G. Submit samples for examination and approval when appearance is different than sprinkler specified.

H. Provide high pressure sprinklers where pressures exceed 175 psi (1205 kPa) working water pressure.

I. Spare Sprinkler Cabinets:

(1) Shall be complete with required number of spare sprinklers of each type and temperature rating per NFPA 13.

(2) Shall be provided with at least one sprinkler wrench for each type of sprinkler installed.

(3) Provide multiple cabinets to meet this requirement.

(4) Coordinate cabinet locations with Owner's representative.

2.03 FIRE PROTECTION PIPE JOINTS AND FITTINGS

A. Below Ground:

(1) Pipe: Ductile iron, Class 52, American Water Works Association AWWA C151/A21.51, minimum 350 psi (2413 kPa) working pressure, with standard cement mortar lining, AWWA C104/A21.4, American National Standards Institute (ANSI) A21.4

(2) Fittings: Ductile iron or grey iron, mechanical joint, 350 psi (2413 kPa) working pressure, AWWA C153/A21.53, cement mortar lined, AWWA C104/A21.4.

(3) Encasement: Polyethylene encasement, 8 mil (0.2 mm) thick, AWWA C105/A21.5.

(4) Underground Restraint:

(a) Acceptable manufacturers: EBAA Iron, Inc., Smith-Blair, or equal

(b) Mechanical Joints Utilizing Setscrew Retainer Glands

1) Mechanical joint restraint device for nominal pipe sizes 3" (80 mm) through 12" (300 mm) per AWWA C151/A21.51, shall consist of multiple gripping wedges incorporated into a follower gland meeting the applicable requirements of AWWA C110/A21.10, body, wedges and wedge actuating components shall be cast from grade 65-45-12 ductile iron material in accordance with ASTM A536, minimum working pressure rating of 350 psi (2413 kPa), includes torque limiting breakaway nuts, allows for a minimum of 3° of deflection, and includes fusion-bonded epoxy coating per AWWA C213.

2) Mechanical restraint coupling gasket shall be furnished by same manufacturer.

(c) Pipe Clamps and Tie Rods

1) Clamps, rods, and washers shall be sized per the requirements listed in NFPA 24.

1. Clamps shall be made of steel, used to prevent joint separation through use in combination with rod clamp washers, rod couplings, and heavy hex nuts.

2. Rods shall be carbon steel per ASTM A193/A193M GR B7, using rolled threads for improved physical characteristics, greater thread accuracy, and smooth surface finish.

(5) Underground Penetration Modular Seal:

(a) Acceptable manufacturers: GPT Industries, Roxtec, or equal

(b) Modular sealing device consisting of sealing elements, pressure fittings, and hardware preassembled from manufacturer.

1) Sealing elements: EPDM rubber that adjusts to the outside diameter of the pipe to ensure proper fitment and sealing.

2) Pressure resistant to a minimum of 20 psig (40 ft. of head).

3) Bolts and nuts: 316 stainless steel per ASTM F593

(c) Basis of Design: GPT Industries Link-Seal, Roxtec Model RS, or equal

B. Above Ground:

(1) Steel Pipe: Steel fire protection pipe shall be selected according to nominal pipe diameter. Schedule 30, Schedule 7, or similar thin-walled steel pipes are prohibited. CPVC pipe and fittings are prohibited.

(a) Carbon (Black) Steel Pipe, 2" (50 mm) and smaller:

1) Schedule 10, ASTM A135/A135M

2) Schedule 40, ASTM A795/A795M or ASTM A53/A53M

(b) Carbon (Black) Steel Pipe, larger than 2":

1) Schedule 10, ASTM A135/A135M

2) Schedule 40, ASTM A795/A795M or ASTM A53/A53M

(2) Steel Pipe Finishes: Unless noted otherwise, galvanized (hot dipped zinc coated) pipe and fittings shall be used when sprinkler system is exposed to weather or other corrosive environments.

(3) Steel Pipe Joints:

(a) Black Steel Pipe Joints:

1) Threaded, tapered pipe threads, ANSI B1.20.1

2) Flanged, cast iron,175 psi (1205 kPa) CWP rating, ANSI B16.1, square head machine bolts with semi-finished hexagon nuts, ASTM A183, neoprene gasket

3) Welded, welding electrodes shall be Lincoln or equal with coating and diameter as recommended by manufacturer for type and thickness of work being done.

4) Cut or roll grooved, with mechanical coupling.

5) Factory-welded pipe outlets, threaded or grooved

(b) Galvanized Schedule 10 Steel Pipe Joints:

1) Roll grooved with mechanical coupling.

2) Factory-welded pipe outlets, threaded or grooved

(c) Galvanized Schedule 40 Steel Pipe Joints:

1) Threaded, tapered pipe threads, ANSI B1.20.1

2) Cut grooved with mechanical coupling

3) Factory-welded pipe outlets, threaded or grooved

(4) Steel Pipe Fittings:

(a) Black Steel Fittings:

1) Cast iron threaded fittings, Class 125, 175 psi (1205 kPa) CWP rating, ASME B16.4

2) Ductile iron threaded fittings, Class 150, 175 psi (1205 kPa) CWP rating, ASME B16.3

3) Malleable iron threaded fittings, Class 150 or 300, ASTM A197/A197M /ANSI B16.3

4) Cast iron flanged fittings, Class 125, 175 psi (1205 kPa) CWP rating, ANSI B16.1

5) Carbon steel butt weld fittings, ASTM A234/A234M Grade WPB/American Society of Mechanical Engineers ASME B16.9, standard weight, seamless

6) Mechanical grooved fittings, ASTM A536 ductile iron, ASTM A47/A47M malleable iron or ASTM A53/A53M fabricated steel, 175 psi (1205 kPa) CWP rating, malleable iron conforming to ASTM A47/A47M

1. Acceptable manufacturers: Victaulic, SPF/Anvil, Tyco Grinnell, Viking, or equal.
2. Flexible Couplings: Victaulic Style 75, or equal.
3. Rigid Couplings: Victaulic Style 009N, Victaulic Style 07, Victaulic Style 005H, or equal. Single-bolt or hinged couplings are prohibited.
4. Wet systems gasket: Grade E EPDM gasket per UL 157 and UL 213.
5. Dry systems gasket: Victaulic “FlushSeal” or equal.
6. Rigid or zero flex type couplings shall be provided when operating pressures cause piping to move out of place or sway on hangers. Flexible couplings may be used where pipe is braced or clamped into rigid position.
7. Fitting, gasket, and coupling shall be furnished by same manufacturer.
8. Pre-fabricated, one-piece assemblies that contain the fitting housing, gaskets, and bolts are prohibited.

(b) Flexible Sprinkler Hose Fittings for Fire Protection Service:

1) Listings and Approvals: complete hose and bracket assembly shall be FM approved and UL Listed. FMRC Approved for its intended use pursuant to FM 1637 and UL Listed for its intended use pursuant to UL 2443 – Standard for Flexible Sprinkler Hose with Fittings for Fire Protection Service.

2) For seismic projects, product shall be seismically qualified for use pursuant to ICC-ES AC156 – Acceptance Criteria for Seismic Qualification by Shake-Table Testing of Nonstructural Components and Systems.

3) Provide high pressure fittings where pressures exceed 175 psi (1205 kPa) water working pressure. Model numbers on high pressure fittings must include the “H” suffix, or other indication that the product is rated for working pressures over 175psi.

4) Acceptable Manufacturers: FlexHead as manufactured by ASC Engineered Solutions or VicFlex as manufactured by Victaulic.

5) Flexible Hose Assemblies and End Fittings:

1. Application: shall be used in lieu of rigid steel pipe offsets or return bends for sprinkler drops.
2. Composition: 100% Type 304 or 316 corrugated braided stainless steel with true 1" minimum ID.

3. Minimum Bend Radius: 2" minimum bend radius per UL and 7-inch minimum bend radius per FM.
4. Connections shall be threaded.

6) Brackets:
1. Listed Assemblies: shall be of same manufacturer as flexible sprinkler hose fittings. Mixing of manufacturers shall not be allowed.
2. Listings and Approvals: shall be FM approved, UL Listed for use with flexible sprinkler hose fittings.
3. Applications: can be used on ceiling grid, hard lid, and open ceiling applications by attaching to framing, concrete deck or walls.

(5) Copper, 2" and Smaller:
(a) Pipe: Copper tube, Type L, hard drawn, ASTM B88
(b) Fittings:
1) Cast bronze, solder joint, pressure rated, ANSI/ASME B16.18.
2) Wrought copper, solder joint, pressure rated ANSI/ASME B16.22.
(c) Joints:
1) Lead free (<0.2%) solder, Bridgit or Silvabrite, ASTM B32, flux ASTM B813.
2) Brazed, silver solder, BCuP-5, AWS A5.8M/A5.8, 1250°F (676°C) melting point minimum.
(d) Nipples:
1) Red brass pipe, threaded.
(6) Threaded bushings are prohibited.
(7) Plain end couplings such as Roust-A-Bouts, Plainloks or similar fittings are prohibited.
(8) Slip-style fittings such as Wardlox or similar fittings are prohibited.
(9) Adjustable drop nipples are prohibited.
(10) Clamp-on or saddle type fittings (i.e., mechanical tees and tee lox) are prohibited.
(11) Outlet fittings inserted into holes drilled into piping such as Victaulic Style 923 are prohibited.
(12) Outlet couplings such as Victaulic Style 72 are prohibited.
(13) Grooved reducing couplings such as Victaulic Style 750 are prohibited.
(14) Dielectric Fittings:
(a) Acceptable manufacturers: Epco Sales, Lochinvar, Watts Regulator Co., Wilkins, or equal
(b) Insulating nipple, metal casing, inert thermoplastic lining, Clearflow dielectric fitting by Perfection Corporation or equal.
1) Dielectric unions 2" (50 mm) and smaller; dielectric flanges 2" (50 mm) and larger; with iron female pipe thread to copper solder joint or brass female pipe thread end connections, non-asbestos gaskets, and pressure rating of not less than 175 psi (1205 kPa) at 180°F (82°C). Provide high pressure type when pressures exceed 175 psi (1205 kPa) water working pressure.

2.04 VALVES

A. Double Check Detector Backflow Prevention Assembly (DCBP):
(1) Acceptable manufacturers: Ames, Apollo, Cla-Val, Febco, Watts, or equal
(2) Weighted clapper double check valve assembly including 2 supervised outside screw and yoke (OS&Y) gate valves.
(3) Assembly shall be double check valve assembly for cross connection devices.
(4) Certified in accordance with ASSE 1015 and AWWA C510.
(5) Double check valve shall be selected based on minimal pressure drop to allow maximum available pressure to sprinkler system.
(6) Provide high pressure DCBP assembly and fittings when pressures exceed 175 psi (1205 kPa).

B. Gate Valve:
(1) Acceptable manufacturers: Kennedy, Milwaukee Valve Co., Mueller, Nibco, Stockham, Victaulic, or equal
(2) Outside screw and yoke (OS&Y) gate valve, bronze body and trim or cast-iron body bronze mounted and rated for 175 psi (1205 kPa), non-shock water working pressure, Nibco F-607-OTS or equal.
(3) Provide high pressure valves and fittings when pressures exceed 175 psi (1205 kPa) water working pressure.

C. Butterfly Valve with Integrated Tamper Switch - sizes: 2 to 12" (50 to 305 mm)
(1) Acceptable manufacturers: Kennedy, Milwaukee Valve Co., Mueller, Nibco, Tyco Fire Products, Victaulic, or equal
(2) For normally open valves, provide valve equal to Victaulic FireLock Series 705.

(3) For normally closed valves, provide valve equal to Victaulic FireLock Series 705C.

(4) Provide high pressure valves and fittings when pressures exceed 300 psi (2070 kPa) water working pressure.

D. Slow-Close Ball Valve with Integrated Tamper Switch - sizes 1 to 2" (25 to 50 mm):

(1) Acceptable manufacturers: Kennedy, Milwaukee Valve Co., Mueller, Nibco, Tyco Fire Products, Victaulic, or equal

(2) Provide valve equal to Victaulic FireLock Series 728.

E. Vertical Post Indicator Valve (PIV) Assembly:

(1) Acceptable manufacturers: Kennedy, Mueller, Nibco, Stockham, Victaulic, or equal

(2) Non-rising stem (NRS) gate valve, ductile iron body, resilient wedge, epoxy coated interior and exterior, includes indicator post flange and flange screw, rated for 300 psi (2070 kPa) non-shock cold working pressure, Nibco F-609-RWS or equal.

(3) Cast iron post with lockable lever operator for use with non-rising stem gate valve, 1" (25 mm) square valve stem extension rod, UV-stabilized Lexan window containing cast aluminum signage reading “OPEN” and “SHUT”, Kennedy Model 2495A, Nibco NIP-1AJ, Victaulic Series 774, or equal.

F. Wall Post Indicator Valve (PIV) Assembly:

(1) Acceptable manufacturers: Kennedy, Mueller, Nibco, Stockham, Victaulic, or equal

(2) Non-rising stem (NRS) gate valve, ductile iron body, resilient wedge, epoxy coated interior and exterior, includes indicator post flange and flange screw, rated for 300 psi (2070 kPa) non-shock cold working pressure, Nibco F-609-RWS or equal.

(3) Wall post indicator for use with non-rising stem (NRS) gate valve, cast iron body, steel operating rod, Lexan-UV stabilized or polycarbonate window containing cast aluminum signage reading “OPEN” and “SHUT”, Kennedy Model 641, Nibco Model NIP-3AJ, Victaulic Series 773, or equal.

G. Check Valve:

(1) Acceptable manufacturers: Globe Fire Sprinkler, Reliable, Tyco Fire Products, Victaulic, Viking, or equal

(2) Iron body, bronze seat, stainless steel clapper with a replaceable rubber seal, Globe Fire Sprinkler Model RCV, Tyco Fire Products CV-1F, Viking Model G-1, or equal.

(3) Check valve shall be equipped with removable cover for inspection and maintenance.

(4) Provide high pressure valves and fittings when pressures exceed 300 psi (2070 kPa) water working pressure.

H. Check Valve (Anti-Water-Hammer type)

(1) Acceptable manufacturers: Anvil Gruvlok, Reliable, Tyco Fire Products, Victaulic, Viking, or equal

(2) Ductile iron conforming to ASTM A536, Grade 65-45-12, rust inhibiting coating, sizes 2 to 5" (50 to 130 mm) consisting of stainless steel clapper conforming to ASTM A-167 and for sizes 6 to 8" (150 to 200 mm) consisting of ductile iron clapper conforming to ASTM A536, Anvil Gruvlok Series 7800 or equal.

(3) Provide high pressure valves and fittings where pressures exceed 175 psi (1205 kPa) water working pressure.

I. Ball Valve:

(1) Acceptable manufacturers: Milwaukee Valve Co., Mueller, Nibco, Stockham, Victaulic, or equal

(2) Bronze body and stem, full port design, brass ball with chrome plated finish, conforms to MSS SP-110 standard, Nibco Model KT-585-70-UL or equal.

(3) Provide high pressure valves and fittings when pressures exceed 300 psi (2070 kPa) water working pressure.

J. Angle/Drain Valve:

(1) Acceptable manufacturers: Milwaukee Valve Co., Mueller, Nibco, Stockham, Victaulic, or equal

(2) Bronze body, stem, bonnet, and packing nut; non-asbestos packing; nitrile seat disc; stainless steel handwheel screw or nut; Nibco Model T-301-W, or equal.

(3) Provide high pressure valves and fittings where pressures exceed 175 psi (1205 kPa) water working pressure.

K. Test and Drain Valves:

(1) Acceptable manufacturers: AGF, Victaulic, or equal

(2) AGF TESTanDRAIN, Victaulic Style 720 TestMaster II, or equal.

(3) Test and drain valve shall include integral pressure relief valve. Pressure relief valve shall be set to operate at 175 psi (1205 kPa) or 10 psi (70 kPa) in excess of the maximum system pressure, whichever is greater.

(4) Provide high pressure valves and fittings where pressures exceed 175 psi (1205 kPa) water working pressure.

L. Air Release Valve:

(1) Acceptable manufacturers: Engineered Corrosion Solutions, Potter Electric Signal Co., or equal

(2) Automatic float type air vent, ball valve with tamper switch, Y-type strainer, and single set of normally closed dry contacts rated 24VAC/DC at 2 Amps, UL 2573 Listed, FM Approved “Automatic Air Release Valve for Sprinkler Systems”, rated to 175 psi (1205 kPa) non-shock water working pressure, Potter Electric Signal Co. Model PAAR-B or equal.

(3) Air release valve shall be installed in an accessible location to permit operation, maintenance, and visual inspection of the status of the valve.

(4) Provide high pressure valves and fittings where pressures exceed 175 psi (1205 kPa) water working pressure.

M. Fire Hose Valve (FHV):

(1) Acceptable manufacturers: Croker, Elkhart Brass, Potter-Roemer, or equal

(2) Fire Hose Valve shall be 2-1/2" (65 mm) angle valve, cast brass body, polished chrome plated finish, equal to Potter-Roemer Model 4065. Valve cap for 2-1/2" (65 mm) 2-1/2 " (65 mm) valve shall be 2-1/2 " (65 mm) cap with chain, Potter-Roemer Model 4625 or equal. Cap and chain finish shall match finish of valve body. Threads shall match Fire Department Standards.

2.05 FIRE DEPARTMENT CONNECTION (FDC)

A. Manufacturers:

(1) Acceptable Manufacturers: Croker Corp.; Dixon Fire; Elkhart Brass; Potter-Roemer; or equal

B. Fire Department Connection:

(1) Provide wall mounted, flush type, cast brass body with drop clappers, faceplate shall be polished chrome plated finish, with lettering reading AUTOSPKR STANDPIPE.

(a) Unit shall include 4 2-1/2" (65 mm) inlets with rigid end threading to match local fire department standards by pin-lug hose thread swivels, pin-lug plugs and chains. Finish of snoots shall match faceplate finish. Provide Potter Roemer Series 5100-5400 or equal.

C. Ball Drip

(1) Acceptable manufacturer: Potter-Roemer, Tyco Fire Products, or equal

(2) Provide bronze ball drip for fire department connection (FDC) inside of building and pipe to nearest floor drain or discharge to exterior.

(3) Exterior discharge location must be coordinated with Architect and Owner.

2.06 ROOF FIRE HOSE MANIFOLD

A. Acceptable Manufacturers: Croker Corp., Elkhart Brass, Potter-Roemer, or equal

B. Basis of Design: Two-way connection, cast brass body with female NPT inlet and (2) 2-1/2" (65 mm) male NPT outlets, Potter-Roemer Model 5886 or equal.

2.07 TAMPER SWITCH

A. Acceptable manufacturers: Potter Electric Signal Co., System Sensor, or equal

B. Outside screw and yoke (OS&Y) supervisory switch, NEMA 4 enclosure, provided with 2 sets of SPDT (Form C) contacts rated at 2.5 Amps at 30 VDC and 15 Amps at 125/250 VAC. For areas identified as hazardous locations, provide “EX” Model. Potter Electric Signal Co. OSY series or equal.

C. Control valve supervisory switch, NEMA 4 enclosure, provided with 2 sets of contacts rated at 2.5 Amps at 30 VDC and 15 Amps at 125/250 VAC. Provide with optional cover tamper kit. For areas identified as hazardous locations, provide “EX” Model. Potter Electric Signal Co. PIBV series or equal.

D. Tamper switch shall be capable of transmitting signal during first 2 revolutions of handwheel or during 1/5 of travel distance of valve control apparatus from its normal position.

E. Unit shall be compatible with building’s fire alarm system.

2.08 FLOW SWITCH

A. Acceptable manufacturers: Potter Electric Signal Co., System Sensor, or equal

B. Vane type waterflow switch for use in wet sprinkler systems, minimum 300 psi (2070 kPa) service pressure rating, 10 gpm (0.63 L/s) minimal flow rate to activate alarm, and 2 sets of SPDT (Form C) contacts. Potter Electric Signal Co. VS series or equal.

C. Unit shall be compatible with building’s fire alarm system.

2.09 WATERFLOW ALARM PRESSURE SWITCH

A. Acceptable manufacturers: Potter Electric Signal Co., System Sensor, or equal

B. Pressure actuated switch for use in dry sprinkler systems, 300 psi (2070 kPa) service pressure rating, adjustable between 4-15 psi (27-100 kPa), 2 sets of SPDT (Form C) contacts rated at 2 amps at 30 VDC and 10.1 amps at 125/250 VAC. Potter Electric Signal Co. PS10 series or equal.

C. Unit shall be compatible with building’s fire alarm system.

2.10 WATERFLOW ALARM (EXTERIOR OF BUILDING)

A. Acceptable manufacturers: Cooper Wheelock, Potter Electric Signal Co., or equal

B. Basis of Design:

(1) Cooper Wheelock ASWP series, red finish with compatible weatherproof backbox. Audible strobe shall comply with UL 1638 – Standard for Visual Signaling Appliances, and UL 464 – Audible Signal Appliances.

C. Device shall be compatible with building's fire alarm system.

D. If required by code official, provide approved signage per NFPA 13.

2.11 PRESSURE GAUGES

A. Acceptable manufacturers: Ashcroft, Potter-Roemer, Viking, or equal

B. Pressure gauges shall be 3-1/2" (90 mm), corrosion resistant moving parts, polycarbonate window, and provided with connection not smaller than 1/4" (6 mm) NPT.

C. Include ball valve with provisions for draining on each pressure gauge.

2.12 WET PIPE SYSTEM COMPONENTS

A. Each wet pipe system shall include:

(1) Indicating-type control valve with tamper switch

(2) Indicating-type, pressure regulating control valve with tamper switch

(3) Check valve

(4) Pressure gauge

(5) Waterflow switch

(6) Inspector's test and drain assembly with integral pressure relief valve.

(7) Means of testing pressure reducing valve

B. Riser Manifold

(1) Acceptable manufacturers: Tyco Fire Products, Victaulic, Viking, or equal

(2) Ductile iron or fabricated steel pipe body; threaded or grooved connections; rated to 175 psi (1205 kPa) non-shock water working pressure; includes test and drain valve with integral pressure relief valve, flow switch, and pressure gauge; Tyco Fire Products Model RM-1, Victaulic UM, Viking EasyPac, or equal.

(3) Provide high pressure valves and fittings when pressures exceed 175 psi (1205 kPa) water working pressure.

C. Alarm Check Valve Assembly

(1) Acceptable manufacturers: Reliable, Tyco Fire Products, Victaulic, Viking, or equal

(2) Alarm check valve shall be check valve assembly with retard chamber.

(3) Include gauges, waterflow alarm pressure switch, drain valve, bypass piping and valves.

(4) Alarm check valve shall be capable of transmitting signal when water flow equals or exceeds discharge of single sprinkler.

2.13 HANGERS

A. Acceptable manufacturers: Afcon, Anvil, Eaton, Pentair, Tolco, or equal

B. Concrete expansion hangers, when provided, are to be Hilti, Illinois Tool Works (ITW), Powers Fasteners, or equal.

C. Screw anchors for concrete, when provided, are to be Hilti, Illinois Tool Works (ITW), Powers Fasteners, or equal.

D. Screw anchors for steel structure, when provided, are to be Illinois Tool Works (ITW), Powers Fasteners, or equal.

E. Screw anchors for wood structure, when provided, are to be Illinois Tool Works (ITW), Powers Fasteners, or equal.

F. Hanger rods shall comply with Manufacturer Standardization Society (MSS) standards and manufacturer's published load rating.

G. Provide hanger rod, hanger rod attachments, pipe stands, bolts, U-bolts, nuts, studs and washers with electroplated zinc coating or with hot-dipped galvanized finish.

H. Riser clamps shall be electroplated zinc coated or have a hot-dipped galvanized finish and shall not protrude more than 2" (50 mm) beyond edge of hole, Anvil Fig. 261 or equal.

I. Hangers for stainless steel pipe shall be of stainless steel construction.

J. Hangers for copper tube shall be of copper construction.

2.14 FIRE PUMP (FP)

A. Acceptable Manufacturers: A-C Fire Pump, Fairbanks Nijhuis, Patterson Pump, Peerless Pump, Pentair Aurora or equal

B. Fire pump shall meet following criteria:

(1) Deliver rated flow at rated pressure

(2) Deliver not less than 65% of rated pressure at 150% rated capacity

(3) Not exceed 140% of rated pressure at shutoff

C. Pump Type: Electric Driven

D. Pump Configuration: Horizontal Split Case

E. Pump casing shall be pressure rated to handle system pressure.

F. Pump and motor shall be mounted on common steel baseplate.

G. Motor:

(1) Provide open drip proof, high-efficiency, foot-mounted.

(2) Locked rotor current shall not exceed values specified in NFPA 20.

H. Engine

(1) Provide compression ignition type engine.

I. Accessories to be provided with each fire pump are as follows:

(1) Fire Pump Test Connection:

(a) Test connection shall be flush type, cast brass body, polished chrome plated with lettering reading “PUMP TEST CONNECTION”.

(2) Discharge pressure gauge and compound suction gauge shall be liquid-filled type.

(3) Circulation Relief Valve: 3/4" (19 mm) Cla-Val Model 55L pressure relief valve or equal

(4) Automatic Air Release Valve

2.15 CONTROL EQUIPMENT FOR ELECTRIC DRIVE

A. Acceptable Manufacturers: Eaton, Firetrol, Joslyn Clark, Metron, or equal

B. Fire Pump Controller:

(1) Shall be completely assembled, wired and tested by control manufacturer before shipment from factory

(2) Shall be labeled “Fire Pump Controller”

(3) Shall be located as close as practical and within sight of motor

(4) Shall be located and protected such that it will not be damaged by water escaping from pump or connections

(5) Shall be combined manual and automatic

(6) Heavy gauge formed steel, NEMA Type 2 enclosure with top drip hood

(7) Provide complete with following:

(a) Starter: Reduced Voltage Solid State

(b) Isolating Switch: Externally operable, quick-break type

(c) Locked rotor protector for drive motor

(d) Pilot light to show circuit breaker closed and power available

(e) Ammeter and voltmeter displays on front of panel

(f) Alarm relay to energize audible or visible alarm

(g) Pressure recording device

(h) With Automatic Transfer Switch

(i) Voltage surge protection

(j) Contacts for remote alarm of:

1) Pump Running

2) Loss of Line Power in any phase

3) Phase Reversal

4) Controller Connected to Alternate Source

(k) Provide remote fire pump alarm panel in a location of constant attendance.

1) Remote pump alarm panel shall be key lockable enclosure consisting of audible or visible alarms.

2) Alarms shall show: “Pump Running”; “Supervisory Power Failure”; “Phase Reversal” and, when required by NFPA 20, “Controller Connected to Alternate Source”.

2.16 JOCKEY PUMP (JP)

A. Acceptable manufacturers: A-C Fire Pump, Fairbanks Nijhuis, Patterson Pump, Peerless Pump, Pentair Aurora or equal

B. Jockey pump shall be:

(1) Same manufacturer as main fire pump

C. Pump casing shall be pressure rated to handle system pressure.

D. Motor shall be:

(1) Open Drip Proof (ODP)

(2) Pump and motor shall be integrally mounted on common steel baseplate.

2.17 JOCKEY PUMP CONTROLLER

A. Acceptable manufacturers: Eaton, Firetrol, Joslyn Clark, Metron, or equal

B. Jockey pump controller shall be same manufacturer as main fire pump controller.

C. Jockey pump controller:

(1) Wall mounted, NEMA Type 2 control cabinet

(2) Maintain automatic sprinkler system at 5-10 psi (35-70 kPa) above fire pump starting pressure.

(3) Mercury-free pressure switch with independent adjustment

(4) Multiple position control switch

(5) 3-pole disconnect switch

(6) Starter

PART 3 - EXECUTION

3.01 GENERAL

A. Fire Protection System Layout and Installation Drawings:

(1) Contractor shall review Design Drawings and Specifications, and shall provide installation drawings, calculations, and product datasheets.

(2) Conceal sprinkler piping above ceilings where possible.

(3) Contractor shall consult with Architect during development of piping layout to avoid conflicts with general appearance. Pipe routing is a critical issue due to attributes of this building.

(4) Submit stamped and sealed installation drawings, calculations and product data sheets for coordination review to: local Fire Department, Engineer, Architect, Owner's insurance representative, City of _____ and other Authorities Having Jurisdiction prior to installation (see submittals).

(5) Contractor shall be responsible to have examined "Reflected Ceiling" drawings as well as Mechanical, Electrical, Piping, Information Technology, Structural and Architectural building plans prior to system layout.

(6) Contractor shall coordinate routing of piping with other trades and Architect.

(7) Contractor shall participate in coordination process and shall not install piping prior to coordination with other trades.

(8) Provide identification sign (enamel on metal) for valves per NFPA requirements.

3.02 DESIGN CRITERIA

A. Sprinkler Contractor, prior to preparation of installation drawings and hydraulic design calculations, shall conduct a hydrant flow test within the last 12 months.

B. Send current hydrant flow test data to Engineer.

C. Fire pump shall be designed to meet fire protection system demand.

D. Hydraulically calculated system shall be designed to a minimum of 5% below available water flow curve.

E. Basis of Design:

(1) Hazard Category -1 spaces shall be hydraulically designed to provide minimum density of 0.1 gpm (_____ L/s) per sq ft (sq m) over most hydraulically remote 1,500 sq ft (sq m). Maximum spacing shall not exceed 225 sq ft (_____ sq m) per sprinkler.

(2) Hazard Category - 2 , shall be hydraulically designed to provide minimum density of 0.2 gpm (_____ L/s) (mm/min) per sq ft (sq m) over most hydraulically remote 2,500 sq ft (_____ sq m). Maximum spacing shall not exceed 120 sq ft (_____ sq m) per sprinkler.

(3) Hazard Category - 3 shall be hydraulically designed to provide minimum density 0.3 gpm (_____ L/s) per sq ft (sq m) over most hydraulically remote2,500 sq ft (_____ sq m). Maximum spacing shall not exceed 100 sq ft (_____ sq m) per sprinkler.

F. Hose Streams:

(1) Add 250 gpm (_____ L/s) hose stream to sprinkler zone hydraulic calculations, for Hazard Category - 1 Occupancies.

(2) Add 250 gpm (_____ L/s) hose stream to sprinkler zone hydraulic calculations, for Hazard Category - 2 Occupancies.

(3) Add 500 gpm (_____ L/s) hose stream to sprinkler zone hydraulic calculations, for Hazard Category - 3 Occupancies.

3.03 INSPECTION

A. Investigate site conditions; verify utility locations and elevations before start of excavation. Forward discrepancies to Architect/Engineer before proceeding with construction.

3.04 INSTALLATION

A. Install hydraulically designed sprinkler system and associated accessories according to requirements of NFPA 13 and as shown on drawings.

B. Install hydraulically designed standpipe system and associated accessories according to requirements of NFPA 14 and as shown on drawings.

C. Install fire pump pipe, fittings, and associated accessories according to the requirements of NFPA 20.

D. Install underground pipe, fittings, and associated accessories according to the requirements of NFPA 24 and as shown on drawings.

E. Install pipe, fittings, couplings, and valves according to requirements of manufacturer.

F. Keep materials within listed temperature range to assure jointing in accordance with manufacturer's requirements.

G. Pipe and fittings shall be of corresponding materials when assembled.

H. Underground Pipe:

(1) Underground pipe shall be restrained against movement at changes in direction per the requirements of NFPA 24. Restraint shall be provided by using thrust blocks or one of the following methods:

(a) Mechanical joint restraint utilizing setscrew retainer glands

1) Mechanical joint restraint shall require conventional tools and installation procedures per AWWA C600, while retaining full mechanical joint deflection during assembly as well as allowing joint deflection after assembly.

2) Proper actuation of the gripping wedges shall be ensured by use of torque limiting twist off nuts.

(b) Pipe clamps and tie rods

(c) Locking mechanical or push-on joints

(d) Bolted flange joints

(2) Thrust blocks shall be of concrete, of a mix not leaner than one part cement, two and one-half parts sand, and five parts stone.

(3) Wherever possible, thrust blocks shall be located so that the joints are accessible for repair.

(4) Pipe clamps and tie rods shall not be installed where the pipe penetrates building walls or floors.

(5) Threaded sections of rods shall not be formed or bent.

(6) Except for fittings, valves, glands, and other accessories having an epoxy-coated finish, all rods, nuts, bolts, washers, clamps, and other restraining devices shall be cleaned and thoroughly coated with a bituminous or other acceptable corrosion-retarding material after installation.

(7) Provide metallic bond at each joint of ductile iron and cast-iron pipe. Bond wire shall be type RHW-USE size 1/0 neoprene-jacketed copper conductor shaped to stand clear of joint.

(8) Polyethylene encasement shall be installed for ductile iron pipe. Refer to AWWA C105/A21.5 for material standards and installation procedures.

I. Above Ground Pipe:

(1) Provide pipe identification system with flow directional arrows on fire protection pipe in accordance with manufacturer’s installation instructions. For additional information, refer to Section 22 05 53 - Identification for Plumbing Piping and Equipment.

(2) Make joints of threaded pipe by cutting pipe square and reaming inside.

(3) Exposed pipe threads shall be protected by one of the following methods

(a) Coat bare threads with corrosion inhibitive paint, equal to Rust-Oleum. Apply paint per manufacturer’s instructions.

(b) Cover bare threads with thread tape or joint compound. Use of thread tape and joint compound shall not be excessive.

(4) Joints for mechanically coupled pipe shall be made according to manufacturer's instructions. Use manufacturer’s gasket lubricant sparingly.

(5) Welded joints shall be made in fabrication shop. Welding at project site is prohibited.

(6) Changes in pipe sizes shall utilize one of the following installation methods:

(a) Concentric threaded reducers. Threaded bushings are prohibited.

(b) Concentric grooved reducers. Reducing couplings such as Victaulic Style 750 are prohibited.

(c) Threaded reducing elbows and tees.

(d) Grooved reducing elbows and tees such as Victaulic No. 25 and No. 29T.

(e) Groove x Thread End-Of-Run fitting such as Victaulic No. 67.

(f) Shop-fabricated threaded or grooved weld-o-lets.

(7) Provide readily removable fittings at end of cross-mains. Minimum size of flushing connection shall be 2" (50 mm).

(8) Provide dielectric fittings between dissimilar pipe materials.

(9) Provide nonferrous metal pipe, fittings, and hanger assemblies in MRI area(s).

(10) Provide stainless steel pipe, fittings, sprinklers, and hangers in cooling towers.

(11) All tools used for fabrication and installation of stainless steel pipe and fittings shall be dedicated for use on stainless steel materials only.

J. Sprinkler heads

(1) Install sprinklers as recommended by manufacturer. Sprinklers shall be set level and at locations to avoid interference with spray pattern of sprinkler. When ducts and lights are obstructions to sprinkler distribution, provide additional sprinklers beneath obstruction.

(2) Feed sprinklers, installed in finished ceilings, with flexible sprinkler drop, swing joint, or return bend arrangement for final positioning in ceiling grid pattern during construction phases.

(3) All arm-over and flexible sprinkler fittings shall be taken from the sides or top of the branch line. No arm-overs or flexible sprinkler fittings shall be connected to the bottom of the branch line.

(4) Sprinklers are required to be installed in the center of ceiling tiles

(5) Provide minimum 1" (25 mm) outlets with sprigs for sprinklers located in shelled spaces.

K. Provide test connection for each flow switch.

L. Discharge test connections inside building to receptacles provided as part of plumbing system or to standpipe's drain riser. Outside discharge is preferred.

M. Drain line detailed adjacent to standpipe/sprinkler risers shall be considered as part of Sprinkler System from combination test/auxiliary drain valve for each zone or sub-zone shown on plans to plumbing receptacle.

N. Provide auxiliary drains at low points of systems per requirements of NFPA 13.

O. Identify valve with brass tag denoting which flow switch is being tested, when test valves are located remote from flow switch.

P. Clamp-on or saddle type fittings (i.e., mechanical tees) are not allowed. Outlet fittings inserted into holes drilled into piping or pipe-o-lets are not allowed.

Q. Provide reducing fittings or provide shop fabricated weld-o-lets to change pipe sizes in sprinkler/standpipe systems. No bushings or grooved reducing couplings, such as Victaulic Style 750, are allowed.

R. System Drains, Inspector's Test Connections, and Auxiliary Drains

(1) Provide system drain lines sized in accordance with NFPA 13.

(2) Provide inspector's test connection for each vane-type or pressure actuated flow switch in accordance with NFPA 13. When inspector's test valve is remotely located from associated flow switch, identify valve with brass tag denoting which flow switch is being tested.

(3) Inspector's test connections and system drains shall discharge to one of the following locations:

(a) Outside building at location approved by owner.

(b) Inside building to waste receptacle (hub drain) provided as part of plumbing system.

(c) Combination drain serving multiple standpipe and/or sprinkler systems

1) Combination drain shall discharge to exterior building location approved by owner or inside building to waste receptacle (hub drain) provided as part of plumbing system.

(d) Provide auxiliary drains at low points of systems in accordance with NFPA 13.

S. Valves

(1) Valves and associated accessories shall be installed according to manufacturer's instructions.

(2) Each shutoff valve shall be equipped with a tamper switch.

(3) Install locking device with each shutoff valve to prevent inadvertent closing of valve. Keys shall be indexed to identify valve location.

T. Hangers, Bracing, and Restraint of System Piping:

(1) Provide hangers and associated parts to support piping in perfect alignment without sagging or interference, to permit free expansion and contraction, and meet requirements of NFPA 13 and manufacturer's installation instructions.

(2) Select and size building attachments per Manufacturer Standardization Society (MSS) standards and manufacturer's published load rating.

(3) Coordinate hanger support installation to group piping of all trades.

(4) Hang pipe from building members using either concrete inserts for concrete construction or beam clamps for steel construction. Installation shall comply with manufacturer's installation instructions. Expansion type inserts may be used for branch piping.

(5) Hang pipe from steel purlins via side or bottom screw applications. Install steel screws with restraining nuts. Installation shall comply with manufacturer's installation instructions.

(6) Suspend hangers by means of electroplated zinc or hot-dipped galvanized finish hanger rods. Perforated band iron and flat wire straps (strap iron) are not allowed.

(7) Mains larger than 4” in diameter when installed parallel to open web joists shall not be supported from a single joist. Mains larger than 4” in diameter when installed parallel to joists, shall be supported by trapeze hanger assembly and shall be positioned equally between two joists. Trapeze hangers shall be positioned to load joists at panel points only

(8) Support pipe from top flange of beams.

(9) Where joists are used, locations of pipe supports shall be approved by the structural engineer prior to installation.

(10) Supporting equipment or piping from metal roof deck is prohibited.

U. Install pressure gauges ____, and as required per NFPA standards.

3.05 FIRE PUMP INSTALLATION

A. Install fire pump, jockey pump and their controllers per manufacturer’s installation instructions, as shown on drawings and as required in NFPA 20.

B. Grout base–mounted pumps after securely anchoring to structure.

C. Coordinate installation with Division 26 and Division 28 Contractors.

3.06 CLEANING

A. Ensure underground feed pipe has been flushed per NFPA 24 to clear out construction debris, prior to connecting aboveground fire protection system to it. Provide copy of underground pipe flush test certificate to engineer.

B. Clean systems after installation is complete.

C. Clean piping both internally and externally to remove dirt, plaster dust, or other foreign materials. When external surfaces of piping are rusted, clean and restore surface to original condition. Replacement of heavily soiled and deteriorated materials shall be done at the Contractor’s expense.

D. Clean equipment as recommended by manufacturers. Thoroughly clean equipment of stains, paint spots, dirt, dust, and any other foreign materials. Remove temporary labels not used for instruction or operation.

3.07 TESTING

A. Refer to testing paragraph of Section 22 00 00 - General Plumbing Requirements.

B. Perform all NFPA required acceptance tests.

C. Test sprinkler system as entire system or partial system. System shall be hydrostatically tested at not less than 200 psi (1380 kPa) or 50 psi (350 kPa)above static pressure in excess of 150 psi (1035 kPs) for 2 h. No leakage allowed. Replace defective joints with new materials. No caulking of defective joints allowed. Re-test system after defective joints are replaced, until satisfactory results are obtained.

D. Hydrostatically test piping between the exterior fire department connection (FDC) and the check valve in the fire department inlet pipe in the same manner as the balance of the system.

E. Pipe shall not be concealed until satisfactorily pressure tested.

F. Conduct drain test. Record static pressure and residual pressure per NFPA 13.

G. Owner’s representative or engineer may witness tests. Contractor shall notify Owner and Engineer a minimum of 3 days in advance to allow for participation.

H. Log of tests shall be kept at job site and shall identify:

(1) Who performed test

(2) Time of test

(3) Date of test

(4) Section of system tested

(5) Results of test

(6) Completed Contractor's Material and Test Certification form(s) from NFPA 13 and NFPA 14.

I. Operate flow switches to test that signals are transmitted to Fire Alarm Control Panel.

J. Include test for tamper switches.

K. Conduct forward flow test of backflow prevention assembly in accordance with NFPA 13 and NFPA 24.

3.08 FIRE PUMP TESTING

A. Test fire pump, jockey pump and their controllers per manufacturer’s installation instructions and as required in NFPA 20.

B. Furnish test certificate indicating suction pipe has been flushed and suction and discharge pipe has been hydrostatically tested in accordance with NFPA 20, prior to fire pump acceptance test.

C. Coordinate fire pump acceptance test so Local Authorities, Owner's representatives, and Insurance Company representatives can witness the test.

D. Coordinate fire pump test with Division 26 and Division 28 contractors.

E. Owner's representative or Engineer may witness tests. Contractor shall notify Owner and Engineer a minimum of 3 days in advance to allow for participation.

F. Representatives from following shall be present for fire pump field acceptance test:

(1) Pump manufacturer
(2) Controller manufacturer
(3) Transfer switch manufacturer

G. Coordinate fire pump test with local utilities to verify acceptable method for disposal of water.

H. Provide equipment to perform fire pump test, including:

(1) Calibrated test gauges
(2) Calibrated tachometer
(3) Hoses
(4) Nozzles
(5) Valves

I. Diesel engine fire pumps shall be run for a minimum of 30 min no less than once per week.

3.09 WARRANTY

A. Installing contractor shall warranty system installation for a minimum of 1 year from date of substantial completion.

B. Installing contractor in combination with flexible sprinkler head manufacturer shall provide a warranty of 5 years from date of substantial completion related to leak assurance and water damage.

C. Manufacturer shall warranty all pumps and components for 2 years from date of start-up.

SECTION 22 00 00 - GENERAL PLUMBING REQUIREMENTS

PART 1 GENERAL

1.01 DESCRIPTION

A. Specification requirements defined in Division 20 of this Specification apply to, and are in addition to the work associated with equipment, systems, materials, and installation requirements specified in Division 22. Contractor shall provide the requirements specified in Division 20 to obtain complete systems, tested, adjusted, and ready for operation.

1.02 RELATED WORK

A. Section 01 81 13 - Certification Requirements

B. Section 20 00 00 - General Mechanical Requirements

C. Section 20 05 13 - Motors

D. Section 20 05 14 - Variable Frequency Drives

E. Section 20 05 29 - Piping and Equipment Supporting Devices

G. Section 20 05 73 - Mechanical Systems Firestopping

H. Section 20 07 00 - Mechanical Systems Insulation

1.03 LEED V4 BD+C NEW CONSTRUCTION CERTIFICATION

A. Project goal is to pursue certification under LEED v4 BD+C New Construction. Provide services, documentation and product data required to meet LEED features involving equipment and components specified in Division 22.

(1) LEED Credits

(a) Water Efficiency – Indoor Water Use Reduction (Prerequisite)

1) Provide product data and shop drawings for plumbing fixtures indicating water consumption in gallons/minute or gallons/cycle.

2) Once through cooling with potable water sources for heat rejection shall not be used for any equipment or appliances.

1.04 LEED PERFORMANCE CRITERIA

A. VOC Emissions Evaluation: For adhesives and sealants used to install Plumbing, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: For adhesives and sealants used to install Plumbing, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for Adhesive and Sealant Applications, as per the SCAQMD Rule 1168, October 6, 2017, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

1.05 LEED SUBMITTALS

A. Submit additional LEED submittals as required for targeted LEED credits and detailed in LEED guidance and applicable specification sections concurrent with standard product submittal packages. All references to specification section and related LEED credit should be clearly identified where specific information is requested.

B. VOC Emissions Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

C. VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant.

PART 2 PRODUCTS

2.01 NOT APPLICABLE TO THIS SECTION.

PART 3 EXECUTION

3.01 NOT APPLICABLE TO THIS SECTION.

END OF SECTION 22 00 00

SECTION 22 05 13 - COMMON MOTOR REQUIREMENTS FOR PLUMBING EQUIPMENT

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 23 05 14 - Variable Frequency Drive (VFD) System

B. Section 26 29 13 - Enclosed Controllers

1.02 SUBMITTALS

A. Product Data including the following:

(1) Manufacturer
(2) hp (kW), voltage, phase, hertz, rpm
(3) Motor type
(4) Enclosure type
(5) Frame type
(6) Insulation class
(7) NEMA design designation
(8) Service factor
(9) Nominal efficiency at full load
(10) Power factor at full load
(11) Full load amperes
(12) Bearings
(13) Mountings
(14) Dimensions
(15) Weight
(16) Shaft grounding brush for motors driven by Variable Frequency Drives (VFD)

1.03 PRODUCT CRITERIA

A. Motors covered by this Specification shall conform to applicable requirements of NEMA, IEEE, ANSI, and NEC Standards and shall be UL Listed where applicable for service specified.

B. Motors shall be designed for conditions in which they will be required to perform, i.e., general purpose, splash proof, explosion proof, standard duty, high torque or other special type as required by equipment manufacturers.

C. Select motors so they do not exceed nameplate rating nor operate into service factor to meet specified duty.

D. Motors located in outdoor or wash down environments shall have totally enclosed fan cooled (TEFC) enclosures.

E. Motors shall be furnished for starting in accordance with utility requirements and be compatible with starters specified hereinafter or under Electrical sections of Specifications.

(1) Refer to Section 26 29 13 - Enclosed Controllers for reduced voltage starting requirements.
(2) Starters for NEMA rated 200 or 230 V motors, 25 hp (18.5 kW) and above shall be reduced voltage starting type.
(3) Starters for NEMA rated 460 V motors, 60 hp (45 kW) and above to be reduced voltage starting type.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Materials shall be new and guaranteed for service intended.

2.02 ELECTRICALLY COMMUTATED MOTORS (ECM)

A. Motor assembly shall be designed for use on direct drive fans or pumps and shall be electrically commutated, DC, brushless type, specifically designed for use with 120 Volt or 208-230/277 Volt, 60 Hz single-phase electrical input or three-phase, 60 Hz electrical input as scheduled.

B. Motor speed shall be variable via compatible input signal and shall be complete with and operated by single-phase integrated controller/inverter that operates wound stator and senses rotor position to electronically commutate stator. Motor shall maintain minimum of 70% efficiency over entire operating range.

C. Motors shall:

(1) have permanently lubricated ball bearings.
(2) be designed for synchronous rotation.
(3) be permanent magnet type with near-zero rotor losses.
(4) be able to be mounted with shaft in horizontal or vertical orientation.

(5) be controllable from local and remote speed-control adjustments.

(6) be designed to overcome reverse rotation without affecting life expectancy.

D. Provide Power Factor Correction / Harmonic Correction module to limit harmonic distortion to less than 10% THDi at input of the filter.

E. Speed Control (Drive):

(1) Motor manufacturer shall provide factory installed PWM speed control drive for local (manual) and remote speed adjustment. Local PWM drive shall be field adjustable with standard screwdriver. Drive shall also be capable of receiving 0-10 vdc signal from DDC controller to control fan or pump speed.

(2) Drive shall provide soft start and adjustable speed change ramp rate.

(3) Drive shall provide motor protection consisting of locked rotor, over-current, and thermal overload protection at minimum.

2.03 INDUCTION MOTORS

A. Voltage Ratings

(1) Refer to equipment schedules and specification sections for voltages required.

(2) Unless otherwise indicated, motors 1/3 hp (0.25 kW) and smaller shall be rated 115 V for operation on 120 V, 1 Ph, 60 Hz service.

(3) Unless otherwise indicated, motors 1/2 hp (0.37 kW) and larger shall be rated:

(a) 460 V for operation on 480 V, 3 Ph, 60 Hz service.

(b) 200 V for operation on 208 V, 3 Ph, 60 Hz service.

(c) 230 V for operation on 240 V, 3 Ph, 60 Hz service.

B. Motors shall be 4 pole (approximately 1750 rpm) unless otherwise noted.

C. Single-phase motors shall be furnished with built-in thermal overload protection.

D. Use NEMA Design B motors, normal starting torque with greasable ball bearings, and Class B insulation unless specified otherwise or unless manufacturer of equipment on which motor is being used has more stringent requirements.

(1) Bearings shall be rated for minimum AFBMA 9, L-10 life of 26,280 hours (belted) and 200,000 hours (direct-coupled) at full-load.

E. Motors shall be rated continuous duty and have 1.15 service factor unless otherwise noted.

F. Motors Driven by Variable Frequency Drives (VFD)

(1) Motors shall comply with the latest NEMA MG 00001, Section IV, Part 31.

(2) Motors shall have service factor not less than 1.0 at rated load.

(3) Insulation shall be Class F or H.

(4) Furnish each motor with shaft grounding ring utilizing conductive microfiber similar to AEGIS SGR to protect motor bearings from electrical damage.

G. Vibration shall not exceed 0.15" (3.8 mm) per second, unfiltered peak unless otherwise noted.

H. Motors (180 frames and larger) shall have provisions for lifting eyes or lugs capable of safety factor of 5.

I. Full load nominal efficiency of motors 1 hp (0.75 kW) and larger, except special-purpose motors including 2-speed or multi-speed motors, and rewound motors, shall meet or exceed listed values when tested in accordance with IEEE Standard 112 Method B as defined by NEMA MG 00001-12.6C. Efficiency values listed are based on NEMA Premium Efficiency Electric Motors of NEMA MG 00001-2011, Table 12-12.

	Open Drip Proof Motors			Totally Enclosed Fan-Cooled Motors

250 hp (185 kW)	95.4	95.8	95.0	95.8	96.2	95.8

J. Single-phase motors for hard starting applications including outdoor applications shall be capacitor start type. Motors for fans and pumps located indoors may be split phase or permanent split-capacitor. Motors shall be equipped with permanently lubricated and sealed ball bearings and shall be selected for quiet operation. Motors 1/8 hp (0.09 kW) and below may be shaded pole type.

(1) Refer to individual equipment section for additional requirements or specific type of motors.

K. 3 Ph, 2-speed motors shall be one winding, consequent pole, variable torque type and 1 Ph, 2-speed motors shall be capacitor start capacitor run type.

L. When submersible pumps are specified, each pump shall include in addition to controls specified, all necessary controls, relays, wiring, etc. that may be required for safety features incorporated in motor design. No submersible motor shall be run or activated until all requirements of motor manufacturer's recommendations have been complied with.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install materials in accordance with drawings, approved Shop Drawings, and manufacturer's recommendations.

END OF SECTION 22 05 13

SECTION 22 05 20 - PLUMBING EXCAVATION AND BACKFILL

PART 1 - GENERAL

1.01 DESCRIPTION

A. This Section lists methods and materials for trench excavation and backfill for plumbing piping systems inside and outside the building.

1.02 RELATED WORK

A. Division 31 - Earthwork

1.03 SUBMITTALS

A. List of materials to be used for backfill.

PART 2 - PRODUCTS

2.01 FILL MATERIAL

A. Type 1 Fill:

(1) Material from excavation separated from materials, which do not compact by tamping and rolling. No stones larger than 3” (75 mm) and no building, organic, corrosive, or frozen materials.

B. Type 2A Fill:

(1) Sand or gravel materials with none larger than 2” (50 mm) and of that portion passing #4 sieve less 5% to pass #200 sieve.

C. Type 2B Fill:

(1) Sand or gravel materials with none larger than 1/2” (13 mm) and of that portion passing #4 sieve less 5% to pass #200 sieve.

D. Type 3 Fill:

(1) Gravel of rounded to subangular shape, screened, which will pass 0.75” (19 mm) sieve and retained on #4 sieve.

E. Type 4 Fill:

(1) Pit run rock or gravel with maximum stone size of 1” (25 mm).

F. Type 5 Fill:

(1) Pea gravel, screened, which will pass 0.375” (9 mm) sieve and retained on #4 sieve.

G. Type 6 Fill:

(1) Soils Engineer approved fill material, backfilled, and compacted beneath building footprint.

