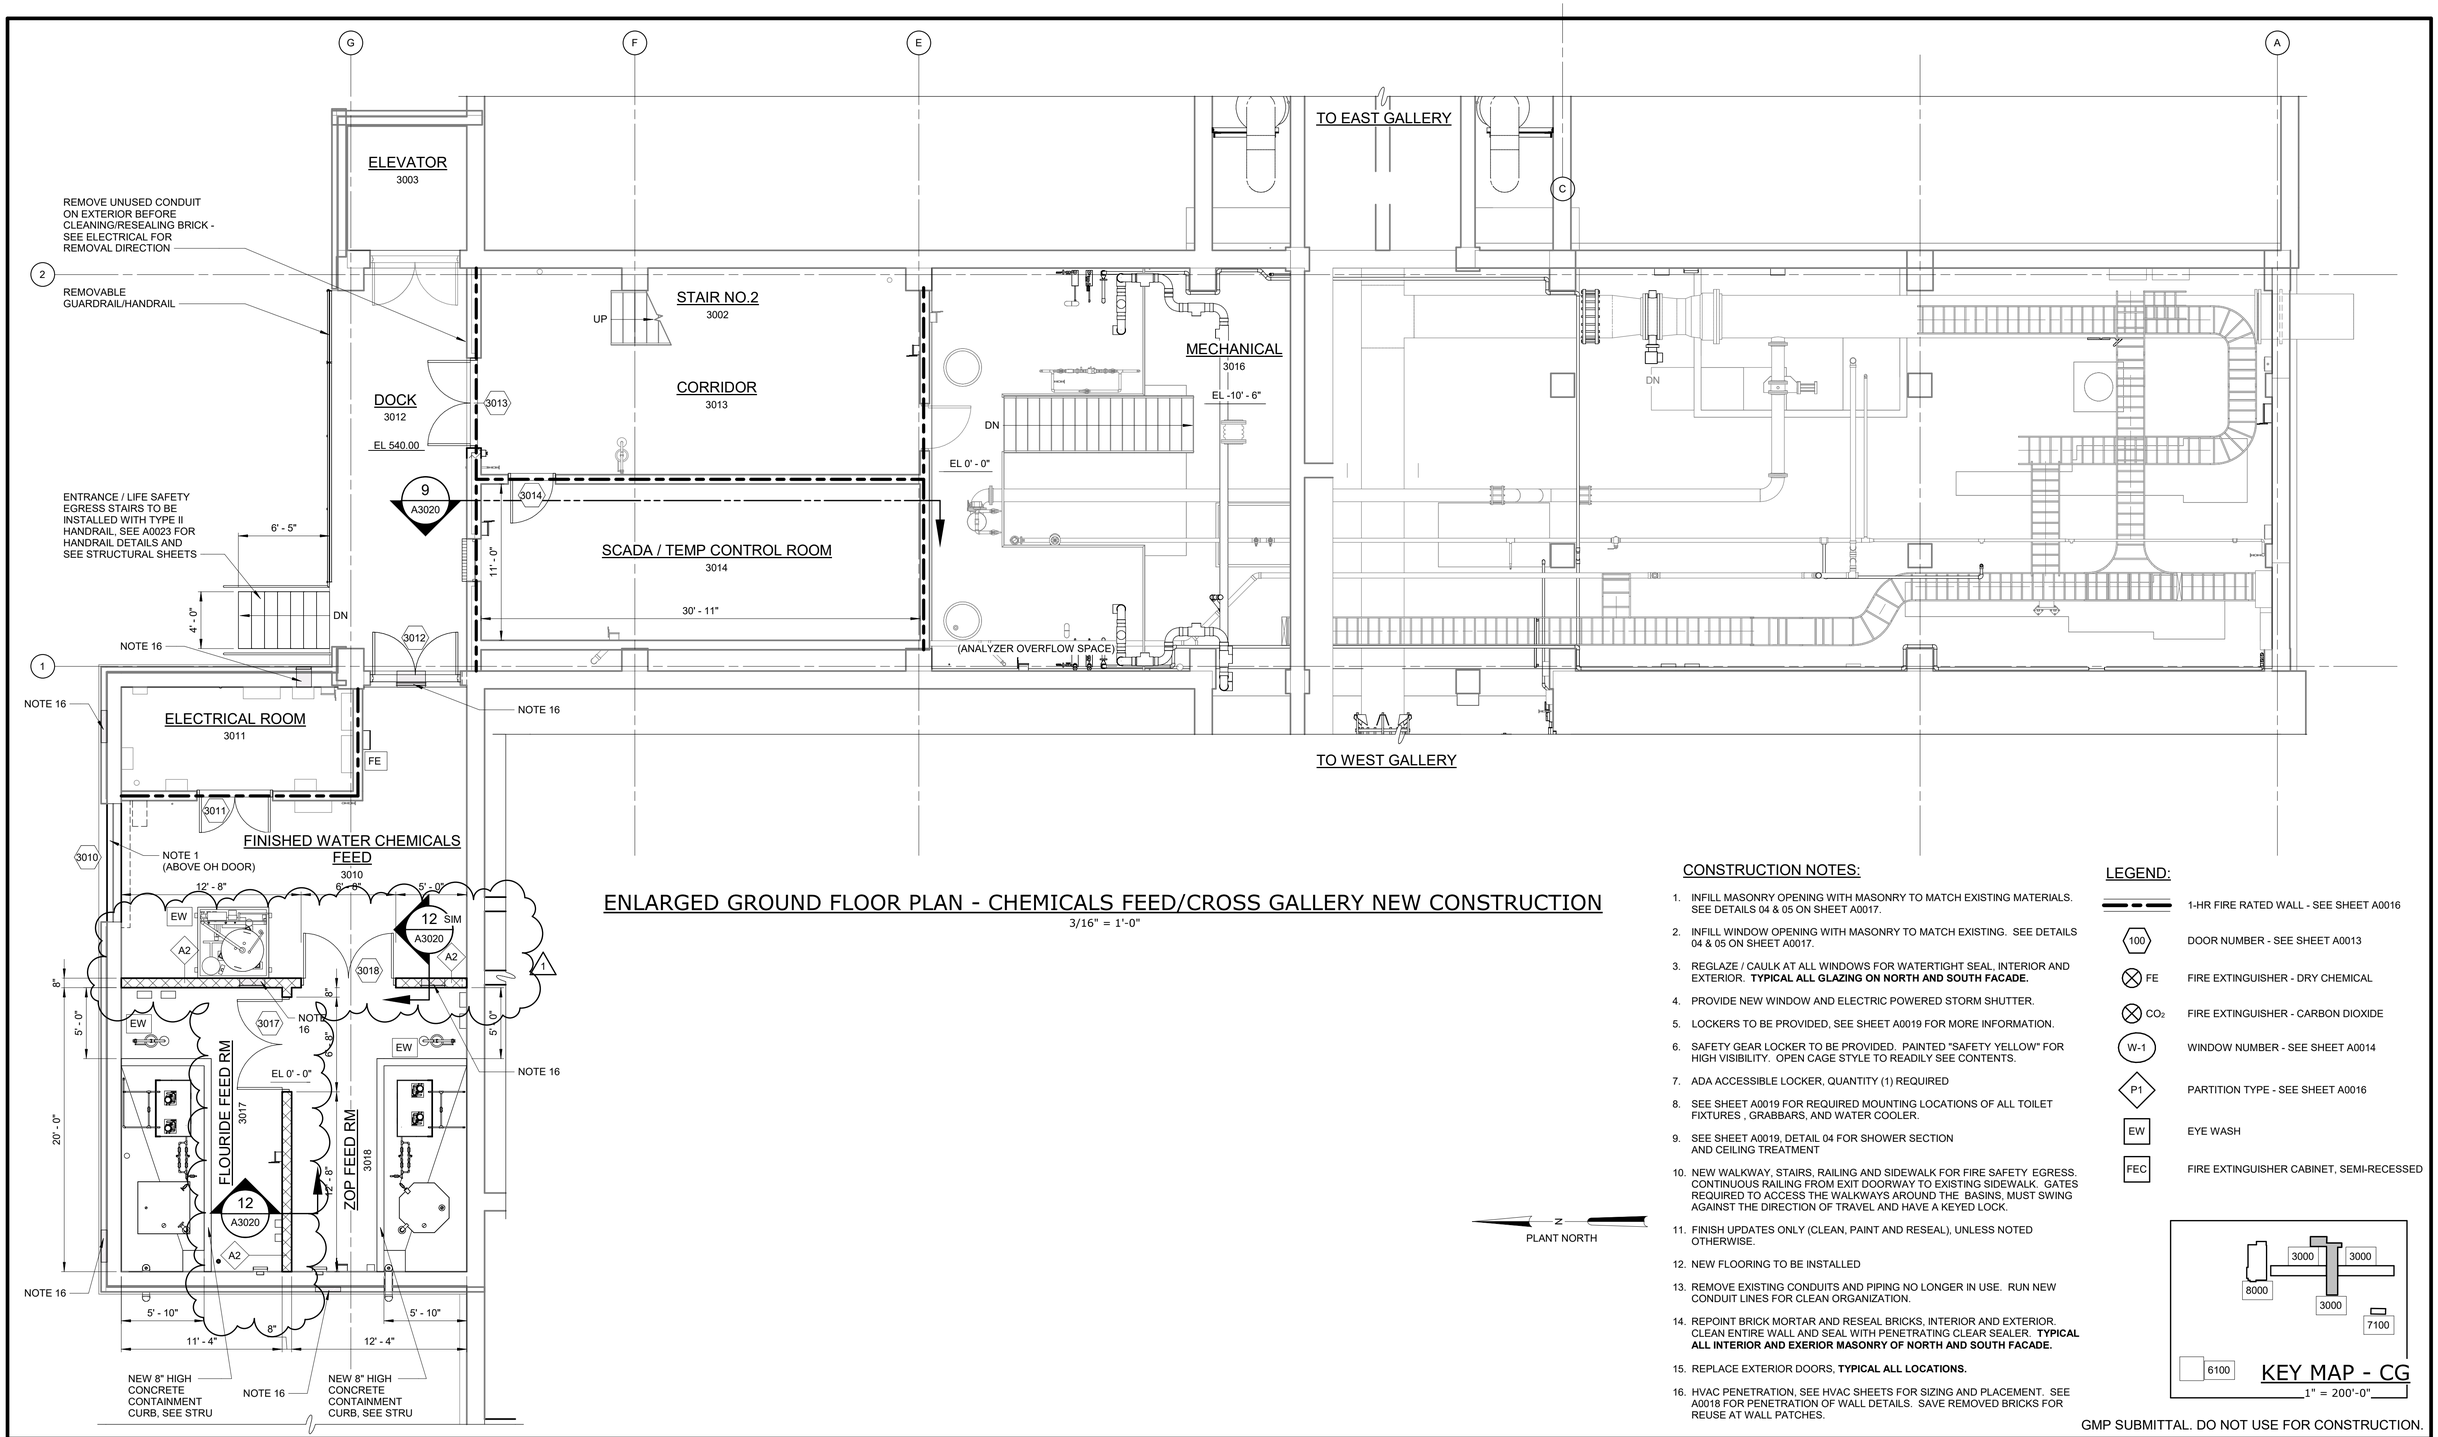
CONTRACT NO.:	1
DRAWING NUMBER:	A0013



ENLARGED GROUND FLOOR PLAN - CHEMICALS FEED/CROSS GALLERY NEW CONSTRUCTION

3/16" = 1'-0"

PLANT NORTH

CONSTRUCTION NOTES:

1. INFILL MASONRY OPENING WITH MASONRY TO MATCH EXISTING MATERIALS. SEE DETAILS 04 & 05 ON SHEET A0017.
2. INFILL WINDOW OPENING WITH MASONRY TO MATCH EXISTING. SEE DETAILS 04 & 05 ON SHEET A0017.
3. REGLAZE / CAULK AT ALL WINDOWS FOR WATERTIGHT SEAL, INTERIOR AND EXTERIOR. **TYPICAL ALL GLAZING ON NORTH AND SOUTH FACADE.**
4. PROVIDE NEW WINDOW AND ELECTRIC POWERED STORM SHUTTER.
5. LOCKERS TO BE PROVIDED, SEE SHEET A0019 FOR MORE INFORMATION.