PART 3 - EXECUTION

3.01 PREPARATION

A. Establish grade lines and locations of mains and manholes. Provide necessary stakes and batter boards.

B. Verify invert elevations of existing utilities prior to excavation for new utility piping.

3.02 EXCAVATION

A. Provide excavation for all underground work, including piping, manholes, catch basins, tanks, concrete structures, etc., unless otherwise shown or specified. Lay piping in open trench except when Architect gives written permission for tunneling.

B. Include all necessary clearing; tree removal; grubbing; pavement removal; substructure removal such as walls, footings and piers and all incidental work such as tunneling, sheet piling, shoring, underpinning, pumping, bailing and transportation. Coordinate excavation extending beyond construction limits with Contractor and Owner.

C. Blasting is not allowed on this project without written permission of Architect and Owner.

D. Remove all excess excavation material from site unless directed otherwise.

E. Use mechanical methods to remove rock in trenches for piping systems.

F. Include rock excavation in the Bid unless otherwise indicated.

3.03 PIPE INSTALLATION

A. Keep underground piping to proper line and grade and sealed at all times to prevent entrance of animals or foreign matter.

B. Provide bracing and sheet piling as necessary to support trenches. Comply with Local Regulations, applicable provisions of OSHA Regulations on trenching, or with provisions of “Manual of Accident Prevention in Construction” published by Associated General Contractors of America.

C. Under no circumstances lay pipe or install appurtenances in water. Keep trench free from water until pipe joint material has hardened.

D. Presence of ground water in soil or necessity of sheet piling or bracing trenches shall not constitute condition for which any increase may be made in Contract price, except when sheet piling is left in place on written order of Owner, Contract price will be adjusted.

E. Cut off sheet piling left in place not less than 2” (50 mm) below new finished grade. Do not remove sheet piling until trench is substantially backfilled.

F. Install underground plastic pipe per ASTM D2321.

G. Place underground piping outside and inside building in open excavated trenches. Where trench bottom does not contain stones larger than 1” (25 mm) in size or where bedrock is not encountered, trench may be excavated to final pipe grade. Where bedrock or stones larger than 1” (25 mm) is encountered, excavate entire length of trench to depth 4" (100 mm) below final pipe grade elevation and provide 4" (100 mm) of pipe bedding material compacted to minimum of 90% Standard Proctor Density consisting of Type 2B, 3 or 5 fill to establish final pipe grade. Shape bedding for clearance for all joints and fittings, tamped in place and graded evenly to ensure uniform bearing for full length of pipe. Do not support piping by blocking, planking, or mounding of bedding material.

3.04 BACKFILL

A. Exterior:

(1) Backfill outside building including all piping beyond construction limits only after piping and appurtenances have been inspected, recorded, tested and approved. Backfill around pipe by hand to depth of 12” (300 mm) above top of pipe with Type 2B, 3 or 5 fill in 6" (150 mm) layers. Take care not to disturb pipe or damage pipe coating. Do not use Type 3 fill where it will come in contact with polyethylene encasement specified in Section 21 11 14 - Exterior Fire Suppression Piping Systemsand Section 22 11 14 - Exterior Services. Compact backfill thoroughly with compactor of suitable weight or with approved mechanical tamper. No flooding or jetting with water is allowed.

(2) Place backfill from 12” (300 mm) above pipe in layers not exceeding 8" (200 mm) in depth with Type 1 fill. Compact backfill material to the same density as surrounding area prior to that of excavation.

(3) When excavating through areas which are to become walks, roads, driveways or parking areas of concrete, bituminous or exposed gravel surfacing or such areas are existing to remain; backfilling from 12” (300 mm) above pipe to subgrade shall be with Type 2A, 2B, 3 or 4 fill. Backfill in 12” (300 mm) layers and compact with mechanical means to density 95% modified proctor. Frequency of compaction testing shall be determined by testing consultant, based on site conditions, materials and workmanship.

(4) When excavation occurs on public property or areas beyond property line, all excavation, pipe laying, backfilling, grading, and surfacing shall conform as herein specified, except additional requirements for public utility or other authorities shall be complied with when in order. Check with each utility and incorporate cost of any additional requirements in Base Bid.

B. Interior:

(1) Backfill inside building only after piping and appurtenances have been inspected and approved. Backfill to 12” (300 mm) above pipe with Type 2B, 3 or 5 fill in 6" (150 mm) layers. Remainder of backfill shall be Type 2A, 2B, 3, 4, or 6 fill in 12" (300 mm) layers.

(2) Install lines passing under foundations with minimum of 1-1/2” (40 mm) clearance to concrete and ensure there is no disturbance of bearing soil.

(3) Backfill piping suspended from slab on grade with Type 2B or 5 fill in 6” (150 mm) layers. Same fill materials shall be provided for 12” (300 mm) minimum on each side of pipe.

3.05 ROCK EXCAVATION

A. Consider material over 1 yd³ (0.80 cubic meter) in size encountered during excavation as rock. Rock excavation will be paid as extra if it cannot be removed by 200 net hp (150 net kW) crawler tractor with ripper attachment all in good running condition and operated by an experienced individual.

B. Excavate rock to 4” (100 mm) below intended pipe invert.

3.06 FINISHING

A. On completion of trenching and backfilling operations, restore grades to original elevation or to new subgrade elevation.

B. When trenching is through existing areas or beyond constructions limits, replace surfaces to existing conditions.

C. In landscaped areas use 6” (150 mm) of topsoil and sod to match existing elevations, or as otherwise approved by Landscape Architect.

END OF SECTION 22 05 20

SECTION 22 05 29 - HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 22 07 00 - Plumbing Insulation

B. Section 23 05 50 - Vibration Isolation (Spring Hangers and Mounts)

1.02 DESCRIPTION

A. Provide all supporting devices not provided as part of building structure or indicated on structural drawings or structural details, as specified and as required for proper supporting, anchoring, and guiding of piping, equipment, materials, and systems.

B. Support for all conditions of operation, including variations in installed and operating weight of equipment, piping, and ductwork, to prevent excess stress and allow for proper expansion and contraction.

C. Support of fire protection pipe shall comply with NFPA 13 Standard for the Installation of Sprinkler Systems, Current Edition.

1.03 SUBMITTALS

A. Product Data for each piping system for all pipe sizes and all applicable equipment including the following:

(1) Manufacturer's name

(2) Model numbers

(3) Materials of construction and load ratings lbs (kg).

(4) Schedule of hangers and support devices with pipe support spacing

(5) Insulated pipe supports along with application chart or table including pipe support spacing.

(6) Insulation protection saddles and weight bearing insulation table.

(7) Details and calculations for sizing supplementary steel utilized for trapeze or specially designed supports.

(8) Structural attachments, inserts, and concrete anchors. Submit ICC-ES Evaluation Report for each type of anchor.

(9) Calculations and drawings for concrete inserts and anchors for each application.

(10) Drawings showing specific locations of any weld attachments to structure, including weight supported by such attachments.

(11) Drawings showing specific locations of any suspended loads which exceed 100 lbs (45 kg) within joist chord panel to be attached to open web steel joist structural members. Include weight supported by such attachments. (Panel is length of chord between two adjacent diagonal web members at point of connection to chord.)

(12) Equipment mounting devices.

(13) Pipe guides and anchors.

(14) All other appropriate data.

B. Submittals in PDF format shall be organized using PDF bookmarks per detailed instructions on assembling submittal packages identified under Submittal Requirements section of 22 00 00 - General Plumbing Requirements.

1.04 DESIGN CRITERIA

A. Materials and application of pipe hangers and supports shall conform to the latest requirements of ANSI B31/ASME B31.1 Code for Pressure Piping and MSS Standard Practice SP-58-2018 (Pipe Hangers and Supports Materials, Design, Manufacture, Selection, Application, and Installation), except as supplemented or modified herein.

B. Support materials shall be steel or stainless steel unless specifically indicated.

C. Support devices shall be factory fabricated and have published load ratings.

D. Unless otherwise indicated, design supports, anchors, and related components with safety factor in accordance with AISC Manual of Steel Construction, but not less than 2.0.

E. Maximum deflection of support members, including trapeze supports, shall be in accordance with the following equation, but shall not exceed 0.3" (7.5 mm):

D = L/240

Where D = Max deflection in " (millimeters)

L = Support member length in " (millimeters)

F. Unless otherwise indicated, hangers, support devices and hardware shall be steel and shall have factory standard black, primed, galvanized, or electroplated finish for indoor application, and hot-dipped galvanized finish for outdoor application and corrosive atmospheres. Coat cut edges, welds, or any damaged finish with galvanized paint.

(1) Corrosive atmospheres include the following locations:

(a) Exterior locations
(b) Chemical storage and hazardous waste storage rooms
(c) Food service/kitchen areas
(d) Locker/shower rooms
(e) Meter pits
(f) Utility tunnels
(g) Cage washroom (dirty and clean)
(h) Sterilizer/autoclave room

G. Materials in contact with pipe shall be galvanically compatible with piping material to eliminate conductive path for galvanic corrosion. Provide galvanic separation, such as nonmetallic coating or inserts between piping and metallic supports where piping and support materials have galvanic potential. Pipe insulation is acceptable galvanic separation. Galvanic potential shall be determined by table below:

	Galvanized Steel	**Carbon Steel**	**Stainless Steel (Type 304 or 316)**	**Copper** **Brass** **Bronze**
Copper, Brass, Bronze	Yes	Yes	No	NA
Stainless Steel (Type 304 or 316)	Yes Note (1)	Yes Note (1)	NA	
Carbon Steel	No	NA		
Galvanized Steel	NA			

(1) Required where stainless steel surface area near interface is equal or greater than steel surface area

H. Unless otherwise indicated, steel support devices exposed to ventilation air stream shall be stainless steel or steel with either galvanized finish or paint finish. Paint type shall be approved by Architect/Engineer.

I. This Contractor is responsible for proper placement and sizing of supporting devices to accommodate insulation thickness and pitching of pipe. Coordinate with Contractor performing work specified in Section 22 07 00 - Plumbing Insulation.

J. In addition to hangers specified in this Section, piping connected to pumps, compressors, and similar rotating or reciprocating equipment shall have vibration isolation hangers or supports for specified distance from such equipment. Refer to Section 23 05 50 - Vibration Isolation for required distance.

K. Where piping can be conveniently grouped to allow trapeze type supports, supporting steel shall be by means of standard structural shapes.

L. Hangers and rods shall be plumb when pipelines are at their normal operating temperatures.

M. Unless otherwise indicated, continuous insert channels are not allowed.

N. Punching, drilling, or welding of building structural steel is not allowed unless approved by Structural Engineer.

O. Refer to Structural Documents and ICC-ES Evaluation Report for application of concrete inserts and concrete anchors.

P. Lateral braces shall be designed and detailed to apply loads as directly as possible to structural floor slabs, roof decks, or other building lateral elements. Braces shall not be applied to bottom flanges of steel beams or bottom chords of open web steel joists.

Q. Coordinate with Contractor for any proposed weld attachments to building structure. This may result in use of welding codes or standards, which may apply to "structural work". and may necessitate repair of fireproofing and/or extension of fireproofing to support members. Execution of this work may be assigned to General Trades responsible for building structural steel. Cost for this work, however, will remain the responsibility of this Contractor.

R. Top or bottom chords of open web steel joists may be used to support loads, provided total load within panel does not exceed 100 lbs (45 kg) and load is placed concentric to joist. (Panel is length of chord between two adjacent diagonal web members at point of connection to chord).

S. Where fire rated fiberglass products are used for channel and support devices, the following properties shall apply:

(1) Flame Spread Properties
(a) Polyester Fiberglass (PF) Class 1 ASTM E84

(b) Vinylester Fiberglass (VF) Class 1 ASTM E84

T. Fasteners including concrete anchors for seismic application shall have ICC Evaluation Service Report (ESR) and meet requirements of local authorities.

PART 2 - PRODUCTS

2.01 STRUCTURAL SUPPORTS

A. Unless specifically indicated on structural drawings, design and provide all supporting devices including miscellaneous steel (angles, channels, beams, etc.), required for proper support of piping, equipment, and materials.

2.02 PIPE HANGERS AND SUPPORTS (METALLIC)

A. Manufacturers: Anvil, Erico, Tolco, PHD, National Pipe Hanger Corporation, or B-Line, equal to Anvil figures listed. Corresponding MSS Type is indicated where applicable.

B. Clevis and Roller Type Hangers:

System	Pipe Size	Clevis	Roller
Hot Pipes with Insulation (105°F (41°C) and above)	and 2" (50 mm) and smaller	65 (MSS Type-1), 260 (MSS Type-1)	---
	2-1/2" (65 mm) to 6" (150 mm)	---	171 (MSS Type-41), 181 (MSS Type-43)
	8" (200 mm) and larger	---	171 (MSS Type-41)
Cold Pipes with Insulation (33°F (1°C) to 60°F (15°C))	2" (50 mm) and smaller	65 (MSS Type-1), 260 (MSS Type-1)	---
	2-1/2" (65 mm) and larger	260 (MSS Type-1), 295 (MSS Type-1)	---

(1) For pipe size 2-1/2" (65 mm) and larger, where there is transverse movement at support points due to thermal expansion/contraction, clevis type hangers similar to Anvil Figure 260 (MSS Type-1) may be used if vertical angle of hanger rod is less than 4°.

C. Flat Surfaces (Trapeze, Rack Type):

(1) Use structural steel members such as struts, angles, channels, and beams to support pipes as required. Select members properly for pipe support types and loading conditions. Refer to Part 1 for design criteria. Submit support details with type of members selected and load calculations. Provide straps, clamps, rollers, or slides indicated below at each support point.

System	Pipe Size	Straps or Clamps	Rollers	Slides
Hot Pipes with Insulation (105°F (41°C) and above)	2" (50 mm) and smaller	Anvil Klo-Shure	---	
	2-1/2" (65 mm) and larger	---	171 or 177(MSS Type-41), 271 (MSS Type-45), 274 (MSS Type-46)	257 or 436 with 212 or 432 clamps, Type 1, 2 or 3 for longitudinal movement only. Type 4, 5 or 6 for both longitudinal and transverse movement
Cold Pipes with Insulation (33°F (1°C) to 60°F (15°C))	10" (250 mm) and smaller	137 (MSS Type-24)	---	---
	12" (300 mm) and larger	432	171 or 177 (MSS Type-41), 271 (MSS Type-45), 274 (MSS Type-46)	257 or 436 with 212 or 432 clamps, Type 1, 2 or 3 for longitudinal movement only and Type 4, 5 or 6 for both longitudinal and transverse movement.

D. Vertical Pipe within Wall Cavities

(1) Use clamps, straps, inserts or channels to support pipes concealed in wall cavity. Select members for pipe support types and loading conditions. Refer to Part 1 for design criteria.

(2) Provide clamps, strut channels, insulated supports, or brackets and inserts equal to manufacturer indicated below:

System	Pipe Size	Supports	Clamps, Brackets/Inserts	Pre-insulated Inserts
Hot and Cold Pipes with Insulation	All sizes	Anvil 137	HoldRite 260 series with SBIS bracket, Anvil 262	Anvil Klo-Sure, Pipe Shields A2000

2.03 INSULATION PROTECTION SHIELDS

A. Anvil Fig. 167 (MSS Type-40) constructed of galvanized carbon steel. Per the latest edition of Standard MSS SP-58, select shield to accommodate outer diameter of insulation. Shield length and gauge for insulation compression strength not less than 15 psi (103 kPa), shall be as follows:

Pipe Size	Length	Gauge
1/4" (8 mm) thru 3" (80 mm)	12" (300 mm)	18 (1.316 mm)
4" (100 mm)	12" (300 mm)	16 (1.621 mm)
5" (130 mm) and 6" (150 mm)	18" (450 mm)	16 (1.621 mm)
8" (200 mm) thru 14" (350 mm)	24" (600 mm)	14 (2 mm)
16" (400 mm) thru 24" (600 mm)	24" (600 mm)	12 (2.758 mm)

2.04 INSULATED PIPE SUPPORTS

A. Description:

(1) Products designed specifically for weight-bearing support of insulated pipes. Apply products in accordance with manufacturer’s recommendations and requirements indicated below:

(2) Refer to PART 3 – EXECUTION for application of Type A, Type B, and Type C Insulated Pipe Supports specified below.

B. General:

(1) Supports shall be designed and rated for applied load, including weight of pipe, fluid, insulation, and any other imposed loads, with minimum 1.5 safety factor. Ratings shall be published by manufacturer and included in submittals.

(2) High compressive strength inserts utilized to support loads shall encircle circumference of pipe. Block-style inserts are not allowed.

(3) Supports shall be suitable for hot or cold pipe service as applicable.

(4) Submit chart or table indicating selected model along with pipe sizes, rated loads, support device types and support spacing for each piping system.

(5) Pipe support spacing shall be in accordance with manufacturer's recommendations but shall not exceed maximum spacing indicated under Hanger and Support Spacing in Part 3 of this Section.

(6) Testing of insulation for compressive strength properties shall comply with ASTM D1621.

(7) Insulation thickness shall match adjacent pipe insulation thickness.

(8) Integrity of vapor barrier jacket shall be maintained continuously through support assembly.

(9) Insulated pipe support style shall be specifically selected for the application and shall consider the following criteria at minimum:

(a) Vertical, lateral, and axial support design load limits.

(b) Vertical, lateral, and axial support design travel limits.

(c) Temperature of support, at pipe surface, and ambient conditions.

(d) Test or pre-operational loads that may exceed normal operating conditions.

(e) Material for any items that will be welded directly to the pipe.

(f) Loading and displacements caused by seismic, hydraulic surge, or other forces.

(g) Temperature at support steel.

(10) All steel components shall have corrosion protection coating consisting of hot-dip galvanizing or zinc-rich primer coating.

C. Type A Insulated Pipe Supports (Light Duty)

(1) Description:

(a) Pipe insulation specified in Section 22 07 00 - Plumbing Insulation with insulation protection shields specified in this Section. Weight-bearing inserts are not required.

(b) Type B or Type C supports may be utilized in lieu of Type A supports.

D. Type B Insulated Pipe Supports (Standard Duty):

(1) Manufacturers:

(a) SNAPP ITZ insulation inserts by KB Enterprise, Tru-Balance Insulated Saddles by Buckaroos, Inc., Value Engineered Products or approved equal.

(b) Klo-Shure insulation couplings may be used for cold pipes insulated with elastomeric insulation. Mount shall be 7 Series Strut Mount with metal clamps or Clevis System for clevis hangers.

(c) Type C supports may be utilized in lieu of Type B supports.

(d) Contractor may propose to utilize contractor-fabricated insulated pipe supports in lieu of manufactured Type B Supports. Use of contractor-fabricated assemblies is subject to approval of appropriate submittal data. Submit detail drawings of assemblies and product data showing equivalency to specified manufactured products for approval.

(2) Description:

(a) Load-rated assembly consisting of high compressive strength insulation material completely encompassing circumference of pipe, vapor barrier jacket, and insulation protection shield.

(b) Insulation protection shield shall conform to ANSI/MSS SP-58. Shield shall be G90 galvanized steel and shall span full circumference of pipe insulation. Half-shields spanning lower 180° degrees arc of insulation outer circumference will be acceptable when used with clevis hangers.

(c) Axial length of insulation material shall be not less than 9" (230 mm) or 2" (50 mm) longer than insulation protection shields 1" (25 mm) minimum on each end), whichever is longer.

(3) Insulation Materials:

(a) Hot Pipes 105°F (41°C) to 250°F (120°C):

1) Rigid closed cell, polyisocyanurate or phenolic insulation by ITW, Resolco, or Kingspan. Minimum compressive strength shall be 100 psi (690 kPa).

(b) Hot Pipes 251°F (121°C) to 1200°F (650°C):

1) High-density calcium silicate insulation similar to Johns Manville Thermo-12 Gold. Minimum compressive strength shall be 100 psi (690 kPa).

(c) Cold Pipes 60°F (16°C) and below:

1) Rigid closed cell, polyisocyanurate, phenolic insulation similar to ITW, Resolco, Kingspan, or cellular glass insulation similar to Pittsburgh Corning Foamglas.

E. Type C Insulated Pipe Supports (Heavy Duty):

(1) Manufacturers:

(a) Pipe Shields, Inc., Bergen Pipe Supports, or Rilco equal to Pipe Shields models listed.

(b) Unless otherwise indicated, pre-insulated pipe supports shall be as indicated in the following schedule. Model numbers are based on Pipe Shields, Inc.

1) Pipe supported on hangers: Model “A” Series and Model “D” Series

2) Pipe supported on flat surfaces and pipe rollers: Models “A” Series

3) Pipe supported on slides: Model "B" Series with lateral guide or restraint

4) Pipe anchors: Model “C” Series

5) Riser clamps: Model “E” Series with thrust plates. Select proper model for restraint for downward load or upward load.

(c) Contractor may propose to utilize contractor-fabricated insulated pipe supports in lieu of manufactured Type C Supports. Use of contractor-fabricated assemblies is subject to approval of appropriate submittal data. Submit detail drawings of assemblies and product data showing equivalency to specified manufactured products for approval.

(2) Description:

(a) Load-rated assembly consisting of high compressive strength insulation material completely encircling circumference of pipe, vapor barrier jacket system incorporating structural inserts and insulation protection shield/casing where applicable.

(3) Insulation Material:

(a) Water-resistant high density calcium silicate with minimum density of 13 lb/ft³ (208 kg/m³) and compressive strength not less than 100 psi (690 kPa). Thermal conductivity shall be not more than 0.38 Btu in/hr ft²°F (0.055 W/m°C at 24°C) at 75°F (23.89°C).

(b) Structural Inserts:

1) Structural inserts used by manufacturer to reinforce between pipe and insulation jacket for clamping devices shall be water-resistant high compressive strength inorganic materials selected by manufacturer for desired combination of structural strength and insulating properties. Structural inserts shall have minimum compressive strength of 600 psi (4140 kPa). Thermal conductivity shall be not more than 0.58 Btu in/hr ft²°F (0.084 W/m°C at 24°C) at 75°F (23.89°C).

(c) Jacket:

1) Jacket shall consist of G90 galvanized steel conforming to ASTM A653/A653M and shall provide complete vapor barrier around insulation and bearing surface for protection of insulation.

2) When recommended by manufacturer, use reinforced insulation protection shield at support bearing surface. Insulation shall extend 1" (25 mm) beyond insulation protection shield to maintain vapor barrier integrity.

2.05 HANGER RODS (METALLIC)

A. Rods shall conform to the latest MSS Standards except as modified herein. Furnish rods complete with adjusting and lock nuts.

B. Rods shall have electroplated zinc or hot dip galvanized finish.

C. Unless otherwise indicated, size rods for individual hangers and trapeze support as indicated in the following schedule. Rod size may be reduced one size for double rod hangers. Total weight of equipment, including valves, fittings, pipe, pipe content and insulation, shall not exceed limits indicated.

Max. Pipe Size with Single Rigid Rod	Rod Diameter inches (millimeters)	Max Load lbs (kg)of Hanger Rod (Not exceeding 650 °F (340 °C) Service Temp.)
2" (50 mm)	3/8 (10)	730 (330)
3" (80 mm)	1/2 (13)	1350 (610)
5" (130 mm)	5/8 (16)	2160 (980)
8" (200 mm)	3/4 (20)	3230 (1460)
12" (300 mm)	7/8 (24)	4480 (2030)
18" (450 mm)	1 (25)	5900 (2670)
30" (750 mm)	1-1/4 (33)	9500 (4310)

D. Threaded rods are not allowed in clean rooms.

2.06 BOLTS, NUTS, STUDS AND WASHERS

A. ASTM A307, electroplated zinc finish

2.07 ROD ATTACHMENTS

A. Anvil Fig. 290 (MSS Type-17), galvanized finish

2.08 U-BOLTS

A. Anvil Fig. 137 (MSS Type-24), galvanized finish

2.09 BEAM CLAMPS

A. Beam Clamps: Anvil Fig. 133/134 (MSS Type-21), 218 (MSS Type-30), 228 (MSS Type-28 or 29) and 292 (MSS Type-28 or 29)

B. Top Beam Clamps: Anvil Fig. 227 (MSS Type-25)

C. C-Clamps: Anvil Fig. 86, 92 or 93 (MSS Type-19 or 23) with set screw and lock nut

2.10 ADJUSTABLE PIPE SADDLE SUPPORTS

A. Anvil Fig. 264 (MSS Type-38), galvanized finish. Provide Anvil Fig. 63 Type T stanchion with base, galvanized finish, where applicable.

2.11 RISER CLAMPS (BARE PIPE)

A. Anvil Fig. 261 (MSS Type-8), galvanized finish

B. B-Line B3373C, PVC coated carbon steel, in area at pipe contact, for bare copper tubing

C. Proset system, proseal plug and fire-fill for sleeved and cored holes.

2.12 RISER CLAMPS (INSULATED PIPE)

A. Unless otherwise indicated, insulated pipe riser clamps shall be Type C insulated pipe supports. Refer to Insulated Pipe Supports in Part 2.

B. Contractor may propose to utilize contractor-fabricated riser supports. Use of contractor-fabricated riser supports is subject to approval of appropriate submittal data. Submit support detail drawings, bearing stamp of Structural Engineer registered in project jurisdiction, for approval. Supports shall be engineered to withstand static and dynamic forces with minimum safety factor of 2.0. Submit insulation details addressing thermal break from building structure and vapor barriers.

2.13 CONCRETE INSERTS (WOODEN FORMED CONCRETE)

A. Anvil Fig. 281 or 282, or Hilti HCI-WF (MSS Type-18), suitable for rod diameter and weight supported.

2.14 CONCRETE INSERTS (METAL DECK FORMED CONCRETE)

A. Anvil Fig. 284, Tolco No. 109DD, B-Line Fig. B3019, DeWalt/Powers "Bang-It+", Hilti HCI-MD, or MSCO No. MX34.

2.15 CONCRETE ANCHORS

A. Manufacturers: Hilti, DeWalt/Powers, or Red Head

B. Anchors shall be selected, sized, and detailed by Contractor's structural engineer registered in project's jurisdiction, based on project conditions and in accordance with project building code. Calculations and drawings shall be submitted.

C. Anchors shall meet ICC Acceptance Criteria, and ICC-ES Evaluation Reports (ESRs) shall specifically list the current applicable codes.

D. Anchors installed in hardened concrete for purpose of transmitting structural loads from one connected element to another, or for safety related elements such as sprinkler pipes, heavy suspended pipes, and barrier rails shall have ICC-ES report demonstrating anchors have met requirements of AC 193 for mechanical anchors in concrete elements.

E. Post-installed expansion anchors and undercut anchors installed in hardened concrete shall be qualified for strength design and tested according to ACI 355.2. Designs shall be per the requirements of ACI 318, Appendix D.

F. Anchors for seismic load application shall be approved by ICC-ES Evaluation Reports to resist seismic loads and selected to meet project seismic design requirements. Refer to Section 22 05 48 - Vibration and Seismic Controls for Plumbing Piping and Equipment and Structural drawings.

G. Anchors shall be zinc plated in accordance with ASTM B633.

H. Select anchors with load ratings based on cracked concrete conditions.

2.16 METAL FRAMING SUPPORT SYSTEM (STRUT SYSTEM)

A. Manufacturers: Unistrut, B-Line Strut Systems, Anvil-Strut, Power-Strut, Erico, Superstrut, Kindorf, Hilti, and Hydra-Zorb.

B. Channels shall have epoxy paint or electroplated zinc finish.

C. Channels shall not be lighter than 12 ga (2.5 mm).

2.17 PIPE MOUNTING PEDESTALS

A. Equal to Roof Products & System Corporation consisting of equipment rail, "U" shaped mounting brackets, galvanized threaded rod and cast-iron pipe rollers. Rail shall have built-in raised cant to match roof deck insulation.

2.18 EQUIPMENT RAILS

A. Manufacturers: Roof Products & Systems, ThyCurb, Custom Curb, Inc. or Vent Products equal to Roof Products & Systems Model ER-4 with raised cant style for built-up roofing system. Mounting rails shall be galvanized steel with integral base plate, continuous welded corner seams, factory installed 2" (50 mm) x 4" (100 mm) wood nailer and 18 ga (1.2 mm) galvanized steel counter flashing.

B. Manufacturers: Roof Products & Systems, ThyCurb, Custom Curb, Inc. or Vent Products equal to Roof Products & Systems Model ER-2 for elastic sheet roofing system. Mounting rails shall be galvanized steel with integral base plate, continuous welded corner seams, factory installed 2" (50 mm) x 4" (100 mm) wood nailer and 18 ga (1.2 mm) galvanized steel counter flashing.

C. Mounting rail gauge shall be selected to support equipment adequately but shall be not less than 18 ga (1.2 mm).

D. Height shall be as detailed, but not less than 8" (200 mm) above finished roof.

E. Equipment rails shall span minimum of 2 joists and not cantilever more than 6" (150 mm) where joists are used. Rails shall be level at top with pitch built in when deck slopes 1/4" per foot (21 mm per meter) or greater.

2.19 PIPE ROOF PENETRATION PROTECTIONS

A. Manufacturers: Roof Products & Systems, ThyCurb or Vent Products equal to Roof Products & Systems "RPS-Pipe Portals" consisting of 12" (300 mm) OD prefabricated roof curb, laminated acrylic coated ABS plastic curb cover with EPDM protective rubber cap and stainless steel clamp.

2.20 PIPE GUIDES

A. Unless otherwise indicated, guides shall be equal to Pipe Shields "B" Series, selected by load and movement. Refer to Insulated Pipe Supports in Part 2.

2.21 PIPE ANCHORS

A. Unless otherwise indicated, anchors shall be Type C Insulated Pipe Supports. Refer to Insulated Pipe Supports in Part 2.

B. Contractor may propose to utilize contractor-fabricated anchors. Use of contractor-fabricated anchors is subject to approval of appropriate submittal data. Submit anchor system detail drawings, bearing stamp of Structural Engineer registered in project jurisdiction, for approval. Anchors shall be engineered to withstand static and dynamic forces with minimum safety factor of 3.0. Submit insulation details addressing thermal break from building structure and vapor barriers.

2.22 CASEWORK PIPE SUPPORTS

A. Hinged pipe clamp and Strutcatcher, nylon 12 Grilamid, Clic by Litchfield International.

B. Vibration isolation pipe clamp, yellow zinc chromate finish, B-Line BVT Series Vibraclamp or Kwik-Clip by B-Line.

2.23 FIXTURE SUPPLY SUPPORT

A. Acceptable manufacturers: Erico, Holdrite, Siou

B. Vertical Pipe Support:

(1) Galvanized steel stud support bracket, pre-drilled tube support mounting holes, adjustable stud width, Erico TSGB or equal.

(2) UV resistant nylon tube support, rated for 0-130°F (32-54°C) through 0-130°F (32-54°C), resealable locking mechanism, Erico TPC or equal.

(3) Support bracket and tube support to be from same manufacturer.

C. Through Stud Support:

(1) Polypropylene stud insert for isolation of water tubing through metal wall studs, rated for maximum water temperature of 130°F (54°C), Erico ESGP or equal.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install supports to allow for free expansion of piping. Support piping from building structural members using concrete inserts, beam clamps, ceiling plates, wall brackets, or floor stands. At no time shall hangers and supports overload building structural members. Fasten ceiling plates and wall brackets securely to structure and test to demonstrate adequacy of fastening.

B. Select and size building attachments properly in accordance with MSS Standards and manufacturer's published load rating information.

C. Coordinate hanger and support installation to properly group piping of all trades.

D. Suspend piping hangers by means of hanger rods. Perforated band iron and flat wire (strap iron) are not allowed.

E. Piping and ductwork shall be supported independently from other piping or ductwork.

F. Pipe hangers and supports shall not penetrate vapor barrier of pipe insulation.

G. Do not support equipment, or piping from metal roof decking or ceiling grid.

H. Install adequate supports so as not to over stress either piping or equipment to which piping is connected.

I. Refer to Section 22 00 00 - General Plumbing Requirements for requirements of personnel injury protection guards for supporting devices.

3.02 HANGER AND SUPPORT SPACING

A. Space pipe hangers and supports for horizontal pipe accordance with the following schedule, with exceptions as indicated herein:

B. Copper Tube (Unless Otherwise Noted):

Pipe Size	Max Spacing
3/4" (19 mm) and smaller	5 ft-0" (1.5 m)
1" (25 mm) to 1-1/4" (32 mm)	6 ft-0" (1.8 m)
1-1/2" (40 mm) to 2-1/2" (65 mm)	8 ft-0" (2.4 m)
3" (80 mm) and larger	10 ft-0" (3.0 m)

C. Copper Tube (Domestic Water, Laboratory Water, Non-potable Water):

Pipe Size	Max Spacing
1-1/4" (32 mm) and smaller	6 ft-0" (1.8 m)
1-1/2" (40 mm) and larger	10 ft-0" (3.0 m)

D. Plastic Pipe

(1) PVC Pipe:

Pipe Size	Max Spacing
All sizes	4 ft-0" (1.2 m)

(2) PVDF Pipe (Waste and Vent):

Pipe Size	Max Spacing
2" (50 mm) and smaller	3 ft-0" (0.9 m)
3" (80 mm) and larger	4 ft-0" (1.2 m)

(3) PP Pipe (Waste and Vent):

Pipe Size	Max Spacing
2" (50 mm) and smaller	3 ft-0" (0.9 m)
3" (80 mm)	4 ft-0" (1.2 m)
4" (100 mm)	4 ft-6" (1.4 m)

(4) Support plastic pipe at all changes of direction. Adequate consideration shall be given to piping expansion.

E. Cast Iron Pipe:

(1) Maximum hanger and support spacing shall be 10 ft (3 m) for all pipe sizes. Provide minimum of one hanger per pipe section close to joint on barrel, at each pipe fitting, at change of direction and branch connections.

(2) Support Cast Iron No-Hub pipe as recommended in CISPI Publication "Cast Iron Soil Pipe and Fittings Handbook, Chapter IV - Installation of Cast Iron Soil Pipe and Fittings."

F. Maximum spacing shown above may be restricted by strength of attachment to building structure. Submit data with calculations with published load ratings showing attachment to be utilized and maximum spacing allowable for that type of attachment and pipe size.

G. Spacing less than indicated above may be required to conform to building structure design or loading limitations.

H. Spacing less than indicated may be required depending on compressive strength of pipe insulation and insulated pipe supports.

I. If pipe size changes between support points, maximum spacing shall be based on the smaller pipe size.

J. If trapeze hangers are used to support multiple services, spacing shall be based on the most restrictive pipe size and material on trapeze hanger.

K. For non-metallic pipe, follow manufacturer's installation recommendations in addition to requirements noted herein.

L. Install supports for vertical piping and anchors as recommended by pipe manufacturer.

M. Place hangers and supports to meet requirements of Section 23 21 16 - Pipe and Pipe Fittings or specific pipe system sections, with regard to pitch for drainage and venting and clearance between services.

N. Hangers and supports shall bear on outside of insulation when pipes are to be insulated.

O. Place hangers and supports within 1 ft (0.3 m) of each fitting, such as elbows and tees, and at each valve, strainer, and other piping specialty for piping 4" (100 mm)and larger.

P. Place hanger or support at first elbow upstream of pump inlet and first elbow downstream of pump outlet.

3.03 RISER SUPPORTS

A. Insulated Piping:

(1) Unless otherwise indicated, support vertical piping as indicated below:

(2) Support vertical piping at approximately midpoint of riser, secured and anchored to building structure. Provide guides on vertical piping. Use spring hangers at top and bottom of riser and at take offs from riser at each floor. Use spring hangers for minimum 3 hangers away from top and bottom elbows and from each take off at riser.

(3) Guide vertical piping 2-1/2" (65 mm) and smaller at every floor. Guide 2-1/2" (65 mm) and larger at every other floor. Spring hangers (Type 6) and guides (Type VSG) are specified in Section 23 05 50 - Vibration Isolation.

B. Bare Piping:

(1) Unless otherwise indicated, maximum vertical support spacing for ambient bare steel and cast-iron pipes shall be 15 ft (4.6 m).

(2) Maximum vertical support spacing for other piping including copper tubing and plastic piping shall be 10 ft (3 m).

(3) Install riser clamps and intermediate supports as required.

(4) Rest riser clamps on floor or on pipe sleeve.

(5) Bare piping above 120°F (50°C) such as steam vents shall be supported per insulated piping requirements.

3.04 INSULATED PIPE SUPPORTS APPLICATION

A. Install insulated pipe support at each support point of insulated pipe.

B. Pipe Size 1-1/2" (40 mm) and Smaller:

(1) Use Type A insulated pipe support. Pipe insulation specified in Section 22 07 00 - Plumbing Insulation shall be continuous through support points.

(2) Use one shield (bottom) for clevis hanger.

(3) Use 2 shields (top and bottom) for roller hanger/support or strap/clamp support. Apply 2 metal straps to hold top and bottom shields onto insulation jacket.

(4) Type B or Type C insulated pipe supports may be used in lieu of Type A support.

C. Pipe Size 2" (50 mm) through 5" (125 mm):

(1) Use Type B insulated pipe supports. Refer to Part 2 for acceptable products.

(2) Type C insulated pipe supports may be used in lieu of Type B supports.

D. Pipe Size 6" (150 mm) and Larger:

(1) Use Type C insulated pipe supports. Refer to Part 2 for applicable products.

3.05 PIPE FLOOR SUPPORTS

A. Unless specifically shown otherwise, use adjustable pipe saddle supports with associated stanchion similar to Anvil Fig. 264/63. Select supports properly for weight and height of pipe stand.

3.06 CONCRETE INSERTS

A. Concrete insert application, size, loading, and placement shall be this Contractor’s responsibility.

B. Coordinate placement of inserts before concrete pour. Minimize use of inserts and anchors after concrete pour.

3.07 BEAM CLAMPS

A. Provide locknut for hanging rod at clamp.

B. C-clamps are allowed for rod size 3/8" (9 mm) or smaller and only for static loading such as air piping, cold water piping, fire protection piping and, other similar piping. C-clamps are not allowed for hot water piping and steam and steam condensate piping, except hot water runouts to terminal heating devices.

C. C-clamps are not allowed for open web steel joist application.

D. C-clamps are not allowed for seismic application.

3.08 TRAPEZE SUPPORTS

A. Construct trapeze supports with struts, angles, or channels and hang them by inserts or welded beam attachments and rods.

B. Determine trapeze supports spacing by the smallest pipe on trapeze.

C. If trapeze supports are used to support multiple services, support spacing shall be based on the most restrictive pipe size and material on trapeze supports.

D. Refer to Part 1, Design Criteria for maximum deflection allowed for trapeze supports.

3.09 PIPE MOUNTING PEDESTALS

A. Use for all piping on roof. Install bottom of pedestal flat on roof deck, insulate exterior of pedestal, flash. and counter flash.

3.10 EQUIPMENT RAILS

A. Use for all roof-mounted equipment, which is not curb mounted. Install bottom of equipment rail flat on roof deck. Insulate exterior of equipment rail.

B. Provide equipment rails with sufficient height to provide code required space for servicing roof below supported equipment.

C. Provide supplemental roof/structure framing for required anchoring of rail bases per wind load requirements.

D. Provide supplemental lateral wind bracing between rails when supporting items above roof to meet wind load design requiremetns.

E. Flashing shall be by Division 07. Provide counter flashing as specified and secure to wood nailer with stainless steel truss head screws.

3.11 CONCRETE ANCHORS

A. Anchor application, size, and placement shall be this Contractor's responsibility.

3.12 PIPE ROOF PENETRATION PROTECTIONS

A. Install at points where pipes are penetrating roof. Install as shown and according to manufacturer's installation instructions.

3.13 PIPE GUIDES

A. Install where shown on drawings.

B. For manufactured expansion devices, install minimum of 2 pipe guides at each side of manufactured pipe expansion device. Locate first guide no more than 4 pipe diameters from expansion device and second guide at 14 pipe diameters from first guide. Install intermediate guides in accordance with guide spacing data recommended by manufacturer or the following table, whichever is more stringent.

MAXIMUM DISTANCE BETWEEN INTERMEDIATE GUIDES (ft (m))				
	Pipe Operating Pressure			
Pipe Size (inches (millimeters))	0-50 psig (0-345 kPa)	51-100 psig (350-690 kPa)	101-150 psig (695-1035 kPa)	151-200 psig (1040-1380 kPa)

3 (80)	21 (6.4)	19 (5.8)	17 (5.2)	16 (4.8)
4 (100)	35 (10.6)	29 (8.8)	25 (7.6)	22 (6.7)
6 (150)	57 (17.0)	44 (13.0)	37 (11.0)	32 (9.7)
8 (200)	66 (20.0)	52 (15.0)	45 (13.0)	40 (12.0)
10 (250)	91 (27.0)	69 (21.0)	58 (17.0)	51 (15.0)
12 (300)	107 (32.0)	79 (24.0)	66 (20.0)	58 (17.0)
14 (350)	115 (35.0)	85 (25.0)	71 (21.0)	62 (18.0)
16 (400)	127 (38.0)	94 (28.0)	78 (23.0)	68 (20.0)

C. If anchor is located within 4 pipe diameters from expansion joints, guides need not be installed on anchor side.

3.14 PIPE ANCHORS

A. Install anchors where shown on drawings or in conjunction with expansion joints, loops and swing joints as required to allow proper expansion and contraction of piping without damage to structure, equipment or piping.

B. Do not anchor piping to concrete block walls, wood, or partition walls.

END OF SECTION 22 05 29

SECTION 22 05 53 - IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 SUBMITTALS

A. Product Data: For identification materials and devices.

B. Valve Schedules: For each piping system.

C. Samples: Of color, lettering style, and graphic representation required for each identification material and device.

PART 2 - PRODUCTS

2.01 IDENTIFYING DEVICES

A. Marker System:

(1) Manufacturers: Brady USA, Marking Services Inc. (MSI), Kolbi, or Seton

(2) Manufacturer's standard, preprinted with color coding, lettering size, and length of color field according to ASME A13.1.

(3) Use pressure-sensitive type or “snap-on” type.

(4) “Strap-on” type may be used for piping over 6” (150 mm) size, including insulation.

B. Valve Tags:

(1) Minimum 1-1/2” (40 mm) diameter, 0.032" (0.8 mm) thick, polished brass or 316 stainless steel.

C. Laminated Plastic Nameplates:

(1) Nameplates shall be approximately 1-1/2” x 4”, 1/16” (40 mm x 100 mm, 1.5 mm) thick, and have 1/2" (13 mm) high lettering. Face of plastic nameplates shall be black with white letters.

(2) Fasteners shall be self-tapping, stainless steel screws or contact type with permanent adhesive.

D. Underground Warning Tape:

(1) Manufacturers: Brady USA, Marking Services Inc. (MSI), Kolbi, or Seton

(2) Underground warning tape, 5.0 mil overall thickness, 2” (50 mm) width minimum, aluminum foil core where required to be detectable, bonded polyethylene jacket. Brady “Identoline” or equal.

(3) Following services shall be provided with warning tape with colors and trace wire as indicated:

(a) Natural Gas: Yellow with black letters, detectable

(b) Water Lines: Blue with black letters, (non) detectable

(c) Sanitary Sewer: Green with black letters, (non) detectable

(d) Storm Sewer: Green with black letters, (non) detectable

PART 3 - EXECUTION

3.01 GENERAL

A. After painting and/or covering is completed, identify equipment and piping as indicated. Locate identification as conspicuously as possible except where such would distract from finished area.

B. Where markers are used in high heat applications or exposed to harsh chemical or acid environments, specifically select marker materials for those applications.

C. Coordinate, obtain and confirm mechanical systems identification criteria and requirements from Owner.

3.02 PIPING SYSTEM IDENTIFICATION

A. Install pipe identification on each system.

B. Place flow directional arrows at each pipe identification location.

C. Identify all piping (except medical gas) not less than once every 25 ft (8 m), not less than once in each room, at each branch, adjacent to each access door or panel, at each valve and where exposed piping passes through walls and floors.

D. Identify piping with marker system.

(1) For “strap-on” type, ensure marker is fitted snugly to pipe or pipe insulation surface with sufficient straps.

3.03 VALVE IDENTIFICATION

A. Identify valves with brass tags bearing system identification and valve sequence number in 1/2” (13 mm) black characters. Attach tag to valve body with brass jack chain and “S” hook for brass tag and SS jack chain or SS braided wires with swag sleeves and “S” hook for stainless steel tag. Non-metallic fasteners are not allowed.

B. Valve numbers shall be prefixed with corresponding piping system identification in 1/4” (6 mm) black letters.

C. Furnish typewritten valve schedule indicating valve number, fixtures, equipment, or areas served by each numbered valve and incorporate in O&M Manuals.

3.04 EQUIPMENT IDENTIFICATION

A. Identify major equipment, including heat exchangers, pumps, water heaters, tanks, compressors, etc.

B. Identify equipment with laminated plastic nameplates.

C. Identify control equipment and panels with laminated plastic nameplates.

D. Nameplate Markings:

(1) Identify model number, size, capacity, electrical characteristics, serial number, along with other items scheduled for equipment on drawings.

(2) Indicate motor horsepower, voltage, phase, cycles, RPM, full load amps, locked motor amps, frame size, manufacturer's name and model number, Service Factor, Power Factor, efficiency, minimum circuit amps, minimum feeder conductor size, disconnect or fuse size, refrigerant, and other pertinent information.

E. Locate motor nameplates for easy reading. Relocate or provide new nameplates on motors if original nameplates are not located for easy reading.

3.05 ACCESS PANEL IDENTIFICATION

A. Identify each service opening or access opening with minimum 1/2" (13 mm) high letters indicating type of damper.

B. Furnish typewritten charts with identification and location of all access panels serving equipment and valves and incorporate in O&M Manuals.

3.06 SPRINKLER ZONE CONTROL VALVE IDENTIFICATION

A. Identify sprinkler zone control valves with laminated plastic nameplates. Nameplate shall include name of sprinkler zone served and description of area served.

B. Identify inspector's test valve with laminated plastic nameplate if valve is located remote from sprinkler control valve. Nameplate shall include name of sprinkler zone served.

3.07 UNDERGROUND WARNING TAPE

A. Install detectable warning tape 4" to 6" (100 mm to 150 mm) below grade to allow for accurate above surface detection.

B. Install non-detectable warning tape 6" to 12" (150 mm to 300 mm) below grade.

C. Repair and replace existing underground warning tape where disturbed by excavation.

END OF SECTION 22 05 53

SECTION 22 05 94 - DOMESTIC WATER SYSTEMS BALANCE

PART 1 GENERAL

1.01 RELATED WORK

A. Section 22 11 18 – Water Distribution System

B. Section 22 21 14 – Plumbing Specialties

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESCRIPTION

A. Test and Balance (TAB) Contractor shall be responsible for providing complete testing and balancing work of liquid fluid handling systems, such as domestic hot water return, laboratory hot water return, water mixing valves, and other processes included in this Project.

B. Work required shall consist of setting volume flow rates and adjusting speed controls, recording data, making tests, and preparing reports as specified herein.

C. Scope of work includes new work specified herein and includes all equipment, distribution systems, and terminal units connected.

D. Scope of work also includes existing liquid fluid handling systems as defined by drawings and/or schedules.

E. Work is limited to new areas within construction boundaries and does not include central pumping equipment or other areas. Adjust and balance flows to values indicated or scheduled. If flow is abnormal, attempt to proportional balance flows to the same percentage below design and contact Engineer for additional instruction.

F. Procedures shall be in accordance with the latest edition of AABC or NEBB and as per detailed herein.

G. TAB work shall be performed by persons trained in TAB work and certified by Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB). Contractors who are members of AABC or NEBB and who have qualified personnel available to perform work may submit Quality Assurance Submittal for approval.

H. Contractors who are members of AABC or NEBB and who have qualified personnel available to perform Work may submit Quality Assurance Submittal for approval. Contractors who cannot meet these requirements shall subcontract with independent TAB Contractor. TAB subcontractor shall prepare Quality Assurance Submittal for Contractor who will submit it for approval.

I. Owner will separately contract with an independent TAB Contractor to perform all testing, adjusting and balancing of HVAC hydronic systems required for this Project. Work related to testing, adjusting, and balancing that must be performed by Mechanical Contractor is specified in other sections of these Specifications.

J. Upon direction of Architect/Engineer or TAB subcontractor, Contractor shall provide (at no additional cost to Owner) any additional work and/or devices necessary to properly balance the system, including calibrated balancing valves, gauge tappings, flow sensors, and thermometer wells. Contractor shall be responsible for trimming and balancing pump impellers as necessary to obtain design pump flow rates at minimum pressure differential.

K. TAB work shall not proceed until all assigned personnel have been approved by, Engineer via Quality Assurance Submittal. Coordinate each phase of TAB work with overall project schedule. Each phase of TAB work shall be done in timely manner as detailed herein. Fieldwork must be complete before occupancy. Certificate of Substantial Completion shall not be issued until after Final Report is accepted by Engineer.

1.04 SUBMITTALS

A. General:

(1) Make submittals in accordance with Section 01 33 00 – Submittals. Submit minimum of 5 copies of all submittals unless otherwise directed.

(2) Reports shall be assembled using a 3-ring hard cover binder with Project Name and location on the cover and the side panel. Information sheets shall be 8-1/2” x 11” white bond paper. Use pre-printed forms of NEBB or AABC wherever possible. Assemble report in the following order.

(a) Transmittal letter

(b) Cover sheet with Project title, location, submittal date, and names and addresses of Owner, Contractor, TAB subcontractor, Architect, and Engineer

(c) Index of numbered tabs listing major systems

(d) Data organized by system in the following order:

1) Equipment data and measurement summary

2) Equipment measurement data

3) Branch main measurement data
4) Terminal device measurement data

(e) Provide numbered tabs for each system.

B. Quality Assurance Submittal:

(1) Within 30 days of signing Contract, Contractor shall submit the following information:

(a) Firm resume

1) AABC or NEBB active membership required
2) Names of 3 recent relevant completed projects along with the project address, Owner's contact person, supervising design professional.

(b) Supervisor resume

(c) Balance technician(s) resume

(2) Architect/Engineer and Owner reserve the right to contact previous project representatives and to reject persons whom Architect/Engineer and/or Owner feel are not qualified for this Project due to lack of relevant experience or problems on previous projects.

C. Planning Report:

(1) Submit Planning Report as detailed in Part 3-EXECUTION of this Section to demonstrate to Engineer and Owner that proper procedures are being followed. Planning Report shall be submitted after Quality Assurance submittal and 30 days before fieldwork starts.

D. Initial Test Report:

(1) Prior to starting Final Balance Phase, submit Initial Test Report as detailed in Part 3 of this Section to indicate to A/E and Contractor incomplete work or problem areas to be resolved before final balance is completed.

E. Final Report:

(1) Within 30 days after fieldwork is completed, submit Final Report as detailed in Part 3 of this Section to assure design objectives are met and to assist Owner in future maintenance.

1.05 REFERENCE STANDARDS

A. Refer to the latest publications of the NEBB, the American Society of Plumbing Engineers (ASPE) and the American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE) for establishing required procedures.

PART 2 PRODUCTS

2.01 INSTRUMENTATION

A. Provide required instrumentation to obtain proper measurements. Application of instruments and accuracy of instruments and measurements shall be in accordance with requirements of NEBB or AABC Standards and instrument manufacturer's specifications.

B. Instruments used for measurements shall be accurate, and calibration histories for each instrument shall be available for examination by Architect/Engineer upon request. Calibration and maintenance of all instruments to be in accordance with requirements of NEBB or AABC Standards.

PART 3 EXECUTION

3.01 GENERAL

A. TAB work shall be done in separate phases as outlined herein. Project schedule shall allow ample time to complete TAB work before occupancy. Follow procedures outlined herein and as described in Planning Phase narratives.

B. Set point for individual branch balancing valves in domestic hot water return system shall be 0.5 gpm unless otherwise noted on drawings or schedules.

C. Set point for the domestic hot water return circulating pump shall be the flow rate defined in the schedules on the plumbing drawings.

3.02 PLANNING PHASE

A. Procedure:

(1) Obtain latest contract documents including addenda and change orders. Obtain shop drawings and performance curves from Contractor for pumps, flow measuring devices, and terminal devices. Prepare Planning Report as detailed herein. Make adjustments in Planning Report and/or measuring instrument calibration.

B. Planning Report:

(1) Planning Report shall contain the following minimum requirements.

(a) Narratives:

1) Provide written narratives of procedures used. Provide separate narratives for each pump and liquid fluid handling system.

2) Identify flow-measuring devices to be used at each pump and terminal device. Provide different narratives for constant and variable flow systems.

3) For non-standard water systems, include narratives on how to measure and adjust for different viscosities.

4) Narratives shall include references to published standards of NEBB or AABC. Narratives shall include measuring instruments to be used and ranges required for each procedure. Narratives shall include specified adjustment tolerances. For this Project, minimum acceptable is ± 10% of design flow.

(b) Prebalance Checklist: include, but not limited to:

1) Check for completeness or work
2) System cleaning
3) System fill and air venting
4) Place system into operation
5) Check expansion tanks and fill pressures
6) Pump bearings, alignment, starters, vibration isolators, rotation
7) Setting valves to proper position including shutoff and bypass valves
8) Set up of controls and control devices

(c) Measuring Instrument List: list measuring instruments to be used for each procedure. Indicate ranges required for each procedure. Provide data on each measuring instrument to be used. This data shall include:

1) Manufacturer name and model number
2) Measurement range
3) Pressure/temperature limits
4) Date put into service
5) Date of last calibration
6) Include certificate from calibration firm

(2) Architect/Engineer reserves the right to request adjustments in any procedure and/or ask for recalibration of any measuring instrument, which has not been recalibrated within the past year.

(3) Samples: Submit copies of TAB forms to be used.

(4) Branch circuit and terminal measurements: indicate on pre-printed forms of AABC or NEBB measurements to be taken in the field. Include branch circuit or terminal identification, system, space served, location, design flows (include zone and system summaries), and flow measuring device size, type, Cv, and manufacturer. Indicate initial setpoint on forms.

3.03 SET-UP PHASE

A. Procedure:

(1) Perform prebalance checkout as per Planning Phase narrative.

B. Initial Test:

(1) Measure pump data and flows in "as found" condition after initial valve settings are made.

C. Initial Test Report:

(1) Submit report to Architect/Engineer and Contractor indicating measurements made and make notes of items, which are not complete or are not within design tolerance.

3.04 FINAL BALANCE PHASE

A. Procedure:

(1) Perform procedures as per Planning Phase narrative. Correct deficiencies and redo procedures as required before submitting Final Report.

B. Final Report:

(1) Submit report to Engineer and to Contractor indicating data and measurements as per requirements herein and per Planning Phase narrative. Do not submit partial or incomplete reports.

C. Final Report Adjustments:

(1) Architect/Engineer reserves the right to check any measurement made and to reject any portion of work not within the design tolerance of ± 10% of design flow. Contractor shall resubmit all or portions of Final Report as directed by Engineer.

END OF SECTION 22 05 94

SECTION 22 07 00 - PLUMBING INSULATION

CPART 1 - GENERAL

1.01 RELATED WORK

A. Section 22 05 29 - Hangers and Supports for Plumbing Piping and Equipment

1.02 DESCRIPTION

A. Provide insulating materials and accessories as required for mechanical systems as specified below.

B. Insulating products delivered to construction site shall be labeled with manufacturer's name and description of materials.

1.03 DEFINITIONS

A. Concealed areas, where indicated in this Section, shall apply to shafts, furred spaces and space above finished ceilings, inaccessible tunnels and crawl spaces. All other areas, including walk-through tunnels, shall be considered as exposed.

B. Unless otherwise indicated, unit of thermal conductivity is Btu in/(h ft² °F) (W/(m K)).

C. Interstitial spaces are considered as concealed areas.

1.04 SUBMITTALS

A. Product Data for each piping system for all pipe sizes and all equipment, including but not limited to, the following:

(1) Manufacturer's name

(2) Schedule of insulating materials

(3) Insulation material and thickness

(4) Jacket

(5) Adhesives

(6) Fastening methods

(7) Fitting materials

(8) Intended use of each material

(9) Manufacturer's data sheets indicating density, thermal characteristics, temperature ratings

(10) Insulation installation details (manufacturer's installation instruction/details, Contractor's installation details, MICA plates where applicable)

(11) Literature data sheet from sealants and adhesive manufacturers stating VOC compliance with USGBC LEED IEQ 4.1.

(12) Literature data sheet from coatings and mastics (including lagging adhesives) manufacturers stating VOC compliance with USGBC LEED IEQ 4.2.

(13) All other appropriate data

1.05 DELIVERY, STORAGE AND HANDLING

A. Insulation material shall be delivered to project site in original, unbroken factory packaging labeled with product designation and thickness. Shipment of materials from manufacturer to installation location shall be in weather-tight transportation. Protect insulation materials from moisture and weather during storage and installation. Protect insulation material against long exposure to UV light from sun.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Insulation:

(1) Owens Corning, Johns Manville, Manson, Knauf or CertainTeed similar to product indicated except where product of manufacturers not listed above is specifically identified for special type of insulation.

B. Coatings, Mastics, Sealants and Adhesives:

(1) Foster, Childers, Design Polymerics, Vimasco, Miracle or Pittsburgh Corning

2.02 MATERIALS

A. Products used for or related to air conditioning and ventilating systems shall conform to NFPA 90A possessing flame spread index of not over 25 and smoke developed index no higher than 50.

B. Unless otherwise indicated, all products, material itself or on composite basis, shall have flame spread index not more than 25 and smoke developed index not more than 50, when tested in accordance with ASTM E84 or UL 723.

C. Pipe insulation installed outdoors may have smoke developed index not exceeding 450.

D. Insulation shall not contain formaldehyde.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in manufacturing process.

F. Insulation applied on stainless steel shall meet requirements of ASTM C795 and NRC 1.36.

2.03 INSULATION

A. Insulation materials shall be fire retardant, moisture, and mildew resistant, vermin proof, and suitable to receive jackets, adhesives and coatings as indicated.

B. Glass fiber insulation shall be of inert inorganic material, non-corrosive to mechanical surfaces.

C. Insulating cement shall be Quick-Cote by PK Insulation MFG Co. or Ryder GP, with dry density of no more than 38 lb/ft³ (603 kg/m³) thermal conductivity of 0.96 at 400°F (0.138 at 204°C) mean temperature, and service temperature to 1200°F (650°C).

D. Filling and finishing cement shall be Super-Stik by PK Insulation MFG Co., or Ryder MW, with dry density of no more than 24 lb/ft³ (384 kg/m³), thermal conductivity of 0.74 at 500°F (0.107 at 260°C) mean temperature, and service temperature to 1900°F (1040°C).

E. Type A Insulation (Flexible Elastomeric):

(1) Flexible, closed-cell, elastomeric cellular insulation.

(a) ASTM Standard: ASTM C534/C534M, Type I (tube form) or Type II (sheet form), Grade I

(b) Thermal Conductivity: Maximum 0.28 at 75°F (0.04 at 24°C) mean temperature

(c) Water Vapor Permeability: Maximum 0.08 perm-" (0.12 ng/s m Pa)

(d) Water Absorption: Maximum 0.2 % by volume

(e) Service Temperature: -297 to 220°F (-183°C to 104°C)

(2) Manufacturers/Products:

(a) Armacell, AP Armaflex FS

(b) Aeroflex, Aerocel

(c) K-Flex, Insul-Tube

F. Type R Insulation (Rigid Mineral Fiber Pipe Insulation):

(1) Mineral fiber (fiberglass) preformed pipe insulation faced with specified jacket.

(a) ASTM Standard: ASTM C547, Type I

(b) Density: Minimum nominal 3 lb/ft³ (48 kg/m³)

1) Thermal Conductivity: Maximum 0.23 at 75°F (0.034 at 24°C) and 0.29 at 200°F (0.040 at 93°C)

2) 0.29 at 200°F (0.040 at 93°C) mean temperature

(c) Service Temperature: To 850°F (454°C)

(2) Manufacturers/Products:

(a) Johns Manville, Micro-Lok HP

(b) Owens Corning, ASJ Max Fiberglas Pipe Insulation

(c) Knauf, Earthwool 1000° Pipe Insulation

2.04 JACKETS

A. Jacket puncture resistances shall be based on ASTM D781 test methods. Vapor barrier permeance ratings shall be based on ASTM E96/E96M Procedure A.

B. Type A-1 Jacket (Aluminum Roll Jacketing):

(1) Factory fabricated 0.016" (0.41 mm) thick, ASTM B209/B209M, Type 3003 or 3105, stucco embossed aluminum jacket with integrally bonded moisture barrier/retarder consisting of 3 layers of polymer films with total thickness of 3 mil (0.075 mm).

(2) Fitting covers shall be factory fabricated from not lighter than 0.016" (0.41 mm) 0.024" (0.61 mm)thick, Type 3003 or 1100 aluminum. For large pipes, where factory fabricated fitting covers are not available, Contractor shall fabricate fitting covers from like sheet materials.

(3) Manufacturers/Products:

(a) Johns Manville, Aluminum Jacketing

(b) RPR Products, Insul-Mate

C. Type P-1 Jackets:

(1) Heavy-duty, fire retardant material with glass fiber reinforcing and self-sealing lap. Jacket shall have neat, white Kraft finish suitable for painting, with burst strength of 1.5 Joules (50 beach units) minimum and tensile strength 45 lbs/in (7.9 N/mm) minimum. Vapor barrier shall be adhered to inner surface of jacket. Permeance shall not exceed 0.02 perm (1.15 ng/s m² Pa).

(2) Manufacturer/Products:

(a) Owens Corning: ASJ-SSL

(b) Johns Manville, ASJ

(c) Knauf, ASJ+

2.05 ADHESIVES, MASTIC, COATINGS, SEALANTS, AND REINFORCING MATERIALS

A. Adhesives and sealants shall comply with the South Coast Air Quality Management District SCAQMD 1168; VOC limits shall comply with Indoor Environmental Quality Section, Credit IEQ-4.1.

B. Coatings and mastics shall comply with VOC limits set forth by Green Seal BS-11 and comply with the South Coast Air Quality Management District SCAQMD 1113; VOC limits shall comply with Indoor Environmental Quality Section, Credit IEQ-4.2.

C. Products shall be compatible with surfaces and materials on which they are applied and shall be suitable for use at operating temperatures of systems to which they are applied.

D. Products shall be fire retardant, moisture resistant and mildew resistant and vermin proof.

E. Vapor Barrier Mastic: Below ambient insulation. Water vapor permeance shall be less than 0.08 perms at 45 mils dry film thickness per ASTM F1249.

(1) Foster 30-33

(2) Childers CP-33

(3) Vimasco 749

F. Weather Barrier Breather Mastic: Above ambient insulation. Permeance shall be greater than 1.0 perms at 1/16" (1.59 mm) dry film thickness per ASTM E96/E96M.

(1) Foster 46-50 Weatherite

(2) Childers CP-10/CP-11 Vi Cryl

(3) Vimasco WC-5

G. Lagging Adhesive/Coatings: Indoors applications used in conjunction with canvas/glass cloth.

(1) Foster 30-36

(2) Childers CP-50 AMV1

(3) Vimasco 713

H. Metal jacketing sealant for aluminum jacketing:

(1) Foster 95-44 Elastolar

(2) Childers CP-76 Chil Byl

(3) Pittsburgh Corning 727

I. Insulation joint sealant for Type P, Type PP, and Type G insulation:

(1) Foster 95-50 Flextra

(2) Childers CP-76 Chil Byl

(3) Pittsburgh Corning CW Sealant

J. Glass fiber fabric reinforcing shall be 10 x 10 mesh similar to Childers Chil Glas #10 or Foster Mast A Fab.

K. Wire mesh reinforcing shall be 22 ga (0.7 mm), 1" (25 mm) galvanized.

L. Insulation cement shall be ANSI/ASTM C195, hydraulic setting mineral wool.

M. Finishing cement shall be ASTM C449.

N. Butt joint and longitudinal joint adhesive for Type A insulation shall be Armstrong 520, Rubatex 373, Childers CP-82 or Foster 85-75.

O. Weather-resistant protective finish for Type A insulation shall be equal to Armstrong WB Armaflex finish or Foster 30-64 elastomeric coating.

2.06 METAL BANDS AND WIRES

A. Aluminum bands shall be 0.5 x 0.20" (13 mm x 0.51 mm) up to 48" (1220 mm) diameter and 0.75 x 0.020" (19 mm x 0.51 mm) over 48" (1220 mm) diameter.

B. Stainless steel bands shall be 0.5 x 0.015" or 0.75 x 0.015" (13 mm x 0.38 mm or 19 mm x 0.38 mm).

C. Stainless steel wires shall be 16 ga (1.50 mm).

2.07 REMOVABLE INSULATING BLANKETS

A. Custom designed removable, reusable, flexible, blanket thermal insulation system.

B. Acceptable Manufacturers: Thermal Energy Products, Inc., Advanced Thermal Corp., Temptec and Remco Technology, Inc.

C. Removable insulation system shall be custom designed for each individual item to provide close contour fit. Overlapping seams and gaps are not acceptable.

D. Removable insulation shall be designed to overlap adjoining pipe insulation by.

E. Insulation: Minimum 2" (50 mm) thick, 2.4 lb/ft³ (38.4 kg/m³) density, 1000°F (540°C) continuous service temperature thermal insulating wool; Owens Corning Fiberglass or equal.

F. Interior and Exterior Fabric: Minimum weight 0.59 kg/m² (17.5 oz/sq yd) silicone rubber coated fiberglass cloth.

G. Securement: Blanket seams shall be closed with buckle and strap assembly (D ring closure).

H. Identification/Tagging: Label each removable insulation device with plastic or 304 stainless steel tag with raised letters. Tag as directed by Owner.

2.08 ACOUSTICAL BARRIER MATERIALS

A. Acoustical barrier material shall be combination of absorber and barrier, similar to Sound Seal Model B-10 LAG/QFA-3. Absorber/Barrier material shall have acoustic ratings of STC-29,1.0 lb/ft³ (4.88 kg/m³)nominal density, 1" (25 mm) thick, flame spread index of less than 25, smoke developed index less than 50, and minimum continuous operating range from --20 to 350°F (-29 to 176°C).

B. Minimum sound transmission loss at each octave band shall be as follows:

Sound Transmission Loss (dB)					
Octave Band Center Frequency (Hz)					
125	250	500	1000	2000	4000
18	18	23	30	39	46

PART 3 - EXECUTION

3.01 APPLICATION

A. Provide insulation and jackets with minimum insulation thickness as indicated in the following schedule. The schedule applies to both exposed and concealed applications unless noted otherwise:

Piping System							
		Minimum Insulation Thickness According to Pipe Size					
Service	Jacket Type	Insulation Type	3/4" (19 mm) and Smaller	1" - 1-1/4" (25 mm to 32 mm)	1-1/2" - 3" (40 mm to 80 mm)	4" - 6" (100 mm to 150 mm)	8" (200 mm) and Larger
Domestic Cold Water	P-1	R	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
	---	A	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)
(Type A Insulation is an option)							
Domestic Hot Water and Hot Water Return 105-140°F (40-60°C)	P-1	R	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)
	---	A	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	NA
(Type A Insulation is an option)							
Stormand overflow piping including roof drain body	P-1	R	NA	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
	---	A	NA	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	NA
(Type A insulation is an option.)							
Sanitary waste piping downstream of cooling coil condensate connection	P-1	NA	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)
	P-1	A	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	NA
(Type A insulation is an option.)							

Equipment & Systems			
Service	Jacket Type	Insulation Type	Insulation Thickness
Heat Exchangers (Shell and Tube Type)	P-1	R	2-1/2" (65 mm)
Heat Exchangers (Plate and Frame Type)	---	A	1" (25 mm)
Water Softener Mineral Tanks		A	1" (25 mm)

3.02 INSTALLATION - GENERAL

A. All insulation installation methods shall be performed in accordance with the latest edition of National Commercial and Industrial Insulation Standards published by MICA (Midwest Insulation Contractors Association) and manufacturer's installation instructions, except as modified in this Section of specifications.

B. Install products with good workmanship, with smooth and even surfaces. Use full-length factory-furnished material where possible. Do not use scrap pieces.

C. Apply insulation only on clean, dry surfaces, after all rust and scale have been removed and testing of systems has been completed. Do not insulate any section of system that must be pressure tested until after it has been successfully tested. Any removal and reinstallation to correct system defects prior to end of guarantee period shall be accomplished at no expense to Owner.

D. Install insulating materials with necessary joints and terminations, to permit easy access and removal of equipment sections where inspection, service or repair is required, and to allow for expansion.

E. Where possible longitudinal joints in jackets shall face toward wall or ceiling.

F. Apply insulation to each pipe individually. Common insulation applied to adjacent pipes will not be accepted.

G. Unless otherwise indicated, pipe insulation shall be continuous through walls and floors.

H. Where multiple layers of insulation are used, stagger and secure each layer with metal bands.

I. Where penetrations occur through fire-rated walls, partitions, or floors, provide fire seal as specified in Section 22 00 00 - General Plumbing Requirements and Section 07 84 00 - Firestopping.

J. Insulate water piping within casework up to penetration of casework pipe chase at fixture stop. Insulate water piping within walls up to pipe penetration through the wall at fixture stop when serving wall-mounted fixtures. Termination of insulation shall be in neat and workman like manner with insulation jacket cap.

K. Insulate the following systems for complete vapor barrier protection:

   (1) Storm
   (2) Cold Water
   (3) All equipment with surface temperature below 60°F (16°C)

L. Apply Type A insulation for insulation and jackets requiring vapor barrier protection where specified insulations are cut for mounting sensors, control devices, parts of valves, devices or components which extend out from specified insulation to prevent condensation.

3.03 PIPING, VALVE AND FITTING INSULATION

A. Apply insulation to pipe, unions, flanges, fittings, valves and piping specialties with butt joints and longitudinal seams closed tightly. Valve insulation shall cover entire valve body including bonnets and packing nuts.

B. Laps on factory-applied jackets shall be 2" (50 mm) minimum width firmly cemented with lap adhesive or shall be pressure sealing type lap.

C. Cover joints with factory furnished tape 3" (80 mm) minimum width) to match jacket. Cement firmly with lap adhesive. On systems requiring a vapor barrier (ASJ), vaporseal all longitudinal and butt joints ASJ/Saran seams with 4" (100 mm) wide coat of vapor barrier mastic or 3" (80 mm) minimum tape.

D. Where staples are used, they shall be on 6" (150 mm) maximum centers. When used for systems requiring vapor barrier, cover lap and staples with finish coat of vapor barrier mastic or 3" (80 mm) minimum tape.

E. For finishing of insulated pipe fittings and valves where surface temperature of insulation is not higher than 125°F (51°C), use one piece PVC fitting covers, minimum thickness of 20 mil (0.05 mm), Fitting cover shall be Johns Manville Zeston 2000 PVC, PROTO Fitting Covers, or similar by other manufacturers listed. Where fitting and valve insulation requires vapor barrier, seal joints of PVC covers with vapor barrier adhesives. Insulation type, R-value and density of insulation used at fittings shall match insulation of adjacent piping. Install insulation at pipe fittings and valves completely prior to applying PVC covers.

   (1) For Type R (Rigid glass fiber) pipe insulation, PVC fitting covers with flexible mineral fiber blanket insulation inserts are acceptable, except those located in mechanical rooms within 6' (1.8m) above floor. For fitting covers located in mechanical room within 6' (1.8m) above floor, insulation inserts shall be pre-molded rigid fiber glass type wrapped around elbows.

F. Stove pipe style insulation on elbows (Detail A on Plate 2-200 of MICA 8th Edition) is not allowed. It may be used for closed cell elastomeric insulation.

G. Where terminations of pipe insulation are required, insulation shall have tapered ends, built up and finished as specified for fittings.

H. For pipes 1" (25 mm) and smaller, install specified pipe insulation and jacket continuous through hanger or support locations. Install insulation protection shields to protect insulation from compressing.

I. For pipes 1-1/2" (40 mm) and larger, where manufactured pre-insulated pipe supports are used at hanger or support locations, extend insulation to insulated pipe supports. Where vapor barrier is required, this Contractor shall be responsible for continuity of vapor barrier at insulated pipe supports. 3" (80 mm) wide vapor barrier tape on hot and cold systems at pipe supports.

J. For pre-insulated pipe supports and insulation protection shields, refer to Section 22 05 29 - Hangers and Supports for Plumbing Piping and Equipment.

K. For Contractor-fabricated anchors, secure insulation directly to pipe surface and extend insulation up anchor for distance of 4 times insulation thickness. For pre-insulated anchors, cover entire surface of anchors with Type A insulation. Where applicable, take special care to assure vapor seal at anchor.

L. Where mechanical grooved pipe connections are used in piping system, insulate couplings as specified for pipe.

M. Piping, fittings, and valves not to be insulated:

(1) Valves furnished with removable insulation/jacket

3.04 EQUIPMENT INSULATION

A. Where multiple layers of insulation are required, stagger and secure each layer with stainless steel bands.

B. Install removable insulation where access is required for cleaning, repair, and inspection. Construct removable insulation with Type A insulation for cold equipment and Type R insulation with V-1 jacket for hot equipment. Do not apply bonding adhesive to equipment surface.

C. Provide removable insulating blankets on expansion joints.

D. Do not insulate over equipment nameplates or ASME stamps. Bevel and seal insulation at these locations.

E. Equipment not to be insulated:

(1) Equipment furnished with factory insulation.

3.05 EQUIPMENT AND COMPONENTS

A. Acoustical Barrier Materials:

(1) Provide 2" (50 mm) thick Type R insulation with Type D-1 jacket as inner layer. Over insulation install acoustical barrier materials as outer layer in accordance with manufacturer’s installation instruction.

(2) Refer to plans for equipment requiring acoustical barrier materials.

3.06 PROTECTIVE INSULATION SHIELD (A-1 JACKET) FOR PIPE JACKETS EXTERIOR TO BUILDING

A. Unless otherwise indicated, install shields (A-1 jacket) around insulated pipe and fittings exterior to building. Seal water and vapor tight at terminations.

B. Longitudinal overlap shall be at least 2" (50 mm) wide with vapor barrier sealant.

C. Secure jacketing with 3/4" (19 mm) wide .015" (.38 mm) stainless steel or 3/4" (19 mm) wide .020" (.51 mm) aluminum bands and wing seals on maximum 18" (450 mm) centers.

END OF SECTION 22 07 00

SECTION 22 08 00 - COMMISSIONING OF PLUMBING

PART 1 - GENERAL

1.01 DESCRIPTION

A. Commissioning of Plumbing is the process of ensuring that the Plumbing System is installed and performs interactively according to the basis of design criteria and meets the building's operational performance expectations as defined in the sequences of operations. The process also provides adequate documentation of installation, start-up, and functional testing and ensures that the Owner's maintenance personnel are adequately trained. It provides for discovery of system operational performance deficiencies prior to substantial completion while the responsible contractors can provide a timely response. It establishes testing and communication protocols in an effort to advance the Plumbing System from installation to complete dynamic operation and optimization.

B. The commissioning process involves all the parties involved in the design and construction process as well as the Owner and the Commissioning Agent (CxA). Primary elements of Commissioning during the construction, acceptance, and warranty phases of the project include:

(1) Verify applicable equipment and systems are installed in accordance with manufacturers' instructions and contract documents and receive adequate operational start-up checkout by installing contractors.

(2) Demonstrate functional operational performance of equipment and systems in the commissioning program.

(3) Verify O&M documentation submitted is complete. Provide required documentation and information to the ____ to allow compilation of Building Systems Manuals in accordance with Section 01 78 23 - Building System Manuals (O&M).

(4) Verify Owner's maintenance personnel are adequately trained in accordance with specified training plan requirements.

(5) Verify systems are interacting and performing optimally in accordance with the system sequence of operations.

(6) Furnish labor and material to accomplish plumbing system commissioning and systems' testing as specified herein and other related sections.

1.02 RELATED SECTIONS

A. Section 01 79 13 - Demonstration and Training

B. Section 01 78 23 - Building System Manuals (O&M)

C. Section 01 91 13 - General Commissioning Requirements.

D. Section 01 91 14 - Functional Testing Requirements.

1.03 SUBMITTALS

A. Refer to Section 01 91 13 for commissioning submittal requirements. Provide copies of commissioning submittal requirements to the Commissioning Agent, in addition to the copies required by the Owner and Design Professional.

1.04 COORDINATION

A. The installation schedule for the components, equipment & systems included in the commissioning program shall be such that the commissioning requirements can be met without impacting the construction schedule. Commissioning Functional Performance Testing is a requirement for Substantial Completion.

B. All maintenance points for components installed by the contractor for building systems servicing shall be flagged utilizing construction marker ribbons if the maintenance point is located where multiple trades will be installing systems, unobstructed access from floor level shall be maintained. Refer to Section 01 91 13 - General Commissioning Requirements for additional information on maintenance/service point access.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Trade contractors shall provide all specialized tools, test equipment, and instruments required to execute startup, checkout, field calibration and functional performance testing of equipment under their contract.

B. Test equipment shall be of sufficient quality and accuracy (great accuracy than specified for component) to test and/or measure system performance according to specified tolerances. Test equipment is to have calibrated within the previous 12 months. Calibration shall be NIST traceable. Equipment shall be re-calibrated when dropped or damaged. Calibration tags shall be affixed, or certificates be readily available.

C. Datalogging equipment or software required to test equipment will be provided by the CxA but shall not become the property of the Owner.

PART 3 - EXECUTION

3.01 COMMISSIONING

A. General Requirements. For additional information regarding general commissioning requirements refer to Section 01 91 13 - General Commissioning Requirements.

B. Installation contractors shall be responsible for executing and documenting equipment installation, start-up and check out for systems and equipment. Contractors shall also be responsible for executing and documenting Contractor Pre-Testing. Both of these documents are required prior to the CxA scheduling the Functional Performance Testing. Contractors shall also be responsible for providing training for the Owner's maintenance personnel in accordance with project requirements.

C. Construction Checklists for each type of equipment and system shall be provided to the installation contractors by the CxA for use by the contractors in documenting the installation and start-up of equipment in the commissioning program.

D. For equipment and system components requiring a manufacturer's representative for Construction Checklists and start-up, manufacturer documentation of these activities shall be attached to the checklists provided by the CxA.

E. Functional Testing Procedures for each type of equipment and system shall be provided to the installation contractors by the CxA for use by the contractor in documenting the performance of the Contractor Pre-Testing. Refer to Section 01 91 14 - Functional Testing Requirements for further information.

F. Completed Start-up checklists and Contractor Pre-Testing for all pieces of equipment shall be submitted by contractors to the CxA through the General Contractor prior to the scheduling of the final Functional Performance Testing that is witnessed by the CxA.

3.02 TRAINING

A. Contractor responsible for the installation of the system shall coordinate the participation of other sub-contractors and manufacturer's representatives in the training program in accordance with requirements of 01 79 13 - Demonstration and Training and 01 79 13A - Demonstration and Training Sample Agenda.

3.03 OPERATIONS AND MAINTENANCE DATA

A. Contractor responsible for the installation of the system shall provide operations and maintenance manuals in accordance with requirements of other sections of the project specifications.

3.04 GENERAL SYSTEM TESTING CRITERIA

A. Functional Performance Testing

(1) Refer to Sections 01 91 13 - General Commissioning Requirements and 01 91 14 - Functional Testing Requirements. Installation contractor shall be responsible for providing authorized manufacturer's representatives to demonstrate the operational capabilities of the equipment systems.

END OF SECTION 22 08 00

SECTION 22 11 18 - WATER DISTRIBUTION SYSTEM

PART 1 GENERAL

1.01 DESCRIPTION

A. This Section covers interior domestic cold water, domestic hot water (125°F), domestic hot water return, tempered water, and nonpotable cold water to a point 5 ft outside building wall.

B. All components shall comply with NSF-61 and NSF-372 to be compliant with requirement for lead content of ≤0.25% maximum weighted average.

1.02 RELATED WORK

A. Section 01 81 13 - Certification Requirements

B. Section 22 05 13 - Common Motor Requirements for Plumbing Equipment

C. Section 23 05 14 - Variable Frequency Drive (VFD) Systems

D. Section 22 05 29 - Hangers and Supports for Plumbing Piping and Equipment

E. Section 22 05 53 - Identification for Plumbing Piping and Equipment

F. Section 22 07 00 - Plumbing Insulation

G. Section 22 05 94 - Domestic Water Systems Balance

H. Section 22 21 14 - Plumbing Specialties

I. Section 26 29 13 - Enclosed Controllers

1.03 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.04 LEED PERFORMANCE REQUIREMENTS

A. VOC Emissions Evaluation: For adhesives and/or sealants used for installation, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: for adhesives and sealants, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for adhesive and sealant applications, as per the SCAQMD Rule 1168, October 6, 2017, adhesive and sealant applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

1.05 LEED SUBMITTAL DOCUMENTATION

A. VOC Emissions Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant.

1.06 QUALITY ASSURANCE

A. Order pipe with each length marked with manufacturer's name or trademark and type of pipe; with each shipping unit marked with purchase order number, metal or alloy designation, temper, size, and supplier's name.

B. Installed material not meeting specification requirements must be replaced with material that meets these Specifications without additional cost to Owner.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Promptly inspect shipments to ensure material is undamaged and complies with specifications.

B. Cover pipe to prevent corrosion or deterioration while allowing sufficient ventilation to avoid condensation. Do not store materials directly on grade. Protect pipe, tube, and fitting ends from damage. End caps shall remain in place. Protect fittings, flanges, and unions by storage inside or by durable, waterproof, above ground packaging.

C. Offsite storage agreements will not relieve Contractor from using proper storage techniques.

D. Storage and protection methods must allow inspection to verify products.

E. Before shipping, piping shall be cleaned, free of rust and scale, and chemically treated to protect inside of pipe from rusting and furnished with end caps.

1.08 SUBMITTALS

A. Manufacturer's technical data for the following:

(1) Pipe
(2) Fittings
(3) Joints
(4) Valves
(5) Unions and Flanges
(6) Dielectric fittings
(7) Water hammer arrestors
(8) Expansion joints
(9) In-line Centrifugal Pumps
(10) Pressure Booster Pump

B. Shop Drawings on items specified herein.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials as specified shall be new unless otherwise noted.

B. Materials shall be provided from list of approved manufacturers. Home Market, Generic Broker, or Wholesaler's house brands are not acceptable.

2.02 PIPE, FITTINGS, AND JOINTS

A. Above Ground:

(1) Copper (2-1/2" and Smaller):
(a) Pipe: Copper tube, Type L, hard drawn, ASTM B88
(b) Fittings:
1) Cast copper alloy, solder joint, pressure rated, ANSI B16.18
2) Wrought copper, solder joint, pressure rated, ANSI B16.22
3) Copper, press fit joint, EPDM O-ring, ANSI B16.51, 0° - 250°F, maximum 200 psig (1378.95 kPa). Propress by Viega, ApolloPress by Apollo Flow Controls or Pressystem by Nibco.
(c) Joints:
1) Lead free (<0.2%) solder, ASTM B32, flux, ASTM B813
2) Press fit joint, EPDM O-ring, made with electro-hydraulic crimping tool and jaw correct for pipe size.
(d) Nipples: Red brass pipe, threaded

(2) Copper (3" thru 8"):
(a) Pipe: Copper tube, Type L, hard drawn, ASTM B88
(b) Fittings:
1) Cast copper alloy, solder joint, pressure rated, ANSI B16.18
2) Wrought copper, solder joint, pressure rated, ANSI B16.22
(c) Joints: Brazed, BCuP-3 or BCuP-5 type, AWS A5.8, 1250°F minimum melting point

(3) Stainless Steel 3" and Larger):
(a) Pipe: Stainless steel, Type 304L, Schedule 10, seamless, ASTM A312.
(b) Fittings:

1) Wrought stainless steel, Type 304L, Schedule 10, socket or butt weld pattern, ASTM A312, ASME B16.9

(c) Joints:

1) Welded

2.03 UNIONS AND FLANGES

A. General:

(1) Unions, flanges and gasket materials to have pressure rating of not less than 150 psig (1034.21 kPa) at 180°F.

B. Copper (3" and Smaller):

(1) Wrought copper union, Nibco Figure 633-W. Mueller Brass equal.

C. Copper (4" and Larger):

(1) Cast red brass flanges, alloy 844, ASTM B584, Class 150, Standard bolt pattern, ANSI B16.24 with neoprene gasket

D. Stainless Steel 3" and Larger):

(1) ASTM A182, Type 304L stainless steel raised face flange, welding neck, Class 150, ASME B16.5 with EPDM gasket.

2.04 VALVES

A. Shutoff Valves:

(1) Ball Valves (3" and smaller):

(a) Acceptable manufacturers: Apollo, Hammond, Milwaukee, Nibco, Stockham and Watts with indicated features and equal to model listed. Note that not all manufacturers make all sizes. Basis of design valves have threaded or soldered ends. Equivalent valves with press ends are acceptable when press fit joints and fittings are allowed.

(b) Full Port, 2 Piece: Bronze body, ASTM B584, stainless steel ball and stem, teflon seats, stem extension with length according to installed system insulation thickness, 600 psi (4136.86 kPa) CWP pressure rating, Nibco 585-66-LF.

(c) Insulated Handle: For insulated systems to prevent condensation on valve body with thermal and vapor seal, equal to Nibco Nib Seal

(2) Butterfly Valves (4"and larger):

(a) Acceptable Manufacturers: Apollo, Hammond, Kitz, Milwaukee, Nibco, and Stockham with indicated features and equal to model listed. Note that not all manufacturers make all sizes or styles.

(b) Threaded or Solder Ends: Bronze body, stainless steel disc and stem, viton disk seal, Milwaukee Series BB2

(c) Lug Type: Ductile iron body, 316 stainless steel disc mounted without pins or bolts, EPDM liner, stainless steel stem, copper or glass reinforced epoxy resin bushings (lower, upper and collar), 200 psi (1378.95 kPa) CWP pressure rating, 10 position lever handle through 6", gear operator 8" and larger, Apollo LD141 or Nibco LD-2012.

(d) Wafer Type: Ductile iron body, 316 stainless steel disc mounted without pins or bolts, EPDM liner, stainless steel stem, copper or glass reinforced epoxy resin bushings (lower, upper and collar), 200 psi (1378.95 kPa) CWP pressure rating, 10 position lever handle through 6", gear operator 8" and larger, Apollo WD141 or Nibco WD-3222.

B. Swing Check Valves:

(1) Size 2" and Smaller:

(a) Bronze body, ASTM B62, Y pattern, PTFE resilient disc, horizontal swing, 200 psi (1378.95 kPa) CWP rating, Nibco 413-Y-LF

(2) Valves 2-1/2" and Larger:

(a) Nickle iron body, horizontal swing, stainless steel or nickel iron disc, stainless steel replaceable seat, 200 psi (1378.95 kPa) CWP rating, Nibco F-918-13

C. Spring Check Valves:

(1) Valves 2" and Smaller:

(a) Bronze body, ASTM B584, in-line lift type with spring, Buna-N or PTFE disc, 250 psi (1723.69 kPa) CWP rating, Nibco 480-Y-LF

(2) Valves 2-1/2" and Larger:

(a) Cast iron body, wafer type, Buna-N seat, aluminum bronze disc, in-line type with stainless steel spring, 250 psi (1723.69 kPa) CWP rating, Nibco W-960-W-LF

(3) Size 1/2" thru 2":

(a) Stainless steel body, in-line pattern, stainless steel seats, spring and valve disc. DFT, Inc. Basic Check, Model BSS, rated for 300 psi (2068.43 kPa) WSP.

(b) Manufacturers: Nibco, Watts, Mission, DFT, Inc., Circle Seal, Milwaukee, Stockham

D. Balancing Valves:

(1) Circuit Setter:

(a) Acceptable Manufacturers: Bell and Gossett, Victaulic, Watts or approved equal

(b) 2" and Smaller: Shall be of lead-free brass or bronze construction with glass and carbon-filled TFE seat rings and have differential pressure read-out ports across valve seat area. Read-out ports to be filled with internal EPT insert and better connection with check valve. Valve bodies to have 1/4" NPT tapped drain/purge port. Valves to have memory stop feature and calibrated nameplate to assure specific valve setting. Valve to be leak-tight at full-rated working pressure and temperature 300 psi (2068.43 kPa)/250°F). B&G Circuit Setter Model CB, Victaulic TA Series 78BL, Watts LFCSM-61-S, or approved equal.

E. Mixing Valves

(1) Electronic Thermostatic Master Mixing Valves

(a) Acceptable manufacturers: Armstrong Brain, Leonard Nucleus, Powers Intellistation or approved equal

(b) Master digital thermostatic mixing valve, capable of maintaining mixed water temperature within 4°F of setpoint at zero demand and peak flow with recirculated flow for temperature maintenance. Valve assembly shall be capable of sensing temperature in recirculated water temperature and returning water to main distribution if temperature is adequate or diverting partial flow to heater when temperature falls below setpoint.

(c) Mixing valve station shall be factory assembled on single frame with single point of connection for each piped service and single point of power connection.

(d) Mixing valve station shall be digitally controlled to maintain output setpoint with minimum flow rate of 0.5 gpm. Mixing station shall include color touch screen controller, isolation valves on each service pipe, check valves on cold and hot water inlet and return to water heater, strainers on inlet piping and transmitters for pressure and temperature within the assembly.

(e) Valve shall be rated for 125 psig (861.84 kPa) operating pressure, 180°F maximum inlet temperature and be certified under ASSE 1017.

(2) Thermostatic Point of Use Tempered Water Mixing Valve

(a) Acceptable manufacturers: Bradley, Lawler, Leonard, Powers or approved equal

(b) Emergency fixture thermostatic mixing valve, capable of maintaining mixed water temperature within 5°F of setpoint. Valve shall fail to cold water supply only on loss of hot water supply. Valve shall fail closed on loss of cold water supply.

(c) Mixing valve shall be bronze construction with dual thermostatic elements, high temperature limit stop, locked temperature regulator and integral thermometers on inlet, outlet and mixed water lines. Valve shall be rated for 125 psig (861.84 kPa) operating pressure and be certified per ANSI Z358.1 requirements.

F. Pressure Reducing Valves – Point Of Use

(1) Manufacturers: Apollo, Cla-Val Company, Watts Regulator Company, or Wilkins Regulator Division

(2) High Temperature/Low Pressure Regulators:

(a) Self-contained regulator with cast bronze body, renewable stainless steel seat, spring loaded diaphragm, integral stainless steel strainer, union connection, 160°F maximum temperature rating, 200 psi (1378.95 kPa) maximum inlet pressure rating, and 25 to 75 psi (517.11 kPa) adjustable reduced pressure range. Regulator shall be Apollo 36ELF or approved equal.

2.05 WATER METERS

A. Compound Flow Meter

(1) Acceptable Manufacturers: Badger, Neptune, Sensus Metering Systems or approved equal

(2) Meter shall be in-line compound meter type consisting of one positive displacement chamber and one turbine chamber. Meter shall have integral or remote converter with graphic display and keypad. Meter shall be factory sized and programmed for its specific application and flow range. Meter shall be reprogrammable using converter keypad without use of special interface device or computer.

(3) Meter body shall be lead-free bronze construction with stainless steel trim. Meter shall have thermoplastic piston, turbine chamber and turbine. Meter materials and finish shall meet AWWA Standard C700.

(4) Meter shall be provided with ANSI Class 150 flanges.

(5) Meter shall be selected for 10:1 turndown. Meter shall be wet-calibrated and accurate to within ±1.5% of reading. Meter shall be shipped with certification of calibration.

(6) Meter shall have programmable pulse output signal.

(7) Meter shall have integral lead-free bronze or stainless steel plate type strainer. Strainer shall have access cover for cleaning of strainer grid.

(8) Meter shall provide totalized flow in gal.

(9) Refer to schedules on drawings for meter performance requirements.

B. Positive Displacement Flow Meter

(1) Acceptable Manufacturers: Badger, Niagara Meters or approved equal

(2) Meter shall be in-line nutating disc positive displacement type. Meter shall have integral analog totalizer. Meter shall be factory sized and programmed for its specific application and flow range.

(3) Meter body shall be lead-free bronze construction with non-metallic trim. Meter materials and finish shall meet AWWA Standard C700.

(4) Meter shall be provided with threaded end connections.

(5) Meter shall be selected for 10:1 turndown. Meter shall be wet-calibrated and accurate to within ±2% of reading. Meter shall be shipped with certificate of calibration.

(6) Meter shall have transmitter with programmable pulse output signal.

(7) Meter shall have integral polymer strainer on meter inlet. Strainer shall have access cover for cleaning of strainer grid.

(8) Meter shall provide totalized flow in gal.

(9) Refer to schedules on drawings for meter performance requirements.

C. Turbine Flow Meters

(1) Acceptable Manufacturers: Badger, Neptune, Onicon, or Sensus

(2) Meter shall be in-line turbine type. Meter shall have integral analog totalizer. Meter shall be factory sized and programmed for its specific application and flow range.

(3) Meter body shall be lead-free bronze construction with stainless steel trim. Meter shall have thermoplastic rotor with stainless steel rotor pivots. Meter materials and finish shall meet AWWA Standard C701.

(4) Meter shall be provided with ANSI Class 150 flanges.

(5) Meter shall be selected for 10:1 turndown. Meter shall be wet-calibrated and accurate to within ±2% of reading. Meter shall be shipped with certificate of calibration.

(6) Meter shall have transmitter with programmable pulse output signal.

(7) Meter shall have integral stainless steel strainer on meter inlet. Strainer shall have integral cover plate for cleaning of strainer grid.Meter shall provide totalized flow in gal.

(8) Refer to schedules on drawings for meter performance requirements.

2.06 DIELECTRIC FITTINGS

A. Insulating nipple, metal casing, inert thermoplastic lining; Anvil Figure 7090, Clearflow dielectric fitting by Perfection Corporation or Victaulic Style 47.

B. Dielectric unions 2” and smaller; dielectric flanges 2-1/2” and larger; with iron female pipe thread to copper solder joint or brass female pipe thread end connections, non-asbestos gaskets and pressure rating of not less than 175 psig (1206.58 kPa) at 180°F. Watts Regulator Company, Lochinvar, Wilkins or Epco Sales, Inc.

2.07 WATER HAMMER ARRESTORS

A. Mechanical Water Hammer Arrestors:

(1) Piston-compressed air column type, with sealed air chamber.

(2) Manufacturers: Watts, Sioux-Chief, and Precision Plumbing Products (PPP), Inc., equal to size shown. Provide access panels when mechanical shockstops are installed in non-accessible concealed locations.

2.08 EXPANSION JOINTS/LOOPS

A. Copper Tubing:

(1) Use expansion loops where space is available. Size expansion loops as listed in the following table:

Pipe Size	Length of Each Loop	Number of Legs
3/4”	38”	3
1”	40”	3
1-1/4”	42”	3
1-1/2”	46”	3
2”	50”	3
2-1/2”	54”	3
3”	60”	3
4”	68”	3

B. Copper Tubing:

(1) Mechanical expansion fittings, size 3/4” thru 4”, copper tube sweat ends, stainless steel laminated internal bellows, 200 psi (1378.95 kPa) working pressure, 600°F rated; Keflex Model 7QT.

(2) Mechanical expansion fittings, sizes 3/4” thru 4”, copper tube sweat ends, stainless steel laminated internal bellows, 175 psig (1206.58 kPa) working pressure, 500°F rated, Hyspan Model 8509 or 8510.

(3) Allowable length of copper tube per mechanical expansion fitting shall be in accordance with the following table:

System Operating Temperature	Length of Pipe
110°F	300 ft
120°F	275 ft
130°F	250 ft
140°F	225 ft
150°F	175 ft
160°F	175 ft
170°F	150 ft
180°F	140 ft

C. Pre-manufactured expansion loop will be allowed: Metraflex Model MLS Series for sweat ends, MLT Series for threaded ends and MLF Series for flanged or groove ends. Verify pipe size required, laying length, and face-to-face dimension required. Coordinate location with other trades.

2.09 IN-LINE CENTRIFUGAL PUMPS FOR TEMPERATURE MAINTENANCE OF POTABLE HOT WATER

A. Manufacturers: Bell and Gossett, Grundfos, Wilo or approved equal

B. Pumps shall be wet rotor inline pump with lead free bronze body construction. Pump shall be specifically designed for quiet operation with working pressure of 175 psig (1206.58 kPa) and operating temperature of 225°F continuous with electronically commutated magnet motor (ECP/PM).

C. Impellers shall be stainless steel and shall be directly hung from motor shafts without using flexible couplings.

D. Pump shafts shall be stainless steel, sealed and gasketed from pumped fluid.

E. Bearing assemblies and motor shall be permanently oil lubricated and maintenance free.

F. Pump shall be controlled by onboard user interface. Pump shall be capable of following operating modes:

(1) Proportional Pressure: Pump differential pressure shall be continuously monitored and increased or decreased along linear curve based on flow demand.

(2) Constant Pressure: Pump shall maintain constant differential pressure at any flow demand until maximum speed is reached. Set point shall be adjustable through onboard interface.

(3) Constant Speed: Pump shall maintain constant speed at any flow rate.

(4) Night Set Back: Pump shall recognize 18°F water temperature reduction and shall switch to nighttime operation.

(5) T-Constant: Pump speed shall vary to maintain constant fluid temperature based on PI algorithm.

(6) Delta-T Constant: Pump speed shall vary to maintain constant differential temperature between built-in temperature sensor and external temperature sensor based on PI algorithm.

(7) Delta-P-T: This pump control mode is paired with proportional or constant pressure mode. Nominal differential pressure setpoint shall vary according to fluid temperature.

(8) Delta-P/Delta-T: This pump control mode is paired with proportional or constant pressure mode. Nominal differential pressure setpoint shall vary according to differential temperature between built-in temperature sensor and external temperature sensor.

G. Refer to schedule on Drawings for capacity requirements of pumps.

2.10 PRESSURE BOOSTER PUMP

A. Pump Manufacturers: Armstrong, Bell and Gossett, Ebara, Grundfos, Peerless Pumps

B. Pump Skid Integrator: Armstrong, Bell and Gossett, Canariis, Delta P Carver, Flow Therm Systems, Metropolitan Pump company, Quantum Flo, SyncroFlo, or Tigerflow.

C. Booster pump package shall have components frame mounted, piped, painted, wired and factory tested. Package shall include triplex pumps, hydro-pneumatic bladder tank and control panel. Pumps shall be configured to run in lead-lag-lag sequence. Package shall have single 480 V 3 Ph power connection with transformer provided for lower voltage requirement. Pump package shall be provided with auto-restart function on loss of power.

D. Pumps:

(1) Pumps shall be vertical close coupled end suction type.

(2) Pumps shall have iron volute, backplate and bronze wearing rings; brass or bronze impeller, single suction enclosed type, keyed to shaft, hydraulically and dynamically balanced; stainless or carbon steel shaft with stainless steel or bronze sleeve; mechanical seals with carbon rotating against stationary ceramic seat.

(3) Pumps shall be rated at 125 psig (861.84 kPa) maximum working pressure and 225°F continuous temperature. Manufacturer shall certify ratings.

(4) Pumps shall run without excessive noise or vibration.

(5) Provide spare pump seals for each pump.

E. Each pump shall have open drip-proof high efficiency motor sized for non-overloading over entire pump curve.

F. Each pump and motor to have nameplate listing manufacturer's name, pump serial number, capacity in gpm and ft of head at design conditions, motor horsepower, voltage, frequency, speed and full load current.

G. Pump shall have manufacturer supplied VFD for each pump.

H. Provide isolation valves at inlet and outlet of each pump. Valves shall be butterfly or ball valves as specified previously.

I. Pump manifold piping shall be Type L copper tube, hard drawn, ASTM B88 or schedule 10, type 304 stainless steel pipe, ASTM A312.

J. Pumps shall have flexible suction and discharge braided pipe connectors, suction and discharge pressure gauges and common thermal relief valve. Discharge from relief valve shall be piped to 3” above floor at floor drain.

K. Package shall be controlled by skid mounted, UL listed NEMA 1 control panel with following components:

(1) Magnetic starter for each motor with overload protection, external resets, and starter failure interlocks
(2) Single door interlocked disconnect
(3) H-O-A switch for each pump
(4) Control circuit transformer with protected secondary
(5) Time delays
(6) Minimum run timers
(7) Adjustable solid-state current sensing relays
(8) Low suction pressure cutout
(9) High suction pressure shutdown
(10) Two sensor differential temperature no-flow shutdown
(11) Pump operation and warning lights, and alarm horn
(12) Automatic pump alternation of pumps 1, 2 and 3
(13) Provide necessary components in control panel to integrate via BACnet to Building Automation System for transmission of general fault alarm, run indicator for each pump, high pump pressure alarm, and low suction pressure alarm.
(14) Refer to Section 26 29 13 – Enclosed Controllers.

L. Hydro-pneumatic bladder tank shall be ASME rated with ring stand base and replaceable bladder. Tank shall include inlet and outlet pressure gauge, bladder charge pressure gauge and pressure switch for pump control.

M. Refer to schedule on Drawings for capacity requirements of pumps.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install pipe and fittings in accordance with reference standards, manufacturer's recommendations and recognized industry practices.

B. Maintain piping system in clean condition during installation. Remove dirt and debris from assembly of piping as work progresses. Cap open pipe ends where left unattended or subject to contamination.

C. Include connections to plumbing fixtures, to equipment by others, and to equipment requiring water. Provide proper backflow and back siphonage protection to safeguard potable water system from contamination.

D. Lay out water system so as to conform to intent of drawings. Coordinate piping with building features and work of other trades. Install water piping plumb and square with building. Plans indicate, general routing, provide additional offsets as required. Install piping with necessary swing joints and offsets to allow for expansion.

E. Install shut-off valves on branch lines near mains to avoid long dead-leg branches when valves are closed.

F. Install shut-off valves where indicated and at base of risers to allow isolation of portions of system for repair.

G. Do not install water piping within exterior walls.

H. Provide drain valves at base of risers and at low points of trapped piping 2” and larger where trapped water volume exceeds 5 gallons.

I. Install pressure reducing valves where indicated on drawings. Provide pressure gauges on both inlet and outlet sides of valve. Flush strainer and adjust to outlet pressure as scheduled.

J. Provide protective sleeve covering of elastomeric pipe insulation where copper or steel piping is embedded in masonry or concrete.

K. Provide dielectric fittings between dissimilar piping materials.

L. Do not route piping through transformer vaults or above transformers, panelboards, or switchboards, including required service space for this equipment, unless piping is serving this equipment.

M. Install valves and piping specialties, including items furnished by others, as specified and/or detailed. Provide access to valves and specialties for maintenance. Make connections to equipment, fixtures and systems installed by others where same requires piping services indicated in this Section.

N. In-line pumps 3 hp and larger shall be independently supported from building structure.

O. Install water pipe using proper pipe and fittings. Use reducing fittings for changes in pipe size.

3.02 COPPER TUBING

A. Copper tubing shall be installed per Copper Development Association guidelines in addition to methods specified herein.

B. Soldered Copper Joints:

(1) Use non-acidic and lead free flux on cleaned pipe and fittings for soldered joints.

(2) Cut tube square, remove burrs from exterior of tube and ream interior of tube before assembly.

(3) Fill joints with solder by capillary action. Solder shall cover joint periphery. Wipe joint clean.

(4) Apply heat carefully to prevent damage to pipe, fittings and valves.

(5) Follow manufacturer's recommendations when heating valves and equipment for soldered connections.

C. Brazed Copper Joints:

(1) Cut tube square, remove burrs from exterior of tube and ream interior of tube before assembly.

(2) Joints shall be cleaned and polished before brazing.

(3) Flux of any type shall not be used.

(4) Apply heat carefully to prevent damage to pipe, fittings and valves. Disassemble valves where possible to prevent damage to seats during brazing.

D. Press Fit Copper Joint:

(1) Cut tube square, remove burrs from exterior of tube and ream interior of tube before assembly.

(2) Tubing shall be clean and dry before inserting into fittings.

(3) Insert pipe fully into fitting and mark on pipe at shoulder of fitting.

(4) Check fitting alignment against mark on pipe to ensure pipe is fully engaged.

(5) Crimp joint with pressing tool approved by fitting manufacturer.

E. Mechanically Formed Tee Fittings:

(1) Form mechanically extracted collars in continuous operation consisting of drilling pilot hole and drawing out tube surface to form collar, having height of not less than 3 times thickness of tube wall. Use adjustable collaring device. Notch and dimple branch tube.

(2) To form couplings, anneal end of tubing to be expanded - insert expander and reform tube to accept size OD. Socket expansion shall be at least 3 times base tube wall thickness in depth.

(3) Braze joints and couplings in accordance with American Welding Society "lap-joint" weld, and Copper Development Association copper tube handbook using BCuP filler metal. (Note: soft soldered joints will not be permitted.)

3.03 STAINLESS STEEL PIPE

A. Welded Pipe Joints:

(1) Shop-fabricate major piping assemblies to keep field welds to minimum.

(2) Prepare ends of pipe for welding by machining, abrasive cutting, grinding, sawing, or combination of these methods using stainless steel saw blades and cutting and grinding tools suitable for stainless steel pipe.