6. SAFETY GEAR LOCKER TO BE PROVIDED. PAINTED "SAFETY YELLOW" FOR HIGH VISIBILITY. OPEN CAGE STYLE TO READILY SEE CONTENTS.
7. ADA ACCESSIBLE LOCKER, QUANTITY (1) REQUIRED
8. SEE SHEET A0019 FOR REQUIRED MOUNTING LOCATIONS OF ALL TOILET FIXTURES , GRABBARS, AND WATER COOLER.
9. SEE SHEET A0019, DETAIL 04 FOR SHOWER SECTION AND CEILING TREATMENT
10. NEW WALKWAY, STAIRS, RAILING AND SIDEWALK FOR FIRE SAFETY EGRESS. CONTINUOUS RAILING FROM EXIT DOORWAY TO EXISTING SIDEWALK. GATES REQUIRED TO ACCESS THE WALKWAYS AROUND THE BASINS, MUST SWING AGAINST THE DIRECTION OF TRAVEL AND HAVE A KEYED LOCK.
11. FINISH UPDATES ONLY (CLEAN, PAINT AND RESEAL), UNLESS NOTED OTHERWISE.
12. NEW FLOORING TO BE INSTALLED
13. REMOVE EXISTING CONDUITS AND PIPING NO LONGER IN USE. RUN NEW CONDUIT LINES FOR CLEAN ORGANIZATION.
14. REPOINT BRICK MORTAR AND RESEAL BRICKS, INTERIOR AND EXTERIOR. CLEAN ENTIRE WALL AND SEAL WITH PENETRATING CLEAR SEALER. **TYPICAL ALL INTERIOR AND EXERIOR MASONRY OF NORTH AND SOUTH FACADE.**
15. REPLACE EXTERIOR DOORS, **TYPICAL ALL LOCATIONS.**
16. HVAC PENETRATION, SEE HVAC SHEETS FOR SIZING AND PLACEMENT. SEE A0018 FOR PENETRATION OF WALL DETAILS. SAVE REMOVED BRICKS FOR REUSE AT WALL PATCHES.