(3) Thoroughly clean weld areas and remove burrs and scale. Remove foreign substances such as cutting oils, metal particles, grinding compounds, etc. Clean only with stainless steel wool, stainless steel wire brushes, or other noncontaminating media.

(4) Align work accurately in jigs or fixtures. Keep aligning benches clean. Do not allow stainless steel to come in contact with carbon steel benches, jigs, or fixtures. Place sheet of stainless steel between bench and stainless steel pipe. Carbon steel jig or fixture surfaces that come in contact with stainless steel pipe will be galvanized.

(5) Make welds using Tungsten Inert Gas (TIG) welding process. Fusion weld only; use no filler metal. Use tungsten nonconsumable electrodes and 100% commercially dry and pure argon gas for internal pipe purging, and use 100% commercially dry and pre argon gas for electrode shielding. Purge paper must be physically removed from systems prior to cleaning of systems. Welds will be purged using inlet gas backup. Passivation will be performed on welds.

(6) Manual fusion welding will start and end with tungsten arc adjacent to weld joint to prevent joint contamination.

(7) Perform welding of piping systems with qualified welders and/or welding operators. Qualify welders and/or welding operators in accordance with ANSI Standard B31.1.

(8) Maintain qualification weld records in accordance with ANSI Standard B31.1. Provide Owner's Project Representative with copy of records and keep records current.

(9) Prior to beginning fabrication of any welded piping system, Contractor and each subcontractor required to do welding as specified, shall prepare and submit to Owner's Project Representative for approval, 3 quality control samples of pipe joints made in accordance with applicable specifications.

(10) Additional samples will be prepared and submitted as required until 3 samples of each pipe system are approved by Owner's Project Representative. One approved sample will be returned to Contractor.

(11) Approved samples will be basis of minimum acceptable quality of pipe joints furnished under this Contract and for welder qualification tests.

(12) Architect or Engineer reserves right to test work of any welder employed on project, at Contractor's expense. If work of welder is found to be unsatisfactory, welder shall be prevented from doing further welding on Project.

(13) Welds must have 100% penetration and smooth lines of fusion on exterior and interior.

(14) Interior must be flush and smooth, and weld concavity shall not exceed 10% of pipe wall thickness.

(15) Clean interior and exterior of welds which are accessible. Use stainless steel wire brushes, resinoid, or rubber-bonded aluminum grinding wheels, which are free of carbon particles. Do not use carbon steel tools or brushes, or grinding wheels for use on carbon steel material.

(16) Provide plugs or caps for openings during construction phase. Temporary plug shall be plastic cap or equivalent.

(17) Support piping drops through finished ceiling from structure above to prevent any lateral or up/down movement. Other outlet drops shall be supported from walls, columns, or workbenches using appropriate hangers, anchors, or Unistrut.

3.04 SPRING LOADED CHECK VALVES

A. Provide spring loaded check valve in each pump discharge line.

3.05 WATER METERS

A. Provide minimum of 5 pipe diameters of straight pipe on inlet of meter and minimum of 2 pipe diameters of straight pipe on outlet of meter.

B. Provide strainer on inlet to meter.

C. Refer to instrumentation points list for monitoring data points required from transmitter.

3.06 WATER HAMMER ARRESTORS

A. Use water hammer arrestors to control water hammer. Installed devices shall be sized and located according to manufacturer's recommendations, PDI Standards, or as shown on drawings.

B. Use water hammer arrestors with flush valves and quick-closing valves. Provide access panels when water hammer arrestors are installed in non-accessible concealed locations.

3.07 DIELECTRIC UNIONS AND FLANGES

A. Install dielectric unions or flanges at points where copper-to-steel pipe connection is required in domestic water systems.

B. Install unions on equipment side of shutoff valves for items such as: water heaters, water softeners, pumps, filters, and similar equipment requiring periodic replacement.

3.08 EXPANSION JOINTS

A. Install one anchor on either side of expansion joint, opposite direction of expansion.

B. Install pipe guides on each side of mechanical expansion fittings.

3.09 VALVE ACTUATORS

A. Install chain operators on ball, gate and butterfly valves (2-1/2” and larger).

3.10 CLEANING

A. Flush and clean piping prior to testing. Remove corrosion by mechanical or chemical means. Use chemicals that are non-toxic.

3.11 TESTING

A. Refer to Testing paragraph of Section 20 00 00 - General Mechanical Requirements.

B. Water test system may be applied to system in its entirety or in sections. Test piping with water to pressure of 100 psi (689.48 kPa) for 2 h. No decrease in pressure allowed. Provide pressure gauge with shutoff and bleeder valve at highest point of system tested. Inspect joints in system under test.

C. Defective work or material shall be replaced or repaired as necessary and inspection and test repeated. Repairs shall be made with new materials. No caulking of threaded joints or holes will be allowed.

D. Do not conceal pipe until satisfactorily tested.

E. Testing with air will not be allowed.

3.12 BALANCING

A. Balance water distribution system. Adjust control valves for proper operation. Set balancing valves to maintain hot water in hot water system.

B. Balance flush valves, flow control valves and mixing valves for adequate flow and temperature to plumbing fixtures and equipment.

3.13 DISINFECTION

A. Disinfect water piping in the following manner:

(1) Clean and flush water pipe with water until water at remote tap is clear.

(2) Fill water systems with solution containing 50 ppm of chlorine (minimum concentration). Allow solution to stay in water system for 24 h. Alternately use solution of 200 ppm of chlorine (minimum concentration) for 3 h.

(3) Flush water system of chlorine solution.

(4) Allow clean water to stand in system for 24 h. Take sample from remote tap for bacteriological test.

B. Do not use water system for potable water supply until safe bacteriological test is obtained. Repeat steps 1 through 4 until safe water system is obtained.

3.14 BACTERIOLOGICAL TESTS

A. Take representative water samples and test to ensure bacteriologically safe water supply system. Include HPC (Heterotrophic Plate Count) test and test for presence of Pseudomonas aeruginosa as well as regular coliform bacteria test. HPC test maximum containment level of 500 organisms/ml. Perform bacteriological tests shortly before Owner's acceptance of building. If tests fail, make corrections and retest.

B. When connecting to existing water supply of unknown quality, sample for analysis and comparison with finished water system analysis shall be taken prior to making new connection. This will allow isolating source of contamination from within scope of work or pre-existing water supply. Final conditions shall meet criteria specified above for areas within scope of work.

END OF SECTION 22 11 18

SECTION 22 13 14 - SANITARY WASTE AND STORM DRAINAGE SYSTEMS

PART 1 GENERAL

1.01 DESCRIPTION

A. This Section includes materials and methods for sanitary waste and vent storm drainage, and overflow storm drainage piping systems within and including piping to 5 ft outside building wall.

1.02 RELATED WORK

A. Section 01 81 13 - Certification Requirements

B. Section 22 05 13 - Common Motor Requirements for Plumbing Equipment

C. Section 22 05 29 - Hangers and Supports for Plumbing Piping and Equipment

D. Section 22 07 00 - Plumbing Insulation

E. Section 22 21 14 - Plumbing Specialties

F. Section 22 40 00 - Plumbing Fixtures

G. Section 26 29 13 - Enclosed Controllers

1.03 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.04 QUALITY ASSURANCE

A. Order piping with each length marked with manufacturer's name or trademark and type of pipe; with each shipping unit marked with purchase order number, metal or alloy designation, temper, size, and supplier's name.

B. Installed material not meeting specification requirements must be replaced with material that meets these specifications without additional cost to Owner.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Promptly inspect shipments to ensure material is undamaged and complies with Specifications.

B. Cover pipe to prevent corrosion or deterioration while allowing sufficient ventilation to avoid condensation. Do not store materials directly on grade. Protect pipe, tube, and fitting ends from damage. End caps shall remain in place. Protect fittings by storage inside or by durable, waterproof, above ground packaging.

C. Offsite storage agreements will not relieve Contractor from using proper storage techniques.

D. Storage and protection methods must allow inspection to verify products.

1.06 SUBMITTALS

A. Manufacturer's technical data for the following:

(1) Pipe and fittings
(2) Joints
(3) Cleanouts
(4) Floor drains and floor sinks
(5) Roof drains
(6) Downspout nozzles
(7) Air gap fittings
(8) Discharge check valves
(9) Discharge isolation valves
(10) Traps
(11) Sump pumps

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials herein specified shall be new, unless otherwise noted.

2.02 PIPE, FITTINGS, AND JOINTS

A. Interior Above Ground:

(1) Cast Iron (Storm, Overflow Storm, Sanitary Waste):

(a) Pipe: Hubless cast iron pipe, ASTM A-888, CISPI 301, NSF certified
(b) Fittings: Hubless cast iron fittings, ASTM A-888, CISPI 301, NSF certified

(c) Joints: Heavyweight no-hub couplings with stainless steel clamps, FM 1680 Class 1, ASTM C-1540, Mission Heavyweight, Husky Series HD 2000, Ideal Tridon "MD", or Clamp-All Hi-Torq 80.

(2) Copper (Indirect Waste):

(a) Pipe: Type M copper tube, ASTM B88

(b) Fittings:

1) Cast copper drainage fittings (DWV), ANSI B16.23

2) Wrought copper drainage fittings (DWV), ANSI B16.29

(c) Joints: Lead free (<0.2%) solder, ASTM B32; flux, ASTM B813

(3) Polyvinyl Chloride (PVC) (Sanitary Vent, not in return air plenums):

(a) Pipe: Schedule 40, Class 12454 (PVC 1120), ASTM D1785

(b) Fittings: Drain, waste and vent (DWV) pattern fittings, ASTM D2665; socket fitting patterns, ASTM D3311. Fabricated fittings 10" and larger shall be per ASTM F1866.

(c) Joints: Primer, low VOC, ASTM F656; solvent cement, low VOC, ASTM D2564

B. Pressurized Interior Above Ground:

(1) Copper (2 1/2" and smaller):

(a) Pipe: Type L copper tube, hard drawn temper, ASTM B88

(b) Fittings:

1) Cast copper drainage fittings (DWV), ANSI B16.23

2) Wrought copper drainage fittings (DWV), ANSI B16.29

(c) Joints: Lead free (<0.2%) solder, ASTM B32; flux, ASTM B813

C. Adapter Couplings for Joining Dissimilar Pipe Materials:

(1) Acceptable Manufacturers: Fernco, Mission

(2) 1" through 6" diameter: Fernco Proflex 3000 Series shielded coupling with neoprene gasket, stainless steel shield, and stainless steel clamping bands. Adapter couplings shall be specifically designed for pipe materials being joined.

(3) 8" through 27" diameter: Fernco 1000 Series flexible coupling with elastomeric PVC or neoprene gasket and stainless steel clamping bands. Adapter couplings shall be specifically designed for pipe materials being joined.

2.03 VALVES

A. Pump Discharge Check Valves:

(1) Acceptable Manufacturers: Hammond, Milwaukee, Nibco and Stockham with indicated features and equal to model listed

(2) Size 2" to 4", Horizontal Installation:

(a) Cast iron body, swing check, bronze disc and ring, brass pin, Class 125, threaded ends, Nibco T-918-B

(3) Size 2-1/2" and Larger, Vertical Installation:

(a) Cast iron body, swing check, bronze disc to 4" and cast iron disc with bronze disc face rings or bronze disc for 5" and up, lever and spring operator, brass pin, Class 125, flanged ends, Nibco F-918-BLS

B. Pump Discharge Isolation Valves:

(1) Ball Valves:

(a) Acceptable Manufacturers: Apollo, Hammond and Nibco with indicated features and equal to model listed

(b) Size 2" to 3":

1) Full Port, 2 Piece: Bronze body, ASTM B584, stainless steel ball, teflon seats, stem extension, 600 psi (4136.86 kPa) CWP pressure rating, Nibco 585-70-66

2.04 CLEANOUTS

A. Josam, Mifab, Smith, Wade, Watts or Zurn, equal to number listed in Drains and Cleanout Schedule.

B. Provide recessed, solid brass, cleanout plugs where fittings are used as cleanouts. Provide taper-thread plug with Teflon tape thread wrap.

C. Floor Cleanouts: Cleanout with cast iron ferrule, adjustable top, nickel-bronze scoriated cover and frame, bronze taper-thread plug, equal to J.R. Smith 4033L. Provide flashing flange and clamp where cleanout is installed in elevated slabs, equal to J.R. Smith 4033L-F-C.

D. Floor Cleanouts, Carpeted Areas: Cleanout with cast iron ferrule, adjustable round top, nickel-bronze scoriated cover and frame, bronze taper-thread plug, and small stainless steel carpet marker, equal to J.R. Smith 4033L-Y. Provide flashing flange and clamp where cleanout is installed in elevated slabs, equal to J.R. Smith 4033L-F-C-Y.

E. Floor Cleanouts, Tiled Areas: Cleanout with cast iron ferrule, adjustable square tile top, nickel-bronze scoriated cover and frame, and bronze taper-thread plug, equal to J.R. Smith 4053L. Provide flashing flange and clamp where cleanout is installed in elevated slabs, equal to J.R. Smith 4053L-F-C.

F. Floor Cleanouts, Unfinished Floors and Areas Outside Building: Cleanout with cast iron ferrule, adjustable round top, scoriated cast iron tractor cover, and bronze taper-thread plug, equal to J.R. Smith 4239L. Provide flashing flange and clamp where cleanout is installed in elevated slabs, equal to J.R. Smith 4239L-F-C.

G. Floor Cleanouts, Areas with Heavy Traffic: Cleanout with cast iron ferrule, adjustable housing, heavy-duty ductile iron scoriated top, and brass taper-thread plug, equal to J.R. Smith 4233L-M. Provide flashing flange and clamp where cleanout is installed in elevated slabs, equal to J.R. Smith 4233L-M-F-C

H. Wall Cleanouts: Cleanout with cast iron counter sunk ferrule, bronze or brass taper-thread plug, secured stainless steel access cover, equal to J.R. Smith 4472T.

2.05 FLOOR DRAINS AND FLOOR SINKS

A. Josam, Mifab, Smith, Wade, Watts or Zurn, equal to number listed herein or in Drains and Cleanout Schedule.

B. Floor drains shall be in accordance with ANSI A112.21.1. Provide with caulked or no-hub connection. Floor drains shall have internal seepage collar for embedding in floor construction and weep holes to provide adequate drainage to drain pipe. Include trap seal insert at all floor drains unless otherwise indicated on drawings.

2.06 ROOF DRAINS AND OVERFLOW DRAINS

A. Josam, Mifab, Smith, Wade, Watts or Zurn, equal to number listed in Drain Schedule.

B. Roof drains and overflow drains shall have cast iron body with adjustable collar, cast iron flashing ring, gravel stops, 10” diameter cast iron dome strainer, and cast iron underdeck clamp. J.R. Smith 1010Y-RC-CID.

2.07 AIR GAP FITTINGS

A. Air gap fittings constructed of cast iron with integral air gap having free area of at least twice the inlet area. Josam, Mifab, Smith, Wade, Watts or Zurn, equal to J.R. Smith 3950 or 3951.

2.08 DOWNSPOUT NOZZLES

A. Acceptable Manufacturers: Josam, Smith, Wade or Zurn equal to number listed

B. Downspout nozzles shall be fabricated stainless steel body, wall flange and threaded inlet, secured hinged perforated grate, equal to J.R. Smith #1775.

2.09 TRAPS

A. Same material as pipe or fittings unless specified with fixtures. Refer to Section 22 40 00 - Plumbing Fixtures. Provide 17 ga brass, chrome plated traps for exposed traps.

2.10 ELEVATOR SUMP PUMPS

A. Acceptable manufacturers: Aurora/Hydromatic, Liberty, Stancor, Weil, or Zoeller

B. Pump shall be submersible type constructed of epoxy coated cast iron shell, cast iron volute, two vane enclosed semi-open non-clog bronze impeller, stainless steel shaft, stainless steel fasteners, upper sleeve and lower ball bearing factory sealed grease lubricated, and ceramic mechanical seal.

C. Pump shall be hermetically sealed, capacitor start, built-in thermal overload protection sized for no-overloading entire pump curve.

D. Pump shall be of capacity and electrical service as indicated in the equipment schedules on the drawings.

E. Pump controls shall include:

(1) Single on/off UL listed float switch

(2) Oil sensor to terminate operation on oil

F. Pump accessories shall include:

(1) Discharge check valve

(2) Full port ball valve

(3) Union for each pump

PART 3 EXECUTION

3.01 INSTALLATION - GENERAL

A. Install pipe and fittings in accordance with reference standards, manufacturer's recommendations and recognized industry practices.

B. Provide rigid bracing to resist movement of upstream pipe for horizontal pipes 4” and larger with changes in direction greater than 45 degrees.

C. Connect piping to fixtures, each piece of equipment, and drains. Install required piping as shown on drawings.

D. Grade horizontal lines with minimum of 1/8” per ft, except piping 2” diameter or smaller which shall be run at 1/4” per ft slope.

E. Install piping parallel with building lines and at heights, which do not obstruct any portion of window, doorway, stairway, or passageway, except, as may be shown on plans. Install overhead piping as high as possible.

F. Grade vent pipe for complete drainage by gravity to soil or waste pipes. Vent terminations shall be set true and level. Locate vent piping at least 10 ft away from window, door or intake openings. Coordinate closely with roofing contractor to prevent damage to roofing membrane. Flashing shall be in accordance with requirements of roofing manufacturer.

G. Where interferences develop, offset or reroute piping as required to clear interferences. Coordinate locations of plumbing piping with piping, ductwork, conduit and equipment of other trades to allow sufficient clearances. Consult drawings for exact location of pipe spaces, ceiling heights, door and window openings, or other architectural details before installing piping.

H. Provide protective sleeve covering of elastomeric pipe insulation, where piping and/or fittings are embedded in masonry or concrete.

I. Maintain piping in clean condition internally during construction.

J. Mitered ells, notched tees, and orange peel reducers are not allowed. Bushings are not allowed on threaded piping.

K. Do not route piping through transformer vaults or above transformers, panelboards, or switchboards, including required service space for this equipment, unless piping is serving this equipment.

L. Set cleanouts true and level and protect properly throughout construction.

M. Set floor drains and floor sinks true and level and protect properly throughout construction. Weep holes shall be filled with removable material and kept free from concrete and other debris during construction. Weep holes shall be cleaned out for final working order. Provide safing for floor drains installed in elevated slabs.

N. Trap each fixture and piece of equipment requiring sanitary drainage connections. Trap seals shall be standard depth, except when deep seals are required by code. Traps shall be set true and level and located within limits of code requirements. Traps shall not be used as separator, interceptor or other type of device to retain solids. Traps shall be provided with thread type approved cleanout plugs when specified. Protect traps during construction and seal off to prevent stones, debris and other foreign matter from entering before use. Locate running traps for full accessibility with double cleanout.

O. Provide plugs or caps for pipe openings during construction to prevent debris from entering pipe. Temporary plug shall be plastic cap or equivalent.

3.02 COPPER TUBING

A. Copper tubing shall be installed per Copper Development Association guidelines in addition to methods specified herein.

B. Soldered Copper Joints:

(1) Use non-acidic and lead free flux on cleaned pipe and fittings for soldered joints.

(2) Cut tube square, remove burrs from exterior of tube and ream interior of tube before assembly.

(3) Fill joints with solder by capillary action. Solder shall cover joint periphery. Wipe joint clean.

(4) Apply heat carefully to prevent damage to pipe, fittings and valves.

(5) Follow manufacturer’s recommendations when heating valves and equipment for soldered connections.

3.03 POLYVINYL CHLORIDE (PVC) PIPE

A. Pipe Joints:

(1) Install in accordance with ASTM D2855 "Making Solvent Cemented Joints with PVC pipe and Fittings". Saw cut piping square and smooth. Tube cutters may be used if fitted with wheels designed for use with PVC pipe that do not leave raised bead on pipe exterior. Support and restrain pipe during cutting to prevent nicks and scratches. Bevel ends 10-15 degrees and deburr interior. Check dry fit of pipe and fittings. Reject materials, which are out of round or do not fit within close tolerance. Use heavy body solvent cement for large diameter fittings.

(2) Maintain pipe, fittings, primer and cement between 40°F and 100°F during application and curing. Apply primer and solvent using separate daubers (3” and smaller piping only) or clean natural bristle brushes about 1/2 size of pipe diameter. Apply primer to fitting socket and pipe surface with scrubbing motion. Check for penetration and reapply as needed to dissolve surface to depth of 4-5 thousandths. Apply solvent cement to fitting socket and pipe in amount greater than needed to fill gap. While both surfaces are wet, insert pipe into socket fitting with quarter turn to bottom of socket. Solvent cement application and insertion must be completed in less than 1 minute. Minimum of 2 installers is required on piping 4” and larger. Hold joint for 30 seconds or until set, whichever is longer. Reference manufacturer's recommendations for initial set time before handling and for full curing time before pressure testing.

B. Install plastic pipe and fittings as recommended by manufacturer. Include adequate offsets or expansion joints to allow for pipe expansion.

C. Do not install plastic pipe in plenum space.

3.04 CAST IRON PIPE

A. No-hub Piping: Place gasket on end of one pipe of fitting and clamp assembly on end of other pipe or fitting. Firmly seat pipe or fittings ends against integrally molded shoulder inside neoprene gasket. Slide clamp assembly into position over gasket. Tighten fasteners to manufacturer's recommended torque.

B. Install cast iron pipe and fittings as recommended by CISPI in their publication "Installation of Cast Iron Soil Pipe and Fittings".

C. Support piping at every coupling. Locate hanger within 18” of coupling.

D. Installations with multiple joints within a 4 ft developed length shall be supported at every second joint.

E. Secure base of risers with thrust restraints to prevent joint separation. Restraint shall be in accordance with CISPI recommendations.

F. Brace horizontal piping 5” and larger to prevent horizontal movement. Install bracing at every branch connection and every change of direction in accordance with CISPI recommendations.

3.05 TESTING

A. Refer to Testing paragraph of Section 20 0000 - General Mechanical Requirements.

B. Gravity Systems:

(1) Water test may be applied to system either in its entirety or in sections. Piping shall be tightly plugged and submitted to 10 ft head of water located at highest point. Provide separate standpipe above highest point being tested or extend system to obtain required 10 ft head of water. Head shall be maintained for at least 30 minutes before inspection starts.

C. Pressurized Systems:

(1) Water test system may be applied to system in its entirety or in sections. Test piping with water to pressure of 25 psi (172.37 kPa) for 2 h. No decrease in pressure allowed. Provide pressure gauge with shutoff and bleeder valve at highest point of system tested. Inspect joints in system under test.

D. Defective work or material shall be replaced or repaired as necessary and inspection and test repeated. Repairs shall be made with new materials. No caulking of threaded joints or holes will be allowed.

E. Testing with air will not be allowed.

END OF SECTION 22 13 14

SECTION 22 14 14 - BUILDING SUBSOIL DRAINAGE

PART 1 - GENERAL

1.01 DESCRIPTION

A. This Section specifies pipe and materials to provide subsoil drainage system for building.

1.02 RELATED WORK

A. Section 22 05 20 - Plumbing Excavation and Backfill

1.03 SUBMITTALS

A. Shop drawings and Product Data on items specified herein.

PART 2 - PRODUCTS

2.01 PIPE, FITTINGS AND JOINTS

A. Interior Underground

(1) Vitrified Clay:

(a) Pipe: Extra strength, perforated, ASTM C700

(b) Joints: PVC Nobell collar ASTM D1784, compression gasket, ASTM C425

(c) Cover: Polypropylene filter fabric, design flow rate range from 110 to 220 gpm (6.9 to 20.8 L/s) per square foot when tested according to ASTM D4491/D4491M

(2) Concrete:

(a) Pipe: Perforated, ASTM C444

(b) Joints: Flexible plastic coupling

(c) Cover: Polypropylene filter fabric, design flow rate range from 110 to 220 gpm (6.9 to 20.8 L/s) per square foot when tested according to ASTM D4491/D4491M

(3) Corrugated Steel:

(a) Pipe: Galvanized, bituminous coated, perforated, AASHTO M 36

(b) Joints: Corrugated steel band

(c) Cover: Polypropylene filter fabric, design flow rate range from 110 to 220 gpm (6.9 to 20.8 L/s) per square foot when tested according to ASTM D4491/D4491M

(4) Polyvinyl Chloride (PVC):

(a) Pipe: Perforated, ASTM D2729

(b) Joints: Primer, low VOC, ASTM F656; solvent cement, low VOC, ASTM D2564

(c) Cover: Polypropylene filter fabric, design flow rate range from 110 to 330 gpm per square foot when tested according to ASTM D4491/D4491M

(5) Plastic Corrugated Tubing:

(a) Pipe: Polyethylene corrugated drainage and footing type, ASTM F405 or AASHTO M 252, ASTM F405, Type C similar to product by Advanced Drainage System (ADS)

(b) Joints: Plastic snap coupling meeting soil tightness requirements of AASHTO M 252 or AASHTO M 294

(c) Cover: Polypropylene filter fabric, design flow rate range from 110 to 220 gpm (6.9 to 20.8 L/s) per square foot when tested according to ASTM D4491/D4491M

(6) Heavy Duty Polyethylene:

(a) Pipe: Corrugated tubing, Hancor Hi-Q perforated channel tubing, ASTM F405

(b) Cover: Polypropylene filter fabric, design flow rate range from 110 to 220 gpm (6.9 to 20.8 L/s) per square foot when tested according to ASTM D4491/D4491M

B. Solid Pipe Through Foundation Wall and Under Building

(1) Polyvinyl Chloride (PVC):

(a) Pipe: Schedule 40, Class 12454-B (PVC 1120), ASTM D1785

(b) Fittings: Socket fitting patterns, DWV patterns, ASTM D3311

(c) Joints: Primer, low VOC, ASTM F656; solvent cement, low VOC, ASTM D2564

C. Pressurized Interior Underground

(1) Polyvinyl Chloride (PVC):

(a) Pipe: Schedule 40, Class 12454-B (PVC 1120), ASTM D1785

(b) Fittings: Socket fitting patterns, ASTM D3311

(c) Joints: Primer, low VOC, ASTM F656; solvent cement, low VOC,ASTM D2564

D. Pressurized Interior Above Ground

(1) Polyvinyl Chloride (PVC):
(a) Pipe: Schedule 40, Class 12454-B (PVC 1120), ASTM D1785
(b) Fittings: Socket fitting patterns, ASTM D3311
(c) Joints: Primer, low VOC, ASTM F656; solvent cement, low VOC, ASTM D2564

2.02 VALVES

A. Ball Valves:
(1) Acceptable manufacturers: Asahi, Chemtrol, Ipex, Plast-O-Matic, Spears
(2) Size 3" (72 mm) and smaller: PVC body, full port, true union, Teflon seats, EPDM seals, socket ends. Ipex VX Series

B. Check Valves:
(1) Acceptable manufacturers: Asahi, Chemtrol, Hayward, Ipex, Spears
(a) Size 3" (72 mm) and smaller: PVC body, ball check, EPDM seals, socket ends

2.03 FILTER FABRIC

A. Filter fabric shall be non-woven polypropylene fiber bonded at crossing points. Equivalent opening size (EOS) shall be 70 to 100 U.S. Standard sieve size, ASTM D4751. Fabric shall have water flow rate of 55 gal/min/sq ft, ASTM D4491/D4491M.

B. Fabric shall be Typar, Style 3401 by DuPont or Mirafi 140 by TenCate.

2.04 STONE

A. Drainage stone shall be washed rock or gravel evenly graded with stone smaller than 2" (50.8 mm) size and larger than 3/4" (19.05 mm) size.

2.05 CLEANOUT

A. Manufacturers: Josam, Wade, Zurn or Smith equal to item listed in Cleanout Schedule in Section 22 06 00 - Plumbing Schedules.

2.06 STRUCTURES

A. Settling Basin:
(1) Reinforced precast concrete manhole sections, ASTM C478/C478M. Size to accommodate piping shown.
(2) Frames and Covers; ASTM A48/A48M-83, Class 35, gray cast iron frame and cover. See Details, Section 22 06 90 - Plumbing Details. Neenah Foundry Standard.
(3) Frames and Covers; ASTM A536-80, Grade 65-45-12, ductile iron frame and cover. See Details, Section 22 06 90 - Plumbing Details. Neenah Foundry Standard.

2.07 SUMP PUMPS (AIR FILLED)

A. Acceptable pump manufacturers: Ebera, KSB, Paco, and Weil

B. Acceptable control manufacturers: See Water, SJE-Rhombus and Weil

C. Pump shall be _____ submersible type constructed of epoxy or enamel coated cast iron shell, and cast iron volute, ASTM A48/A48M, Class 30, multi-vane enclosed _____ non-clog _____ impeller, stainless steel shaft, stainless steel fasteners, upper sleeve and lower ball bearings permanently lubricated, and ceramic mechanical seal.

D. Motors shall be NEMA 6, submersible, air-filled, hermetically sealed with Class F insulation. Motors shall meet requirements of Section 22 05 13 - Common Motor Requirements for Plumbing Equipment.

E. Pump shall be of capacity and motors shall be of electrical service as indicated in the equipment schedules on the drawings.

F. Pump Removal System:
(1) Removal system shall permit removal and re-installation of pump without disturbing discharge piping and without personnel entering wet well.
(2) Lifting cable shall be braided stainless steel.
(a) Pump shall be provided with lifting bail to permit attachment of cable to pump.
(3) Pump shall be guided by two guide poles provided with system.
(a) The guide poles shall be mounted on floor elbow and 304 stainless steel upper guide bracket.
(4) Pump sliding bracket shall be constructed of heavy duty bronze.
(5) Floor elbow shall be constructed of ASTM A48/A48M-83, class 30, close grain cast iron.
(6) Pump sliding bracket shall act as wedge type coupling between pump and floor elbow to ensure metal to metal, watertight fit.
(7) Systems that require gaskets, diaphragms, or O-rings to ensure a watertight fit shall not be acceptable.

G. Pump controls shall include:

(1) NEMA 4X outdoor alarm panel with warning light, horn, silent switch, test switch and high level float switch, UL Listed

(2) Control panel with HOA switch, pump run light, resettable overload heaters, NEMA 4X, enclosure

(3) Refer to Section 26 29 13 - Enclosed Controllers for starter requirements.

(4) Electrical pump alternator and alarm panel with HOA switch, run light and resettable overload heaters for each pump; warning light; horn; silent switch; test switch; labeled terminal switch and devices; auxiliary dry contacts for remote alarm; NEMA 4X, enclosure.

H. Pump accessories shall include:

(1) 20 foot (6 m) Power cord, as required

(2) NEMA 4 junction box

(3) Dual mechanical seals, seal leak detector probe and warning light in control panel

(4) Dual stainless steel lift out guide rails, stainless steel wall, pump, and sump brackets, bronze and neoprene quick disconnect fitting, corrosion resistant pull chain or cable.

(5) Unions

2.08 SUMP PUMPS (OIL FILLED)

A. Acceptable pump manufacturers: ABS, Aurora/Hydromatic, Bell and Gossett ITT, Gould, Liberty, Myers, and Zoeller

B. Acceptable control manufacturers: See Water, SJE-Rhombus, Hydromatic and Zoeller

C. Pump shall be simplex submersible type constructed of epoxy or enamel coated cast iron shell and volute, ASTM A48/A48M, Class 30, multi-vane enclosed non-clog bronze impeller, stainless steel shaft, stainless steel fasteners, upper sleeve or ball bearings and lower ball bearings, oil lubricated, and carbon ceramic mechanical seals.

D. Motors shall be NEMA design B, filled with non-toxic dielectric oil. Motors shall meet requirements of Section 22 05 13 - Common Motor Requirements for Plumbing Equipment.

E. Pump shall be of capacity and motors shall be of electrical service as indicated in equipment schedules on drawings.

F. Pump Removal System:

(1) Removal system shall permit removal and re-installation of pump without disturbing discharge piping and without personnel entering wet well.

(2) Lifting cable shall be braided stainless steel.

(a) Pump shall be provided with lifting bail to permit attachment of cable to pump.

(3) Pump shall be guided by two guide poles provided with system.

(a) The guide poles shall be mounted on floor elbow and 304 stainless steel upper guide bracket.

(4) Pump sliding bracket shall be constructed of heavy duty bronze.

(5) Floor elbow shall be constructed of ASTM A48/A48M-83, Class 30, close grain cast iron.

(6) Pump sliding bracket shall act as wedge type coupling between pump and floor elbow to ensure metal to metal, watertight fit.

(7) Systems that require gaskets, diaphragms, or O-rings to ensure watertight fit shall not be acceptable.

G. Pump controls shall include:

(1) NEMA 4X outdoor alarm panel with warning light, horn, silent switch, test switch and high level float switch, UL Listed

(2) Control panel with HOA switch, pump run light, resettable overload heaters, NEMA 4X, enclosure

(3) Refer to Section 26 29 13 - Enclosed Controllers for starter requirements.

(4) Electrical pump alternator and alarm panel with HOA switch, run light and resettable overload heaters for each pump; warning light; horn; silent switch; test switch; labeled terminal switch and devices; auxiliary dry contacts for remote alarm; NEMA 4X, enclosure

H. Pump accessories shall include:

(1) 20 foot (6 m) Power cord, as required

(2) NEMA 4 junction box

(3) Dual mechanical seals, seal leak detector probe and warning light in control panel

(4) Dual stainless steel lift out guide rails, stainless steel wall, pump, and sump brackets, bronze and neoprene quick disconnect fitting, corrosion resistant pull chain or cable

(5) Unions

2.09 FIBERGLASS SUMP BASINS

A. Basin shall be constructed of 70-75% fiberglass and 25-30% polyester resin, ASTM D3753, with no fillers with minimum design safety of four. Basin shall have side hub inlet fittings and tapped top outlet flange.

B. Basin shall have bolted galvanized steel gasketed cover with inspection access plate. Access plate shall have discharge pipe flange for each pump and vent pipe, and hole for control cabling.

C. Minimum wall thickness for basins as follows:

Sump Diameter	24" (600 mm)	30" (750 mm)	36" (915 mm)	42" (1070 mm)	48" (1220 mm)	60" (1525 mm)	72" (1830 mm)
Max 10 ft (3 m) Depth	3/16" (4.8 mm)	1/4" (6 mm)	1/4" (6 mm)	1/4" (6 mm)	5/16" (8 mm)	5/16" (8 mm)	3/8" (10 mm)
Max 15 ft (4.5 m) Depth	1/4" (6 mm)	5/16" (8 mm)	5/16" (8 mm)	5/16" (8 mm)	3/8" (10 mm)	3/8" (10 mm)	7/16" (11 mm)
Max20 ft (6 m) Depth	5/16" (8 mm)	5/16" (8 mm)	3/8" (10 mm)	3/8" (10 mm)	7/16" (11 mm)	1/2" (13 mm)	1/2" (13 mm)

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install subsoil drainage system as shown on drawings and details. Placement of drainage stone shall be carefully done to prevent tearing of filter fabric. Pipe shall be pitched at grade of 2" per 100' (50 mm per 30 m).

B. Install jointing systems for pipe to accomplish proper pipe alignment and pitch.

C. Handle and store filter fabric according to manufacturer`s recommendations.

D. Only pipe in stone bedding shall be perforated. Extensions to cleanouts shall be solid pipe material.

E. Install filter fabric as envelope around pipe and stone as follows:

(1) Lay fabric in trench.
(2) Place stone in filter fabric.
(3) Level stone to proper grade and set perforated pipe on stone.
(4) Place remaining stone on side and top of pipe.
(5) Wrap filter fabric around and close with minimum 6" (150 mm) lap.

F. Components (fabric, stone, pipe) form subsoil drain conduit.

G. Where subsoil drains are required to penetrate foundation work, sleeve subsoil drains and use non-perforated sections of piping and place prior to foundation work.

H. Install settling basins base on undisturbed soil with setting pad of level concrete to bed base, build up basin with standard sections and epoxy based concrete mortar joints. Adjust cover slab and access frame to align with poured floor level.

END OF SECTION 22 14 14

SECTION 22 16 00 - NATURAL GAS PIPING

PART 1 - GENERAL

1.01 DESCRIPTION

A. This Section specifies natural gas piping and accessories to 5 ft (1.5 m) outside the building wall.

1.02 RELATED WORK

A. Section 22 05 20 - Plumbing Excavation and Backfill

B. Section 22 05 29 - Hangers and Supports for Plumbing Piping and Equipment

C. Section 22 05 53 - Identification for Plumbing Piping and Equipment

D. Division 26 - Electrical

1.03 QUALITY ASSURANCE

A. Order piping with each length marked with manufacturer's name or trademark and type of pipe; with each shipping unit marked with purchase order number, metal or alloy designation, temper, size, and supplier's name.

B. Installed material not meeting specification requirements must be replaced with material that meets these Specifications without additional cost to Owner.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Promptly inspect shipments to ensure material is undamaged and complies with specifications.

B. Cover pipe to prevent corrosion or deterioration while allowing sufficient ventilation to avoid condensation. Do not store materials directly on grade. Protect pipe, tube, and fitting ends from damage. End caps shall remain in place. Protect fittings, flanges, and unions by storage inside or by durable, waterproof, above ground packaging.

C. Off-site storage agreements will not relieve Contractor from using proper storage techniques.

D. Storage and protection methods must allow inspection to verify products.

1.05 SUBMITTALS

A. Manufacturer's technical data for the following:

(1) Pipe and fittings

(2) Joints

(3) Valves

(4) Valve boxes

(5) Seismic Shutoff Valves

(6) Regulators

(7) Appliance connectors

B. Shop Drawings and Product Data on items specified herein.

1.06 NATURAL GAS SERVICE

A. Contact local gas company for cost of gas service to building, including pressure reducing valves, if required, and gas meter. Include this cost in Bid.

B. All charges for gas service as shown on drawings including connection from main in street or other location to gas meter shall be paid by this Contractor. This includes setting of gas meter and work performed by Gas Company.

C. Gas service, meters and regulating equipment will be installed by gas company on inlet side of meters.

D. Cost of gas service, meters and regulating equipment to inlet side of meters will be paid by Gas Company.

E. Include cost of alterations of existing gas service, meters and reducing valves in Base Bid. This includes work performed by Gas Company to, and including, gas meters.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Materials herein specified shall be new, unless otherwise noted.

2.02 BELOW GROUND PIPE, FITTINGS AND JOINTS

A. 2" (50 mm) and Smaller:

(1) Pipe: Thermoplastic polyethylene tubing, PE 2708 or PE4710, ASTM D3350, SDR-11, rated for 80 psig (550 kPa) working pressure at 73°F (23°C), ASTM D2513

(2) Fittings: ASTM D2683, socket fusion. Use transition fitting at joints between polyethylene tubing and steel with protective coating. Transition fittings shall have socket joint on polyethylene tubing side and plain beveled end on steel side.

(3) Joints: Socket fusion

(4) Trace Wire: No. 12, copper 600 V, THHN insulation

B. 2-1/2” (65 mm) and Larger:

(1) Pipe: Thermoplastic polyethylene tubing, PE 2708 or PE4710, ASTM D3350, SDR-11, rated for 80 psig (550 kPa) working pressure at 73°F (23°C), ASTM D2513

(2) Fittings: ASTM D3261, butt fusion. Use transition fitting at joints between polyethylene tubing and steel with protective coating. Transition fittings shall have butt joint on polyethylene tubing side and plain beveled end on steel side.

(3) Joints: Socket fusion

(4) Trace Wire: No. 12, copper 600 V, THHN insulation

C. Service Entrance Pipe:

(1) Same as above ground covered with flexible polymer film with coal tar and synthetic elastomeric coating of 36 mil (0.9 mm) thickness or extruded high density polyethylene factory applied coating of 30 mil (0.8 mm) thickness. Wrap fittings with 10 mil (0.25 mm) polyethylene tape, AWWA C105/A21.5, double layer, half-lapped. Minimum dielectric strength exceeding 12 kV. Use compatible primer below polymer film or polyethylene tape.

D. Anodeless Gas Riser:

(1) Acceptable manufacturers: Elster Perfection, Gastite, Georg Fischer, Lyall, or approved equal

(2) Manufactured polyethylene to carbon steel transition fitting, requiring no cathodic protection for buried carbon steel pipe, socket, or butt fusion connection for polyethylene pipe, plain beveled end for carbon steel pipe, electrostatically applied epoxy coating on carbon steel pipe, CSA listed

2.03 ABOVE GROUND PIPE, FITTINGS AND JOINTS (UNDER 5 PSIG (35 KPA))

A. 2” (50 mm) and Smaller:

(1) Pipe: ASTM A53/A53M, Grade A or B, Type E, or ASTM A106/A106M, Grade B, standard weight, (Schedule 40), carbon steel

(2) Fittings: ASTM A197/A197M/ASME B16.3 Class 150, black malleable iron, threaded

(3) Joints: Threaded

B. 2-1/2” (65 mm) and Larger:

(1) Pipe: ASTM A53/A53M, Grade B, Type E or S, standard weight, (Schedule 40), carbon steel

(2) Fittings: ASTM A234/A234M Grade WPB/ASME B16.9, standard weight, (Schedule 40), seamless, carbon steel, welded

(3) Joints: Welded

2.04 ABOVE GROUND PIPE, FITTINGS AND JOINTS (OVER 1 PSIG (7 KPA))

A. 2” (50 mm) and Smaller:

(1) Pipe: ASTM A53/A53M, Grade A or B, Type E, or ASTM A106/A106M, Grade B, standard weight, (Schedule 40), carbon steel

(2) Fittings: ASTM A105/A105M/ASME B16.11, 3000 lb (20,685 kPa) forged steel, socket weld

(3) Joints: Welded

B. 2-1/2” (65 mm) and Larger:

(1) Pipe: ASTM A53/A53M, Grade B, Type E or S, standard weight, (Schedule 40), carbon steel

(2) Fittings: ASTM A234/A234M Grade WPB/ASME B16.9, standard weight, (Schedule 40), seamless, carbon steel, welded

(3) Joints: Welded

2.05 UNIONS

A. Steel Pipe, 2” (50 mm) and Smaller:

(1) Malleable iron, ground brass seat, 150 psi (1035 kPa) steam working pressure; Anvil 2125 or equivalent

(2) Forged steel, spiral wound gasket seats, ASTM A105/A105M, ASME B16.5

2.06 FLANGES

A. Steel Pipe, 2-1/2” (65 mm) and Larger:

(1) ANSI 150 lb (1035 kPa) class forged steel flanges, ASTM A105/A105M/ASME B16.5. Standard bolt pattern, ANSI 150 lb (1035 kPa) class 1/8” (3 mm) thick gasket, Type 304 stainless steel, spiral wound metal with graphite filler.

2.07 VALVES

A. Ball Valves:

(1) Acceptable Manufacturers: Neles-Jamesbury, Apollo, Kerotest, Nibco and Watts equal to manufacturer's Figure number listed

(2) 2” (50 mm) and Smaller:

(a) Bronze body, threaded, quarter turn, chrome plated brass ball, large port, reinforced TFE seat and stem packing, blowout-proof stem, 250 psig (1720 kPa) LP-Gas, UL Listed, CSA certified. Apollo 50 GB series.

(b) Carbon steel body, threaded, quarter turn, 2 piece design, 316 stainless steel ball and stem, full port, spiral wound 316 stainless steel and teflon seats and seals, blowout proof stem, 800 psi (5510 kPa) CWP rated, lever handle, CSA certified. Jamesbury Fire-Tite, Series 2000 Style 23-22.

(c) Carbon steel body, quarter turn, 3 piece design, chrome plated steel ball, full port, TFE seats and seals, blowout proof stem,1000 psi (6895 kPa) CWP, lever handle, CSA certified. Jamesbury Fire-Tite, Series 4000.

(3) 2-1/2” through 8” (65 mm through 200 mm):

(a) Carbon steel body, ASTM A216/A216M-WCB Class 150, quarter turn, carbon steel flanged ends, Type 316 stainless steel ball, stainless steel stem, PTFE seats and seals, API-6D test requirement. Apollo 88A-140-35-59-TD

B. Plug Valves:

(1) Acceptable Manufacturers: DeZurik, Homestead, Key Port, Milliken and Resun equal to manufacturer's Figure number listed

(2) 2” (50 mm) and Smaller:

(a) Cast iron body, threaded, permanently lubricated bearings, bronze plug, corrosion resistant Hycar plug seal, Buna stem seal packing, lever actuator, 175 psi (1205 kPa) CWP, UL Listed. Key Port Figure 425S.

(3) 2-1/2” through 4” (65 mm through 100 mm):

(a) Cast iron body, flanged, permanently lubricated bearings, electroless nickel plated cast iron plug, corrosion resistant Hycar plug seal, Buna stem seal packing, lever actuator, 175 psi (1205 kPa) CWP, UL Listed. Key Port Figure 425F.

(4) 5” (130 mm) and Larger:

(a) Cast iron body, flanged, stainless steel bearings, resilient faced plugs, totally enclosed hand wheel actuators, 200 psi (1380 kPa) CWP. Resun Model R-1431.

(b) Actuator shall be sized based on maximum pressure differential across valve.

C. Vented Gas Pressure Regulators:

(1) Acceptable Manufacturers: Fisher, Rockwell, Sensus, or American meeting capacity and performance as scheduled.

(2) 2” (50 mm) and Smaller Venting: Cast iron body, aluminum spring case, plated steel spring, Nitrile diaphragm and disc, threaded, vent to exterior of building, 150 psi (1035 kPa) CWP, -20°F to 160°F (-29°C to 71°C), listed in compliance with ANSI Z21.80/CSA 6.22, Fisher S200 series. .

D. Non-Vented Gas Pressure Regulators:

(1) Acceptable Manufacturers: Maxitrol 325 with VLimiter, Pietro Fiorentini “Gas Governor”, or approved equal.

(2) 2” (50 mm) and Smaller: Cast iron or cast steel body, plated steel spring, threaded, external vent limiter, 2 psi (14 kPa) maximum inlet pressure, listed in compliance with ANSI Z21.80/CSA 6.22. .

2.08 VALVE BOXES

A. Acceptable Manufacturers: Acorn, Acudor, or approved equal

B. Valve Box: Acudor ARVB, recessed wall mounted, 12” by 12” by 4” (300 mm by 300 mm by 100 mm) size, 16 ga (1.50 mm) stainless steel construction, continuous concealed piano hinge, lever latch or slide latch, #4 satin polish finish, holes for piping penetration

C. Valves: Ball valves as specified above, with lever handles, easily operated without tools.

D. Identification: Engraved plastic plate, “NATURAL GAS SHUTOFF VALVE”. Refer to Section 22 05 53 - Identification for Plumbing Piping and Equipment.

2.09 SEISMIC GAS SHUTOFF VALVE

A. Valve shall have manual reset, selected with minimum pressure drop based on 7” WC (1743 Pa), positive closure, soft seal seating, visual open-close indicator and UL Certified.

B. Valve shall close within 5 seconds when subjected to horizontal, sinusoidal oscillation at peak acceleration of 0.3 G for period of 0.4 seconds.

C. Valve shall not close when subjected for 5 seconds to each of the listed horizontal, sinusoidal oscillations as follows:

Peak Acceleration	Period
0.4 G	0.1 seconds
0.08 G	0.4 seconds
0.08 FG	1.0 seconds

D. Valve shall be either threaded or flanged selected at maximum capacity with minimal pressure drop.

E. Manufacturers:

(1) Koso/California Valves, Tremble Tech Inc., Safe-T-Quake or equal

(2) The following are options available only on Koso/California Valves:

(a) Maximum pressure: 0.5 psi, 7 psi, 20 psi, and 60 psi (3.5 kPa, 48 kPa, 135 kPa, and 415 kPa)

(b) Flanged ends: 2”, 3”, 4”, and 6” (50 mm, 80 mm, 100 mm, and 150 mm)

(c) Three way valve (seismic shut-off for pneumatic controls. Dry air or Nitrogen ONLY)

(d) Electrical switch (seismic shut-off for electrical circuits)

(e) Remote actuator (use with panic switch, smoke/fire alarm)

2.10 NATURAL GAS PRESSURE BOOSTER PUMPS

A. Manufacturers: Eclipse, The Spencer Turbine Company, or approved equal.

B. Natural gas pressure booster pump shall be skid mounted, duplex pump package designed increase service natural gas pressure at ambient temperatures and humidity levels. Package shall consist of two hermetically sealed centrifugal gas booster blowers, each sized for full scheduled load, inlet and outlet piping with flange connectors, accessories, and control system all mounted to single structural mounting base. Package shall be factory assembled, wired, and tested prior to delivery to site.

C. Gas Booster Blower:

(1) Blower shall be hermetically sealed centrifugal type designed to deliver natural gas at constant boosted pressure without surge characteristics.

(2) Minimum booster flow rate shall be sufficient to prevent excessive booster motor temperature.

(3) Blower assembly shall be UL listed including motor.

(4) Gas Booster Casing:

(a) Cylindrical fabricated steel.

(b) Enclosing heads shall be of similar metal, properly braced for strength.

(c) Inlet and outlet connections shall be flanged.

(d) Casing shall be leak tight to 10-3 cc/sec without external shaft seals.

(e) Drive fans shall be contained within casing shell.

(5) Impellers:

(a) Impeller peripheral speed shall not exceed 25,000 fpm.

(b) Minimum of 1/8" (3 mm) clearance between each impeller and all stationary parts.

(c) Fabricated from high strength aluminum alloy.

(6) Deflectors:

(a) Fabricated steel deflectors with properly curved guide vanes for directing natural gas to each succeeding impeller.

(7) Shaft and Bearings:

(a) Motor shall have an oversized, extending shaft supported by two oversized, anti-friction grease lubricated bearings designed to absorb both thrust and radial loads.

(b) Each shaft sized for rotating assembly operating minimum of 20% below first critical speed.

(8) Motor:

(a) Capable of operating continuously in natural gas environment.

(b) Explosion proof per NEMA Class 1, Division 1, Group D classification.

(c) Thermal overload protection.

(d) Motor starter shall be non-reversing type.

(e) Motor and blower shall be balanced for minimum vibration and capable of operation throughout design range without need for hold down or mounting bolts.

D. Flexible Joints:

(1) Flanged, flexible expansion joint suitable for natural gas service shall be provided at gas inlet and discharge connection.

(2) Flexible joints shall be of same diameter as gas inlet and discharge.

E. Low Pressure Switch:

(1) Provide UL Approved, automatic reset type low inlet pressure switch to shut down gas booster skid on low suction pressure.

(2) Low pressure switch shall be set at 3.5” water column (0.87 kPa) (adjustable).

F. Control Panel:

(1) Provide a NEMA 12 control panel for automatic operation and control of gas booster pumps.

(2) Control panel shall be built in accordance with UL508A Standards of Industrial Control Panels.

(3) Control panel shall include all required controls and electrical equipment for operational gas booster pump package.

G. Uninterruptable Power Supply:

(1) Uninterruptable power supply (UPS) shall be provided integral to booster pump skid.

(2) UPS shall provide backup power in case of main power failure and shall maintain gas booster operation for minimum 6 minutes at 100% load.

(3) UPS, including battery system, shall be sized to handle motor starting current and be rated for gas booster pump motor horsepower, voltage and phase.

H. Accessories:

(1) Pressure gauges:

(a) Listed for natural gas service.

(b) Operating range: 0 to 14” water column (0 to 3.5 kPa)

(c) Gauge shall be located at gas supply meter and at each pump discharge.

(d) Gauges shall be installed in an upright position and shall include shut-off cocks.

(2) Check valves shall be provided on outlet of each pump.

(3) Isolation valves shall be provided on inlet and outlet of each pump.

(4) Factory mounted flow control kit.

(5) Automatic bypass valve for operation under adequate pressure or no flow conditions with manual valve adjustment for start-up and valve test procedures. All electronics associated with bypass valve shall be housed in skid control panel.

(6) Provide unit with complete factory testing over full range of operation.

2.11 METERS

A. Thermal Dispersion Flow Meter

(1) Acceptable Manufacturers: Fluid Components International, Kurz Instruments, Magnetrol, Sage Metering, or Sierra Instruments

(2) Insertion Flow Sensor:

(a) Thermal dispersion type flow sensing element consisting of all welded 316 stainless steel probe assembly with male compression fitting.

(b) Element shall be designed to sense flow of natural gas with specific gravity of 0.60.