1/4" = 1'-0"

1ST FL CONSTRUCTION NOTES:

1. INSTALL LAB COUNTERTOPS AND LAB CASEWORK PER ELEVATIONS.
   SEE A0019 FOR CASEWORK SECTIONS
2. ENTRANCE VESTIBULE AND DOOR SHALL BE MODIFIED TO MEET ACCESSIBILITY REQUIREMENTS AND PROVIDE WIDER ENTRANCE.
3. EXTERIOR ENVELOPE TO BE EVALUATED FURTHER TO FIND POTENTIAL AIR LEAKAGE ISSUES WITH THE EXTERIOR WALLS AND WINDOWS. ADD INSULATION AND WEATHERPROOFING. APPLY SPRAY INSULATION IN CRAWL SPACE.
4. INSTALL SHELVING
5. ADD PUSH PANELS AT ENTRY AND NARTHEX FOR HANDS FREE ACCESSIBILITY.
6. FLOORING TO BE INSTALLED.
7. PROVIDE UNDERCABINET PASS THROUGH REFRIGERATOR FOR NIGHT DEPOSIT. SIGN IN SHELF ON VESTIBULE SIDE.
8. ADDRESS AIR FLOW INSIDE COLUMN BUILD OUT.
9. 4'x10' OBSERVATION WINDOW INTO LAB SPACE, SET 42" AFF
10. INSTALL ENERGY EFFICIENT FUME HOODS.
11. EXISTING WINDOWS SHALL BE REGLAZED OR REPLACED DEPENDING ON FURTHER INVESTIGATION, TYP
12. SAMPLE SINK TO BE REPLACED IN KIND, SEE MECHANICAL DRAWINGS FOR DETAILS.
13. EXISTING COLUMNS TO BE INSULATED TO PREVENT CONDENSATION - SEE A8012 FOR EXISTING CONDITIONS AND REMEDIATION MEASURES
14. WASH EXTERIOR OF BUILDING UPON COMPLETION OF WORK BEFORE TURN OVER TO CLIENT.
15. OUTLET AND BLOCKING FOR WALL MOUNTED TV, SEE ELECTRICAL AND STRUCTURAL SHEETS FOR DETAILS.
16. PAINT HANDRAILS (1)

Number	Question	Drawing/Specification Reference	Response
18	There are two sets of blower conditions listed. Are we doing two separate proposals, one for each option, or just for one or the other of the two options?	M3201 and M3202	The blower design criteria has been updated to keep the exsiting blower regardless of the underdrain selection. Only one proposal is required. Please see updated drawing M3201 and Specification 43 11 18.
	a. Set one is for ONE blower for a Plastic Dual-lateral underdrain system, 6000 SCFM at 6.0 PSIG, 250HP motor	M3201 and M3202	This is now the only blower design criteria, regardless of the underdrain selection.
	b. Set two is for TWO blowers for Folded SST plate underdrain system, 6000 SCFM at 6.75 PSIG, 300HP motor	M3201 and M3202	This option has been removed.