(c) Flow sensor and body:

1) Accuracy: ±1% of Reading

2) Repeatability: ±1% of Reading

3) Pressure Rating: 150-300 psig

4) Process Temperature Range: -40°C to 125°C

5) Calibrated Range: 0-5000 ft/min

(3) Transmitter:

(a) Power Requirement: 15 VDC, 24, VDC, or 120 VAC, 60 Hz

(b) Enclosure: Epoxy Coated Aluminum

(c) Enclosure Rating: NEMA 4X

(d) Display: Back-lit LCD display, 2 lines, 12-16 characters per line

(e) Output: 4-20 mA DC or 0-5 VDC

(f) Output Resolution: 0.5% of selected range

(g) Output Units: Totalized mass flow in cubic feet

(h) Ambient Temperature: -25°C to 65°C

(4) Refer to schedules on drawings for meter performance requirements.

B. Positive Displacement Flow Meter

(1) Acceptable Manufacturers: Actaris, American Meter, Dresser Roots, or Itron

(2) Positive displacement diaphragm type meter, aluminum case, with temperature compensation.

(3) Totalizing register with pulse output signal for transmission of signal to Building Automation System. Calibrate for standard cubic feet (cubic meters) of natural gas at 60°F (15°C).

(4) Meters shall be capable of measuring average hourly flow with readings taken every minute and total gas consumption.

(5) Refer to schedules on drawings for meter performance requirements.

2.12 APPLIANCE CONNECTORS

A. Appliance connectors shall be corrugated stainless steel tubing with protective exterior coating, brass valve with non-displaceable rotor, brass outlet fitting, and CSA certified. Connector length shall be as required to allow servicing of appliance. Inside diameter of connector shall be 3/8" (10 mm) for appliances up to 60,500 btu/h (17,700 W), 1/2" (15 mm) for appliances up to 106,000 btu/h (31,050 W). Connectors shall be Brass-Craft CSSD44 Series or CSSC44 Series.

2.13 CASEWORK FLEXIBLE GAS PIPING

A. 2" (50 mm) and Smaller:

(1) Tubing: Flexible gas piping shall be UL Listed, FM approved, 300 series corrugated stainless steel tubing (CSST) fabricated in accordance with ASTM A240/A240M and conforming to ANSI/CSA LC-1. Tubing shall be suitable for operation with natural gas or LP (propane) gas.

(2) Fittings and Joints: Yellow brass mechanical fittings and joints with stainless steel AutoFlare pilot insert for ID tubing

(3) Jacket: Fire retarded, UV resistant, extruded polyethylene with ASTM E84 flame and smoke density rating of 25/50

B. Manufacturer: OmegaFlex TracPipe or equal

2.14 CATHODIC PROTECTION

A. Provide complete galvanic anode type cathodic protection system for underground steel gas piping, including devices to electrically isolate system being protected.

B. Corrosion protection system shall be provided by Contractor regularly engaged in installation and testing of cathodic protection systems. Contractor's personnel shall be experienced and shall be supervised by Engineer who is accredited as Corrosion Specialist by National Association of Corrosion Engineers. Calculations, design and testing shall be performed by Corrosion Specialist. Procedures shall conform to NACE Standards.

C. Submit catalog cuts and shop drawings for the following:

(1) Anodes
(2) Permanent Reference Cells
(3) Cable and wire
(4) Test stations
(5) Terminal boxes
(6) Isolating flanges, unions, coatings, easing seals
(7) Exothermic welding devices
(8) Layout drawings, wiring diagrams
(9) Test instruments
(10) Dielectric tape
(11) Test connection points
(12) Accreditation of Corrosion Specialists by National Association of Corrosion Engineers
(13) Calculations from field survey, performed by Corrosion Specialist

D. Foreign Metallic Contacts:

(1) No foreign metal shall be allowed to contact electrically isolated sections of pipe between flange insulators. Where pipe passes through building walls, manholes, valve pits, etc., caution shall be exercised to ensure that pipe does not contact reinforcing steel. Pipe anchors and supports shall not be permitted in contact with metallic structures. Flange insulators shall be placed as close as possible to building and manhole entrances to avoid shorting to other metallic members.

(2) Upon completion of installation, system shall be tested to ensure system performance. One year service agreement shall be included in base price. Cathodic protection system must be certified by NACE Accredited Corrosion Specialist.

E. Field Quality Control:

(1) Provide system with calculated design life exceeding 40 yrs.

(2) Corrosion Specialist shall perform soil resistivity survey. Survey shall include entire length of proposed right-of-way. Soil survey shall include soil pH and presence of chlorides. Stray current investigation shall also be conducted prior to cathodic protection design.

(3) Corrosion Specialist shall provide engineering calculations to verify design of system. Calculations shall follow format published by recognized corrosion expert.

(4) Corrosion Specialist shall inspect work at least twice to ascertain that there is no grounding, short circuits, coating damage, and that installation is in accordance with standards and methods specified herein.

PART 3 - EXECUTION

3.01 GENERAL

A. Install gas piping according to requirements of this Section, local gas utility, NFPA 54 National Fuel Gas Code, AGA pamphlets and as shown on drawings.

B. Piping through roof to be run through approved roof penetration with flashing and counter flashing.

C. Install buried/underground polyethylene gas piping with trace wire taped to pipe along its entire route. Secure wire to pipe to prevent movement during backfilling. Extend trace wire to valve boxes and service entrance.

D. Transition from polyethylene piping to steel piping shall occur below grade. Provide cathodic protection and corrosion protection pipe wrap for underground steel pipe.

E. Install underground polyethylene gas piping exterior to building according to pipe manufacturer's recommendations and to meet local gas utility company's installation standards.

F. Manufacturer's representative shall instruct workmen in proper techniques for installation of underground polyethylene gas piping and provide certification to Owner that instructions have been given and proficiency been demonstrated by Contractor for installation of that piping system. Joints must be made by "Qualified" personnel proficient in joining methods of ASTM D2513 thermoplastic gas pressure pipe.

G. Grounding to gas piping is prohibited.

H. Gas piping shall be installed with dirt legs adjacent to equipment. The dirt legs shall have drain tees and plugs at low points.

I. Gas piping in plenum ceilings shall have welded joints.

J. Install gas piping above ground in buildings. Gas piping shall not be installed below building floor or footings.

K. Pitch horizontal piping downward at 1” per 60 ft (25 mm per 18 m) in direction of flow toward risers or appliances. Install minimum of 4” (100 mm) deep dirt leg at bottom of each vertical run and at each appliance. When installing mains and branches, cap gastight each tee or pipe end, which will not be immediately extended. Take branch connections to main from top or side of main.

L. Coat underground piping with corrosion resistant tape equal to Tapecoat H-30 and cathodically protected as specified herein. Repair breaks in tape coating caused by installation process.

M. Make threaded joints by cutting pipe square and reaming inside. Threads shall be cut so exposed threads do not exceed 3 in number. Protect exposed threads against corrosion. Use only joint compounds approved for gas piping.

N. Seismic shut-off valve must be installed upright, level, plumb, and downstream of regulator or main gas meter (prior to structure it protects). Valve must be rigidly mounted to earth foundation or structure so that seismic movements will be transmitted to acceleration trigger mechanism within valve assembly.

O. Do not exceed maximum torque (inch-pounds) specified by valve Manufacturer during installation of seismic shut-off valve.

P. Do not route piping through transformer vaults or above transformers, panelboards, or switchboards, including the required service space for this equipment, unless piping is serving this equipment.

3.02 UNDERGROUND WARNING TAPE

A. Provide warning tape for exterior buried gas lines per Section 22 05 53 - Identification for Plumbing Piping and Equipment.

3.03 PRESSURE REGULATORS

A. Install regulators in accordance with manufacturer's instructions.

B. Regulator shall be accessible for maintenance and protected from fire and mechanical damage. Regulator shall be supported from structure by brackets and supports.

C. Vent(s) from vented pressure regulators or pressure safety valves shall be piped to outside. Terminate vent with protection screen and return bend. If above ground vent terminates in area subject to snow accumulation, terminate line at least 5 ft (1.5 m) above grade. Coordinate vent routing with other trades to point of termination. Size vents in accordance with regulator manufacturer's requirements for regulator flow rate and length of run.

D. Provide unions on both sides of regulators for removal and maintenance.

E. Provide gas cock for pressure verification.

3.04 BOOSTER PUMPS

A. Install pumps in accordance with manufacturer's instructions to avoid stress and misalignment.

B. Provide necessary concentric reducers/increasers for vertical piping at pump connection and eccentric reducers/increasers for horizontal piping at pump connection where pump connection size and indicated line sizes are not identical. Install eccentric reducers/increasers with top of pipe level.

C. Valves and piping specialties shall be full line size as indicated on drawings.

D. Start-up:

(1) Verify that piping system has been flushed, cleaned and filled.

(2) Prime pump, vent air from casing and verify that rotation is correct. Do not start or run pump in dry condition to avoid damage to mechanical seals.

(3) Lubricate motor and pump bearings in accordance with manufacturer's recommendation and Section 22 00 00 - General Plumbing Requirements, Part 3, under LUBRICATION.

(4) Verify removal of disposable startup strainer in suction diffuser and turn them over to Owner after several days' operation.

(5) Perform field mechanical balancing, if necessary, to meet vibration tolerance specified in Section 23 05 50 - Vibration Isolation.

3.05 METERS

A. Verify transmission of signal to Building Automation System.

3.06 VALVE BOXES:

A. Mount bottom of box at 60" (1520 mm) above finished floor. Adjust height as required to match wall material pattern.

B. Orient valve to allow closing the door when valve is both open and closed.

C. Seal pipe penetrations with silicone caulk.

D. Mount identification placard onto valve box door.

3.07 CONNECTIONS

A. Provide appliance connectors at ranges, ovens and other appliances, which require that they be relocated before accessing gas connection. Do not use appliance connectors for water heaters or for other equipment or appliances, which do not require that they be relocated before accessing gas connection.

B. Install shut off valve at each appliance. Provide valved connection at main for equipment and appliances furnished by others.

C. Shutoff valves shall be accessible in case of emergency; installed minimum of 5 ft (1.5 m) from equipment. Provide shutoff valves at each piece of equipment.

3.08 WELDER QUALIFICATIONS

A. Welding procedures, welders, and welding operators for building service piping to be in accordance with certified welding procedures of National Certified Pipe Welding Bureau and Section 927.5 of ASME B31.9 Building Services Piping or AWS 10.9 Qualification of Welding Procedures and Welders for Piping and Tubing.

B. Before metallic welding is performed, submit Welding Procedure Specification together with Procedure Qualification Record as required by Section 927.6 of ASME B31.9 Building Services Piping.

C. Before polyethylene fusion welding is performed, submit certification that welders to be used on this project have successfully demonstrated proper welding procedures in accordance with Code of Federal Regulations, Title 49, Part 192, Section 192.285.

D. Before welding is performed, submit Standard Welding Procedure Specification together with Procedure Qualification Record as required by Section IX of ASME Boiler and Pressure Vessel Code.

E. Welded joints shall be made in conformance with latest provision of Code for Pressure Piping, ANSI Standard B31-8 - Gas Transmission and Distribution Systems. elds to be made by qualified welders experienced in piping work. Welding, piping fabrication, etc. shall be in accordance with ASME Code, State Codes, and Welding Manual of Mechanical Contractors Association of America.

F. Architect or Engineer reserves right to test work of welder employed on Project, at Contractor's/Owner's expense. If work of welder is found to be unsatisfactory, welder shall be prevented from doing further welding on project and defective welds replaced at no additional cost to Owner.

3.09 TESTING

A. Test above ground steel gas piping with dry compressed air at 50 psi (345 kPa) for 2 h. Soap test of each joint shall be done to detect leaks during 2 h period. No loss of pressure allowed during test period. No piping shall be concealed until successfully tested.

B. Test underground polyethylene gas piping at 50 psi (345 kPa) with dry air for 2 h. No loss in pressure allowed. Defective joints shall be cut out, pipe repaired, and retested. No piping may be backfilled until successfully tested.

C. Types and extent of non-destructive examinations required for pipe welds are as shown in Table 136.4 of ASME Code for Pressure Piping, ANSI/ASME B31.1 - Power Piping. If requirements for non-destructive examination are to be other than that stated above, degree of examination, and basis for rejection shall be matter of prior written agreement between fabricator, or Contractor and purchaser.

D. Local regulating and governing agencies may require periodic testing of seismic valve's ability to shut-off gas flow during seismic event. Follow procedures specified by local governing agency for test.

3.10 CLEANING

A. Before actuation of gas system, flush system with dry nitrogen to ensure clean system free of oil and construction debris.

END OF SECTION 22 16 00

SECTION 22 21 14 - PLUMBING SPECIALTIES

PART 1 GENERAL

1.01 DESCRIPTION

A. This Section covers material specialties for piping systems.

B. All components installed on water systems defined in Section 22 11 18 shall comply with NSF-372 to be compliant with requirement for lead content of <0.25% maximum weighted average.

1.02 RELATED WORK

A. Section 01 81 13 - Certification Requirements

B. Section 22 05 94 - Domestic Water Systems Balance

C. Section 22 11 18 - Water Distribution System

D. Section 22 13 14 - Sanitary Waste and Storm Drainage Systems

1.03 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.04 LEED PERFORMANCE REQUIREMENTS

A. VOC Emissions Evaluation: For adhesives and/or sealants used for installation, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: For adhesives and sealants, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for Adhesive and Sealant Applications, as per the SCAQMD Rule 1168, October 6, 2017, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

1.05 LEED SUBMITTAL DOCUMENTATION

A. VOC Emissions Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant.

1.06 SUBMITTALS

A. Manufacturer's technical data for the following:

(1) Thermometers

(2) Pressure gauges

(3) Pressure relief valves

(4) Strainers

(5) Backflow preventers

(6) Flexible connections

(7) Air vents

(8) In-line trap sealers

(9) Flashings

(10) Safings

B. Shop drawings on items specified herein.

C. Certificates: Submit performance testing certificates for reduced pressure backflow preventers and double check backflow preventers.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials herein specified shall be new unless otherwise noted.

2.02 THERMOMETERS

A. Manufacturers: Miljoco, Taylor, Trerice, Weksler, Winters and Weiss equal to Trerice number listed

B. Thermometers shall be 9” die cast aluminum case and frame, double strength glass window, adjustable angle stem, permanently stabilized glass tube with mercury free indicating fluid, readable scale with gradations from 30°F to 240°F. Provide brass extension neck sockets of appropriate length. Trerice Series No. A400 (old catalog number BX91400).

2.03 THERMOMETER SOCKETS AND TEST WELLS

A. Brass construction with threaded connections suitable for thermometer bulbs and control sensing devices, well length suitable for pipe diameter with extended neck as required to suit pipe insulation. Trerice 5550 Series.

B. Test wells for stainless steel piping shall be same material as piping.

2.04 PRESSURE GAUGES

A. Manufacturers: Ashcroft, Marsh, Marshalltown, Miljoco, Taylor, Trerice, U.S. Gauge, Weiss, and Winters, equal to Trerice number listed

B. Pressure gauge shall be 4-1/2” die cast aluminum case, double strength glass window, readable dial scale with gradations from 0 to 200 psi (1378.95 kPa), phosphor bronze bourdon tube, brass socket. Provide shutoff valve with pressure gauge, Trerice Series No. 600.

C. Gauge accuracy shall meet ASME B40.1 Grade 1A (1% full scale).

D. Pressure gauges shall be calibrated for the following pressure ranges:

(1) Domestic Water: 0 to 160 psi (1103.16 kPa) at 2 psi (13.79 kPa) increments

(2) Medical Air: 0 to 100 psi (689.48 kPa) at 1 psi (6.89 kPa) increments

2.05 PRESSURE RELIEF VALVE

A. Manufacturers: Apollo, Cash-Acme, Consolidated, Kunkle, Lonergan, and Watts

B. Bronze body, resilient seat/seal, ASME Section VIII, stainless steel spring

2.06 STRAINERS

A. Manufacturers: Apollo, Hoffman, Keckley, Metraflex, Mueller, Watts, Wheatley or Zurn

B. Strainers shall be comparable to regulator or control valve specified. Strainers shall be "Y" type for liquid service to 300 lbs WOG at 210°F, with 20 mesh stainless steel screen. Body material shall be compatible with installed piping, stainless steel, or FDA approved, heat fused, epoxy coated interior.

2.07 BACKFLOW PREVENTER

A. Reduced Pressure Zone Backflow Preventers:

(1) Manufacturers: Apollo, Cla-Val, Febco, Watts or Zurn, equal to model listed in schedules on drawings

(2) 3/4” through 2”: Lead free cast copper silicon body, resilient check valve seats, shut-off valves, Y-pattern strainer with bronze body and stainless steel screen, drain line air-gap fitting, bronze test cocks, certified in accordance with ASSE 1013 and AWWA C511

(3) 2-1/2” through 10”: Lead free body, stainless steel housing, EPDM elastomers, OS&Y isolation valves, drain air-gap fitting, bronze test cocks, certified in accordance with ASSE 1013 and AWWA C511

B. Double Check Valve Backflow Preventers:

(1) Manufacturers: Cla-Val, Febco, Apollo or Watts, equal to model listed

(2) 2-1/2” through 10”: Cast iron body, bronze trimmed check valves, OS&Y gate valves, bronze test cocks, certified in accordance with ASSE 1015 and AWWA C506, UL listed or FM approved

C. Double Check with Vent (DCV) Backflow Preventers:

(1) All bronze construction with stainless steel trim, union connections, 175 psi (1206.58 kPa) pressure rating, 250°F temperature rating, and conforming to ASSE Standard 1012. Watts No. 9D.

2.08 IN-LINE TRAP SEALER

A. Manufacturers: Mi-Gard by Mifab, Quad Close Trap Seal by Jay R. Smith, Sure Seal by Rector Seal, Trap Guard by Proset, Green Drain by Green Drains Inc., or ZShield by Zurn

B. Inline trap sealer shall be ABS plastic housing and neoprene rubber diaphragm, silicone, or Elastomeric PVC material with self-closing bottom. In-line trap sealer shall conform to ASSE 1072.

2.09 FLEXIBLE CONNECTIONS

A. Bronze, braided flexible hose or neoprene twinsphere connectors by Mason Industries with 150 psi (1034.21 kPa) WOG working pressure rating.

B. Alternate manufacturers are Redflex, Resistoflex and Flexonics.

2.10 AIR VENTS

A. Manual Air Vents: Bell and Gossett Model 4V, 125 psi (861.84 kPa) pressure at 210°F temperature, or approved equal. Use 1/2” ball valve for main pipes.

2.11 FLASHINGS

A. Elastomer Membrane Roofing:

(1) Pipe clamps, Fernco Series 1056 flex coupling with Series 300 stainless steel clamps.

B. Built-Up Roofing:

(1) 4 lb/ft2 sheet lead, to 18” beyond drain perimeter.

(2) Preformed lead vent collar, 4 lb/ft2 sheet lead, to 18” beyond vent perimeter; 18” minimum square base flange.

(3) Nobleflex roof drain flashing of Chloraloy and 20 lb/ft2 asphalt saturated roofing felt bonded together.

2.12 SAFINGS

A. 4 lb/ft2 sheet lead, to 18” beyond edge of drain on all sides.

B. Chlorinated polyethylene (CPE) as manufactured by Noble Company under trade name Chloraloy 240.

C. Polyvinyl Chloride (PVC) shower pan line, 40 mil (1.016 mm) thickness, ASTM D4551.

PART 3 EXECUTION

3.01 INSTALLATION

A. Provide thermometers where indicated on drawings. Thermometers shall be easily read from floor or maintenance platforms. Calibrate thermometers to ensure accuracy.

B. Install pressure gauges where indicated on drawings. Gauges shall be easily read from floor or maintenance platforms. Provide extensions as required to make gauges easily readable. Calibrate gauges to ensure accuracy.

C. Install backflow preventers as indicated on drawings. Flush debris from strainers. Certified tester shall test reduced pressure zone backflow preventers to verify that functions are operational. Route vent line to adjacent hub drain.

D. Install strainers for equipment including pumps, meters, backflow preventers, reducers and regulators, and as shown on drawings.

E. Install in-line trap sealer as recommended by manufacturer.

F. Install flexible connections for base mounted pumps and other vibrating equipment.

G. Install air vents at high points in water systems where air may collect.

H. Safing:

(1) Install safing for floor drains. Extend safing to 18” from edge of drain. Safing shall be clamped to floor drain body and pitched to drain to weep holes. Floor drains installed in unexcavated areas do not require safing.

(2) Where core drilled floor drain installation into existing floor slab has been approved by A/E, drain strainer inlet shall be grouted in place with non-shrink epoxy concrete approved by Structural Engineer.

(3) Install safings for showers. Concrete floor shall be smooth and free of dirt. Seal joints per manufacturer's recommendations and turn up sides minimum of 6” above curb or maximum water level. Safing shall clamp into drip pan of floor drain and be secured by flashing clamp to assure drainage into weep holes of drain body. Inside vertical corners of showers shall have 12” strips 6 ft above floor, extend 6” in each direction and bottom to overlap pan 3”.

(4) Membrane roofing material, preformed elastomer pipe pots, and flashing seams are provided by Roofing Contractor for pipe penetrations and drain flashing. Plumbing Contractor shall provide drain flashing clamps and stainless steel strap clamps for piping penetrations. Coordinate with General Contractor to facilitate sealing drain flashing and pipe penetrations.

I. Flashing:

(1) Coordinate flashings on roof closely with Roofing Contractor. Install flashings as required to insure proper vapor barrier and as directed by Architect.

(2) Install flashing for roof drains and overflow drains. Flashing shall extend minimum of 18” beyond edge of drain and shall be clamped into drain body.

(3) Roof penetrations for corrosive or acid vent systems shall be preformed EPDM vent pot with flex coupling pipe clamp collar.

3.02 TESTING

A. Safings shall be subject to standing water test to detect leaks and proper drainage to weep holes of floor drain.

END OF SECTION 22 21 14

SECTION 22 33 14 - WATER HEATING EQUIPMENT

PART 1 GENERAL

1.01 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions of Contract, Supplementary Conditions, and sections under Division 01 General Requirements.

1.02 QUALITY ASSURANCE

A. Water heating equipment shall conform to State and Local Codes, meet national standards, and be certified by respective organization and bear its stamp.

1.03 SUBMITTALS

A. Shop drawings on items specified herein.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials specified herein shall be new unless otherwise noted.

2.02 HEAT EXCHANGERS (PLATE AND FRAME TYPE)

A. Manufacturers: Aerco, Bell and Gossett, Cemline, Lochinvar, PVI, or approved equal

B. Heat exchangers shall be plate and frame or brazed plate type with removable gasketed plates constructed and stamped in accordance with the latest ASME Code. Each unit shall be registered with National Board of Boiler and Pressure Vessel Inspectors.

C. Heat exchangers shall be suitable for working pressure of 150 psi (1034.21 kPa) and test pressure of 195 psi (1344.48 kPa).

D. Heat exchange plates shall be 304 or 316 stainless steel with gasketing material suitable for potable water systems and compatible with hot water heating system chemical treatment.

E. End plate shall be stainless steel, studded for flange connection.

F. Furnish units with epoxy coated structural steel framework as required to adequately support assembled plates.

G. Heat exchangers used for domestic water heating shall be double wall type construction and be lined with same material as plate.

H. Construct nozzles, where used, of same material as plates.

I. Fouling margin shall be 10% minimum.

J. Refer to Water Heater Schedule for water heater capacity.

2.03 HOT WATER STORAGE TANK

A. Manufacturers: Same as heat exchanger manufacturer.

B. Domestic hot water storage tanks shall be commercial, UL-listed, vertical storage tank with ASME pressure and temperature relief valve.

C. Tank shall be glass-lined steel or stainless steel, ASME rated for 150 psi (1034.21 kPa). Tank shall have removable magnesium anode rod (if required), pressure and temperature relief valve, drain valve, polyurethane insulation, and painted steel jacket.

D. Provide thermometers on inlet and outlet to tank.

E. Refer to Water Heater Schedule for water heater storage tank capacity.

2.04 THERMAL EXPANSION TANK

A. Manufacturers: Amtrol, Goulds, Wessels

B. Expansion tank shall be precharged, diaphragm-type tank designed for hot water systems. Tank shall be ASME rated for 125 psig (861.84 kPa) and come with fixed rubber bladder, air charge fitting, steel base ring stand (floor mounted tanks only), factory primed and enamel painted exterior, and ASME relief valve. Materials exposed to water to be NSF or FDA approved for potable water service.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install water heaters as recommended by manufacturer. Provide final connections as required. Coordinate water heater location with other Contractors.

B. Initial start up and balancing service shall be provided by representative of manufacturer.

END OF SECTION 22 33 14

SECTION 22 40 00 - PLUMBING FIXTURES

PART 1 GENERAL

1.01 DESCRIPTION

A. This Section lists plumbing fixtures and accessories including method of installation.

1.02 RELATED WORK

A. Section 01 81 13 - Certification Requirements

B. Section 22 11 18 - Water Distribution System

C. Section 22 13 14 - Sanitary Waste and Storm Drainage Systems

1.03 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.04 LEED PERFORMANCE REQUIREMENTS

A. All water closets (toilets), urinals, private lavatory faucets, and showerheads must be WaterSense labeled.

B. All plumbing fixtures must meet the following baseline flow rates:

(1) Water closets (toilets): 1.28gpf

(2) Urinals: 0.125gpf

(3) Public lavatory (restroom faucet): 0.35gpm

(4) Private lavatory faucet: 0.35gpm

(5) Kitchen faucet: 1.5gpm

(6) Showerhead: 1.5gpm

C. Purchase product from manufacturer that has an EPD conforming to ISO 14025 and EN 15804, or ISO 21930 and having at least a cradle to gate scope. If applicable, use products that have a compliant embodied carbon optimization report or action plan.

1.05 LEED SUBMITTAL DOCUMENTATION

A. Provide plumbing fixture cutsheet with WaterSense label.

B. Provide manufacturer's cutsheet with the fixture's flowrate.

C. Provide manufacturers EPD conforming to ISO 14025 and EN 15804, or ISO 21930 and having at least a cradle to gate scope. If applicable, provide a compliant embodied carbon optimization report or action plan.

1.06 SUBMITTALS

A. One package of manufacturer's technical data for all items. Submittal shall be assembled brochure, showing cuts and full detailed descriptions for each item.

B. Shop drawings on items specified herein.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials as specified shall be new unless otherwise noted.

B. Vitreous china fixtures shall be of highest quality, non-absorbent, hard-burned, and vitrified throughout.

C. Enameled ware shall be quality cast iron of uniform thickness and density, glazed to uniform depth and high gloss rubbed smooth, without chips or flaws, craze, or cracks, and completely acid resisting.

D. Stainless steel fixtures shall be 302/304 types of non-corrosive steel, 18 ga self-rim for cabinet sinks, 14 ga for free standing compartment type sinks. Sink material shall have satin finish and coved corners, with faucet holes punched to match specified faucet fitting.

E. Precast receptors and shower basins shall be "terrazzo" concrete (stainless steel in vivarium). Receptor and basin colors shall be standard colors unless otherwise noted. Assembly of drain to waste piping shall be made from floor level on which basin or receptor is installed.

F. Insulation for traps and supplies shall be molded closed cell vinyl insulation and shall meet ASTM E84 for flame and smoke spread. Insulation shall be vandal resistant and be color as listed.

2.02 MANUFACTURERS

A. Plumbing fixtures shall be provided from list of approved manufacturers. Home Market, Generic Broker, or Wholesaler’s house brands are not acceptable.

B. Water closets, urinals, and lavatories: American Standard, Kohler, Sloan, TOTO, or Zurn equal to number listed

C. Water Closet Seats: Bemis, Beneke, Centoco, Olsonite or Zurn equal to number listed

D. Flush Valves: American Standard, Kohler, Sloan, TOTO, or Zurn equal to number listed

E. Stainless Steel Sinks: Advance Tabco, Elkay or Just equal to number listed

F. Electric Water Coolers: Elkay, Halsey-Taylor, Haws, or Oasis equal to model listed

G. Mop Basins (Janitor Sinks): Fiat, Mustee, Stern-Williams, or Zurn equal to number listed

H. Emergency Eyewashes and Showers: Acorn, Bradley, Chicago Faucets, Guardian, or Speakman, equal to number listed

I. Manual Faucets: Chicago Faucet, T and S Brass, or Zurn equal to number listed

J. Sensor Activated Faucets: American Standard, Chicago Faucets, Kohler, Sloan, TOTO or Zurn equal to model listed

K. Fixture Traps: Engineered Brass Company, Kohler, McGuire, or Zurn equal to number listed

L. Insulated Traps and Supplies: McGuire or True-Bro equal to model listed

M. Supplies and Stops: Brasscraft, Engineered Brass Company, Kohler, LSP Aqua-Flo or McGuire equal to number listed

N. Shower Valves and Mixing Valves: Acorn, Leonard, Powers or Symmons equal to number listed

O. Hose bibs and wall hydrants: Zurn or approved equal

2.03 CARRIERS AND SUPPORTS

A. Carrier manufacturers shall be Josam, J.R. Smith, Wade, Watts or Zurn, as outlined herein, with models suitable to fixture and use intended. Provide carriers with adjustable faceplate, rectangular steel uprights and at least 3 bolt lugs for securing carrier to floor. Adjustable water closet carriers shall be either right or left, single or double, horizontal or vertical as suggested by drawings and riser diagrams.

(1) Water Closet: Adjustable face plate, rear support for single carries, barrier-free fixtures mounted with top of bowl at 17” from finished floor, .

(2) Urinal: Rectangular uprights, bearing plate, barrier-free fixtures mounted with rim 17” maximum from finished floor, J.R. Smith 0637.

(3) Lavatory: Concealed arms, rectangular steel uprights, J.R. Smith 700-M31.

2.04 WATER CLOSETS AND URINALS

A. Provide appropriate gaskets for fixture installation.

B. Provide bolts with chromium plated caps, nuts and washers.

2.05 WATER CLOSET SEATS

A. Heavy duty, elongated bowl, open front, plastic seat less cover, with stainless steel self-sustaining hinge, white, Bemis 1955-SSCT.

2.06 DRAINS

A. Lavatories: Chrome plated brass grid drain, 1-1/4” seamless tailpiece, McGuire 155A

B. Barrier-free Lavatories: Chrome plated brass offset grid drain, 1-1/4” seamless tailpiece, McGuire 155WC

C. Stainless Steel Sinks: Chrome plated brass grid drain, 1-1/2” seamless tailpiece, McGuire 152

D. Stainless Steel Scullery Sinks: Stainless steel, 1-1/2” diameter tailpiece with perforated grid strainer, Elkay LK18

E. Laboratory Sink: Refer to Division 12.

2.07 TRAPS

A. Lavatories: P-traps shall be chrome plated brass body with cleanout plug, 17 ga seamless tubular wall bend, cast brass slip nuts and wall escutcheon. Trap size to match fixture connections.

B. Sinks: P-traps shall be chrome plated brass body with cleanout plug, 17 ga seamless tubular wall bend, cast brass slip nuts and wall escutcheon. Trap size to match fixture connections.

C. Laboratory Sinks: Corrosion resistant p-trap, refer to Section 22 66 53 for material.

2.08 STOPS AND SUPPLIES

A. Lavatories: Angle pattern, lock shield cap, loose key handle, copper alloy control valve body, stem and gland nut, 1/2” NPT inlet x 3/8” compression outlet, McGuire LF2165LK

B. Sinks: Angle pattern, lock shield cap, loose key handle, copper alloy control valve body, stem and gland nut, 1/2” NPT inlet x 1/2” compression outlet, McGuire LF2167LK

C. Electric Water Cooler: Angle pattern, lock shield cap, loose key handle, copper alloy control valve body, stem and gland nut, 1/2” NPT inlet x 1/2” compression outlet, McGuire LF2167LK

D. Laboratory Sinks: Angle pattern, lock shield cap, loose key handle, copper alloy control valve body, stem and gland nut, 1/2” NPT inlet x 1/2” compression outlet, McGuire LF2167LK

2.09 PROTECTIVE PIPE INSULATION COVERS

A. Manufactured plastic wraps for covering plumbing fixture hot and cold water supplies, trap and tailpieces shall comply with Americans with Disabilities Act (ADA) requirements.

B. Lavatories: Offset strainer, p-trap and angle stop and supply insulation cover, white, True-Bro Lav Guard 2

2.10 PLUMBING FIXTURES

A. Refer to Schedule on drawings for detailed fixture selection criteria not contained herein.

2.11 LABORATORY FIXTURES

A. Refer to Schedule on drawings for detailed fixture selection criteria not contained herein.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install plumbing fixtures as recommended by manufacturer. Caulk around fixtures mounted on irregular surfaces such as tile or stone with silicone sealant, same color as fixture.

B. Support fixtures with proper carrier for each use. Ensure that carrier is solidly anchored to prevent rocking whatever piping is used. Anchor bolts in carrier foot shall extend 3” minimum into concrete slab.

C. Fixture carriers shall be suitable for securing each plumbing fixture in place solidly, yet allowing its removal when necessary. Carriers shall be capable of mounting "Barrier Free" fixtures at suitable heights.

D. Install each fixture with trap easily removable for servicing and cleaning. Install fixture stops in readily accessible location for servicing.

E. Install barrier free fixtures in compliance with local code and Federal ADA Accessibility Guidelines. Install barrier free lavatory traps parallel and adjacent to wall and supplies and stops elevated to 27” above finished floor to avoid contact by wheelchair users.

F. Return fixture waste and supply piping into wall as high as practical under fixture. Provide accessible shutoff in fixture supply. Protect "barrier free" supply and drain piping with white colored wrap neatly trimmed to prevent contact with hot or sharp surfaces by user.

G. Coordinate with Electrical Contractor for electronic sensor wiring necessary to install "sensor" operated fixtures. Provide "shockstops" at supplies to solenoid activated fixtures.

H. Provide individual supplies to fixtures and rough-in fixture piping with adequate support to prevent movement fore, aft and laterally. Provide additional blocking as required.

I. Install flush valves for barrier-free water closets with operator handle facing wide side of toilet stall.

J. Provide unions at water connections to drinking fountains and electric water coolers.

3.02 PROTECTION

A. Protect finished surfaces of fixtures from accidental damage or discoloration by use of protective covering.

3.03 CLEANING

A. Prior to Owner acceptance, clean fixtures with compounds recommended by manufacturer and remove stains and marks from surrounding walls and countertops.

END OF SECTION 22 40 00

SECTION 22 40 14 - EQUIPMENT BY OTHERS

PART 1 GENERAL

1.01 DESCRIPTION

A. Items specified herein shall be provided by Plumbing Contractor to make equipment provided by others and Owner functional.

1.02 RELATED WORK

A. Section 22 11 18 - Water Distribution System

B. Section 22 13 14 - Sanitary Waste and Vent System

C. Section 22 21 14 - Plumbing Specialties

1.03 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions of Contract, Supplementary Conditions, and sections under Division 01 General Requirements.

1.04 SUBMITTALS

A. One package of manufacturer's technical data for all items. Submittal shall be assembled brochure, showing cuts and full detailed descriptions for each item.

B. Shop drawings on items specified herein.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials specified herein shall be new unless otherwise noted.

2.02 GENERAL LAB EQUIPMENT

A. Provide isolation valves at all points-of-connection to lab equipment for domestic water, non-potable water, compressed air, laboratory vacuum, and lab gases. Refer to 22 11 18, 22 61 14, 22 62 14, and 22 63 14 for specific information.

2.03 ICE MACHINES

A. Provide isolation valve on domestic water supply. Refer to Section 22 11 18 for specific information.

B. Provide water hammer arrestor on domestic water supply. Refer to Section 22 11 18 for specific information.

C. Provide dual check backflow preventer on domestic water supply. Refer to Section 22 21 14 for specific information.

D. Provide indirect waste pipe from ice machine to local drain. Refer to Section 22 13 14 for specific information.

2.04 DISHWASHERS

A. Provide isolation valves on domestic water supplies. Refer to Section 22 11 18 for specific information.

B. Provide water hammer arrestors on domestic water supplies. Refer to Section 22 11 18 for specific information.

PART 3 EXECUTION

3.01 INSTALLATION

A. Plumbing Contractor shall install items specified herein as recommended by respective manufacturers. Final connections of waste, water, air, gas, etc., shall be installed by Plumbing Contractor as directed by equipment manufacturer. Incidental items, such as, adapters and unions required to make final connection shall be provided by Plumbing Contractor.

B. Coordinate rough-in sizes and elevations with equipment supplier before proceeding with work.

PART 1 GENERAL

1.01 DESCRIPTION

A. Specification requirements defined in Division 20 of this Specification apply to, and are in addition to the work associated with equipment, systems, materials, and installation requirements specified in Division 23. Contractor shall provide the requirements specified in Division 20 to obtain complete systems, tested, adjusted, and ready for operation.

1.02 RELATED WORK

A. Section 01 8113 – Certification Requirements

B. Section 20 0000 - General Mechanical Requirements

C. Section 20 0513 - Motors

D. Section 20 0514 - Variable Frequency Drives

E. Section 20 0529 - Piping and Equipment Supporting Devices

F. Section 20 0553 - Mechanical Systems Identification

G. Section 20 0573 - Mechanical Systems Firestopping

H. Section 20 0700 - Mechanical Systems Insulation

1.03 LEED PERFORMANCE REQUIREMENTS

A. VOC Emissions Evaluation: For adhesives and sealants used to install HVAC, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: For adhesives and sealants used to install HVAC, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for Adhesive and Sealant Applications, as per the SCAQMD Rule 1168, October 6, 2017, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

C. HVAC equipment and ductwork shall be protected and operated in accordance with the project's Indoor Air Quality During Construction Management Plan (IAQMP).

1.04 LEED SUBMITTALS

A. Complete provided Product Data Reporting Form in spec section 01 8113 and provide the following:

(1) VOC Emissions Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

(2) VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant.

PART 2 PRODUCTS

PART 3 EXECUTION

3.01 NOT APPLICABLE TO THIS SECTION.

END OF SECTION 23 00 00

SECTION 23 05 13 - MOTORS FOR MECHANICAL EQUIPMENT

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 23 05 14 - Variable Frequency Drive (VFD) System

B. Section 26 29 13 - Enclosed Controllers

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents, including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SUBMITTALS

A. Product Data including the following:

(1) Manufacturer
(2) Motor nominal power (hp (kW)), voltage, phase, frequency (hz), rotational speed (rpm)
(3) Motor type
(4) Enclosure type
(5) Frame type
(6) Insulation class
(7) NEMA design designation
(8) Service factor
(9) Nominal efficiency at full load
(10) Power factor at full load
(11) Full load amperes
(12) Bearings
(13) Mountings
(14) Dimensions
(15) Weight
(16) Shaft grounding brush for motors driven by Variable Frequency Drives (VFD)

1.04 PRODUCT CRITERIA

A. Motors covered by this Specification shall conform to applicable requirements of NEMA, IEEE, ANSI, and NEC Standards and shall be UL Listed where applicable for service specified.

B. Motors shall be designed for conditions in which they will be required to perform, i.e., general purpose, splash proof, explosion proof, standard duty, high torque, or other special type as required by equipment manufacturers.

C. Select motors so they do not exceed nameplate rating nor operate into service factor to meet specified duty.

D. Motors located inside air handling units or exposed located in outdoor or wash down environments shall have totally enclosed fan cooled (TEFC) or totally enclosed air over (TEAO) enclosures.

E. Motors shall be furnished for starting in accordance with utility requirements and be compatible with starters specified hereinafter or under Division 26 Specifications.

(1) Refer to Section 26 29 13 - Enclosed Controllersfor reduced voltage starting requirements.
(2) Starters for NEMA rated 200 or 230 V motors, 25 hp (18.5 kW) and above shall be reduced voltage starting type.
(3) Starters for NEMA rated 460 V motors, 60 hp (45 kW) and above to be reduced voltage starting type.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Materials shall be new and guaranteed for service intended.

2.02 ELECTRICALLY COMMUTATED MOTORS (ECM)

A. Motor assembly shall be designed for use on direct drive fans or pumps and shall be electrically commutated, DC, brushless type, specifically designed for use with 120 V or 208-230/277 V, 60 Hz single-phase electrical input or three-phase, 60 Hz electrical input as scheduled.

B. Motor speed shall be variable via compatible input signal and shall be complete with and operated by single-phase integrated controller/inverter that operates wound stator and senses rotor position to electronically commutate stator. Motor shall maintain minimum of 70% efficiency over entire operating range.

C. Motors shall:

(1) have permanently lubricated ball bearings.
(2) be designed for synchronous rotation.
(3) be permanent magnet type with near-zero rotor losses.
(4) be able to be mounted with shaft in horizontal or vertical orientation.
(5) be controllable from local and remote speed-control adjustments.
(6) be designed to overcome reverse rotation without affecting life expectancy.

D. Provide Power Factor Correction / Harmonic Correction module to limit harmonic distortion to less than 10% THDi at input of the filter.

E. Speed Control (Drive):

(1) Motor manufacturer shall provide factory installed PWM speed control drive for local (manual) and remote speed adjustment. Local PWM drive shall be field adjustable with standard screwdriver. Drive shall also be capable of receiving 0-10 VDC signal from DDC controller to control fan or pump speed.
(2) Drive shall provide soft start and adjustable speed change ramp rate.
(3) Drive shall provide motor protection consisting of locked rotor, over-current, and thermal overload protection at minimum.

2.03 INDUCTION MOTORS

A. Voltage Ratings

(1) Refer to equipment schedules and specification sections for voltages required.
(2) Unless otherwise indicated, motors 1/3 hp (0.25 kW) and smaller shall be rated 115 V for operation on 120 V, 1 Ph, 60 Hz service.
(3) Unless otherwise indicated, motors 1/2 hp (0.37 kW) and larger shall be rated:
(a) 460 V for operation on 480 V, 3 Ph, 60 Hz service.
(b) 200 V for operation on 208 V, 3 Ph, 60 Hz service.
(c) 230 V for operation on 240 V, 3 Ph, 60 Hz service.

B. Motors shall be 4 pole (approximately 1750 rpm) unless otherwise noted.

C. Single-phase motors shall be furnished with built-in thermal overload protection.

D. Use NEMA Design B motors, normal starting torque with regreasable ball bearings, and Class B insulation unless specified otherwise or unless manufacturer of equipment on which motor is being used has more stringent requirements.

(1) Bearings shall be rated for minimum AFBMA 9, L-10 life of 26,280 hours (belted) and 200,000 hours (direct-coupled) at full-load.

E. Motors shall be rated continuous duty and have 1.15 service factor unless otherwise noted.

F. Motors Driven by Variable Frequency Drives (VFD)

(1) Motors shall comply with the latest NEMA MG 00001, Section IV, Part 31.
(2) Motors shall have service factor not less than 1.0 at rated load.
(3) Insulation shall be Class F or H.
(4) Furnish each motor with shaft grounding ring utilizing conductive microfiber similar to AEGIS SGR to protect motor bearings from electrical damage.

G. Vibration shall not exceed 0.15" (3.8 mm) per second, unfiltered peak unless otherwise noted.

H. Motors (180 frames and larger) shall have provisions for lifting eyes or lugs capable of safety factor of 5.

I. Full load nominal efficiency of motors 1 hp (0.75 kW) and larger, except special-purpose motors including 2-speed or multi-speed motors, and rewound motors, shall meet or exceed listed values when tested in accordance with IEEE Standard 112 Method B as defined by NEMA MG 00001-12.6C. Efficiency values listed are based on NEMA Premium Efficiency Electric Motors of NEMA MG 00001-2011, Table 12-12.

	Open Drip-Proof Motors			Totally Enclosed Fan-Cooled Motors		
	1200 rpm	1800 rpm	3600 rpm	1200 rpm	1800 rpm	3600 rpm
(hp) ((kW))	(6 pole)	(4 pole)	(2 pole)	(6 pole)	(4 pole)	(2 pole)

200 hp (150 kW)	95.4	95.8	95.0	95.8	96.2	95.4
250 hp (185 kW)	95.4	95.8	95.0	95.8	96.2	95.8

J. Single-phase motors for hard starting applications including outdoor applications shall be capacitor start type. Motors for fans and pumps located indoors may be split phase or permanent split-capacitor. Motors shall be equipped with permanently lubricated and sealed ball bearings and shall be selected for quiet operation. Motors 1/8 hp (0.09 kW) and below may be shaded pole type.

(1) Refer to individual equipment section for additional requirements or specific type of motors.

K. 3 Ph, 2-speed motors shall be one winding, consequent pole, variable torque type and 1 Ph, 2-speed motors shall be capacitor start capacitor run type.

L. When submersible pumps are specified, each pump shall include in addition to controls specified, all necessary controls, relays, wiring, etc. that may be required for safety features incorporated in motor design. No submersible motor shall be run or activated until all requirements of motor manufacturer's recommendations have been complied with.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install materials in accordance with drawings, approved Shop Drawings, and manufacturer's recommendations.

END OF SECTION 23 05 13

SECTION 23 05 14 - VARIABLE FREQUENCY DRIVE (VFD) SYSTEM

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 23 05 13 - Motors for Mechanical Equipment
B. Section 23 09 01 - Control Systems Integration
C. Section 23 09 93 - Control Sequences
D. Section 23 21 23 - Hydronic Pumps
E. Section 23 34 00 - Fans
F. Section 23 73 13 - Packaged Indoor Air Handling Units
G. Section 23 73 28 - Factory Fabricated Custom Air Handling Units(Standard or High-End Units)
H. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
I. Section 26 28 16 - Enclosed Switches and Circuit Breakers
J. Section 26 29 13 - Enclosed Controllers

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SYSTEM DESCRIPTION

A. Provide Variable Frequency Drives (VFD) for each pump, fan or other driven equipment sized to accommodate motors shown on drawings or schedules. Provide all VFDs from same manufacturer.
B. VFD manufacturer shall review driven equipment and motors for VFD compatibility. Submit written statement from manufacturer of driven equipment along with VFD shop drawing submittals, indicating verification of compatibility.
C. VFD shall vary speed of its respective fan, pump, or other driven equipment motor in response to either 4-20 mA or 0-10 VDC control signal provided by Control Contractor.
D. VFD system shall consist of the following:
   (1) Variable frequency drive(s)
   (2) UL Listed disconnect device
   (3) Electrical noise attenuation device _____.
   (4) Motor starter for bypass mode operation with VFD/OFF/BYPASS selector and drive input and output isolation contactors where VFD bypass starters are scheduled.
   (5) Internal reactor with minimum 5% impedance or equivalent input line reactor.
   (6) dV/dt Output filter as required to protect motor, based on total length of conductor from VFD to motor(s).
E. Drives shall have SCCR (short circuit current rating) of _____ kA.

1.04 QUALIFICATIONS

A. VFD system shall be furnished by a manufacturer with at least 10 yrs experience in design, construction, and application of VFD.

1.05 SUBMITTALS

A. Product Data for each VFD system including the following:
   (1) Manufacturer's name.
   (2) Identification of system components.
   (3) Type of enclosure, front elevation and plan view, equipment weight, conduit access locations.
   (4) Capacities/ratings/SCCR.
   (5) Warranty.
   (6) System wiring and block diagram showing system components.
   (7) Performance, control, and protection data with specified features clearly shown.
   (8) Operating and monitoring devices with specified features clearly indicated.
   (9) Start-up operation, maintenance, spare parts, and field tests.
   (10) Manufacturer's installation instructions.
   (11) BACnet point mapping table including point adresses, and read only or writable status.
   (12) Other appropriate data.

B. After quality assurance tests are complete, submit written certification that drive and components have passed factory quality assurance tests.

C. Submit product and performance data on electrical noise attenuation device if required to meet electrical noise criteria specified. Isolation transformer is not electrical noise attenuation device.

D. Submit printed list of settings for all items that require setting during startup or list of Factory Default Parameters.

1.06 ELECTRICAL NOISE CRITERIA

A. Provide harmonic mitigation components as scheduled. Refer to VFD Schedule for components required.

1.07 START-UP OPERATION AND MAINTENANCE DATA

A. Provide services of factory trained engineer or technician to approve installation; start-up test and adjust for proper operation; and instruct and train Owner's representative in operation and maintenance of VFD systems. Provide minimum of 4 h of Owner training for VFD system.

B. Should drive operation be deficient, make changes necessary to bring units into compliance with specified performance requirements. Cost of changes and retest shall be borne by drive manufacturer.

C. Upon completion of this service, submit report signed by manufacturer's service representative, including start-up and test log. _____

D. Include additional 2 yr (total 3 yrs) warranty for VFD system, covering parts, labor, and travel expenses.

PART 2 - PRODUCTS

2.01 MANUFACTURER

A. Manufacturers: ABB, Allen Bradley/Rockwell Automation, Emerson, Eaton, Danfoss, GE, Schneider Electric, Yaskawa, or Toshiba

2.02 FABRICATION

A. VFD shall be variable torque, solid state, microprocessor-based control, modular design for standard induction AC motor.

B. VFD components shall be factory mounted and wired in NEMA _____ enclosure with lockable door handle.

C. VFD components shall be factory mounted and wired in Motor Control Center enclosure.

D. VFD components shall be factory mounted and wired in Plenum Rated Enclosure with lockable door handle.

E. Circuitry shall be plug-in, plug-out modular. Printed circuit boards shall have protective coating to reduce corrosion.

F. Unit shall conform to NEMA and NEC standards and be CSA, UL or ETL Listed. Control circuitry shall be electrically isolated from power circuitry. Entire assembly panel shall have UL or equivalent panel sticker.

G. Invertor section shall be pulse width modulated (PWM) design and most current insulated gate bipolar transistors (IGBTs) technology.

H. For motors 600 hp (450 kW) or larger, inverter section may be current source design.

2.03 PERFORMANCE REQUIREMENTS

A. Input: 460 (+10%, -15%) VAC, 3 Ph, 60 (± 2) Hz

B. Output: 460 VAC, 3 Ph, 10 to 60 Hz

C. Operating Environment: VFD Manufacturer shall rate VFDs for specific environment in which they will operate.

(1) Ambient temperature:

(a) Indoor applications: _____

(b) Outdoor applications: ____

(2) Relative humidity: 95% non-condensing.

(3) Elevation above sea level: _____

D. Linear acceleration and deceleration adjustable from 5 to 60 seconds. Provide adjustable v/Hz ratio and low speed boost features.

E. Output Current Rating: Continuous full load output current rating of drive shall not be less than that listed for motor of equivalent horsepower (kilowatts) in NEC table 430-150.

F. Drive overload capacity to be minimum 110% of motor FLA based on NEC ratings for one minute.

G. Time to Shutdown: Inversely proportional to square of overload current (t = k/I2).

H. Motor Regeneration Protection: Unit shall have capacity of dissipating regeneration energy up to VFD current rating without damage to or shutdown of drive.

I. Output Frequency Stability: ± 0.5% of base frequency in 24 h throughout range of rated operating conditions.

J. Output Voltage Regulation: ± 2% of maximum rated output voltage.

K. Output voltage rise time shall be no faster than 1000 V/micro sec measured at the motor terminals. If power and control cable between VFD and motor is more than100 ft (30.5 m), provide dv/dt output filter.

L. Power Loss Ride-Through: 1 cycle.

M. Linearity (speed reference to output frequency): ±1.0%

N. Input Power Factor: Minimum of 0.95 regardless of speed and load.

O. Minimum drive efficiency as percent of input power shall be as follows:

Percent Load	Frequency (Hz)			
	60	50	30	15
100	97	96	95	90

2.04 CONTROL FEATURES

A. VFD speed control circuit shall accept either 4-20 mA DC or 0-10 VDC isolated ungrounded transmitter signal in automatic mode and from manual speed control keypad in manual mode.

B. Provide adjustable minimum and maximum speed settings (0 - 100%) for both auto and manual mode. Initial minimum setting shall be 25%.

C. Provide adjustable automatic reset for fault trips, except short circuit type faults. After selected number of unsuccessful restart attempts, drive shall be shut down. Number of restart attempts and time interval between resets shall be selective.

D. When unit shuts down due to power outage, unit shall be capable of being restarted manually or automatically.

E. VFD shall be capable of starting into rotating loads spinning in any direction.

F. Provide critical frequency avoidance circuit with at least 3 field adjustable bands to avoid operation at speeds, which cause excessive vibration in driven equipment.

G. Provide isolated ungrounded output signal to indicate drive percent of speed or drive frequency.

H. _____

2.05 COORDINATION WITH BUILDING AUTOMATION SYSTEM (BAS)

A. Furnish each VFD with digital communication bus card for BAS use. Coordinate with Control Contractor for specific interface requirement.

B. Provide contacts (1 NO and 1 NC contact) for remote input control of start/stop function for VFD mode.

C. Provide three pre-programmed relay/contacts (1 NO and 1 NC contact each) for remote output indication of VFD fault condition, motor run status based on current or torque above minimum threshold, and bypass mode if bypass is specified.

D. Provide analog input point for hardwired direct speed control.

2.06 PROTECTION FEATURES

A. Power circuits shall be protected by electronic protection circuits. Electronic protection circuits shall provide orderly shutdown without blowing fuses and prevent component loss under the following abnormal conditions.

(1) Instantaneous overcurrent and over voltage trip of output.

(2) Solid state protective circuit shall provide NEC motor running overload protection tested in accordance with UL 991.

(3) Power line overvoltage or undervoltage.

(4) Phase sequence detection or insensitivity to incoming power phase sequence.

(5) Single and 3 Ph short circuit protection.

(6) Control circuit malfunction.

(7) Overtemperature.

(8) Ground fault for all 3 phases.

B. VFD shall protect itself from damage due to phase-to-phase or phase-to-ground faults without fuse blowing or use of isolation transformers. VFDs which require isolation transformers to provide ground fault protection are not acceptable.

C. In addition, provide the following protection features.

(1) Input line-to-line and line-to-ground transient protection up to 3000 V

(2) Control circuit transformer fusing

(3) Grounded control chassis

(4) Diagnostic indication

(5) One set of three (3) spare fuses for each size or type of VFD

D. VFD shall employ adjustable torque limit control, which shall override speed command and decrease frequency while maintaining correct volts/hertz ratio whenever load level surpasses VFD design level or set point.

2.07 OPERATING AND MONITORING DEVICES

A. The following functionality shall be provided and may be controlled via touchscreen/keypad:

(1) Hand-Off-Auto device

(2) Operating mode selector device marked "Hand-Off-Auto"

(3) Manual speed control keypad

(4) Power on indication

(5) Drive run indication

(6) Drive fault indication with testable feature

(7) Fault reset device

B. Speed indicating meter or digital indication (0 - 100%) calibrated in percent speed or frequency meter with 0 to 90 Hz scale to indicate motor speed.

C. Integral digital programming and operating display which shows Hz, Percent Output Current, Output Voltage, Percent Output Power, Operating Parameters and their values, and Diagnostic Fault Codes. In addition, Keypads shall be incorporated to facilitate digital programming of drive adjustments. Analog potentiometer adjustments are not acceptable.

D. Provision shall be included to provide selectable programming security by inhibiting program parameter changes with password security.

E. Control shall incorporate microprocessors for operator interface, diagnostics, and fault managements, and power management.

F. Optional programming software, which includes provision for serial communication with drive, shall be available for shipment at time of equipment order placement.

G. Fault buffers to sequentially store last 4 faults. Parameter and fault information to be stored in non-volatile memory.

H. VFD with Manual Bypass Starter:

(1) Manual selector switch to select power through VFD or bypass line with label marked "VFD/OFF/BYPASS".

(2) Electrically-interlocked VFD/BYPASS contactors with padlocking capability on input side of VFD and bypass starter. Interlock shall be accomplished such that shorting together of any 2 control circuit points cannot cause non-selected device to be energized. Provide electrically-interlocked device that connects only output of selected starting device (VFD or bypass starter) to VFD system output lug. Single shorting of any 2 control circuit points shall not cause both VFD and bypass starter outputs to be interconnected.

I. Redundant VFDs:

(1) Manual selector switch to select power through VFD1 or VFD2 with label marked "VFD1/AUTO/VFD2".

(2) Electrically-interlocked VFD1/VFD2 contactors with padlocking capability on input side of VFDs. Interlock shall be accomplished such that shorting together of any 2 control circuit points cannot cause non-selected device to be energized. Provide electrically-interlocked device that connects only output of selected starting device to system output lug. Single shorting of any 2 control circuit points shall not cause both VFD outputs to be interconnected.

2.08 QUALITY ASSURANCE TESTS

A. Complete drive assembly shall be factory tested with actual AC induction motor, 100% load and temperature cycled within environment chamber at 104°F (40°C). Documentation of test shall be furnished to verify successful completion of test at Engineer's request.

2.09 DISCONNECT DEVICE

A. Provide integral switch to disconnect incoming electrical power to units. Disconnect device shall be UL Listed devices:

(1) Enclosed molded case breaker; ampere rated and providing over current protection.

(2) Fused switch may be used as option. Fused switch shall be ampere rated and provide overcurrent protection. Non-time delay fuses shall be sized for connected drive and motor.

B. Disconnect device shall be capable of being padlocked in OFF position and complying with OSHA Requirements. Operating handle shall indicate whether switch is “ON” or “OFF”.

C. Switch shall have cover interlock to prevent unauthorized opening of switch door when handle is in “ON” position and to prevent closing of switch mechanism with door open. Provide defeater mechanism to defeat the interlock for user required access.

2.10 MOTOR CONTROL EQUIPMENT (BYPASS STARTERS)

A. Bypass starter shall be NEMA or IEC Rated device of the following:

(1) Electromechanical across-the-line starter with solid state overload protection for 50 hp (37 kW) or smaller.

(2) Solid-state reduced voltage starter consisting of SCR based power section, logic control board, and solid state overload protection for 60 hp (45 kW) or larger.

(3) Reduced voltage auto transformer - electromechanical starter with solid-state overload protection for 60 hp (45 kW) or larger.

(4) Bypass shall include high speed fuses for VFD (not in bypass circuit).

(5) Service switch to disconnect power to VFD (not in bypass circuit).

2.11 VFD BYPASS EQUIPMENT (DUTY/STANDBY DRIVES)

A. Provide redundant drive bypass where scheduled. Drive assembly shall include two individual VFDs of the scheduled capacity, _____

B. VFD Bypass equipment shall include the following:

(1) All harmonic mitigation, control features, protection features, operation and monitoring devices and disconnecting means shall be provided independent of the bypass drive.

(2) Provide input and output contactors to disconnect the non-operational drive. Either VFD shall be fully serviceable when not operating, without interrupting operation of functional drive.

(3) _____

(4) Remote transfer to bypass functionality.

(5) Manual selector switch to select VFD A or VFD B operation.

(6) Manual selector switch to allow testing, adjustment, and programming of either VFD A or VFD B while the alternate VFD is operating.

(7) Indication lights to annunciate VFD A Fault, VFD B Fault, VFD A Run, VFD B Run

(8) Bypass shall include high speed fuses for input protection of each VFD.

C. Primary/Redundant drive assembly shall be provided with _____ points of electrical connection for input conductors, and _____ points of electrical connection for output conductors to motors. _____.

2.12 INPUT LINE REACTORS

A. Series line reactors shall be designed for harmonic filtering service and shall be UL component recognized. Construction shall be copper wire wound on steel cores. Inductors shall be 3-phase. Series line reactors shall be sized per harmonic analysis and appropriately for total connected load. Design maximum temperature rise for inductors shall be 239°F (115°C).

B. Inductors shall be air-gapped to avoid saturation. Inductance shall be measured under full load and shall be within ± 5% of design value.

C. Line reactor shall be included integral to drive enclosure.

(1) Where mounting line reactor in VFD enclosure is not possible, enclosure shall be steel with enamel finish and no knockouts. Enclosure shall match construction of VFD enclosure and shall have hinged lockable cover. Screened openings shall be provided for enclosure ventilation. Enclosure shall be built with integral mounting brackets for platform or wall mounting. Coordinate location with other trades. Provide disconnect switch for line side filters.

D. Internal DC bus chokes are acceptable when providing equivalent performance to AC line reactors specified.

2.13 PASSIVE HARMONIC FILTER

A. Tuned passive harmonic filter shall be designed to remove harmonics generated by a 6-pulse VFD in a power distribution system. The filter shall be designed to minimize the possibility of resonance and other system problems associated with power factor correction in the presence of harmonic distortion.

B. Inductive and capacitive elements shall be arranged in a series configuration and tuned to resonate just below the harmonic frequency for which it is designed to filter. The inductance internal to the filter combined with the series line reactor shall act to limit current surges between the capacitor and other plant electrical equipment and shall minimize the possibility of equipment or capacitor damage due to such surges.

C. Capacitors shall be high-endurance cells with a voltage rating capable of handling the nominal system voltage plus 10% over voltage. Capacitors shall be contained in sealed metal cans. The RMS current in each capacitor cell at full load shall not exceed 150% of the current at no load to limit the stress on capacitors.

D. Both tuning inductors and series line reactors shall be designed for harmonic filtering service and for slowing the rate of rapid current changes. The core shall be made of laminated, magnetic steel. Windings shall consist of copper wire or copper foil. Completed inductors shall be impregnated using solid epoxy resin.

E. Filter shall be housed internal to drive enclosure.

F. Filter shall include contactor to disengage circuit capacitor if VFD is operating at 50% electrical power capacity or less. Set point shall be field programmable. Activation of contactor shall leave inductor in circuit for benefits of added circuit impedance. _____

2.14 DV/DT OUTPUT FILTER

A. dV/dt motor-protecting output filter shall be a low-pass filter consisting of a gapped, three phase iron core inductor, AC-rated capacitor and wire-wound resistors.

B. The filter shall be rated for application at a maximum fundamental system frequency of 60 Hz at nominal system voltages up to 600V.

C. Ambient temperature of operation shall be 104°F (40°C).

D. The combined inductance, capacitance and resistance of the Output Filter shall be specifically designed to reduce voltage waveform dV/dt.

2.15 SPARE PARTS

A. Additional enclosure cooling fan for each different type of drive.

B. Additional keypad/touch screen for each different type of drive.

PART 3 - EXECUTION

3.01 INSPECTION

A. Visually inspect equipment and components at time of delivery. Submit report to Engineer with list of items or deficiencies to be corrected.

3.02 PROTECTION

A. Protect VFD cabinets from dust/dirt during storage and operation until turned over to Owner.

B. If VFDs are not furnished with internal air filter racks, provide temporary filter media to protect VFD cabinets and replace filter media as required.

3.03 INSTALLATION

A. Install VFD system in accordance with details, approved submittals and manufacturer's instructions and recommendations.

B. Provide field low voltage wiring of VFD system components. Provide field interconnecting wiring between VFD and filters, line reactors and/or by-pass starter if bypass starter is specified and the wiring is not installed at factory. Install wiring in metal conduit and in accordance with Electrical sections of this Specification and applicable Electrical Code.

C. Provide control wiring between interlocks in VFD control circuits and driven motor's disconnect switches. Interlock VFD control circuits with driven motor's disconnect switches where such motor disconnect switches are provided. Disconnecting on-line motor shall shut down VFD. VFD shall restart upon reconnection of motor.

D. Do not connect ground from one unit to another unit's cabinet.

E. Use separate conduits for incoming and outgoing power conductors from each unit.

F. Use separate conduit for control wiring for each unit. Do not combine control wiring with power wiring.

G. Use minimum 18 ga shielded wiring with ground for control wiring.

H. Unless otherwise indicated, mount VFD so that display and keypad are at approximately 5 '-0" (1.5 m) to 5 '-6" (1.7 m) above floor.

I. Install floor mounted drives on 3-1/2" (90 mm) high concrete housekeeping pad.

3.04 START UP

A. VFD manufacturer shall perform field inspection, start-up and testing of VFD in accordance with procedures as defined by manufacturer for proper operation.

B. Adjust critical frequency avoidance feature to step over frequencies which cause excessive vibration in driven equipment.

C. Where provided, adjust passive harmonic filter capacitor contactor setpoint to ensure drives do not present leading power factor to electrical systems during low-load conditions.

END OF SECTION 23 05 14

SECTION 23 05 29 - MECHANICAL PIPING AND EQUIPMENT SUPPORTING DEVICES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 23 05 48 - Mechanical Seismic Anchorage and Restraints

B. Section 23 07 00 - Mechanical Systems Insulation

C. Section 23 05 50 - Vibration Isolation

D. Section 23 31 14 - Ductwork

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESCRIPTION

A. Provide all supporting devices not provided as part of building structure or indicated on structural drawings or structural details, as specified and as required for proper supporting, anchoring, and guiding of piping, equipment, materials, and systems.

B. Support for all conditions of operation, including variations in installed and operating weight of equipment, piping, and ductwork, to prevent excess stress and allow for proper expansion and contraction.

1.04 SUBMITTALS

A. Product Data for each piping system for all pipe sizes and all applicable equipment including the following:

(1) Manufacturer's name

(2) Model numbers

(3) Materials of construction and load ratings lbs (kg).

(4) Schedule of hangers and support devices with pipe support spacing.

(5) Insulated pipe supports along with application chart or table including pipe support spacing.

(6) Insulation protection saddles and weight bearing insulation table.

(7) Details and calculations for sizing supplementary steel utilized for trapeze or specially designed supports.

(8) Structural attachments, concrete inserts, and concrete anchors. Submit ICC-ES Evaluation Report for each type of concrete insert and anchor.

(9) Calculations and drawings for concrete inserts and anchors for each application shall be submitted when requested by Owner or Engineer.

(10) Drawings showing specific locations of any weld attachments to structure, including weight supported by such attachments.

(11) Drawings showing specific locations of any suspended loads which exceed 100 lbs (45 kg) within joist chord panel to be attached to open web steel joist structural members. Include weight supported by such attachments. (Panel is length of chord between two adjacent diagonal web members at point of connection to chord.)

(12) Equipment mounting devices

(13) Pipe guides and anchors

(14) All other appropriate data

B. Submittals in PDF format shall be organized using PDF bookmarks per detailed instructions on assembling submittal packages identified under Submittal Requirements section of 23 00 00 - General Mechanical Requirements.

C. Calculations and drawings prepared by the Contractor's structural engineer shall be submitted bearing the stamp of a licensed Structural Engineer registered in project jurisdiction for approval.

1.05 DESIGN CRITERIA

A. Materials and application of pipe hangers and supports shall conform to the latest requirements of ANSI B31/ASME B31.1 Code for Pressure Piping and MSS Standard Practice SP-58-2018 (Pipe Hangers and Supports Materials, Design, Manufacture, Selection, Application, and Installation), except as supplemented or modified herein.

B. Support materials shall be steel or stainless steel unless specifically indicated.

C. Support devices shall be factory fabricated and have published load ratings.

D. Unless otherwise indicated, design supports, anchors, and related components with safety factor in accordance with AISC Manual of Steel Construction, but not less than 2.0.

E. Determine maximum deflection using the following equation.

F. Maximum deflection of support members, including trapeze supports, shall be in accordance with the following equation, but shall not exceed 0.3" (7.5 mm):

(1) D = L/240

D = Max deflection in inches (millimeters)

L = Support member length in inches (millimeters)

G. Unless otherwise indicated, hangers, support devices and hardware shall be steel and shall have factory standard black, primed, galvanized, or electroplated finish for indoor application, and hot-dipped galvanized finish for outdoor application and corrosive atmospheres. Coat cut edges, welds, or any damaged finish with galvanized paint.

(1) Corrosive atmospheres include the following locations:

(a) Exterior locations

(b) Chemical storage and hazardous waste storage rooms

(c) Food service/kitchen areas

(d) Locker/shower rooms

(e) Meter pits

(f) Utility tunnels

(g) Cage wash rooms (dirty and clean)

(h) Sterilizer/autoclave rooms

H. Materials in contact with pipe shall be galvanically compatible with piping material to eliminate conductive path for galvanic corrosion. Where piping and support materials have galvanic potential, provide galvanic separation, such as nonmetallic coating or inserts between piping and metallic supports. Pipe insulation is acceptable galvanic separation. Galvanic potential shall be determined by table below:

	Galvanized Steel	**Carbon Steel**	**Stainless Steel (Type 304 or 316)**	**Copper Brass Bronze**
Copper, Brass, Bronze	Yes	Yes	No	NA
Stainless Steel (Type 304 or 316)	Yes Note (1)	Yes Note (1)	NA	
Carbon Steel	No	NA		
Galvanized Steel	NA			

(1) Required where stainless steel surface area near interface is equal or greater than steel surface area

I. Unless otherwise indicated, steel support devices exposed to ventilation air stream shall be stainless steel or steel with either galvanized finish or paint finish. Paint type shall be approved by Architect.

J. Contractor is responsible for proper placement and sizing of supporting devices to accommodate insulation thickness and pitching of pipe. Coordinate with work specified in Section 23 07 00 - Mechanical Systems Insulation.

K. In addition to hangers specified in this Section, piping connected to pumps, compressors, and similar rotating or reciprocating equipment shall have vibration isolation hangers or supports for specified distance from such equipment. Refer to Section 23 05 50 - Vibration Isolation for required distance.

L. Piping connected to coils, which are in assembly mounted on vibration isolators, shall have vibration isolation hangers or supports as indicated above. Piping connected to coils, which are in equipment where fan assembly is separately isolated by vibration isolators and flexible connections, does not require additional vibration isolation hangers or supports. Refer to Section 23 05 50 - Vibration Isolation for flexible connections, vibration isolators and additional requirements.

M. Where piping can be conveniently grouped to allow trapeze type supports, supporting steel shall be by means of standard structural shapes.

N. Hangers and rods shall be plumb when pipelines are at their normal operating temperatures.

O. Unless otherwise indicated, continuous insert channels are not allowed.

P. Punching, drilling, or welding of building structural steel is not allowed unless approved by Structural Engineer.

Q. Refer to Structural Documents and ICC-ES Evaluation Report for application of concrete inserts and concrete anchors.

R. Lateral braces shall be designed and detailed to apply loads as directly as possible to structural floor slabs, roof decks, or other building lateral elements. Braces shall not be applied to bottom flanges of steel beams or bottom chords of open web steel joists.

S. Coordinate proposed weld attachments to building structure. This may result in use of welding codes or standards, which may apply to "structural work" and may necessitate repair of fireproofing and/or extension of fireproofing to support members. Cost for this workshall be the responsibility of Contractor.

T. Top or bottom chords of open web steel joists may be used to support loads, provided total load within panel does not exceed 100 lbs (45 kg) and load is placed concentric to joist. (Panel is length of chord between two adjacent diagonal web members at point of connection to chord.)

U. Where fire rated fiberglass products are used for channel and support devices, the following properties shall apply:

(1) Flame Spread Properties

(a) Polyester Fiberglass (PF) Class 1 ASTM E84

(b) Vinylester Fiberglass (VF) Class 1 ASTM E84

V. Fasteners including concrete anchors for seismic application shall have ICC Evaluation Service Report (ESR) and meet requirements of local authorities.

PART 2 - PRODUCTS

2.01 STRUCTURAL SUPPORTS

A. Unless specifically indicated on structural drawings, design and provide all supporting devices including miscellaneous steel (angles, channels, beams, etc.), required for proper support of piping, equipment, and materials.

B. Supporting steel _____ shall be stainless steel.

2.02 PIPE HANGERS AND SUPPORTS (METALLIC)

A. Manufacturers: Anvil, Erico, Tolco, PHD, National Pipe Hanger Corporation, or B-Line, equal to Anvil figures listed. Corresponding MSS Type is indicated where applicable.

B. Clevis and Roller Type Hangers:

System	Pipe Size	Clevis	Roller
Hot Pipes with Insulation (105°F (41°C) and above)	2" (50 mm) and smaller	65 (MSS Type-1), 260 (MSS Type-1)	---
	2-1/2" (65 mm) to 6" (150 mm)	---	171 (MSS Type-41), 181 (MSS Type-43)
	8" (200 mm) and larger	---	171 (MSS Type-41)
Ambient Bare Pipes (61°F (16°C) to 104°F (40°C))	2" (50 mm) and smaller	65 (MSS Type-1), 260 (MSS Type-1)	---
	2-1/2" (65 mm) and larger	260 (MSS Type-1), 216 (MSS Type-4)	---
Cold Pipes with Insulation (33°F (1°C) to 60°F (15°C))	2" (50 mm) and smaller	65 (MSS Type-1), 260 (MSS Type-1)	---
	2-1/2" (65 mm) and larger	260 (MSS Type-1), 295 (MSS Type-1)	---
Cold Pipes with Insulation (32°F (0°C) and below)	2" (50 mm) and smaller	65 (MSS Type-1), 260 (MSS Type-1)	---
	2-1/2" (65 mm) to 6" (150 mm)	260 (MSS Type-1)	171 (MSS Type-41), 181 (MSS Type-43)
	8" (200 mm) and larger		171 (MSS Type-41)

(1) For pipe size 2-1/2" (65 mm) and larger, where there is transverse movement at support points due to thermal expansion/contraction, clevis type hangers similar to Anvil Figure 260 (MSS Type-1) may be used if vertical angle of hanger rod is less than 4°.

C. Flat Surfaces (Trapeze, Rack Type):

(1) Use structural steel members such as struts, angles, channels, and beams to support pipes as required. Select members properly for pipe support types and loading conditions. Refer to Part 1 for design criteria. Submit support details with type of members selected and load calculations. Provide straps, clamps, rollers, or slides indicated below at each support point.

System	Pipe Size	Straps or Clamps	Rollers	Slides
Hot Pipes with Insulation (105°F (41°C) and above)	2" (50 mm) and smaller	Anvil Klo-Shure	---	---
	2-1/2" (65 mm) and larger	---	171 or 177(MSS Type-41), 271 (MSS Type-45), 274 (MSS Type-46)	257 or 436 with 212 or 432 clamps, Type 1, 2 or 3 for longitudinal movement only. Type 4, 5 or 6 for both longitudinal and transverse movement
Ambient Bare Steel Pipes (61°F (16°C) to 104°F (40°C))	6" (150 mm) and smaller 8" (200 mm) and larger	B-Line BVT Unistrut Cush-a-Clamp	---	---
Ambient Bare (Copper) pipes (61°F (16°C) to104°F (40°C))	6" (150 mm)and smaller	B-Line BVT Unistrut Cush-a – Clump		
Cold Pipes with Insulation (33°F (1°C) to 60°F (15°C))	10" (250 mm) and smaller	137 (MSS Type-24)	---	---
	12" (300 mm) and larger	432	171 or 177 (MSS Type-41), 271 (MSS Type-45), 274 (MSS Type-46)	257 or 436 with 212 or 432 clamps, Type 1, 2 or 3 for longitudinal movement only and Type 4, 5 or 6 for both longitudinal and transverse movement.
Cold Pipes with Insulation (32°F (0°C) to 59°F (15°C)) and below)	2" (50 mm) and smaller	243, 244	---	---
	2-1/2" (65 mm) and larger	---	171 or 177 (MSS Type-41), 271 (MSS Type-45), 274 (MSS Type-46)	257 or 436 with 212 or 432 clamps, Type 1, 2 or 3 for longitudinal movement only and Type 4, 5 or 6 for both longitudinal and transverse movement.

D. Vertical Pipe within Wall Cavities

(1) Use clamps, straps, inserts or channels to support pipes concealed in wall cavity. Select members for pipe support types and loading conditions. Refer to Part 1 for design criteria.

(2) Provide clamps, strut channels, insulated supports, or brackets and inserts equal to manufacturer indicated below:

System	Pipe Size	Supports	Clamps, Brackets/Inserts	Pre-insulated Inserts
Hot and Cold Pipes with Insulation	All sizes	Anvil 137	HoldRite 260 series with SBIS bracket, Anvil 262	Anvil Klo-Sure, Pipe Shields A2000
Ambient Bare Steel Pipes (61°F (16°C) to 104°F (40°C))	All sizes	Anvil 137, 138-R	Anvil 262	---

System	Pipe Size	Supports	Clamps, Brackets/Inserts	Pre-insulated Inserts
Ambient Bare Copper Pipes (61°F (16°C) to 104°F (40°C))	All sizes	Anvil CT-138R	HoldRite 260 series with SBIS bracket	---

2.03 INSULATION PROTECTION SHIELDS

A. Anvil Fig. 167 (MSS Type-40) constructed of galvanized carbon steel. Per the latest edition of Standard MSS SP-58, select shield to accommodate outer diameter of insulation. Shield length and gauge for insulation compression strength not less than 15 psi (103 kPa), shall be as follows:

Pipe Size	Length	Gauge
1/4" (8 mm)thru 3" (80 mm)	12" (300 mm)	18 (1.316 mm)
4" (100 mm)	12" (300 mm)	16 (1.621 mm)
5" (130 mm)thru 6" (150 mm)	18" (450 mm)	16 (1.621 mm)
8" (200 mm) thru 14" (350 mm)	24" (600 mm)	14 (2 mm)
16" (400 mm) thru 24" (600 mm)	24" (600 mm)	12 (2.758 mm)

2.04 INSULATED PIPE SUPPORTS

A. Description:

(1) Products designed specifically for weight-bearing support of insulated pipes. Apply products in accordance with manufacturer’s recommendations and requirements indicated below:

(2) Refer to PART 3 – EXECUTION for application of Type A, Type B, and Type C Insulated Pipe Supports specified below.

B. General:

(1) High compressive strength inserts utilized to support loads shall encircle circumference of pipe. Block-style inserts are not allowed.

(2) Supports shall be suitable for hot or cold pipe service as applicable.

(3) Submit chart or table indicating selected model along with pipe sizes, rated loads, support device types and support spacing for each piping system.

(4) Pipe support spacing shall be in accordance with manufacturer's recommendations but shall not exceed maximum spacing indicated under Hanger and Support Spacing in Part 3 of this Section.

(5) Testing of insulation for compressive strength properties shall comply with ASTM D1621.

(6) Insulation thickness shall match adjacent pipe insulation thickness.

(7) Integrity of vapor barrier jacket shall be maintained continuously through support assembly.

(8) Insulated pipe support style shall be specifically selected for the application and shall consider the following criteria at minimum:

(a) Vertical, lateral, and axial support design load limits.

(b) Vertical, lateral, and axial support design travel limits.

(c) Temperature of support, at pipe surface, and ambient conditions.

(d) Test or pre-operational loads that may exceed normal operating conditions.

(e) Material for any items that will be welded directly to the pipe.

(f) Loading and displacements caused by seismic, hydraulic surge, or other forces.

(g) Temperature at support steel.

C. Type A Insulated Pipe Supports (Light Duty)

(1) Description:

(a) Pipe insulation specified in Section 23 07 00 - Mechanical Systems Insulation with insulation protection shields specified in this Section. Weight-bearing inserts are not required.

(b) Type B or Type C supports may be utilized in lieu of Type A supports.

D. Type B Insulated Pipe Supports (Standard Duty):

(1) Manufacturers:

(a) SNAPP ITZ insulation inserts by KB Enterprise, Tru-Balance Insulated Saddles by Buckaroos, Inc., Value Engineered Products, or approved equal.

(b) Klo-Shure 7-series or 9-Series insulation couplings by Hydra-Zorb 7-series for pipes with elasomeric insulation or approved equal.

(c) Type C supports may be utilized in lieu of Type B supports

(d) Contractor may propose to utilize contractor-fabricated insulated pipe supports in lieu of manufactured Type B Supports. Use of contractor-fabricated assemblies is subject to approval of appropriate submittal data. Submit detail drawings of assemblies and product data showing equivalency to specified manufactured products for approval.

(2) Description:

(a) Load-rated assembly consisting of high compressive strength insulation material completely encompassing circumference of pipe, vapor barrier jacket, and insulation protection shield.

(b) Insulation protection shield shall conform to ANSI/MSS SP-58. Shield shall be G90 galvanized steel and shall span full circumference of pipe insulation. Half-shields spanning lower 180 degrees arc of insulation outer circumference will be acceptable when used with clevis hangers.

(c) Axial length of insulation material shall be not less than 9" (230 mm) or 2" (50 mm) longer than insulation protection shields (1" (25 mm) minimum on each end), whichever is longer.

(3) Insulation Materials:

(a) Hot Pipes 105°F (41°C) to 250°F (120°C):

1) Rigid closed cell, polyisocyanurate or phenolic insulation by ITW, Resolco, or Kingspan. Minimum compressive strength shall be 100 psi (690 kPa).

(b) Hot Pipes 251°F (121°C) to 1200°F (650°C):

1) High-density calcium silicate insulation similar to Johns Manville Thermo-12 Gold. Minimum compressive strength shall be 100 psi (690 kPa).

(c) Cold Pipes 60°F (16°C) and below:

1) Rigid closed cell, polyisocyanurate, phenolic insulation similar to ITW, Resolco, Kingspan, or cellular glass insulation similar to Pittsburgh Corning Foamglas.

E. Type C Insulated Pipe Supports (Heavy Duty):

(1) Manufacturers:

(a) Pipe Shields, Inc., Bergen Pipe Supports, or Rilco equal to Pipe Shields models listed.

(b) Unless otherwise indicated, pre-insulated pipe supports shall be as indicated in the following schedule. Model numbers are based on Pipe Shields, Inc.

1) Pipe supported on hangers: Model “A” Series and Model “D” Series

2) Pipe supported on flat surfaces and pipe rollers: Models “A” Series

3) Pipe supported on slides: Model "B" Series with lateral guide or restraint

4) Pipe anchors: Model “C” Series

5) Riser clamps: Model “E” Series with thrust plates. Select proper model for restraint for downward load or upward load.

(c) Contractor may propose to utilize contractor-fabricated insulated pipe supports in lieu of manufactured Type C Supports. Use of contractor-fabricated assemblies is subject to approval of appropriate submittal data. Submit detail drawings of assemblies and product data showing equivalency to specified manufactured products for approval.

(2) Description:

(a) Load-rated assembly consisting of high compressive strength insulation material completely encircling circumference of pipe, vapor barrier jacket system incorporating structural inserts and insulation protection shield/casing where applicable.

(3) Insulation Material:

(a) Water-resistant high density calcium silicate with minimum density of 13 lb/ft³ (208 kg/m³) and compressive strength not less than 100 psi (690 kPa). Thermal conductivity shall be not more than 0.38 Btu in/(hr sq ft °F (0.055 W/m°C at 24°C) at 75°F (23.89°C).

(b) Structural Inserts:

1) Structural inserts used by manufacturer to reinforce between pipe and insulation jacket for clamping devices shall be water-resistant high compressive strength inorganic materials selected by manufacturer for desired combination of structural strength and insulating properties. Structural inserts shall have minimum compressive strength of 600 psi (4140 kPa). Thermal conductivity shall be not more than 0.58 Btu in/(hr sq ft °F (0.84 W/m°C at 24°C) at 75°F (23.89°C).

(c) Jacket:

1) Jacket shall consist of G90 galvanized steel conforming to ASTM A653/A653M and shall provide complete vapor barrier around insulation and bearing surface for protection of insulation.

2) When recommended by manufacturer, use reinforced insulation protection shield at support bearing surface. Insulation shall extend 1" (25 mm) beyond insulation protection shield to maintain vapor barrier integrity.

2.05 HANGER RODS (METALLIC)

A. Rods shall conform to the latest MSS Standards except as modified herein. Furnish rods complete with adjusting and lock nuts.

B. Rods shall have electroplated zinc or hot dip galvanized finish.

C. Unless otherwise indicated, size rods for individual hangers and trapeze support as indicated in the following schedule. Rod size may be reduced one size for double rod hangers. Total weight of equipment, including valves, fittings, pipe, pipe content and insulation, shall not exceed limits indicated.

Max. Pipe Size With Single Rigid Rod	Rod Diameter	Max Load of Hanger Rod (Not exceeding 650°F (340°C) Service Temp.)
2" (50 mm)	3/8" (10 mm)	730 lbs (330 kg)
3" (80 mm)	1/2" (13 mm)	1350 lbs (610 kg)
5" (130 mm)	5/8" (16 mm)	2160 lbs (610 kg)
8" (200 mm)	3/4" (20 mm)	3230 lbs (1460 kg)
12" (300 mm)	7/8" (24 mm)	4480 lbs (2030 kg)
18" (450 mm)	1" (25)	5900 lbs (2670 kg)
30" (750 mm)	1-1/4" (33 mm)	9500 lbs (4310 kg)

D. Threaded rods are not allowed in clean rooms.

2.06 BOLTS, NUTS, STUDS AND WASHERS

A. ASTM A307, electroplated zinc finish

2.07 ROD ATTACHMENTS

A. Anvil Fig. 290 (MSS Type-17), galvanized finish

2.08 U-BOLTS

A. Anvil Fig. 137 (MSS Type-24), galvanized finish

2.09 BEAM CLAMPS

A. Beam Clamps: Anvil Fig. 133/134 (MSS Type-21), 218 (MSS Type-30), 228 (MSS Type-28 or 29), and 292 (MSS Type-28 or 29)

B. Top Beam Clamps: Anvil Fig. 227 (MSS Type-25)

C. C-Clamps: Anvil Fig. 86, 92 or 93 (MSS Type-19 or 23) with set screw and lock nut

2.10 ADJUSTABLE PIPE SADDLE SUPPORTS

A. Anvil Fig. 264 (MSS Type-38), galvanized finish. Provide Anvil Fig. 63 Type T stanchion with base, galvanized finish, where applicable.

2.11 RISER CLAMPS (BARE PIPE)

A. Anvil Fig. 261 (MSS Type-8), galvanized finish

B. B-Line B3373C, PVC coated carbon steel, in area at pipe contact, for bare copper tubing

C. Proset system, proseal plug and fire-fill for sleeved and cored holes.

2.12 RISER CLAMPS (INSULATED PIPE)

A. Unless otherwise indicated, insulated pipe riser clamps shall be Type C insulated pipe supports. Refer to Insulated Pipe Supports in Part 2.

B. Contractor may propose to utilize contractor-fabricated riser supports. Use of contractor-fabricated riser supports is subject to approval of appropriate submittal data. Submit support detail drawings, bearing stamp of Structural Engineer registered in project jurisdiction for approval. Supports shall be engineered to withstand static and dynamic forces with minimum safety factor of 2.0. Submit insulation details addressing thermal break from building structure and vapor barriers.

2.13 CONCRETE INSERTS (WOODEN FORMED CONCRETE)

A. Anvil Fig. 281 or 282, or Hilti KCM-WF or DeWalt Wood-Knocker II+, suitable for rod diameter and weight supported.

2.14 CONCRETE INSERTS (METAL DECK FORMED CONCRETE)

A. Tolco No. 109DD, DeWalt Pan-Knoker II+, "Bang-It+", Hilti KCM-MD or KCM-PD, or MSCO No. MX34.

2.15 CONCRETE ANCHORS

A. Manufacturers: Hilti, DeWalt or Red Head

B. Anchors shall be selected, sized, and detailed by Contractor's structural engineer registered in project's jurisdiction based on project conditions and in accordance with project building code.

C. Anchors shall meet ICC Acceptance Criteria, and ICC-ES Evaluation Reports (ESRs) shall specifically list the current applicable codes.

D. Anchors installed in hardened concrete for purpose of transmitting structural loads from one connected element to another, or for safety related elements such as sprinkler pipes, heavy suspended pipes, and barrier rails shall have ICC-ES report demonstrating anchors have met requirements of AC 193 for mechanical anchors in concrete elements.

E. Post-installed expansion anchors and undercut anchors installed in hardened concrete shall be qualified for strength design and tested according to ACI 355.2. Designs shall be per the requirements of ACI 318, Appendix D.

F. Anchors for seismic load application shall be approved by ICC-ES Evaluation Reports to resist seismic loads and selected to meet project seismic design requirements. Refer to Section 23 05 48 - Mechanical Seismic Anchorage and Restraints and Structural drawings.

G. Anchors shall be zinc plated in accordance with ASTM B633.

H. Select anchors with load ratings based on cracked concrete conditions.

2.16 CONTINUOUS INSERT CHANNELS

A. Manufacturers: Unistrut, Anvil, B-Line, Michigan, Halfen, Hilti, or Kindorf. Brackets inserts and accessories shall be suitable for channel insert selected.

2.17 METAL FRAMING SUPPORT SYSTEM (STRUT SYSTEM)

A. Manufacturers: Unistrut, B-Line Strut Systems, Anvil-Strut, Power-Strut, Erico, Superstrut, Kindorf, Hilti, and Hydra-Zorb

B. Channels shall have epoxy paint or electroplated zinc finish.

C. Channels shall not be lighter than 12 ga (2.5 mm).

2.18 PIPE MOUNTING PEDESTALS

A. Equal to Roof Products & System Corporation consisting of equipment rail, "U" shaped mounting brackets, galvanized threaded rod and cast-iron pipe rollers. Rail shall have built-in raised cant to match roof deck insulation.

2.19 EQUIPMENT RAILS

A. Manufacturers: Roof Products & Systems, ThyCurb, Custom Curb, Inc., or Vent Products equal to Roof Products & Systems Model ER-4 with raised cant style for built-up roofing system. Mounting rails shall be galvanized steel with integral base plate, continuous welded corner seams, factory installed 2" (50 mm) x 4" (100 mm) wood nailer and 18 ga (1.2 mm) galvanized steel counter flashing.

B. Manufacturers: Roof Products & Systems, ThyCurb, Custom Curb, Inc., or Vent Products equal to Roof Products & Systems Model ER-2 for elastic sheet roofing system. Mounting rails shall be galvanized steel with integral base plate, continuous welded corner seams, factory installed 2" (50 mm) x 4" (100 mm) wood nailer and 18 ga (1.2 mm) galvanized steel counter flashing.

C. Mounting rail gauge shall be selected to support equipment adequately but shall be not less than 18 ga (1.2 mm).

D. Height shall be as detailed, but not less than 8" (200 mm) above finished roof.

E. Equipment rails shall span minimum of 2 joists and not cantilever more than 6" (150 mm) where joists are used. Rails shall be level at top with pitch built in when deck slopes 1/4" per ft (21 mm per m) or greater.

2.20 PIPE ROOF PENETRATION PROTECTIONS

A. Manufacturers: Roof Products & Systems, ThyCurb, or Vent Products equal to Roof Products & Systems "RPS-Pipe Portals" consisting of 12" (300 mm) OD prefabricated roof curb, laminated acrylic coated ABS plastic curb cover with EPDM protective rubber cap and stainless steel clamp.

2.21 PIPE GUIDES

A. Unless otherwise indicated, guides shall be equal to Pipe Shields "B" Series, selected by load and movement. Refer to Insulated Pipe Supports in Part 2.

2.22 PIPE ANCHORS

A. Unless otherwise indicated, anchors shall be Type C Insulated Pipe Supports. Refer to Insulated Pipe Supports in Part 2.

B. Contractor may propose to utilize contractor-fabricated anchors. Use of contractor-fabricated anchors is subject to approval of appropriate submittal data. Submit anchor system detail drawings, bearing stamp of Structural Engineer registered in project jurisdiction for approval. Anchors shall be engineered to withstand static and dynamic forces with minimum safety factor of 3.0. Submit insulation details addressing thermal break from building structure and vapor barriers.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install supports to allow for free expansion of piping. Support piping from building structural members using concrete inserts, beam clamps, ceiling plates, wall brackets, or floor stands. At no time shall hangers and supports overload building structural members. Fasten ceiling plates and wall brackets securely to structure and test to demonstrate adequacy of fastening.

B. Select and size building attachments properly in accordance with MSS Standards and manufacturer's published load rating information.

C. Coordinate hanger and support installation to properly group piping of all trades.

D. Suspend piping hangers by means of hanger rods. Perforated band iron and flat wire (strap iron) are not allowed.

E. Piping and ductwork shall be supported independently from other piping or ductwork.

F. Pipe hangers and supports shall not penetrate vapor barrier of pipe insulation.

G. Do not support equipment, or piping from metal roof decking or ceiling grid.

H. Install adequate supports so as not to over stress either piping or equipment to which piping is connected.

I. Refer to Section 23 00 00 - General Mechanical Requirements for requirements of personnel injury protection guards for supporting devices.

J. Where pipe weight-distributing shields are installed exposed in open spaces, firmly affix shields to insulated piping at minimum two points with zip ties to prevent shields from shaking loose and falling.

3.02 HANGER AND SUPPORT SPACING

A. Space pipe hangers and supports for horizontal pipe accordance with the following schedule, with exceptions as indicated herein:

B. Steel Pipe (Standard Weight and Extra Strong):

Pipe Size	Max Spacing
1-1/4" (32 mm) and smaller	7 ft (2.1 m)
1-1/2" (40 mm)	9 ft (2.7 m)
2" (50 mm)	10 ft (3.0 m)
2-1/2" (65 mm)	11 ft (3.3 m)
3" (80 mm)	12 ft (3.6 m)
4" (100 mm)	14 ft (4.2 m)
6" (150 mm)	17 ft (5.1 m)
8" (200 mm)	19 ft (5.8 m)
10" (250 mm) and larger	20 ft (6.0 m)

C. Steel Pipe (Standard Weight and Extra Strong):

Pipe Size	Max Spacing
1-1/4" (32 mm)	7 ft-0" (2.1 m)
1-1/2" (40 mm)	9 ft-0" (2.7 m)
2" (50 mm)	10 ft-0" (3.0 m)
2-1/2" (65 mm)	11 ft-0" (3.3 m)
3" (80 mm)	12 ft-0" (3.6 m)

D. Copper Tube (Unless Otherwise Noted):

Pipe Size	Max Spacing
3/4" (19 mm) and smaller	5 ft (1.5 m)
1" (25 mm) 1-1/4" (32 mm)	6 ft (1.8 m)
1-1/2" (40 mm)2-1/2" (65 mm)	8 ft (2.4 m)
3" (80 mm) and larger	10 ft (3.0 m)

E. Plastic Pipe

(1) PP-R Pipe:

Pipe Size	Max Spacing
2" (50 mm) and smaller	4 ft (1.2 m)
3" (80 mm)	6 ft (1.8 m)

(2) PEX-a Pipe:

Pipe Size	Max Spacing
3" (80 mm) and smaller	2 ft-8" (810 mm)

(a) Pipe can be supported with PEX-a Pipe Channel as an alternate. Spacing for supports with pipe channel shall be 6 ft (1.8 m) for pipes 3/4" (19 mm) and smaller and 8 ft (2.4 m) for pipes 1" (25 mm) and larger.

(b) Provide copper tube size riser clamps at base of each floor and at top of every other floor with mid-floor guides for hot water systems.

(c) Provide copper tube size riser clamps at base of each floor and top of every 4 floors with mid-floor guides for cold water systems.

(3) Support plastic pipe at all changes of direction. Adequate consideration shall be given to piping expansion.

F. Maximum spacing shown above may be restricted by strength of attachment to building structure. Submit data with calculations with published load ratings showing attachment to be utilized and maximum spacing allowable for that type of attachment and pipe size.

G. Spacing less than indicated above may be required to conform to building structure design or loading limitations.

H. Spacing less than indicated may be required depending on compressive strength of pipe insulation and insulated pipe supports.

I. If pipe size changes between support points, maximum spacing shall be based on the smaller pipe size.

J. If trapeze hangers are used to support multiple services, spacing shall be based on the most restrictive pipe size and material on trapeze hanger.

K. For non-metallic pipe, follow manufacturer's installation recommendations in addition to requirements noted herein.

L. Install supports for vertical piping and anchors as recommended by pipe manufacturer.

M. Place hangers and supports to meet requirements of Section 23 21 16 - Pipe and Pipe Fittings or specific pipe system sections, with regard to pitch for drainage and venting and clearance between services.

N. Hangers and supports shall bear on outside of insulation when pipes are to be insulated.

O. Place hangers and supports within 1 ft (0.3 m) of each fitting, such as elbows and tees, and at each valve, strainer, and other piping specialty for piping 4" (100 mm) and larger.

P. Place hanger or support at first elbow upstream of pump inlet and first elbow downstream of pump outlet.

3.03 RISER SUPPORTS

A. Insulated Piping:

(1) Unless otherwise indicated, support vertical piping as indicated below:

(2) Support vertical piping at _____ of riser, secured and anchored to building structure. Provide guides on vertical piping. Use spring hangers at _____ of riser and at take offs from riser at each floor. Use spring hangers for minimum 3 hangers away from top and bottom elbows and from each take off at riser.

(3) Guide vertical piping 2-1/2" (65 mm) and smaller at every floor. Guide 2-1/2" (65 mm) and larger at every other floor. Spring hangers (Type 6) and guides (Type VSG) are specified in Section 23 05 50 - Vibration Isolation.

B. Bare Piping:

(1) Unless otherwise indicated, maximum vertical support spacing for ambient bare steel and cast-iron pipes shall be 15 ft (4.6 m).

(2) Maximum vertical support spacing for other piping including copper tubing and plastic piping shall be 10 ft (3 m).

(3) Install riser clamps and intermediate supports as required.

(4) Rest riser clamps on floor or on pipe sleeve.

(5) Bare piping above 120°F (50°C) such as steam vents shall be supported per insulated piping requirements.

3.04 INSULATED PIPE SUPPORTS APPLICATION

A. Install insulated pipe support at each support point of insulated pipe.

B. Pipe Size 1-1/2" (40 mm) and Smaller:

(1) Use Type A insulated pipe support. Pipe insulation specified in Section 23 07 00 - Mechanical Systems Insulation shall be continuous through support points.

(2) Use one shield (bottom) for clevis hanger.

(3) Use 2 shields (top and bottom) for roller hanger/support or strap/clamp support. Apply 2 metal straps to hold top and bottom shields onto insulation jacket.

(4) Type B or Type C insulated pipe supports may be used in lieu of Type A support.

C. Pipe Size 2" (50 mm) through 5" (125 mm):
   (1) Use Type B insulated pipe supports. Refer to Part 2 for acceptable products.
   (2) Type C insulated pipe supports may be used in lieu of Type B supports.
D. Pipe Size 6" (150 mm) and Larger:
   (1) Use Type C insulated pipe supports. Refer to Part 2 for applicable products.

3.05 PIPE FLOOR SUPPORTS

A. Unless specifically shown otherwise, use adjustable pipe saddle supports with associated stanchion similar to Anvil Fig. 264/63. Select supports properly for weight and height of pipe stand.

3.06 CONCRETE INSERTS

A. Concrete insert application, size, loading, and placement shall be this Contractor’s responsibility.
B. Coordinate placement of inserts before concrete pour. Minimize use of inserts and anchors after concrete pour.

3.07 BEAM CLAMPS

A. Provide locknut for hanging rod at clamp.
B. C-clamps are allowed for rod size 3/8" (9 mm) or smaller and only for static loading such as air piping, cold water piping, fire protection piping and, other similar piping. C-clamps are not allowed for hot water piping and steam and steam condensate piping, except hot water runouts to terminal heating devices.
C. C-clamps are not allowed for open web steel joist application.
D. C-clamps are not allowed for seismic application.

3.08 TRAPEZE SUPPORTS

A. Construct trapeze supports with struts, angles, or channels and hang them by inserts or welded beam attachments and rods.
B. If trapeze supports are used to support multiple services, support spacing shall be based on the most restrictive pipe size and material on trapeze supports.
C. Refer to Part 1, Design Criteria for maximum deflection allowed for trapeze supports.

3.09 PIPE MOUNTING PEDESTALS

A. Use for all piping on roof. Install bottom of pedestal flat on roof deck, insulate exterior of pedestal, flash, and counter flash.

3.10 EQUIPMENT RAILS

A. Provide equipment rails with sufficient height to provide code required space for roof servicing below the supported equipment.
B. Provide supplemental roof/structure framing for the required anchoring of the rail bases per wind load requirements.
C. Provide supplemental lateral wind bracing between rails when supporting outdoor condensing units or similar items to meet wind load design requirements.
D. Flashing shall be by Division 07. Provide counter flashing as specified and secure to wood nailer with stainless steel truss head screws.

3.11 CONCRETE ANCHORS

A. Anchor application, size, and placement shall be Contractor’s responsibility.

3.12 PIPE ROOF PENETRATION PROTECTIONS

A. Install at points where pipes are penetrating roof. Install as shown and according to manufacturer's installation instructions.

3.13 PIPE GUIDES

A. Install where shown on drawings.
B. For manufactured expansion devices, install minimum of 2 pipe guides at each side of manufactured pipe expansion device. Locate first guide no more than 4 pipe diameters from expansion device and second guide at 14 pipe diameters from first guide. Install intermediate guides in accordance with guide spacing data recommended by manufacturer or the following table, whichever is more stringent.

MAXIMUM DISTANCE BETWEEN INTERMEDIATE GUIDES				
Pipe Size	**Pipe Operating Pressure**			
	0-50 psig (0-345 kPa)	51-100 psig (350-690 kPa)	101-150 psig (695-1035 kPa)	151-200 psig (1040-1380 kPa)
3" (80 mm)	21 ft (6.4 m)	19 ft (5.8 m)	17 ft (5.2 m)	16 ft (4.8 m)
4" (100)	35 ft (10.6 m)	29 ft (8.8 m)	25 ft (7.6 m)	22 ft (6.7 m)

MAXIMUM DISTANCE BETWEEN INTERMEDIATE GUIDES				
Pipe Size	**Pipe Operating Pressure**			
6" (150 mm)	57 ft (17.0 m)	44 ft (13.0 m)	37 ft (11.0 m)	32 ft (9.7 m)
8" (200 mm)	66 ft (20.0 m)	52 ft (15.0 m)	45 ft (13.0 m)	40 ft (12.0 m)
10" (250 mm)	91 ft (27.0 m)	69 ft (21.0 m)	58 ft (17.0 m)	51 ft (15.0 m)
12" (300 mm)	107 ft (32.0 m)	79 ft (24.0 m)	66 ft (20.0 m)	58 ft (17.0 m)
14" (350 mm)	115 ft (35.0 m)	85 ft (25.0 m)	71 ft (21.0 m)	62 ft (18.0 m)
16" (400 mm)	127 ft (38.0 m)	94 ft (28.0 m)	78 ft (23.0 m)	68 ft (20.0 m)

C. If anchor is located within 4 pipe diameters from expansion joints, guides need not be installed on anchor side.

3.14 PIPE ANCHORS

A. Install anchors where shown on drawings or in conjunction with expansion joints, loops and swing joints as required to allow proper expansion and contraction of piping without damage to structure, equipment or piping.

B. Do not anchor piping to concrete block walls, wood, or partition walls.

END OF SECTION 23 05 29

SECTION 23 05 50 - VIBRATION ISOLATION

PART 1 GENERAL

1.01 RELATED WORK

A. Section 20 0529 - Piping and Equipment Supporting Devices

B. Section 23 3314 - Ductwork Specialties (Duct Flexible Connections)

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESIGN CRITERIA

A. Isolate all motor driven mechanical equipment, unless otherwise noted, from building structure, and from systems that they serve, to prevent equipment vibrations from being transmitted to structure. Unless specifically indicated, follow the latest edition of ASHRAE Application Handbook - Sound and Vibration Control, or manufacturer's recommendations for isolator selection whichever is more stringent.

B. Select and locate isolators to produce uniform loading and deflection. Use minimum of 4 isolators to support each piece of equipment.

C. Select vibration isolation devices based on the lowest operating speed of equipment.

D. Vibration Criteria:

(1) All rotating equipment shall operate at speeds less than 80% of their true critical speed. Unless otherwise required, equipment shall be balanced according to recommendations given in the following schedules.

(2) Vertical vibration of rotating equipment shall not be greater than levels indicated. Vibration shall be measured on equipment. If equipment has inertia base, allowable vibration level is reduced by ratio of equipment weight alone to equipment weight plus inertia base weight.

	Maximum Allowable
Equipment Speed	Vibration Displacement
rpm	Peak-to-Peak (mil)
100 to 200	10
200 to 300	6
300 to 600	4
600 to 1000	3
1000 or 2000	2
over 2000	1

E. Following field installation, each fan and pump over 25 hp shall be balanced in accordance with the following maximum rms velocity levels:

(1) Fans: 0.15 inch (3.81 mm)/sec

(2) Pumps:

0.16 inch (4.06 mm)/sec	for 30 hp and smaller
0.18 inch (4.57 mm)/sec	for 40 through 60 hp
0.20 inch (5.08 mm)/sec	for 75 through 100 hp

1) Allowable field pump vibration values above are based on HI 9.6-2000, Figure 9.6.4.12.

F. Final in-field balance shall be measured with each fan over 25 hp installed on springs specified for unit. Fans shall be loaded with design static pressure. Measurement shall be carried out in vertical, horizontal and axis planes at impeller shaft bearing location.

G. Submittals in PDF format shall be organized using PDF bookmarks per detailed instructions on assembling submittal packages identified under Submittal Requirements section of 20 0000.

1.04 SUBMITTALS

A. Submit Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name

(2) Isolator type and model number

(3) Materials of construction and finish

(4) Dimensional data

(5) Load ratings (lbs)

(6) Isolator free and operating heights
(7) Static deflections
(8) Isolation efficiency based on lowest operating speed
(9) All other appropriate data

1.05 SUPERVISION, INSPECTION AND CERTIFICATION

A. Vibration isolation manufacturer or qualified representative shall provide supervision to assure correct installation and adjustment of isolators. Upon completion of installation and after system is put into operation, manufacturer or manufacturer's representative, shall make final inspection, adjustment, and submit report to Engineer in writing, certifying correctness of installation and compliance with Specifications.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials used shall retain their isolation characteristics for life of equipment served. Elastomeric materials shall comply with ASTM D2240 and shall be oil-resistant industrial grade neoprene.

B. Isolators shall be treated to resist corrosion.

C. Isolation devices subject to weather shall have either hot-dip or cold-dip galvanized, cadmium plated, or neoprene coated finish after fabrication and be furnished with limit stops to resist wind.