Number	Question	Drawing/Specification Reference	Response
153	[Poly-Processing/ETEC] Please review and provide comment to our value differentiations, exceptions, and keynotes.	43 41 43	See below.
	Value Differentiations		
	2.02 C – OR1000 (oxidation resistance) Tank TK-6000 (sodium hypochlorite delivery tank) will include OR1000 a medium density polyethylene resin system with 4x the antioxidant resistance of standard polyethylene resins. OR1000 was engineered by PPC specifically to address the aggressive oxidizing effects of sodium hypochlorite.	43 41 43 - 2.02.C	This is acceptable.
	2.03 C – Opening for pump suction line shall be integrally molded full drain outlet Each tank offered in our quote will feature an Integrally Molded Flanged Outlet (IMFO) capable of providing full drainage through the tank sidewall. Unlike similar “full drain” outlets, the IMFO is molded from the same material as the tank and located flush with the tank bottom to provide full drainage. Similar outlets use adapters or inserts which can never be installed low enough to provide full drainage.	43 41 43 - 2.03.C	This is acceptable.
	Exceptions and Key Notes		
	1.02 A – The tank offered in our quote follow.	43 41 43 - 1.02.A	
	TK-6104: 2050-Gallon IMFO Tank (7’-1” OD x 8’-6” Overall Height)		This is acceptable.
	TK-6151 / TK-6152: 6150-Gallon IMFO Tank (10’-2” OD x 12’-5” Overall Height)		This is acceptable.
	TK-6160 / TK-6210: 230-Gallon IMFO Tank (3’-2” OD x 4’-11” Overall Height)		This is acceptable.
	TK-6201 / TK-6000: 6115-Gallon IMFO Tanks (8’-6” OD x 16’-4” Overall Height)		This is acceptable.
154	[ISI] What is the last day to submit bid questions?		7 days prior to the bid opening. No questions will be accepted after 1/31 at 2 pm CT.
155	[Ideal Construction] Room #8008 calls for flooring but is not on the finish schedule.	A0012	Room 8008 added to finish schedule - will have LVT-MAF installed.
156	[Ideal Construction] 1st floor demo plans, room #8009 - NOTE 14 says to remove exiting floor & prep for new flooring, but it is not on the finish schedule.	A8000	Room 8009 added to finish schedule - will have LVT, RWB, PT, and ACT.
157	[Ideal Construction] #8060 Supply/Mother, plans call for new flooring but is not on the finish schedule.	A0012	Room 8060 added to finish schedule - will have CPT, RWB, PT, and ACT.

Number	Question	Drawing/Specification Reference	Response
158	[Mixtec] The Vertical Shaft Mixer package refers to a Payment Bond and a Performance Bond. It is our experience that these are not common requirements for equipment supply, versus construction activities. The document includes many other items on contractor licensing, trenching, trailer hookups, etc that do not apply to equipment supply. Please confirm that the bonds are required for this equipment supply or if they are a carryover from the construction packages.		The performance and payment bonds only apply to packages 1-7. A bid bond is also not required.
159	[Serv-a-tron] They are asking for a bunch of service days, please confirm if a factory tech is required or if I can take care of it.	40 05 59.23	As noted in the spec, the services must be provided by a qualified manufacturer's technical representative in accordance with Section 46 00 00 – Equipment General Provisions.
160	[Serv-a-tron] We had included the anchors in the budget quote, please confirm if they should be included.	40 05 59.23	Yes, include.
161	[Serv-a-tron] There is no reference to an Arkansas P.E. stamped design calculations (for submittals or anchors), can you verify this ?	40 05 59.23	P.E. seal requirements have been added. Please see the addendum for reference.
162	[Serv-a-tron] Quote item 11C, P & LD: There is a stop plate schedule, asking for 5 frames and 1 stop plate: I can see only 1 stop plate and 1 frame in the Coagulated Water Distribution (M2002).	40 05 59 / 40 06 20	The number of frames will be revised in the updated pipe schedule.
163	[Serv-a-tron] Also, they are asking for a lifting device for the stop plate: not sure if relevant since the plate is of the same height as the frame. The lifting device is normally slid in the frame to reach the stop plate (or stop log).	40 05 59	It is a large stop plate to be lifted by hand in terms of its size and weight. Anything larger than 24X24 requires a lifting device.
164	{Calgon Carbon] As it relates to scraping in 46 61 16 Para. 3.03 C 2 g : The spec states that the media will be installed in two lifts and each lift will be backwashed 3 times. The top 1/2" of media will be scraped after each "washing". Our interpretation of this would be that the top 1/2" of media would be scraped after backwashing each lift 3 times, so a total of 1" of additional GAC would be included, 1/2" for lift 1 and 1/2" for lift 2. Please confirm that this is correct. Each inch of media is several truckloads, so I want to make sure we are interpreting this correctly.	46 61 16 - 3.03.C.2.g	Top 1/2" of media will be scraped after every backwash of each lift. Total of 6 wash/scrape cycles.