D. Vibration isolator springs shall have minimum additional travel to solid equal to 50% of rated deflection.

E. Ratio of lateral to vertical stiffness of vibration isolators shall not be less than 0.8 or greater than 2.0.

F. Coordinate selection of devices with isolator and equipment manufacturer.

2.02 MANUFACTURERS

A. Mason Industries, Amber/Booth Co., Aeroflex-VMC-Korfund. Vibration Eliminator, Vibro-Acoustics, or Kinetics equal to manufacturer's model listed, except flexible pipe connections.

B. Mason, Metraflex, Proco, Twin City Hose, Engineered Flexible Products (EFP) or Flex-Weld/Keflex for flexible pipe connections.

2.03 TYPE 1 MOUNTS (NEOPRENE PAD)

A. Mason Type Super W, neoprene waffle pads, 50 durometer. Select number and size of pads as required to accept equipment operating weight evenly.

2.04 TYPE 2 MOUNTS (NEOPRENE PAD)

A. Mason Type ND, Mason Type HD, or rails Type RND, double deflection neoprene mounts or hangers with cast-in metal inserts for bolting to equipment.

B. Both surfaces shall be rib molded for skid resistance. On equipment such as small vent sets and close coupled pumps, steel rails shall be used above mountings to compensate for overhang.

2.05 TYPE 3 MOUNTS (UNHOUSED SPRING WITH NEOPRENE)

A. Mason Type SLF, combination spring and neoprene with rib molded base. Spring type isolators shall be free standing and laterally stable without any housing and complete with 1/4" neoprene acoustical friction pads between baseplate and support.

B. Mountings shall have leveling bolts rigidly bolted to the equipment. Spring diameters shall be no less than 0.8 of compressed height of spring at rated load.

2.06 TYPE 4 MOUNTS (RESTRAINED SPRING WITH NEOPRENE)

A. Mason Type SLR, combination spring and neoprene with rib molded base similar to Type 3 above, but shall have housing that includes vertical limit stops to prevent spring extension when weight is removed.

B. Installed and operating heights shall be the same. Maintain minimum clearance of 1/2" around restraining bolts and between housing and spring so as not to interfere with spring action. Limit stops shall be out of contact during normal operations. Use height saving brackets.

2.07 TYPE S BASES (STEEL BASE)

A. Mason Type WF, structural steel bases, rectangular in shape for all equipment other than centrifugal refrigeration machines and pump bases which may be "T" or "L" shaped. Pump bases for split case pumps shall include supports for suction and discharge base ells. Perimeter members shall be beams with minimum depth equal to 1/10 of longest base span between isolators, but not less than 4". Beam depth need not exceed 14" provided that deflection and misalignment is kept within acceptable limits as determined by manufacturer. Employ height saving brackets in all mounting locations to provide base clearance of at least 1" above floor or housekeeping pad.

2.08 TYPE I BASES (INERTIA BASE)

A. Mason Type K, or BMK rectangular or T shaped structural beam or channel concrete forms for floating foundations. Bases for split case pumps shall be large enough to provide support for suction and discharge base ells. Base depth need not exceed 12" unless specifically recommended by base manufacturer for mass, rigidity or component alignment. Base depth shall be a minimum of 1/10 of longest base span between isolators, but not less than 6". Forms shall include concrete reinforcement bars welded in place running both ways. Furnish forms with drilled steel members with sleeves welded below holes to receive equipment anchor bolts where anchor bolts fall in concrete locations. Employ height saving brackets in all mounting locations to maintain base clearance of at least 1" above floor or housekeeping pad.

2.09 TYPE 5 HANGERS (SPRING HANGER WITH NEOPRENE)

A. Mason Type 30N, vibration hangers with steel spring and neoprene element in series. Neoprene element shall be molded with rod isolation bushing that passes through hanger box. Spring diameters and hanger box lower hole sizes shall be large enough to permit hanger rod to swing through 30□ arc before contacting hole and short circuiting spring.

B. Mason Type DNHS may be used where load rating and specified deflection cannot be accommodated by Type 30N.

2.10 TYPE 6 HANGERS (PRECOMPRESSED SPRING HANGER WITH NEOPRENE)

A. Mason Type PC30N, vibration hangers similar to Type 5, but precompressed to rated deflection so as to keep piping or equipment at fixed elevation during installation. Design hangers with release mechanism to free spring after installation complete and hanger is subjected to its full load.

2.11 TYPE 7 HANGERS (SPRING HANGER WITH DEFLECTION INDICATOR)

A. Mason Type HES, steel spring in steel housing including deflection indicator scale. Hangers shall be preset at factory for required load. Select hangers so that actual loads do not exceed rated capacities (lbs).

B. Submittals shall include isolator rated deflection, required deflection and supporting calculation. Calculations shall be made by registered mechanical or civil engineer demonstrating structural adequacy of hanger and that hanger connections to building and pipe are adequate for live and dead loads encountered.

2.12 TYPE 8 HANGERS (SPRING HANGER WITH NEOPRENE)

A. Mason Type 30, W30, or PC30 steel spring located in neoprene cup manufactured with grommet to prevent short-circuiting of hanger rod. Neoprene cup to contain steel washer designed to properly distribute load on neoprene and prevent its extrusion. Spring diameters and hanger box lower hole size to be large enough to permit hanger rod to swing through 30□ arc before contacting hole and short-circuiting spring. Provide hangers with rod attachments or eyebolts on spring end.

2.13 TYPE AG PIPE ANCHORS/GUIDES

A. Mason Type ADA all-directional acoustical pipe anchors and Type VSG guides for vertical piping consisting of telescopic arrangement of 2 sizes of steel tubing separated by minimum 1/2" thickness of heavy duty neoprene and neoprene isolation material. Vertical restraints shall prevent vertical travel in either direction. Allowable loads on isolation materials shall not exceed 500 psi (3447.38 kPa) and design shall be balanced for equal resistance in any direction.

B. Submittals shall include supporting calculations by registered mechanical or civil engineer indicating anchor/guide loads and isolator selection.

2.14 TYPE T THRUST RESTRAINTS

A. Mason Type WB, horizontal thrust restraint consisting of spring element in series with neoprene pad as described for Type 3 mounts with the same deflection as specified for mountings or hangers. Spring element shall be contained within steel frame and designed so it can be preset for thrust at factory and adjusted in field for maximum of 1/4" movement at start and stop. Furnish thrust restraints complete with rods and angle brackets for attachment to both equipment and ductwork or equipment and structure. Attach horizontal restraints at centerline of thrust and symmetrically on either side of unit.

2.15 FLEXIBLE PIPING CONNECTORS

A. Flexible connectors shall be suitable for pressure, temperature and fluid involved, but not less than 215 psig (1482.37 kPa) working pressure at 250°F for 14” and smaller and 150 psi (1034.21 kPa) working pressure at 250□F for 16” and larger.

B. Flexible connectors shall be straight pipe configuration and shall not be used to replace pipe fittings such as elbows.

C. Where metal braided covered flexible connector is utilized, minimum live length of flexible connector shall be as follows.

Nominal Pipe Diameter (in)	Minimum Live Length (in)
2-1/2” and smaller	12”

3” and 4”	18”
5” and larger	24”

D. Water System:

(1) Connection to Rotating Equipment:

(a) Connectors shall consist of Kevlar or Nylon tire cord fabric reinforced with EPDM cover and liner. Solid steel rings or steel wire shall be used within raised face rubber flanged ends to prevent pullout. Furnish connectors with control rods only where recommended by connector manufacturer.

(b) 2" and Smaller: Threaded connections, single sphere design similar to Mason SAFEFLEX SFU.

(c) 2-1/2" and Larger: Floating steel flange connections, two sphere design with ductile iron or plated carbon steel reinforcing rings, similar to Mason SAFEFLEX SFDEJ. Single sphere design similar to Mason SAFEFLEX SFEJ, may be used for 14" and larger.

(2) Connection to Non-rotating Equipment Mounted on Vibration Isolators:

(a) Seamless corrugated bronze or stainless steel flexible connector with braided cover for 2" and smaller with threaded or flanged connections; seamless corrugated stainless steel flexible connector with braided cover for 2-1/2" and larger with flanged connections.

E. Steam and Condensate:

(1) Seamless corrugated stainless steel flexible connector with braided cover for 2" and smaller with threaded or flanged connections; seamless corrugated stainless steel flexible connector with braided cover for 2-1/2" and larger with flanged connections.

F. Compressed Air Systems:

(1) Seamless corrugated bronze flexible connector with bronze wire braided cover for copper piping and seamless corrugated stainless steel flexible connector with braided cover for steel piping. Connector ends shall be threaded, soldered, or flanged to match piping system valve ends.

G. Do not provide flexible piping connectors for compressed air piping.

2.16 PERFORMANCE

A. Select vibration isolation devices to achieve either minimum 95% isolation efficiency or minimum static deflection and mounting requirements listed below, whichever is greater. Minimum static deflections listed below are not nominal but certifiable minimums with actual installed load. Unless otherwise indicated, apply requirements listed for floor mount for roof-mounted equipment.

TYPE OF EQUIPMENT	
REFRIGERATION MACHINES (HEAT RECOVERY CHILLER):	
SCREW	**MOUNT ON AIR SPRINGS SIMILAR TO MASON INDUSTRIES TYPE SLR-MAS OR SLR-MT, OR MARSH MELLOW MOUNTS SIMILAR TO NOVIA TYPE RSM-MM, WITH A MAXIMUM NATURAL FREQUENCY OF 2.6 HZ.**
BOILERS:	**USE TYPE 1 MOUNT WITH MINIMUM DEFLECTION OF 0.25”.**
CHILLED WATER AND HOT WATER PUMPS:	
INLINE – FLOOR SUPPORTED	**MECHANICAL LEVEL: SUPPORT INLINE PUMPS BY PIPE STANDS OR SUPPORT FRAME AS SHOWN. STANDS AND SUPPORTS SHALL BE MOUNTED TO TYPE 3-I INERTIA BASE WITH MINIMUM STATIC DEFLECTION OF 1.5”. PROVIDED SPRING HANGERS FOR CONNECTED PIPING AS SPECIFIED IN THIS SECTION.** **GROUND LEVEL (IMAGING CHILLED WATER PUMPS): PROVIDE TYPE 2 NEOPRENE MOUNTS, SELECTED TO ACHIEVE MINIMUM 0.35” STATIC DEFLECTION UNDER LOAD. PROVIDED SPRING HANGERS FOR CONNECTED PIPING AS SPECIFIED IN THIS SECTION.**
INLINE – CEILING HUNG	**PUMPS GREATER THAN 5 HP SHOULD BE SUSPENDED WITH TYPE 5 HANGERS, SELECTED TO ACHIEVE MINIMUM 1.5” STATIC DEFLECTION UNDER LOAD. PROVIDED SPRING HANGERS FOR CONNECTED PIPING AS SPECIFIED IN THIS SECTION.** **PUMPS 5 HP OR LESS SHOULD BE SUSPENDED WITH TYPE 5 HANGERS, SELECTED TO ACHIEVE MINIMUM 0.75” STATIC DEFLECTION UNDER LOAD. PROVIDED SPRING HANGERS FOR CONNECTED PIPING AS SPECIFIED IN THIS SECTION.**

TYPE OF EQUIPMENT	
PLUMBING WATER TREATMENT SKID AND **DOMESTIC WATER BOOSTER PUMP**	**USE TYPE 2 MOUNT WITH MINIMUM STATIC DEFLECTION OF 0.35".**
LAB AIR COMPRESSOR AND LAB VACUUM PUMP	**USE TYPE 2 MOUNT WITH MINIMUM STATIC DEFLECTION OF 0.35".**
DOMESTIC HOT WATER RECIRCULATION PUMP	**USE TYPE 5 HANGERS WITH MINIMUM STATIC DEFLECTION OF 0.75".**
DISTRIBUTION TRANSFORMERS	**USE TYPE 2 MOUNT WITH MINIMUM STATIC DEFLECTION OF 0.25".**
HYDRONIC EQUIPMENT CONNECTED TO ISOLATED PIPING SYSTEMS (EXPANSION TANKS, STORAGE TANKS, HEAT EXCHANGERS, ETC)	**USE TYPE 2 MOUNTS OR HANGERS WITH MINIMUM DEFLECTION OF 0.25"**
UTILITY SET FANS:	
ROOF MOUNTED	**USE TYPE 4 MOUNT WITH MINIMUM DEFLECTION OF 1.5".**
AHU FAN ARRAYS	
FLOOR MOUNTED	**USE TYPE 3 MOUNT WITH MINIMUM DEFLECTION OF 1.5".**
AIR HANDLING UNITS	**INSTALL THE AHU EXTERIOR CASING ON TYPE 1 NEOPRENE PADS, SELECTED TO ACHIEVE MINIMUM 0.1" STATIC DEFLECTION UNDER LOAD.**
FAN COIL UNITS	**TYPE 5 WITH MINIMUM DEFLECTION OF 0.75".**
UNIT HEATERS	**TYPE 2 WITH MINIMUM DEFLECTION OF 0.25"**
PIPING CONNECTED TO ROTATING OR RECIPRO-EQUIPMENT:	**USE FLEXIBLE PIPING CONNECTIONS, AND TYPE 6 HANGERS FOR DISTANCE OF 100 PIPE DIAMETERS OR 50 FT AWAY FROM EQUIPMENT, WHICHEVER IS GREATER. HANGERS SHALL HAVE MINIMUM DEFLECTION OF 0.75" FOR PIPE SIZES 3" AND SMALLER, 1.5" FOR PIPE SIZES 4" THROUGH 6" AND 2.5" FOR PIPE SIZES 8" AND LARGER. FOR PIPING LESS THAN 2" IN DIAMETER, NEOPRENE OR FELT PAD INSERTED BETWEEN PIPE OR PIPE COVERING AND CLAMP OR HANGER MAY BE USED IN LIEU OF TYPE 6 HANGERS.** **FLEXIBLE PIPING CONNECTION SHALL NOT BE USED FOR UNIT HEATERS AND IN-LINE PUMPS THAT ARE SUPPORTED BY CONNECTED PIPES. TYPE 6 HANGERS WITH 1" MINIMUM DEFLECTION SHALL BE APPLIED WITHIN ONE FOOT OF BOTH SIDES OF IN-LINE PUMP AND FOR DISTANCE OF 100 PIPE DIAMETERS OR 50 FT AWAY FROM FIRST HANGER AT IN-LINE PUMP, WHICHEVER IS GREATER.** **WHERE PIPING IS FLOOR-SUPPORTED, ABOVE REQUIREMENTS SHALL APPLY, BUT USE TYPE 3 MOUNTS INSTEAD OF HANGERS.**
VERTICAL PIPE RISERS:	**USE TYPE 6 HANGERS, TYPE AG ANCHORS AND GUIDES. REFER TO SECTION 20 0529 - PIPING AND EQUIPMENT SUPPORTING DEVICES FOR ADDITIONAL RISER SUPPORT REQUIREMENTS.**

TYPE OF EQUIPMENT	
DUCTWORK IN MECHANICAL EQUIPMENT ROOMS:	**USE TYPE 8 HANGERS WITH 0.75" MINIMUM DEFLECTION FOR DUCTS WITH CROSS SECTIONAL AREA GREATER THAN 2.0 SQ FT AND WHERE AIR VELOCITY IS GREATER THAN 2000 FPM FOR DISTANCE 50 FT FROM FAN.**
MRI QUENCH VENT	**USE TYPE 2 HANGERS FOR ALL SUPPORTS, SELECTED TO ACHIEVE 0.25-INCH MINIMUM STATIC DEFLECTION UNDER LOAD.**

PART 3 EXECUTION

3.01 INSTALLATION

A. Install and adjust vibration isolation devices as specified, as shown on drawings and according to manufacturer's recommendations.

(1) Adjust isolators after piping system is at operating weight.

(2) Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

(3) Adjust active height of spring isolators.

(4) Adjust restraints to permit free movement of equipment within normal mode of operation.

(5) Adjust air-spring leveling mechanism.

B. In no case shall installation short circuit isolation devices.

3.02 INERTIA BASES (TYPE I BASES)

A. Provide required concrete for inertia bases. Refer to Section 20 0000 - General Mechanical Requirements for concrete work.

B. Raise inertia bases to final elevation with temporary blocking prior to making piping connections to pumps or ductwork connections to fans. After connections are complete, install vibration isolators in accordance with manufacturer's installation instructions.

3.03 FLEXIBLE PIPING CONNECTIONS

A. Provide flexible connections for piping connected to rotating or reciprocating equipment, equipment such as coils mounted on vibration isolators, and as indicated on plans and details.

B. Piping connected to coil which is in assembly where fan is separately isolated by vibration isolators and duct flexible connections does not require flexible piping connectors or piping vibration hangers.

C. Piping connected to steam heating coils in floor mounted air handling units where coils are supported without vibration isolation shall have flexible piping connections and piping vibration hangers to prevent thermal stress in piping system from damaging the coils.

D. Install flexible connections on equipment side of shut off valves and horizontal and parallel to equipment shafts where applicable.

E. For non-metallic flexible piping connections, 2-1/2" and larger, use flange type recommended by manufacturer. Flanges for mechanical grooved connections are not allowed.

END OF SECTION 23 05 50

SECTION 23 05 94 - WATER SYSTEMS TEST ADJUST BALANCE

PART 1 GENERAL

1.01 RELATED WORK

A. Section 23 0901 - Control Systems Integration

B. Section 23 0993 - Control Sequences

C. Section 23 2118 - Valves (balancing valves)

D. Section 23 2120 - Piping Specialties (flow measure devices)

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESCRIPTION

A. This Contractor shall be responsible for providing complete testing, adjusting and balancing (TAB) work for HVAC hydronic systems, such as chillers, pumps, convertors and other processes included in this project.

B. Work required shall consist of setting volume flow rates and adjusting speed controls, recording data, making tests, and preparing reports, as specified herein.

C. Scope of work includes TAB of new work specified herein and includes all equipment, distribution systems, and terminal units connected.

D. TAB work shall be performed by persons trained in TAB work and certified by Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB). Procedures shall be in accordance with the latest edition of AABC, NEBB or TABB Standards, ASHRAE - 2015 HVAC Applications Chapter 38, and as detailed herein.

E. Mechanical Contractors who are members of AABC, NEBB or TABB and who have qualified personnel available to perform work may submit Quality Assurance Submittal for approval. Mechanical Contractors who cannot meet these requirements shall subcontract with independent TAB Contractor who meets these requirements. TAB subcontractor shall prepare Quality Assurance Submittal for Contractor who will submit it for approval.

F. Upon direction of Architect/Engineer or TAB subcontractor, Mechanical Contractor shall provide at no additional cost to Owner, any additional work and/or devices necessary to properly balance system, including calibrated balancing valves, gauge tappings, flow sensors, and thermometer wells. Mechanical Contractor shall be responsible for trimming and balancing pump impellers as necessary to obtain design pump flow rates at the minimum pressure differential.

G. TAB work shall not proceed until all assigned personnel have been approved by Architect/Engineer via Quality Assurance Submittal. Coordinate each phase of TAB work with overall project schedule. Each phase of TAB work shall be done in timely manner as detailed herein. Fieldwork must be completed before occupancy. Certificate of Substantial Completion shall not be issued until after Final Report is accepted by Architect/Engineer.

1.04 SUBMITTALS

A. General:

(1) Make submittals in accordance with project submittal procedure.

(2) Reports shall be assembled using bookmarked electronic PDF format. Use pre-printed forms of NEBB, AABC or TABB wherever possible. Assemble report in the following order:

(a) Transmittal letter

(b) Cover sheet with project title, location, submittal date, and name and addresses of Owner, Mechanical Contractor, TAB subcontractor, Architect, and Engineer

(c) Index listing major systems

(d) Data organized by system in the following order:

1) Equipment data and measurement summary

2) Equipment measurement data

3) Branch main measurement data

4) Terminal device measurement data arranged by room or zone

B. Quality Assurance Submittal:

(1) Within 30 days of signing contract, Contractor shall submit the following information:

(a) Firm resume

1) AABC, NEBB or TABB active membership certificate

2) Names of 3 recent relevant completed projects along with project address, Owner's contact person, supervising design professional

(b) Supervisor resume

(c) Balance technicians resumes

(2) Architect/Engineer and/or Owner reserves the right to contact previous project representatives and to reject persons whom Architect/Engineer and/or Owner feel are not qualified for this project due to lack of relevant experience or problems on previous projects.

C. Planning Report:

(1) Submit Planning Report as detailed in Part 3 of this Section to demonstrate to Architect/Engineer and Owner that proper procedures are being followed. Submit Planning Report after Quality Assurance submittal and 30 days before any fieldwork starts.

D. Initial Test Report:

(1) Prior to starting Final Balance Phase, submit Initial Test Report as detailed in Part 3 of this Section to indicate to Architect/Engineer and Contractor incomplete work or problem areas to be resolved before final balance is completed.

E. Final Report:

(1) Within 30 days after fieldwork is completed, submit Final Report as detailed in Part 3 of this Section to assure design objectives are met and to assist Owner in future maintenance.

1.05 REFERENCE STANDARDS

A. Refer to the latest publications of NEBB, AABC, TABB and ASHRAE publications for establishing required procedures.

PART 2 PRODUCTS

2.01 INSTRUMENTATION

A. Provide required instrumentation to obtain proper measurements. Application of instruments and accuracy of instruments and measurements shall be in accordance with requirements of NEBB or AABC or TABB Standards and instrument manufacturer's specifications.

B. Instruments used for measurements shall be accurate, and calibration histories for each instrument shall be available for examination by Architect/Engineer upon request. Calibration and maintenance of all instruments to be in accordance with requirements of NEBB, AABC or TABB Standards.

PART 3 EXECUTION

3.01 GENERAL

A. TAB work shall be done in separate phases as outlined herein. TAB schedule shall allow ample time to complete TAB work before occupancy. Follow procedures outlined herein and as described in Planning Phase narratives.

B. Unless otherwise specified, maximum acceptable offset tolerance shall be ± 10% of design flow rates indicated on drawings and schedules.

3.02 PLANNING PHASE

A. Procedure:

(1) Obtain the latest Contract Documents including addenda, construction bulletins and change orders. Obtain shop drawings and performance curves from Mechanical Contractor for pumps, flow measuring devices, and terminal devices. Prepare Planning Report as detailed herein. Make adjustments in Planning Report and/or measuring instrument calibration.

B. Planning Report:

(1) Planning Report shall contain the following minimum requirements.

(2) Narratives: Furnish written narratives of procedures to be used. Include separate narratives for each pump and liquid fluid handling system. Identify flow-measuring devices to be used at each pump and terminal device. Include different narratives for constant and variable flow systems. Narratives shall include references to published standards of NEBB or AABC. Narratives shall include measuring instruments to be used and ranges required for each procedure. Narratives shall include specified adjustment tolerances.

(3) Prebalance Checklist shall include, but not be limited to:

(a) Check for completeness of work

(b) System cleaning

(c) System fill and air venting

(d) Place system into operation

(e) Check expansion tanks and fill pressures

(f) Pump bearings, alignment, starters, vibration isolators, rotation

(g) Setting valves to proper position including shut-off and bypass valves

(h) Set up of controls and control devices

(4) Measuring Instrument List: List of measuring instruments will be used for each procedure. Indicate ranges required for each procedure. Provide data on each measuring instrument to be used. This data shall include:

(a) Manufacturer name and model number

(b) Measurement range

(c) Pressure/temperature limits

(d) Date put into service

(e) Date of last calibration

(f) Certificate from calibration firm

(5) Architect/Engineer reserves the right to request adjustments in any procedure and/or ask for recalibration of any measuring instrument that has not been recalibrated within past year.

(6) Samples: Submit copies of TAB forms to be used.

(7) Branch circuit and terminal measurements and adjustments: Indicate on pre-printed forms all measurements to be taken and adjustments to be made in field. Include branch circuit or terminal identification, system, space served, location, design flow rates (including zone and system summaries), and flow measuring device size, type, Cv, and manufacturer. Indicate the initial set points on forms.

3.03 SET-UP PHASE

A. Procedure:

(1) Perform prebalance checkout as per Planning Phase narrative.

B. Initial Test:

(1) Measure pump data and flow rates in "as found" condition after initial valve settings are made.

C. Initial Test Report:

(1) Submit report to Architect/Engineer and Mechanical Contractor indicating measurements made and including notes of items that are not complete or are not within design tolerance.

3.04 FINAL BALANCE PHASE

A. Procedure:

(1) Perform procedures as per Planning Phase narrative. Correct deficiencies and redo procedures as required prior to submitting Final Report.

B. Final Report:

(1) Submit report to Architect/Engineer and to Mechanical Contractor indicating all data, measurements and adjustments as per requirements herein and per Planning Phase narrative. Do not submit partial or incomplete reports.

C. Final Report Adjustments:

(1) Architect/Engineer reserves the right to check any measurement or adjustment made and to reject any portion of work not within specified tolerance. Contractor shall resubmit all or portions of Final Report as directed by Architect/Engineer.

END OF SECTION 23 05 94

SECTION 23 05 95 - AIR SYSTEMS TEST ADJUST BALANCE

SECTION 23 05 95 – AIR SYSTEMS TEST ADJUST BALANCE

PART 1 GENERAL

2.01 RELATED WORK

A. Section 23 0901 - Control Systems Integration

B. Section 23 0993 - Control Sequences

C. Section 23 3314 - Ductwork Specialties

2.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

2.03 DESCRIPTION

A. This Contractor shall be responsible for providing complete testing, adjusting and balancing (TAB) work for air systems, such as air handling units, exhaust fans, air terminal devices, diffusers, grilles and other air moving processes included in this project.

B. Work required shall consist of setting volume flow rates and adjusting speed controls, recording data, making tests, and preparing reports, as specified herein.

C. Scope of work includes TAB of new work specified herein and includes all equipment, distribution systems, and terminal units connected.

D. TAB work shall be performed by persons trained in TAB work and certified by Associated Air Balance Council (AABC), National Environmental Balancing Bureau (NEBB), or Testing, Adjusting and Balancing Bureau (TABB). Procedures shall be in accordance with the latest edition of AABC, NEBB or TABB Standards, ASHRAE - 2015 HVAC Application Chapter 38, and as detailed herein.

E. Mechanical Contractors who are members of AABC or NEBB and who have qualified personnel available to perform work may submit Quality Assurance Submittal for approval. Mechanical Contractors who cannot meet these requirements shall subcontract with independent TAB Contractor who meets these requirements. TAB subcontractor shall prepare Quality Assurance Submittal for Contractor to submit for approval.

F. Upon direction of Architect/Engineer or TAB subcontractor, Mechanical Contractor shall provide at no additional cost to Owner, any additional work and/or devices necessary to properly balance system, including fan sheaves, motor sheaves and/or drive belts.

G. TAB work shall not proceed until assigned personnel have been approved by Architect/Engineer via Quality Assurance Submittal. Coordinate each phase of TAB work with overall project schedule. Each phase of TAB work shall be done in timely manner as detailed herein. Fieldwork must be completed before occupancy. Certificate of Substantial Completion shall not be issued until after Final Report is accepted by Architect/Engineer.

2.04 SUBMITTALS

A. General:

(1) Make submittals in accordance with project submittal procedure.

(2) Reports shall be assembled using bookmarked electronic PDF format. Use preprinted forms of NEBB, AABC or TABB wherever possible. Assemble report in the following order:

(a) Transmittal letter

(b) Cover sheet with Project title, location, submittal date, and name and addresses of Owner, Mechanical Contractor, TAB subcontractor, Architect, and Engineer

(c) Index listing major systems

(d) Data organized by system in the following order:

1) Equipment data and measurement summary

2) Equipment measurement data

3) Branch main measurement data

4) Terminal device measurement data arranged by room or zone

B. Quality Assurance Submittal:

(1) Within 30 days of signing contract, Contractor shall submit the following information:

(a) Firm resume

1) AABC or NEBB active membership certificate

2) Names of 3 recent relevant completed projects along with project address, Owner's contact person, supervising design professional

(b) Supervisor resume

(c) Balance technician(s) resume

(2) Architect/Engineer and/or Owner reserves the right to contact previous project representatives and to reject persons whom Architect/Engineer and/or Owner feel are not qualified for this project due to lack of relevant experience or problems on previous projects.

C. Planning Report:

(1) Submit Planning Report as detailed in Part 3 of this Section to demonstrate to Architect/Engineer and Owner that proper procedures are being followed. Planning Report shall be submitted after Quality Assurance submittal and 30 days before any fieldwork starts.

D. Initial Test Report:

(1) Prior to starting Final Balance Phase, submit Initial Test Report as detailed in Part 3 of this Section to indicate to Architect/Engineer and Contractor incomplete work or problem areas to be resolved before final balance is completed.

E. Final Report:

(1) Within 30 days after fieldwork is completed, submit Final Report as detailed in Part 3 of this Section to assure design objectives are met and to assist Owner in future maintenance.

F. LEED Submittal:

(1) Air Balance Report for LEED IEQ Prerequisite 1: Documentation of work performed for ASHRAE 62.1-2007, Section 7.2.2, “Air Balancing”.

2.05 REFERENCE STANDARDS

A. Refer to the latest publications of NEBB, AABC, TABB, ASHRAE, and Sheet Metal and Air Conditioning Contractors' National Association (SMACNA) publications for establishing required procedures.

PART 2 PRODUCTS

3.01 INSTRUMENTATION

A. Provide all required instrumentation to obtain proper measurements. Application of instruments and accuracy of instruments and measurements shall be in accordance with requirements of NEBB, AABC or TABB Standards and instrument manufacturer's specifications.

B. Instruments used for measurements shall be accurate, and calibration histories for each instrument to be available for examination by A/E upon request. Calibration and maintenance of instruments to be in accordance with requirements of NEBB, AABC or TABB Standards.

3.02 INSTRUMENT TEST HOLE PLUGS

A. Center-pull plugs similar to CPW Series by Mocap. Plug material shall be low-density polyethylene.

PART 3 EXECUTION

4.01 GENERAL

A. TAB work shall be done in separate phases as outlined herein. TAB schedule shall allow ample time to complete TAB work before occupancy. Follow procedures outlined herein and as described in Planning Phase narratives.

B. Unless otherwise specified, maximum acceptable offset tolerance is plus or minus 10% of the design flow rates as indicated on drawings and/or as scheduled.

C. For spaces where supply airflow rates and exhaust airflow rates are used to maintain pressure relationships, such as lab spaces, clean rooms, and animal rooms, maximum acceptable supply air offset shall be 0 to +10% of design flow rate. Associated exhaust air flow rate shall be balanced to provide indicated airflow differential between supply air and exhaust air after supply air system has been balanced.

D. For areas such as cleanroom and containment suites where supply airflow rates and exhaust airflow rates are used to maintain specific pressure relationships as defined on pressure relationship drawings, higher airflow rate of either supply or exhaust air shall be balanced to 0 to +10% of design flow rate. Lower airflow rate of either supply or exhaust air shall be balanced to provide indicated space pressure. If pressure relationship suite has more than 3 rooms, room pressures shall all be measured and balanced to common or neutral pressure space.

E. For negative and positive pressure rooms provided with pressure differential monitoring devices, TAB contractor shall initially balance rooms to supply air and exhaust air offsets indicated on drawings. Space pressure monitors shall be set to alarm as indicated below:

Space Description	Alarm Setpoint (in. w.c)	Minimum Initial Pressure Differential (in. w.c)
Negative pressure rooms	-0.01	-0.015

Positive pressure rooms	0.01	0.015

(1) TAB contractor shall confirm and coordinate balance schedule with completion of all partition wall penetrations and door seals prior to completion of balance work.

(2) During initial balancing to the indicated supply and exhaust air offsets, TAB contractor shall record pressure differential as observed at space pressure monitor in TAB reports. Minimum initial pressure differential shall be as indicated in the above table.

(3) If initial offsets do not meet specified minimum pressure differential, TAB contractor shall incrementally increase (50 CFM) exhaust air flow offset from negative pressure rooms until minimum pressure differential is achieved and record final offset and pressure differential in TAB report.

(4) If initial offsets do not meet specified minimum pressure differential, TAB contractor shall incrementally decrease (50 CFM) exhaust air flow offset from positive pressure rooms until minimum pressure differential is achieved and record final offset and pressure differential in TAB report.

(5) Associated exhaust fan speeds shall be adjusted as necessary to meet space pressure differential setpoints.

4.02 PLANNING PHASE

A. Procedure:

(1) Obtain the latest Contract Documents including addenda, applicable construction bulletins and change orders. Obtain shop drawings and performance curves from Mechanical Contractor for fans, flow measuring devices, and all terminal devices. Prepare Planning Report as detailed herein. Make adjustments in Planning Report and/or measuring instrument calibration.

B. Planning Report:

(1) Planning Report shall contain the following minimum requirements.

(a) Samples: Provide copies of all forms to be used.

(b) General narratives: Furnish written narratives of all procedures used. Include separate narratives for each fan and air handling system. Identify flow-measuring devices to be used at each fan, air terminal device, and air outlet. Narrative shall include statement that every air outlet shall be measured and adjusted. Provide different narratives for constant and variable flow systems. Narratives shall include references to published standards of NEBB or AABC. Narratives shall include measuring instruments to be used and ranges required for each procedure. Narratives shall include specified adjustment tolerances.

(c) Air system narratives: Provide narratives for each air system which shall include procedures for measuring static pressures at each component of air handling system to generate a static pressure profile. Measurements shall be made to measure performance of system in all operating modes including economizer mode using 100% outside air where applicable. Differentiate between constant and variable flow systems.

(d) Air terminal narratives: Narratives shall describe procedures for measuring flows and adjusting controls to meet specified minimum and maximum flow rates based on actual field installed conditions.

(e) Branch duct and air outlet measurements: Indicate on preprinted forms all measurements to be taken in field. Include branch duct or air outlet identification, system, space served, location, and design flow rates (include zone and system summaries). Indicate duct or air outlet neck size, make, model number, and design velocities.

(f) Pressure relationship test narrative: Narratives shall describe how to obtain and measure pressure relationships between spaces as listed below.

1) Lab Support Space, Technical Area
2) Laboratory Bench and Table Top
3) Freezer Room
4) Bruker/Microscope
5) Bioenergetics Kitchen and Dining
6) Maker Space/Additive Manufacturing
7) Animal Housing (Mice/Rats/Rabbits)
8) Procedure
9) Chemical Procedure
10) Clean Cage Wash
11) Quarantine Housing
12) Surgery
13) Ante Room/Vestibule/Corridor
14) Feed and Bed Storage

(g) Fume Hood Certification: Narrative shall include procedures as described in Scientific Equipment and Furniture Association (SEFA) Standard SEFA 1-2006. Each hood shall be labeled with:

1) Test date

2) Name of tester
3) Sash position at 100 fpm and 125 fpm
4) Hood Classification

(h) Refer to fume hood specification for sash type of each hood, design exhaust rate and sash design opening size. Design airflows are based on design operating sash opening and 100 fpm face velocity at the sash opening.

(2) Prebalance Checklist - to include, but not limited to:
(a) Check for completeness of work
(b) System cleaning if required
(c) Check fire, smoke and balancing damper positions
(d) Place system into normal operation.
(e) Install test openings where required.
(f) Indicate type of test holes to be used and installation procedure.
(g) Note condition of filters.
(h) Provide temporary blankoffs to simulate design pressure drops of filters.
(i) Chisel holes and duct tape are not allowed.
(j) Wet cooling coils
(k) Fan wheels, blades, bearings, alignment, starters, vibration isolators, and rotation
(l) Drive belt tension and alignment
(m) Setting of automatic dampers to proper position including shutoff and bypass dampers
(n) For hoods and ovens indicate temperature and humidity. Correct for density changes.
(o) Set up of controls and control devices

(3) Measuring Instrument List - list what measuring instruments will be used for each procedure. Indicate ranges required for each procedure. Provide data on each measuring instrument to be used. This data shall include:
(a) Manufacturer name and model number
(b) Measurement range
(c) Pressure/temperature limits
(d) Date put into service
(e) Date of last calibration
(f) Include certificate from calibration firm

(4) Architect/Engineer reserves the right to request adjustments in any procedure and/or ask for recalibration of any measuring instrument, which has not been recalibrated within past year.

4.03 SET-UP PHASE

A. Procedure:
(1) Perform prebalance checkout as per Planning Phase narrative.

B. Initial Test:
(1) Measure fan data and flows in "as found" condition after initial damper settings are made.

C. Initial Test Report:
(1) Submit report to Architect/Engineer and Mechanical Contractor indicating all measurements made and make notes of all items, which are not complete or are not within design tolerance.

4.04 FINAL BALANCE PHASE

A. Procedure:
(1) Perform all procedures as per Planning Phase narrative. Correct all deficiencies and redo procedures as required before submitting Final Report.

B. Final Report:
(1) Submit report to Architect/Engineer and Mechanical Contractor indicating all data and measurements as per requirements herein and per Planning Phase narrative. Do not submit partial or incomplete reports.

C. Final Report Adjustments:
(1) Architect/Engineer reserves the right to check any measurement made and to reject any portion of work not within required tolerance of design flow. TAB Contractor shall resubmit all or portions of Final Report as directed by Architect/Engineer.

END OF SECTION 23 05 95

SECTION 23 07 00 - MECHANICAL SYSTEMS INSULATION

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 23 05 29 - Mechanical Piping and Equipment Supporting Devices

B. Section 23 05 53 - Mechanical Systems Identification (pipe jacket color chart)

C. Section 23 31 14 - Ductwork

D. Section 23 21 20 - Piping Specialties (for steam trap insulation)

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESCRIPTION

A. Provide insulating materials and accessories as required for mechanical systems as specified below.

B. Insulating products delivered to construction site shall be labeled with manufacturer's name and description of materials.

1.04 DEFINITIONS

A. Concealed areas, where indicated in this Section, shall apply to shafts, furred spaces and space above finished ceilings, inaccessible tunnels, and crawl spaces. All other areas, including walk-through tunnels, shall be considered as exposed.

B. Unless otherwise indicated, unit of thermal conductivity is BTU in(h ft2'F (W/(m K).

C. Interstitial spaces are considered as concealed areas.

1.05 SUBMITTALS

A. Product Data for each piping system for all pipe sizes, each ductwork system but not limited to, the following:

(1) Manufacturer's name

(2) Schedule of insulating materials

(3) Insulation material and thickness

(4) Jacket

(5) Adhesives

(6) Fastening methods

(7) Fitting materials

(8) Intended use of each material

(9) Manufacturer's data sheets indicating density, thermal characteristics, temperature ratings.

(10) Insulation installation details (manufacturer's installation instruction/details, Contractor's installation details, MICA plates where applicable)

(11) Literature data sheet from sealants and adhesive manufacturers stating VOC compliance with USGBC LEED IEQ 4.1.

(12) Literature data sheet from coatings and mastics (including lagging adhesives) manufacturers stating VOC compliance with USGBC LEED IEQ 4.2.

(13) All other appropriate data.

1.06 DELIVERY, STORAGE AND HANDLING

A. Insulation material shall be delivered to project site in original, unbroken factory packaging labeled with product designation and thickness. Shipment of materials from manufacturer to installation location shall be in weather-tight transportation. Protect insulation materials from moisture and weather during storage and installation. Protect insulation material against long exposure to UV light from sun.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Insulation:

(1) Owens Corning, Johns Manville, Manson, Knauf or CertainTeed similar to product indicated except where product of manufacturers not listed above is specifically identified for special type of insulation.

B. Coatings, Mastics, Sealants and Adhesives:

(1) Foster, Childers, Design Polymerics, Vimasco, Miracle or Pittsburgh Corning

2.02 MATERIALS

A. Products used for or related to air conditioning and ventilating systems shall conform to NFPA 90A possessing flame spread index of not over 25 and smoke developed index no higher than 50.

B. Unless otherwise indicated, all products, material itself or on composite basis, shall have flame spread index not more than 25 and smoke developed index not more than 50, when tested in accordance with ASTM E84 or UL 723.

C. Pipe insulation installed outdoors may have smoke developed index not exceeding 450.

D. Foam insulation materials shall not use CFC or HCFC blowing agents in manufacturing process.

E. Insulation applied on stainless steel shall meet requirements of ASTM C795 and NRC 1.36.

2.03 INSULATION

A. Insulation materials shall be fire retardant, moisture, and mildew resistant, vermin proof, and suitable to receive jackets, adhesives, and coatings as indicated.

B. Glass fiber insulation shall be of inert inorganic material, non-corrosive to mechanical surfaces.

C. Insulating cement shall be Quick-Cote by PK Insulation MFG Co. or Ryder GP, with dry density of no more than 38 lb/ft3 (603 kg/m3) thermal conductivity of 0.96 at 400°F (0.138 at 204°C) mean temperature, and service temperature to 1200°F (650°C).

D. Filling and finishing cement shall be Super-Stik by PK Insulation MFG Co., or Ryder MW, with dry density of no more than 24 lb/ft3 (384 kg/m3), thermal conductivity of 0.74 at 500°F (0.107 at 260°C) mean temperature, and service temperature to 1900°F (1040°C).

E. Type A Insulation (Flexible Elastomeric):

(1) Flexible, closed-cell, elastomeric cellular insulation.

(a) ASTM Standard: ASTM C534/C534M, Type I (tube form) or Type II (sheet form), Grade I

(b) Thermal Conductivity: Maximum 0.28 at 75°F (0.04 at 24°C) mean temperature

(c) Water Vapor Permeability: Maximum 0.08 perm-inch (0.12 ng/s m Pa)

(d) Water Absorption: Maximum 0.2 % by volume

(e) Service Temperature: -297 to 220°F (-183 to 104°C)

(2) Manufacturers/Products:

(a) Armacell, AP Armaflex or AP Armaflex FS

(b) Aeroflex, Aerocel

(c) K-Flex, Insul-Tube

F. Type C Insulation (Ceramic Fiber Blanket):

(1) High temperature ceramic fiber blanket insulation.

(a) Density: Minimum nominal 8 lb/ft3 (128 kg/m3)

(b) Thermal Conductivity: Maximum 0.83 at 1100°F (0.12 at 600°C) mean temperature

(c) Service Temperature: Continuous 1832°F (1000°C)

(2) Manufacturers/Products:

(a) Morgan Thermal Ceramics, Superwool Plus.

G. Type F Insulation (Flexible Fiberglass Blanket):

(1) Flexible fiberglass blanket insulation, faced with specified jacket.

(a) ASTM Standard: ASTM C1290

(b) Density: Minimum 1.0 lb/ft3 (12 kg/m3)

(c) Thermal Conductivity: Out-of-package (uncompressed) conductivity shall not exceed Maximum 0.27 btu-in/(hr-ft2-°F) at 75°F (0.04 at 24°C) mean temperature.

(d) Service Temperature: Maximum 250°F (121°C).

(2) Manufacturers/Products:

(a) Johns Manville, Microlite EQ FSK

(b) Owens Corning, SOFTR Duct Wrap FRK

(c) Knauf, Performance Plus Duct Wrap

H. Type FR Insulation (Fire Resistive Duct Wrap):

(1) High temperature inorganic flexible fiber blanket encapsulated in fiberglass foil facing shall be suitable for ventilation duct wrap. Wrap shall be single layer of 1-1/2” (40 mm) thick, fire resistive rating of 2 hr.

(a) ISO 6944-1, Fire Resistance Tests - Ventilation Ducts

(b) ASTM E136, Non-combustibility

(c) Density: 6 lb/ft3 (96 kg/m3)

(d) Thermal Resistance: (R-value per ASTM C518): 7.2 per layer at 70°F (1.26 m°C/W at 21°C).
(e) Service Temperature: Minimum 1832°F (1000°C)

(2) Manufacturers/Products:
(a) Thermal Ceramics, Fire Master Fast Wrap XL
(b) 3M, Fire Barrier Duct Wrap 615+
(c) Unifrax: FyreWrap Elite 1.5 Duct Insulation

I. Type G Insulation (Cellular Glass):

(1) 100% cellular glass cells with no organic material, noncombustible.
(a) ASTM Standard: ASTM C552, Type I (block) or Type II (pipe), Grade 6
(b) Density: Minimum nominal 7.18 lb/ft3 (115 kg/m3)
(c) Thermal Conductivity: Maximum 0.31 at 75°F (0.045 at 24°C) mean temperature
(d) Compressive Strength: Minimum 90 psi (620 kPa)
(e) Water Vapor Permeability: 0.00 perm-"
(f) Water Absorption: Maximum 0.2% by volume
(g) Service Temperature: -450 - 900°F (268 - 480°C)

(2) Manufacturers/Products:
(a) Owens Corning, Foamglas

J. Type H Insulation (Calcium Silicate Block or Pipe):

(1) Hydrous calcium silicate block and pipe insulation with non-asbestos fibrous reinforcement.
(a) ASTM Standard: ASTM C533, Type I
(b) Density: Minimum dry 13 lb/ft3 (208 kg/m3)
(c) Thermal Conductivity: Maximum 0.49 at 400°F (0.072 at 204°C)
(d) Compressive Strength: Minimum 100 psi (690 kPa) at 5% compression
(e) Service Temperature: 80 to 1200°F (26 to 650°C)

(2) Manufacturers/Products:
(a) Industrial Insulation Group (IIG), Thermo-12 Gold

K. Type KG Insulation (Kitchen Grease Duct Wrap):

(1) High temperature flexible fiber blanket encapsulated in fiberglass foil facing shall be suitable for kitchen grease duct wrap. Wrap shall be two layers, each 1-1/2” (40 mm) thick, rated as 2 hr shaft alternative.
(a) ASTM Standard: ASTM E2336 and related ICC ESR (2 hr grease duct enclosure)
(b) Codes/Standards: ICC (IMC), IAPMO (UMC), NFPA 96.
(c) Density: Nominal 6 lb/ft3 (96 kg/m3)
(d) Service Temperature: Continuous 1832°F (1000°C).

(2) Manufacturers/Products:
(a) Thermal Ceramics, FireMaster FastWrap XL
(b) 3M, Fire Barrier Duct Wrap 615+
(c) Unifrax, FyreWrap Elite 1.5 Duct Insulation

(3) Duct access doors shall be furnished by duct wrap manufacturer as part of duct wrap system. Access doors shall pass ASTM E2336 test standard.

L. Type M Insulation (Mineral Fiber):

(1) Mineral fiber preformed pipe insulation faced with specified jacket.
(a) ASTM C547, Type II
(b) Density: Minimum nominal 8 lb/ft3 (128 kg/m3)
1) Thermal Conductivity: Maximum 0.29 at 200°F (0.040 at 93°C) and 0.40 at 400°F (0.058 at 204°C)
(c) Water Vapor Absorption: Maximum 1% by weight
(d) Service Temperature: To 1200°F (650°C)

(2) Manufacturers/Products:
(a) Roxul, ProRox PS 960
(b) IIG, MinWool-1200 Pipe

M. Type PP Insulation (Phenolic):

(1) Rigid cellular phenolic insulation faced with specified jacket.
(a) ASTM Standard: ASTM C1126, Type III
(b) Density: Minimum 2.5 lb/ft3 (40 kg/m3)

(c) Thermal Conductivity: Maximum 0.18 at 75°F (0.026 at 24°C) mean temperature
(d) Compressive Strength: Minimum 30 psi (206 kPa)
(e) Water Vapor Permeability: 2.14 perm-" (3.10 ng/s m Pa)
(f) Water Absorption: Maximum 0.9% by volume
(g) Service Temperature: -290°F (-179°C) to 250°F (121°C)

(2) Manufacturers/Products:
(a) ITW, Trymer Supercel Phenolic
(b) Resolco, Insul-phen
(c) Polyguard, PolyPhen

N. Type R Insulation (Rigid Mineral Fiber Pipe Insulation):
(1) Mineral fiber (fiberglass) preformed pipe insulation faced with specified jacket.
(a) ASTM Standard: ASTM C547, Type I
(b) Density: Minimum nominal 3 lb/ft3 (48 kg/m3)
1) Thermal Conductivity: Maximum 0.23 at 75°F (0.034 at 24°C) and 0.29 at 200°F (0.040 at 93°C)
2) 0.29 at 200°F (0.040 at 93°C) mean temperature
(c) Service Temperature: To 850°F (454°C)
(2) Manufacturers/Products:
(a) Johns Manville, Micro-Lok HP
(b) Owens Corning, ASJ Max Fiberglas Pipe Insulation
(c) Knauf, Earthwool 1000° Pipe Insulation

O. Type R Insulation (Rigid Mineral Fiber Board Insulation):
(1) Mineral fiber (fiberglass) duct and equipment insulation faced with specified jacket.
(a) ASTM Standard: ASTM C612, Type IA and IB
(b) Density: Minimum nominal 3 lb/ft3 (48 kg/m3)
(c) Thermal Conductivity: Maximum 0.23 at 75°F (0.034 at 24°C) mean temperature
(d) Service Temperature: To 450°F (232°C)
(2) Manufacturers/Products:
(a) Johns Manville, 800 Series Spin-Glas, Type 814
(b) Owens Corning, Fiberglas Fiberglass 700 Series, Type 703
(c) Knauf, Earthwool Insulation Board

P. Type RR Insulation (Rigid Mineral Fiber Board Insulation):
(1) Mineral fiber (fiberglass) duct and equipment insulation faced with specified jacket.
(a) ASTM Standard: ASTM C612, Type IA and IB
(b) Density: Minimum nominal 6 lb/ft3 (96 kg/m3)
(c) Thermal Conductivity: Maximum 0.23 at 75°F (0.034 at 24°C) mean temperature
(d) Service Temperature: To 450°F (232°C)
(2) Manufacturers/Products:
(a) Johns Manville, 800 Series Spin-Glas, Type 817
(b) Owens Corning, Fiberglas Fiberglass 700 Series, Type 705
(c) Knauf, Earthwool Insulation Board

Q. Type S Insulation (Rigid Polystyrene):
(1) Rigid closed cell, extruded polystyrene (XPS), insulation faced with specified jacket.
(a) ASTM Standard: ASTM C578, Type XIII
(b) Density: Minimum nominal 1.6 lb/ft3 (26 kg/m3)
(c) Thermal Conductivity: Maximum 0.26 at 75°F (0.037 at 24°C) mean temperature
(d) Compressive Strength: Minimum 20 psi (138 kPa)
(e) Water Vapor Permeability: 1.5 perm-" (2.2 ng/s m Pa)
(f) Water Absorption: Maximum 1% by volume
(g) Service Temperature: -297°F (-183°C) to 165°F (74°C)
(h) Flame Spread Index/Smoke Developed Index: Maximum 25/165
(2) Manufacturers/Products:
(a) Dow Chemical, Styrofoam XPS Pipe Insulation Billet

(b) ITW, XPS PIB

R. Type T Insulation (Mineral Fiber Fireproofing):

(1) Mineral fiber board insulation.

(a) ASTM Standard: ASTM C612, Type IVa

(b) Density: Minimum nominal 8 lb/ft3 (128 kg/m3)

(c) Thermal Conductivity: Maximum 0.23 at 75°F (0.033 at 24°C) mean temperature

(d) Service Temperature: To 1200°F (650°C).

(e) Flame Spread Index/Smoke Developed Index: Maximum 25/0

(2) Manufacturers/Products:

(a) Owens Corning Thermafiber, FireSpan

(b) Rockwool, Roxul Safe

(c) Fibrex, FBX Industrial Board Insulation

S. Type AG Insulation (Flexible Aerogel):

(1) Flexible aerogel blanket insulation.

(a) ASTM Standard: ASTM C1728, Type III

(b) Density: Minimum 12 lb/ft3 (192 kg/m3)

(c) Thermal Conductivity: Maximum 0.19 at 392°F (0.028 at 200°C) mean temperature

(d) Water Absorption: Maximum 5% by weight

(e) Service Temperature:1200°F (To 650°C)

(2) Manufacturers/Products:

(a) Aspen Aerogels, Pyrogel XTE

(b) Armaflex, ArmaGel HT

2.04 JACKETS

A. Jacket puncture resistances shall be based on ASTM D781 test methods. Vapor barrier permeance ratings shall be based on ASTM E96/E96M Procedure A.

B. Type A-1 Jacket (Aluminum Roll Jacketing):

(1) Factory fabricated 0.016" (0.41 mm) thick, ASTM B209/B209M, Type 3003 or 3105, stucco embossed aluminum jacket with integrally bonded moisture barrier/retarder consisting of 3 layers of polymer films with total thickness of 3 mil (0.075 mm).

(2) Fitting covers shall be factory fabricated from not lighter than thick, Type 3003 or 1100 aluminum. For large pipes, where factory fabricated fitting covers are not available, Contractor shall fabricate fitting covers from like sheet materials.

(3) Manufacturers/Products:

(a) Johns Manville, Aluminum Jacketing

(b) RPR Products, Insul-Mate

C. Type A-2 Jacket (Aluminum Roll Jacketing – High Temperature Application)

(1) Factory fabricated 0.016” (0.41 mm) thick, ASTM B209/B209M, Type 3003 or 3105, stucco embossed aluminum jacket. Due to potential for high temperature exposure, jacket shall be absent of additional moisture barrier/retarder of any kind.

(2) Fitting covers shall be factory fabricated from not lighter than thick, Type 3003 or 1100 aluminum. For large pipes, where factory fabricated fitting covers are not available, Contractor shall fabricate fitting covers from like sheet materials.

D. Type D-1 Jacket:

(1) Heavy-duty, fire retardant material with glass fiber reinforcing. Jackets shall have neat, white Kraft finish suitable for painting, with beach puncture resistance of 50 units minimum. Vapor barrier shall be adhered to inner surface of jacket. Permeance shall not exceed 0.02 perm (1.15 ng/s m2 Pa).

(2) Manufacturers/Products:

(a) Owens Corning, ASJ Max

(b) Johns Manville, ASJ-4535

(c) Knauf, ASJ+

E. Type D-2 Jacket:

(1) Glass fiber reinforced foil Kraft laminate with permeance not exceeding 0.02 perm (1.15 ng/s m2 Pa) and beach puncture resistance 25 units minimum.

(2) Manufacturers/Products:

(a) Owens Corning, FRK

(b) Johns Manville, FSK

(c) Knauf, FSK

F. Type D-3 Jacket:

(1) Self-adhering, multiple laminated waterproofing material with reflective aluminum foil, high density polymer films and minimum 40 mil (1 mm) rubberized asphalt waterproofing compound.

(2) Venture Clad 1577 CW, Alumaguard Lite or Foster Vaporfas 62-05

(a) Jackets shall be minimum 5 ply laminated, weather proofing material with acrylic adhesive capable of installation with no additional mechanical attachments, 0.00 water vapor permeance rating per ASTM E96/E96M, mold inhibitors incorporated and UV stable.

(b) Jackets shall have _____ finish.

(3) Manufacturers/Products:

(a) MFM Building Products Corp., FlexClad

(b) Polyguard, Alumaguard

G. Type E-2 Jacket:

(1) Heat sealable, multi-ply laminate consisting of layer of asphalt, glass fiber reinforcement, second layer of asphalt, aluminum foil layer, third layer of asphalt, and polyester outer film. Minimum total thickness shall be 125 mils (3.175 mm).

(2) Manufacturers/Products:

(a) Owens Corning, Pittwrap HS

H. Type E-3 Jacket:

(1) Self-sealing, non-metallic sheet consisting of special bituminous resin reinforced with woven glass fabric and 1 mil (0.025 mm) thick aluminum film. Minimum total thickness shall be 70 mils (1.8 mm).

(2) Manufacturers/Products:

(a) Owens Corning, Pittwrap SS

I. Type P-1 Jackets:

(1) Heavy-duty, fire retardant material with glass fiber reinforcing and self-sealing lap. Jacket shall have neat, white Kraft finish suitable for painting, with burst strength of 1.5 Joules (50 beach units) minimum and tensile strength 45 lbs/in (7.9 N/mm) minimum. Vapor barrier shall be adhered to inner surface of jacket. Permeance shall not exceed 0.02 perm (1.15 ng/s m2 Pa).

(2) Manufacturers/Products:

(a) Owens Corning, ASJ-SSL

(b) Johns Manville, ASJ

(c) Knauf, ASJ+

J. Type P-2 Jackets:

(1) Jackets shall be minimum 5 ply laminated, weather proofing material with acrylic adhesive capable of installation with no additional mechanical attachments, 0.00 water vapor permeance rating per ASTM E96/E96M, mold inhibitors incorporated and UV stable.

(2) Jackets shall have _____ finish.

(3) Manufacturers/Products:

(a) 3M, VentureClad

(b) Polyguard, Alumaguard Lite

K. Type SS-1 Jacket (Protective Insulation Shield):

(1) Factory fabricated 1 mil (0.025 mm) thick, ASTM A240/A240M, Type 304 stainless steel, 2B mill finish jacket with integrally bonded moisture barrier/retarder consisting of 3 layers of polymer films with total thickness of 3 mil (0.075 mm).

(2) Fitting covers shall be factory fabricated from not lighter than 0.016" (.40 mm) thick, ____, stainless steel. For large pipes, where factory fabricated fitting covers are not available, Contractor shall fabricate fitting covers from like sheet materials.

(3) Manufacturers/Products:

(a) Johns Manville, Stainless Steel Jacket

(b) RPR Products, Insul-Mate Stainless Steel

L. Type SS-2 Jacket (Stainless Steel Roll Jacketing – High Temperature Application)

(1) Factory fabricated 0.01” (0.25 mm) thick, ASTM A240/A240M, Type 304 stainless steel, 2B mill finish jacket. Due to potential for high temperature exposure, jacket shall be absent of additional moisture barrier/retarder of any kind.

(2) Fitting covers shall be factory fabricated from not lighter than 0.016" (.40 mm) thick ____, stainless steel. For large pipe where factory fabricated fitting covers are not available, Contractor shall fabricate fitting covers from like sheet materials.

(3) Manufacturers/Products:

(a) Johns Manville, Stainless Steel Jacketing

(b) RPR Products, Insul-Mate Stainless Steel

M. Type S-1 Jacket:

(1) Saran Vapor Retarder Film with self-sealing lap (SSL), ASTM C755 and ASTM C1136, 6 mil (0.15 mm) thickness, permeance not more than 0.01 perms (0.574 ng/s m2 Pa).

(2) Elbows, fittings, valves, and butt joints shall be wrapped with vapor retarder tape, 2 mil (0.05 mm) thickness, permeance not more than 0.03 perms (1.72 ng/s m2 Pa). Butt joints shall be wrapped with single layer and elbows/fittings/valves with 2 layers of tape.

(3) Provide PVC jacket (Type V-1) over vapor retarder tapes for exposed elbows, fittings, and valves.

(4) Manufacturers/Products:

(a) Johns Manville, Saranex 560 CX

N. Type V-1 Jacket:

(1) Fire retardant and UV resistant PVC in minimum _____ mil (_____ mm) thickness consisting of preformed fitting covers, preformed end terminations, and sheet material for straight runs of pipe. Jacketing system shall be suitable for indoor and outdoor application in temperature range of -35°F (-37°C) to 150°F (66°C). Material when installed according to manufacturer's instructions shall provide complete vapor barrier and readily cleanable surface while meeting Federal CGMP requirements.

(2) Manufacturers/Products:

(a) Johns Manville, Zeston

(b) Speedline, Smoke Safe

(c) Proto, LoSmoke

(3) PVC jacket color _____.

2.05 ADHESIVES, MASTIC, COATINGS, SEALANTS, AND REINFORCING MATERIALS

A. Adhesives and sealants shall comply with the South Coast Air Quality Management District SCAQMD 1168; VOC limits shall comply with Indoor Environmental Quality Section, Credit IEQ-4.1.

B. Coatings and mastics shall comply with VOC limits set forth by Green Seal BS-11 and comply with the South Coast Air Quality Management District SCAQMD 1113; VOC limits shall comply with Indoor Environmental Quality Section, Credit IEQ-4.2.

C. Products shall be compatible with surfaces and materials on which they are applied and shall be suitable for use at operating temperatures of systems to which they are applied.

D. Products shall be fire retardant, moisture resistant and mildew resistant and vermin proof.

E. Vapor Barrier Mastic: Below ambient insulation. Water vapor permeance shall be less than 0.08 perms at 45 mils dry film thickness per ASTM F1249.

(1) Foster 30-33

(2) Childers CP-33

(3) Vimasco 749

F. Weather Barrier Breather Mastic: Above ambient insulation. Permeance shall be greater than 1.0 perms at 1/16" (1.59 mm) dry film thickness per ASTM E96/E96M.

(1) Foster 46-50 Weatherite

(2) Childers CP-10/CP-11 Vi Cryl

(3) Vimasco WC-5

G. Lagging Adhesive/Coatings: Indoors applications used in conjunction with canvas/glass cloth.

(1) Foster 30-36

(2) Childers CP-50 AMV1

(3) Vimasco 713

H. Metal jacketing sealant for aluminum jacketing:

(1) Foster 95-44 Elastolar

(2) Childers CP-76 Chil Byl

(3) Pittsburgh Corning 727

I. Insulation joint sealant for Type P, Type PP, and Type G insulation:

(1) Foster 95-50 Flextra
(2) Childers CP-76 Chil Byl
(3) Pittsburgh Corning CW Sealant

J. Glass fiber fabric reinforcing shall be 10 x 10 mesh similar to Childers Chil Glas #10 or Foster Mast A Fab.

K. Wire mesh reinforcing shall be 22 ga (0.7 mm), 1" (25 mm) galvanized.

L. Insulation cement shall be ANSI/ASTM C195, hydraulic setting mineral wool.

M. Finishing cement shall be ASTM C449.

N. Butt joint and longitudinal joint adhesive for Type A insulation shall be Armaflex 520, Rubatex 373, Childers CP-82 or Foster 85-75.

O. Weather-resistant protective finish for Type A insulation shall be equal to Armstrong WB Armaflex finish or Foster 30-65 elastomeric coating.

2.06 METAL BANDS AND WIRES

A. Aluminum bands shall be 0.5 x 0.20" (13 mm x 0.51 mm) up to 48" (1220 mm) diameter and 0.75 x 0.020" (19 mm x 0.51 mm) over 48" (1220 mm) diameter.

B. Stainless steel bands shall be 0.5 x 0.015" or 0.75 x 0.015" (13 mm x 0.38 mm or 19 mm x 0.38 mm).

C. Stainless steel wires shall be 16 ga (1.50 mm).

2.07 INSULATION FASTENERS

A. Insulation fasteners shall be cup head weld pins, galvanized low carbon steel, minimum 12 ga (0.105”) (2.5 mm)) pins.

B. Washer edge shall be beveled.

C. Fasteners shall be stainless steel for stainless steel ductwork application.

D. Insulation fasteners using adhesive are not allowed.

2.08 REMOVABLE INSULATING BLANKETS

A. Custom designed removable, reusable, flexible, blanket thermal insulation system.

B. Acceptable Manufacturers: Thermal Energy Products, Inc., Advanced Thermal Corp., Temptec, Remco Technology, Inc., or approved equal.

C. Removable insulation system shall be custom designed for each individual item to provide close contour fit. Overlapping seams and gaps are not acceptable.

D. Removable insulation shall be designed to overlap adjoining pipe insulation by minimum of 2" (50 mm).

E. Insulation: Minimum 2" (50 mm) thick, 2.4 lb/ft3 (38.4 kg/m3) density, 1000°F (540°C) continuous service temperature thermal insulating wool; Owens Corning Fiberglass or equal.

F. Interior and Exterior Fabric: Minimum weight 0.59 kg/m² (17.5 oz/sq yd) silicone rubber coated fiberglass cloth.

G. Securement: Blanket seams shall be closed with buckle and strap assembly (D ring closure).

H. Identification/Tagging: Label each removable insulation device with plastic or 304 stainless steel tag with raised letters. Tag as directed by Owner.

2.09 ACOUSTICAL BARRIER MATERIALS

A. Acoustical barrier material shall be combination of absorber and barrier, similar to Sound Seal Model B-10 LAG/QFA-3. Absorber/Barrier material shall have acoustic ratings of STC-29.

B. Minimum sound transmission loss at each octave band shall be as follows:

Sound Transmission Loss (dB)					
Octave Band Center Frequency (Hz)					
125	250	500	1000	2000	4000
18	18	23	30	39	46

PART 3 - EXECUTION

3.01 APPLICATION

A. Provide insulation and jackets with minimum insulation thickness as indicated in the following schedule. The schedule applies to both exposed and concealed applications unless noted otherwise:

Piping System							
		Minimum Insulation Thickness According to Pipe Size					
Service	Jacket Type	Insulation Type	3/4" (19 mm) and	1" - 1-1/4" (25 mm to	1-1/2" - 3" (40 mm to	4" - 6" (100 mm to 150	8" (200 mm) and

			Smaller	32 mm)	80 mm)	mm)	Larger
Heating Hot Water 105-140°F (40-60°C)	P-1	R	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)
Heating Hot Water 141-200°F (60-93°C)	P-1	R	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Heated Glycol 141-200°F (60-93°C)	P-1	R	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Heating Hot Water 201-250°F (94-121°C)	P-1	R	2-1/2" (65 mm)	2-1/2" (65 mm)	2-1/2" (65 mm)	3" (80 mm)	3" (80 mm)
Chilled Water 51-60°F (10-15°C)	P-1	R	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
Chilled Water 40-60°F (4-15°C)	P-1	R	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)
Chilled Water 40-60°F (4-15°C)	---	A	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)
Chilled Water 40-60°F (4-15°C)	S-1	_____	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Chilled Water 40-60°F (4-15°C)	S-1	PP	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Chilled Water (Glycol) 30-40°F (-1-4°C)	---	A	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Chilled Water (Inside AHU housing)	V-1	PP	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Chilled Water (Interior) 40-60°F (4-15°C)	P-1	G	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)
Chilled Water (Exterior) 40-60°F (4-15°C)	P-2	P	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Chilled Water (Exterior) 40-60°F (4-15°C)	P-2	S	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)
Chilled Water (Underground - direct buried)	E-3	G	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)	2-1/2" (65 mm)
Condenser Water (Interior) 50°F (10°C) and lower or used for water side economizer)	S-1	PP	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Condenser Water (Interior) [50°F] ([10°C]) and lower or used for water side economizer)	---	A	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Refrigerant Suction Lines and Hot Gas By-pass Line if Used (Interior)	---	A	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Refrigerant Suction Lines and Hot Gas By-pass Line if Used (Exterior)	P-2	A	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)
Cooling Coil Condensate Drain	---	A	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)
Low Pressure Steam and Condensate 201-250°F (94-121°C)	P-1	R	2-1/2" (65 mm)	2-1/2" (65 mm)	2-1/2" (65 mm)	3" (80 mm)	3" (80 mm)
High Pressure Steam and Condensate 251-350°F (122-176°C)	P-1	R	3" (80 mm)	4" (100 mm)	4-1/2" (115 mm)	4-1/2" (115 mm)	4-1/2" (115 mm)
(Two layers of insulation shall be provided)							
High Pressure Steam and Condensate 351-450°F	P-1	R	4-1/2" (115 mm)	5" (125 mm)	5" (125 mm)	5" (125 mm)	5" (125 mm)

(177-232°C)							
(Two layers of insulation shall be provided) (A-2 jacket shall be provided over P-1 jacket for exposed piping)							
High Pressure Steam and Condensate (Operating Temp. 450°F (232°C)	P-1	M	4-1/2" (115 mm)	5" (125 mm)	5" (125 mm)	5" (125 mm)	5" (125 mm)
(Two layers of insulation shall be provided) (A-2 jacket shall be provided over P-1 jacket for exposed piping)							
Condensate Pump Discharge 141-200°F (60-121°C)	P-1	R	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Steam and Condensate	A-1	G	3" (80 mm)	4" (100 mm)	4" (100 mm)	5" (130 mm)	5" (130 mm)
Steam and Condensate (Underground - direct buried)	E-2	G	3" (80 mm)	4" (100 mm)	4" (100 mm)	5" (130 mm)	5" (130 mm)
Boiler Feed 201-250°F (94-121°C)	P-1	R	2-1/2" (65 mm)	2-1/2" (65 mm)	2-1/2" (65 mm)	3" (80 mm)	3" (80 mm)
Boiler Blow Down	P-1	R	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
Heated Fuel Oil	P-1	R	1" (25 mm)	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)
Snow Melting (Except piping encased in concrete)	P-1	R	1" (25 mm)	1" (25 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)	1-1/2" (40 mm)
Engine Generator Remote Radiator	P-1	R	1-1/2" (40 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Piping Between Separation Chamber and Manifolds of Steam Jacketed Humidifiers	P-1	R	2-1/2" (65 mm)	2-1/2" (65 mm)	2-1/2" (65 mm)	3" (80 mm)	3" (80 mm)
Steam Safety Valve Vent Piping located within 8" (2.4 m) above floor	P-1	R	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
Steam Safety Valve Vent Piping	P-1	R	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
Non-Potable Cold Water	P-1	R	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
Non-Potable ColdWater	---	A	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)	3/4" (19 mm)
Piping Provided with Heat Tracing	P-1	R	1" (25 mm)	1-1/2" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Insulation thickness shall be the greater thickness specified for piping system or thickness specified above.							
MRI Quench Vent	For first 10 ft (3 m) provide two layers of 1" (25 mm) Type A insulation, all seams and joints staggered. Apply minimum 0.002" (0.05 mm) aluminum foil with complete adhesive coverage between first layer and second layer. Provide single layer of 2" (50 mm) Type A insulation for remainder of vent pipe.						
RO Water (pumped)	-	A	1/2" (13 mm)	1/2" (13 mm)	1/2" (13 mm)	1/2" (13 mm)	1/2" (13 mm)

Insulated Exterior Piping	Unless otherwise indicated, provide protective insulation shield (Type A-1 jacket) in addition to pipe insulation and jacket specified in this schedule.
Insulated Piping Subject to Abuse as Indicated on Drawings	Provide Type H insulation for hot piping and Type PP insulation for cold piping with V-1 jacket in lieu of specified insulation/jacket with same insulation thickness.

Ductwork/Equipment & Systems			
Service	Jacket Type	Insulation Type	Insulation Thickness
OA Ducts Exposed	D-1 or D-2	R	2" (50 mm)
OA Ducts Concealed	D-2	R	2" (50 mm)

Mixed Air (Outside Air & Return Air Ducts & Plenum)	D-1	R	1-1/2" (40 mm)
Supply Ducts Exposed	D-1	R	1-1/2" (40 mm)

Engine Generator Set Exhaust Pipe (up to 1200°F (650°C))	A-1	H	4" (100 mm)
Engine Generator Set Muffler (up to 1200°F (650°C))	A-1	H	4" (100 mm)
Engine Exhaust Pipe (over 1200°F (650°C))	A-2	Air Gap (1st layer) 304 SS Liner (2nd layer) C (3rd layer) M (4th layer)	1" (25 mm) (1st layer) 24 gauge (2nd layer) 2" (50 mm) (3rd layer) 3" (80 mm) (4th layer)
Active Chilled Beam Plenums	D-2	F	2" (50 mm)
Supply Air Diffuser Plenums/Back pa ns	D-2	F	2" (50 mm)
Weight-Supporting Insulation Inserts for Trapeze Hangers		G, H, P or PP	To Match System
Air Separators & Water Filters (Hot Water)	P-1	R	2" (50 mm)
Air Separators & Water Filters (Chilled Water)	---	A	1" (25 mm)
Heat Exchangers (Shell and Tube Type)	P-1	R	2-1/2" (65 mm)

Heat Exchangers (Plate and Frame Type)	---	A	1" (25 mm)
Condensate Receivers	P-1	R	2" (50 mm)
Pressure operated condensate pumps (Pump manufacturer may furnish removable insulation blanket as an option.)	P-1	R	2" (50 mm)
Flash Tanks	P-1	R	2" (50 mm)
Blowdown Separator	P-1	R	2" (50 mm)
Chilled Water Storage Tank	---	A	1" (25 mm)
Storage Tanks	---	A	1" (25 mm)
Chiller Evaporator Shell	---	A	1" (25 mm)
Water Cooled Condenser Shell	---	A	1" (25 mm)
Chilled Water Pump Heads (Removable)	(Refer to specification)	A	1" (25 mm)
Chiller Water Boxes (Removable)	---	A	1" (25 mm)
Chilled Water Expansion Tanks	---	A	3/4" (19 mm)
Humidifier Separator	P-1	R	2" (50 mm)

B. Type F insulation with Type D-2 jacket may be used in lieu of Type R insulation with Type D-1 jacket for ductwork located 6 ft (1.8 m) or higher above floor in mechanical equipment rooms. Horizontal ducts that are not completely 6 ft (1.8 m) above floor shall be insulated with Type R insulation as specified for its entirety.

3.02 INSTALLATION - GENERAL

A. All insulation installation methods shall be performed in accordance with the latest edition of National Commercial and Industrial Insulation Standards published by MICA (Midwest Insulation Contractors Association) and manufacturer's installation instructions, except as modified in this Section of specifications.

B. Install products with smooth and even surfaces. Use full-length factory-furnished material where possible. Do not use scrap pieces.

C. Apply insulation only on clean, dry surfaces, after all rust and scale have been removed and testing of systems has been completed. Do not insulate any section of system that must be pressure tested until after it has been successfully tested. Any removal and reinstallation to correct system defects prior to end of guarantee period shall be accomplished at no expense to Owner.

D. Install insulating materials with necessary joints and terminations, to permit easy access and removal of equipment sections where inspection, service or repair is required, and to allow for expansion.

E. Where possible longitudinal joints in jackets shall face toward wall or ceiling.

F. Apply insulation to each pipe or duct individually. Common insulation applied to adjacent pipes or ducts will not be accepted.

G. Unless otherwise indicated, pipe and duct insulation shall be continuous through walls and floors.

H. Where multiple layers of insulation are used, stagger and secure each layer with metal bands.

I. Where penetrations occur through fire-rated walls, partitions, or floors, provide fire-stopping system as specified in Section 23 00 00 - General Mechanical Requirements and Section 07 84 00 - Firestopping.

J. Insulate the following systems for complete vapor barrier protection:

(1) Chilled Water
(2) Refrigerant
(3) Cooling coil condensate drain
(4) Non-Potable Cold Water
(5) Insulated ductwork
(6) Piping and/or equipment with surface temperature below 60°F (16°C)
(7) Geothermal Water

K. Apply Type A insulation for insulation and jackets requiring vapor barrier protection where specified insulations are cut for mounting sensors, control devices, parts of valves, devices or components which extend out from specified insulation to prevent condensation.

3.03 PIPING, VALVE AND FITTING INSULATION

A. Apply insulation to pipe, unions, flanges, fittings, valves and piping specialties with butt joints and longitudinal seams closed tightly. Valve insulation shall cover entire valve body including bonnets and packing nuts.

B. Laps on factory-applied jackets shall be 2" (50 mm) minimum width firmly cemented with lap adhesive or shall be pressure sealing type lap.

C. Cover joints with factory furnished tape 3" (80 mm) minimum width) to match jacket. Cement firmly with lap adhesive. On systems requiring a vapor barrier (ASJ), vaporseal all longitudinal and butt joints ASJ/Saran seams with 4" (100 mm)wide coat of vapor barrier mastic or 3" (80 mm) minimum tape.

D. Where staples are used, they shall be on 6" (150 mm) maximum centers. When used for systems requiring vapor barrier, cover lap and staples with finish coat of vapor barrier mastic or 3" (80 mm) minimum tape.

E. For finishing of insulated pipe fittings and valves where surface temperature of insulation is not higher than 125°F (51°C), use one piece PVC fitting covers, minimum thickness of 20 mil (0.05 mm), Fitting cover shall be Johns Manville Zeston 2000 PVC, PROTO Fitting Covers, or similar by other manufacturers listed. Where fitting and valve insulation requires vapor barrier, seal joints of PVC covers with vapor barrier adhesives. Insulation type, R-value and density of insulation used at fittings shall match insulation of adjacent piping. Install insulation at pipe fittings and valves completely prior to applying PVC covers.

(1) For Type R (Rigid glass fiber) pipe insulation, PVC fitting covers with flexible mineral fiber blanket insulation inserts are acceptable, except those located in mechanical rooms within 6 ft (1.8 m) above floor. For fitting covers located in mechanical room within 6 ft (1.8 m) above floor, insulation inserts shall be pre-molded rigid fiber glass type wrapped around elbows.

F. Stove pipe style insulation on elbows (Detail A on Plate 2-200 of MICA 8th Edition) is not allowed. It may be used for closed cell elastomeric insulation.

G. Where terminations of pipe insulation are required, insulation shall have tapered ends, built up and finished as specified for fittings.

H. For pipes 1" (25 mm) and smaller, install specified pipe insulation and jacket continuous through hanger or support locations. Install insulation protection shields to protect insulation from compressing.

I. For pipes 1-1/2" (40 mm) and larger, where manufactured pre-insulated pipe supports are used at hanger or support locations, extend insulation to insulated pipe supports. Where vapor barrier is required, this Contractor shall be responsible for continuity of vapor barrier at insulated pipe supports 3" (80 mm) wide vapor barrier tape on hot and cold systems at pipe supports.

J. For pre-insulated pipe supports and insulation protection shields, refer to Section 23 05 29 - Mechanical Piping and Equipment Supporting Devices.

K. For Contractor-fabricated anchors, secure insulation directly to pipe surface and extend insulation up anchor for distance of 4 times insulation thickness. For pre-insulated anchors, cover entire surface of anchors with Type A insulation. Where applicable, take special care to assure vapor seal at anchor.

L. Where mechanical grooved pipe connections are used in piping system, insulate couplings as specified for pipe.

M. Piping, fittings, and valves not to be insulated:

(1) Heating hot water piping inside fin tube radiation enclosures

(2) Control valves and balancing valves for heating terminal devices

(3) Valves and steam traps furnished with removable insulation/jacket

3.04 EQUIPMENT INSULATION

A. For equipment requiring _____ insulation such as breechings, stacks, exhaust pipes and mufflers, apply insulation to equipment and secure with stainless steel bands with tightly butted joints as recommended by manufacturer. Where multiple layers of insulation are required, stagger and secure each layer with stainless steel bands.

B. Install removable insulation where access is required for cleaning, repair, and inspection. Construct removable insulation with Type A insulation for cold equipment and Type R insulation with V-1 jacket for hot equipment. Do not apply bonding adhesive to equipment surface.

C. Provide removable insulating blankets on expansion joints.

D. Do not insulate over equipment nameplates or ASME stamps. Bevel and seal insulation at these locations.

E. Water chiller insulation shall include insulation of evaporator shell, water boxes and other miscellaneous piping and/or equipment as directed by equipment supplier and scheduled above. Verify chillers are fully charged with refrigerant before insulating.

F. Chilled Water Pump Insulation Box

(1) Provide removable insulating boxes where shown on Drawings and where access is required for cleaning, repair, and inspection, including pump heads and strainers.

(2) Construct removable insulating boxes with split metal enclosures using minimum 24 ga galvanized sheet metal lined with insulation as scheduled above. Adhesive shall be as specified above.

(3) Do not apply bonding adhesive to equipment surface.

(4) Finish interior surface of insulating box to allow removal without damage. Provide fastener, supports and membranes.

G. Equipment not to be insulated:

(1) Equipment furnished with factory insulation.

3.05 DUCTWORK AND COMPONENTS

A. Apply duct insulation evenly over duct surface. Unless otherwise indicated, insulation and jacket shall run continuously between duct and duct supports. Maintain insulation thickness specified over duct reinforcing members.

B. For support points of ducts supported by trapeze hangers, place weight-supporting insulation at bottom of duct over trapeze. Weight supporting insulation inserts shall be minimum 6" (150 mm) wide and cover entire bottom of duct. Insulation insert shall have same thickness as insulation specified. Size inserts based on compression strength and weight being supported.

C. Insulation may be installed outside of support for rectangular or oval ducts having width 60" (1500 mm) or smaller or round ducts 24" (600 mm) or smaller, and supported with strap hangers, provided that vapor barrier integrity is maintained at strap penetration.

D. For support points of round ducts 16" (400 mm) diameter and larger, place weight-supporting insulation between duct and strap or trapeze. Weight-supporting insulation shall be minimum 6" (150 mm) long with same thickness as insulation specified and shall be Type G, H, P or PP insulation. Size inserts based on compression strength and weight being supported.

E. Securing glass fiber insulation (Type F, R, and RR) for rectangular or oval ductwork.

(1) Horizontal ductwork:

(a) Secure to bottom of duct where duct width is 24" (600 mm) diameter or greater.

(b) Secure to sides of duct where duct side is 24" (600 mm) diameter or greater.

(2) Vertical ductwork:

(a) Secure to all sides where duct width is 18" (450 mm) diameter or greater.

(3) Install fasteners as required to secure, but not over 18" (450 mm) on center and within 3" (80 mm) of butt joint or edge.

(4) Fastener shall be weld pin mechanical type.

F. Fastening insulation anchors to ductwork with adhesives is not allowed. Where weld pin fasteners are used, install them without damage to interior galvanized surface. Where weld pin fasteners cannot be used, use other type of fasteners such as metal bands.

G. Where ductwork is specified to be insulated, entire system including components with external surfaces equivalent to duct exterior (filter housings, mixing air chambers, air measuring stations, reheat coils, life safety dampers, sound attenuators, etc.) shall be insulated and integrity of vapor barrier shall be continuous. For life safety dampers in ductwork requiring insulation, install insulation and jacket to wall and apply vapor barrier sealant to prevent condensation. Coordinate inspection requirements with local Authority Having Jurisdiction before concealing life safety dampers.

H. Where ductwork is specified to be internally lined, duct system components which are not lined (filter housings, mixing chambers, air measuring devices, reheat coils, sound attenuators, etc.), shall be externally insulated and vapor barrier jacket shall be sealed to duct. External insulation shall extend a minimum of ____ in each direction from component.

I. Provide insulation over back pan or plenum of supply air diffusers, registers, or grilles primary air plenums of active chilled beams, and unlined boots after termination point of flexible ducts or rigid duct insulation to prevent sweating.

J. Where vapor barrier jackets are specified, pins and staples if used shall be jacketed over with matching material using 4" (100 mm) tape. Vaporseal insulation seams, punctures, and tears with two 4" (100 mm) wide tape.

K. Insulation without factory jacket shall be cut and mitered to suit surface. Build up voids, seams and joints with insulating cement, cover with glass fabric as specified herein and finish to smooth surface.

L. D-1 jackets:

(1) Butt together joints and seams firmly, cover with glass fiber fabric 4" (100 mm) minimum width. Where operating fluid is below dewpoint of space, finish with 2 coats of vapor barrier mastic.

M. D-2 jackets:

(1) Butt together joints and seams firmly and cover with 4" (100 mm) wide FSK tape.

N. D-3 jackets:

(1) Install jacket in strict accordance with manufacturer's installation requirements.

(2) For rectangular ducts, overlap bottom half jacket and top half jacket at each side of duct at least 4" (100 mm) (bottom inside top outside at overlap).

(3) For round ducts, wrap duct insulation continuously with spiral shaped overlapping. Overlap at least 4" (100 mm).

(4) Use welded stickpins for Type D-3 jacketing wider than 24" (600 mm) in width alongside and bottom surfaces of ducts. Retainers of stick pins shall be covered with Type D-3 patch, minimum ____ square, once retainer cup is in place on stick pin.

O. Acoustical Barrier Materials:

(1) Provide 2" (50 mm) thick Type R insulation with Type D-1 jacket as inner layer. Over insulation install acoustical barrier materials as outer layer in accordance with manufacturer's installation instruction.

(2) For ductwork specified with Type F insulation, replace it with insulation specified above.

(3) Refer to plans for ductwork requiring acoustical barrier materials.

P. Ductwork not to be insulated:

(1) Internally lined ductwork.

(2) Ductwork components with factory installed insulation.

(3) Exposed supply and return ductwork in _____.

3.06 PROTECTIVE INSULATION SHIELD (A-1 JACKET) FOR PIPE JACKETS EXTERIOR TO BUILDING

A. Unless otherwise indicated, install shields (A-1 jacket) around insulated pipe and fittings exterior to building. Seal water and vapor tight at terminations.

B. Longitudinal overlap shall be at least 2" (50 mm) wide with vapor barrier sealant.

C. Secure jacketing with 3/4" (19 mm) wide .015" (.38 mm) stainless steel or 3/4" (19 mm) wide .020" (.51 mm) aluminum bands and wing seals on maximum 18" (450 mm) centers.

3.07 TYPE FR INSULATION (FIRE RESISTIVE DUCT WRAP)

A. Install Fire Resistive Duct Wrap system in accordance with manufacturer's instructions and referenced Standards.

B. Where duct is specified to have Type FR wrap, and other insulation is indicated in Ductwork/Equipment System Schedule in this Section, other insulation does not need to be provided in addition to Type FR wrap.

3.08 TYPE KG INSULATION (KITCHEN GREASE DUCT WRAP)

A. Install Fire Resistive Duct Wrap system in accordance with manufacturer's instructions and referenced Standards.

B. Where duct is specified to have Type KG wrap, and other insulation is indicated in Ductwork/Equipment System Schedule in this Section, other insulation does not need to be provided in addition to or Type KG wrap.

3.09 TYPE G INSULATION (CELLULAR GLASS)

A. Install cellular glass insulation system in strict accordance with manufacturer's installation instructions.

B. Chilled Water Piping (Interior):

(1) Butter joints of insulation with Pittseal 727 or 444N Sealant. Apply insulation to pipe and fittings with joints tightly fitted and sealed full depth with joint sealant. Secure each length of insulation with 1" (25 mm) wide filament tape and stainless steel wire over tape. Apply insulation with joints fitted to eliminate voids. Eliminate voids by refitting or replacing insulation. Do not fill voids with joint sealer.

(2) Finish with specified jacket, joints and laps sealed with fire rated adhesive. Finish elbows and fittings with white PC-79 polyester fabric coated with Pittcote 404.

C. Chilled Water Piping (Underground):

(1) Apply insulation to pipe and fittings with joints tightly fitted. Hold each section of insulation in place with minimum 2 stainless steel wires.

(2) Apply insulation with joints fitted to eliminate voids. Eliminate voids by refitting or replacing insulation. Do not fill voids with joint sealer.

(3) Finish underground insulation with Type E-3 jacket and install in accordance with Pittsburgh Corning Bulletin FI-213, "Foamglas Insulation Systems for Underground Direct Burial Applications" and Product Data Sheets, FI-234, and FI-155, "Pittwrap SS Primer".

D. Steam and Steam Condensate Piping (with Type A-1 jackets):

(1) Apply insulation to piping with all joints dry and tightly fitted without voids. Do not use glue on joints.

(2) Secure insulation to piping with 1" (25 mm) wide, high tensile strength, fiber reinforced strapping tape similar to Scotch Brand Filament Tape and stainless steel wire over tape. Apply tape on equal spacing such that there are 2 rounds of tape per insulation section. Overlap tape minimum 50%.

(3) Apply aluminum jackets over insulation.

(a) Seal water and vapor tight at terminations.

(b) Longitudinal overlap shall be at least 1/8" (3 mm) wide bead with metal jacketing sealant.

(c) Secure jacketing with 3/4" (19 mm) wide .015" (.38 mm) stainless steel or 3/4" (19 mm) wide .020" (.51 mm) aluminum bands and wing seals on maximum 18" (450 mm). Provide minimum of 2 bands per section.

E. Steam and Steam Condensate Piping (Underground Direct Buried)

(1) Install insulation and jackets in accordance with Pittsburgh Corning Bulletin FI-213, Foamglas Insulation Systems for Underground Direct Burial Applications, and other appropriate Pittsburgh Corning product data sheets.

3.10 TYPE P AND PP INSULATION (POLYISOCYANURATE)

A. Install insulation with specified insulation jacket in accordance with manufacturer's installation recommendations. Insulation shall be tightly butted and free of voids and gaps at joints. Use 3" (80 mm)wide tape at butt joints with minimum 1.25 times circumference wrapping. Apply insulation joint sealant in longitudinal and butt joints.

B. Install pre-fabricated tight fitting insulation pieces on fittings, elbows, tees and valves.

C. Insulation at fittings and valves shall be the same thickness as on pipe section.

D. Replace Type P insulation and jacket with Type R insulation of same thickness with Type P-1 jacket at penetration of fire rated walls and floor slabs where fire stopping system is required.

3.11 TYPE S INSULATION (POLYSTYRENE)

A. Pipe:

(1) Use sectional insulation (semi-circular form) for pipe sizes 10" (250 mm) and smaller. Use segmental or sectional insulation for pipe sizes above 10" (250 mm).

(2) Plain sectional insulation shall be applied so that end joints are broken by making one-half of first section 18" (450 mm) long and leaving other half 36" (915 mm) in length. Longitudinal joints shall be on top and bottom of pipe. Apply insulation with sealer such as Foster 30-45 Foam-seal or Childers CP-70 Chil Joint on joints of single layer and outer layer insulation with band placed approximately 80 mm or 3 or 4-1/2" (80 or 115 mm) (see band schedule) back from end joints. Do not cement insulation to pipe. Omit joint sealer from inner layer of double layer insulation.

(3) Plain insulation lagging (blocks) for segmental insulation may be factory fabricated or beveled lagging assembled on job. Lags shall fit pipe snugly and maximum width of each lag shall be such as to leave not more than 1/8" (3 mm) void between pipe and joints of segments. Joints shall be broken by, starting with alternating 18" (450 mm) and 36" (915 mm) lags. Apply sealer and bands same as specified for plain sectional insulation.

(4) Apply pipe insulation in double layer construction with joints staggered (2 layers at 1" (25 mm) thick each).

B. Fittings, Valves and Flanges:

(1) Insulation at fittings shall not be of less thickness than insulation on adjacent piping. Fitting insulation (covers) shall be held together and applied with sealer. Insulation on welded fittings shall fit snugly to fitting contour and shall be applied in same manner and with same materials as specified for pipe.

(2) Apply fitting insulation with sealer on joints and band insulation in place using not fewer than 2 bands on threaded fittings and 4 bands on flanged fitting.

(3) Insulate threaded fittings before straight pipe is covered. Insulate flanged fittings after straight pipe is covered.

C. Band Material:

(1) Secure single layer or outer layer insulation with stainless steel bands, 6" (150 mm) spacing for insulated outside diameter under 12" (300 mm) and 9" (230 mm) spacing for 12" (300 mm) and over.

(2) Secure inner layer insulation with stainless steel bands 9" (230 mm) spacing.

(3) Tighten bands with mechanical tightening tool and secure with 304 stainless steel wing type seals.

D. Vapor Barrier and Jacket:

(1) Finish plain pipe insulation, fittings, valves, and flanges with vapor barrier mastic.

(2) After thoroughly dry, apply service jacket (Type P-1) and insulation shield jacket (Type A-1).

3.12 ENGINE EXHAUST PIPE INSULATION (OVER 650°C (1200°F)

A. Install engine exhaust pipe (4-layer system) in accordance with the following and as detailed on drawings.

B. 1st Layer:

(1) Provide insulation spacer (stand-offs), tack-welded to exhaust pipe, to create specified air space and support for liner (2nd layer). Insulation spacer material shall be of same material as exhaust pipe and shall be minimum of 1/8" (3 mm) thick. Refer to details on drawings for quantity and location of insulation spacers.

C. 2nd Layer:

(1) Liner shall be mechanically fastened to insulation spacers with stainless steel tap screws or bolts.

D. Insulation Support Tabs:

(1) Provide insulation support tabs fastened through liner and into insulation spacers for support of 3rd layer and 4th layer of insulation system.

(2) Support tabs shall be _____ and shall be segments of structural angle or fabricated bent plates in angle configuration, minimum 1/4" (6 mm) thick, with one leg being 1/2" (13 mm) short of outer jacket. The other leg shall be 2" (50 mm). Support tabs shall not come in contact with outer jacket. Provide support tab at each insulation spacer around circumference of pipe at not more than 60" (1500 mm) apart on vertical pipes. Refer to details on drawings.

E. 3rd Layer:

(1) Where multiple layers are required, stagger insulation joints and seams. Insulation shall rest on insulation support tabs and shall be secured in place with stainless steel bands.

F. 4th Layer:

(1) Where multiple layers are required, stagger insulation joints and seams. Insulation shall rest on insulation support tabs and shall be secured in place with stainless steel bands.

G. Outer Jacket:

(1) Finish system with specified outer jacket.

END OF SECTION 23 07 00

SECTION 23 08 00 - COMMISSIONING OF HVAC

PART 1 - GENERAL

1.01 DESCRIPTION

A. Commissioning of HVAC is the process of ensuring that the HVAC System is installed and performs interactively according to the basis of design criteria and meets the building's operational performance expectations as defined in the sequences of operations. The process also provides adequate documentation of installation, start-up, and functional testing and ensures that the Owner's maintenance personnel are adequately trained. It provides for discovery of system operational performance deficiencies prior to substantial completion while the responsible contractors can provide a timely response. It establishes testing and communication protocols in an effort to advance the HVAC System from installation to complete dynamic operation and optimization.

B. The commissioning process involves all the parties involved in the design and construction process as well as the Owner and the Commissioning Agent (CxA). Primary elements of Commissioning during the construction, acceptance, and warranty phases of the project include:

(1) Verify applicable equipment and systems are installed in accordance with manufacturers' instructions and contract documents and receive adequate operational start-up checkout by installing contractors.

(2) Demonstrate functional operational performance of equipment and systems in the commissioning program.

(3) Verify Operations and Maintenance (O&M) documentation submitted is complete. Provide required documentation and information to the General Contractor to allow compilation of Building Systems Manuals in accordance with Section 01 78 23 - Building System Manuals (O&M).

(4) Verify Owner's maintenance personnel are adequately trained in accordance with specified training plan requirements.

(5) Verify systems are interacting and performing optimally in accordance with the system sequence of operations.

(6) Furnish labor and material to accomplish HVAC system commissioning and systems testing as specified herein and other related sections.

1.02 RELATED SECTIONS

A. Section 01 79 13 - Demonstration and Training

B. Section 01 78 23 - Building System Manuals (O&M)

C. Section 01 91 13 - General Commissioning Requirements

D. Section 01 91 14 - Functional Testing Requirements

1.03 SUBMITTALS

A. Refer to Section 01 91 13 - General Commissioning Requirementsfor commissioning submittal requirements. Provide copies of commissioning submittal requirements to the Commissioning Agent, in addition to the copies required by the Owner and Design Professional.

1.04 COORDINATION

A. The installation schedule for the components, equipment & systems included in the commissioning program shall be such that the commissioning requirements can be met without impacting the construction schedule. Commissioning Functional Performance Testing is a requirement for Substantial Completion.

B. All maintenance points for components installed by the contractor (or sub-contractors) for building systems servicing shall be flagged utilizing construction marker ribbons if the maintenance point is located where multiple trades will be installing systems, unobstructed access from floor level shall be maintained. Refer to Section 01 91 13 - General Commissioning Requirements for additional information on maintenance/service point access.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Trade contractors shall provide all specialized tools, test equipment, and instruments required to execute startup, checkout, field calibration and functional performance testing of equipment under their contract.

B. Test equipment shall be of sufficient quality and accuracy (great accuracy than specified for component) to test and/or measure system performance according to specified tolerances. Test equipment is to have calibrated within the previous 12 months. Calibration shall be NIST traceable. Equipment shall be re-calibrated when dropped or damaged. Calibration tags shall be affixed or certificates be readily available.

C. Datalogging equipment or software required to test equipment will be provided by the CxA, but shall not become the property of the Owner.

PART 3 - EXECUTION

3.01 COMMISSIONING

A. General Requirements. For additional information regarding general commissioning requirements refer to Section 01 91 13 - General Commissioning Requirements.

B. Installation contractors shall be responsible for executing and documenting equipment installation, start-up and check out for systems and equipment. Contractors shall also be responsible for executing and documenting Contractor Pre-Testing. Both of these documents are required prior to the CxA scheduling the functional performance test. Contractors shall also be responsible for providing training for the Owner's maintenance personnel in accordance with project requirements.

C. Construction Checlists for each type of equipment and system shall be provided to the installation contractors by the CxA via the web-based commissioning application for use by the contractors in documenting the installation and start-up of equipment in the commissioning program.

D. For equipment and system components requiring a manufacturer's representative for Construction Checklists and start-up, manufacturer documentation of these activities shall be attached to the checklists provided by the CxA.

E. Functional Testing Procedures for each type of equipment and system shall be provided to the installation contractors by the CxA for use by the contractor in documenting the performance of the Contractor Pre-Testing. Refer to Section 01 91 14 - Functional Testing Requirementsfor further information.

F. Completed Start-up checklists and performance test documentation for all pieces of equipment shall be submitted by contractors to the CxA through the General Contractor prior to the scheduling of the final Functional Performance Testing that is witnessed by the CxA.

3.02 TRAINING

A. Contractor responsible for the installation of the system shall coordinate the participation of other sub-contractors and manufacturer's representatives in the training program in accordance with requirements of 01 79 13 - Demonstration and Training and 01 79 13A - Demonstration and Training Sample Agenda.

3.03 OPERATIONS AND MAINTENANCE DATA

A. Contractor responsible for the installation of the system shall provide operations and maintenance manuals in accordance with requirements of other sections of the project specifications

3.04 GENERAL SYSTEM TESTING CRITERIA

A. Functional Performance Testing

(1) Refer to Sections 01 91 13 - General Commissioning Requirementsand 01 91 14 - Functional Testing Requirements. Installation contractor shall be responsible for providing authorized manufacturer's representatives to demonstrate the operational capabilities of the equipment systems.

END OF SECTION 23 08 00

SECTION 23 09 01 - CONTROL SYSTEMS INTEGRATION

SECTION 23 09 01 – CONTROL SYSTEMS INTEGRATION

PART 1 GENERAL

2.01 RELATED WORK

A. Section 20 0513 - Motors
B. Section 20 0553 - Mechanical Systems Identification
C. Section 23 0550 - Vibration Isolation

N. Section 27 1500 - Communications Horizontal Cabling
O. Control Sequences: Refer to Drawings

2.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.
B. ASHRAE FUNDAMENTALS IP - (2013) Fundamentals Handbook, I-P Edition
C. ASHRAE 135 - (2016) BACnet - A Data Communication Protocol for Building Automation and Control Networks (ANSI Approved)

2.03 DEFINITIONS

A. The following abbreviations, acronyms, and definitions may be used in addition to those found elsewhere in Contract Documents.
   (1) Actuator: Control device to provide motion of valve or damper in response to control signal.
   (2) AI: Analog Input
   (3) AO: Analog Output
   (4) Analog: Continuously variable state over stated range of values
   (5) Auto-Tune: Software routine used to adjust tuning parameters based on historical data.
   (6) BAS: Building Automation System
   (7) BMS Building Management System
   (8) DDC: Direct Digital Control
   (9) DDCP: Direct Digital Control Panel
   (10) Discrete: Binary or digital state
   (11) DI: Discrete Input (Sometimes referred to as Binary Input BI)
   (12) DO: Discrete Output (Sometimes referred to as Binary Output BO)
   (13) EMCS: Energy Management and Control System (Typically interchangeable with BAS or BMS)
   (14) E/P: Voltage to pneumatic transducer (Often solenoid valve is referred to as an E/P transducer)
   (15) FA Field Adjustable
   (16) FC: Fail Closed position of control device or actuator. Device moves to closed position on loss of control signal or energy source.
   (17) FLP Fail Last Position
   (18) FMS: Facility Management System linking two or more BAS
   (19) FO: Fail Open position of control device or actuator. Device moves to open position on loss of control signal or energy source.
   (20) I/P: Current to pneumatic transducer

(21) Instrument: Device used for sensing input parameters or used for actuation.

(22) Modulating: Movement of control device through an entire range of values proportional to an infinitely variable input value.

(23) Motorized: Control device with actuator

(24) NC: Normally Closed position of switch after control signal is removed or normally closed position of manually operated valves or dampers.

(25) NO: Normally Open position of switch after control signal is removed or normally open position of manually operated valves or dampers.

(26) Node: DDCP, operator workstation, or other control device connected to communications network.

(27) Operator: Same as actuator for motorized devices. Also refers to an individual who physically "operates" facility.

(28) PC: Personal Computer

(29) Peer-to-Peer: Mode of communication between controllers in which each device connected to network has equal status and each share its database values with other devices connected to network.

(30) P: Proportional control, control mode with continuous linear relationship between observed input signal and final controlled output element.

(31) PI: Proportional - Integral control, control mode with continuous proportional output plus additional change in output based on both amount and duration of change in controlled variable (reset control).

(32) PID: Proportional - Integral - Derivative control, control mode with continuous correction of final controlled output element versus input signal based on proportional error, its time history (reset), and rate at which its changing (derivative).

(33) Point: Analog or discrete instrument with addressable database value.

(34) Self-Tune: Same as Auto-Tune

(35) Solenoid: Electric two-position actuator. (See E/P.)

(36) TCC: Temperature Control Contractor (Same as Control Contractor)

(37) TCP: Temperature Control Panel

2.04 ACCEPTABLE CONTROL CONTRACTORS

A. Control Contractor shall have full-service office within 100 miles (160.93 kilometers) of project site. Full-service office is defined as being home office of applications engineers, supervisors, and field technicians, having complete parts inventory, and having required test and diagnostic equipment. Control Contractors shall be factory authorized agent or dealer of controllers and control hardware as manufactured by:

(1) Johnson Controls, Inc by Harrison Energy Partner.

(2) Siemens Building Technologies by Powers of Arkansas

B. Bids will be accepted only from prequalified Control Contractor per "Instruction to Bidders".

2.05 SYSTEMS DESCRIPTION

A. System shall be electric and/or electronic.

B. Control system shall be Direct Digital Control (DDC).

C. Damper and valve actuators shall be electronic type, unless otherwise noted.

D. Control system shall be 100% DDC unless otherwise indicated.

E. New BAS shall seamlessly integrate with existing site Niagra front end server. Existing web server shall be able to access and read all input, output and calculated points and issue commands to all output points in new BAS by means of a standard web browser. Contractor shall provide necessary hardware and software components to accomplish this interface.

F. Provide modular designed stand-alone controllers capable of future BAS architecture with peer-to-peer and/or low/medium speed communication networks. Upgrade to full BAS architecture shall not require removal of existing controllers, sensors, actuators, etc.

G. BAS network architecture shall be based on an Open implementation of BACnet using ASHRAE 135-2016 exclusively as the communications protocol for communication between DDC Hardware devices, including BAS Web Server, to allow multi-vendor interoperability.

H. Building Automation System (BAS) shall control building's HVAC components and provide interface with Lighting Control System.

I. Provide BAS architecture consisting of communication network, controllers and instrumentation. BAS shall be fully expandable with addition of hardware and/or software. Expansion shall not require removal of existing controllers, sensors, actuators, or communication networks.

J. System shall support operator workstations as specified and shall be capable of additional workstations, limited only by systems maximum node capacity.

K. System intelligence shall be such that operator workstation(s) can be used for programming controls, performing analysis on filed data, generating maintenance and operation reports and providing permanent storage for programs and data.

L. Workstation PCs and printers will be furnished by Owner.

M. Safety devices shall function in both auto and hand modes on starter, and on VFD in auto, hand or bypass modes.

(1) Dampers interlocked with fans shall operate in both auto and hand modes to prevent dead-head of fans.

(2) Valves interlocked with pumps shall operate in both auto and hand modes of operation to prevent dead-head of pump.

(3) All safeties shall be hardwired through starter/VFD safety circuit to prevent unsafe operation when in either auto or hand modes.

2.06 SCOPE OF WORK

A. Provide all labor and materials for complete fully functioning control systems in accordance with Contract Documents included in this Section plus:

(1) Section 23 0902 - Control Valves and Dampers

(2) Section 23 0903 - Control Instrumentation

(3) Section 23 0923 - Direct Digital Controllers and Networks

(4) Section 23 0993 - Control Sequences

B. Engineering services shall be performed by Factory Trained Engineers. System shall be installed either by trained mechanics directly employed by Control Contractor or by subcontractors who are under direct supervision of Control Contractor's representative. Engineer reserves right to exclude Project Managers, Engineers, Field Supervisors, or Technicians whose past experience is not sufficient to meet needs of Project.

C. Control Contractor’s Project Managers, Engineers and Digital System Programmers shall have previously performed in capacity that qualifies them to successfully engineer system of scope and magnitude similar to this Project.

D. Submit qualification of Project Managers, Engineers, Programmers, Field Supervisors, and Technicians to be assigned to this Project within 30 days after contract award. Use Qualification Form attached at end of this Section.

E. Labor shall include, but not be limited to:

(1) Engineering services to size unscheduled valves and dampers based on design criteria specified in Section 23 0902 - Control Valves and Dampers, and confirm sizing of scheduled valves and dampers.

(2) Engineering services to produce requested submittals and working construction drawings and record drawings as specified here within.

(3) Engineering services for required software programming.

(4) Engineering services for graphics programming specified.

(5) Engineering services for mapping control points from Laboratory Temperature and Airflow Control System (Section 23 3614), if provided for the project.

(6) Engineering services for BAS Ethernet network design.

(7) Project management services as single point contact to coordinate construction related activities.

(8) Field mechanics for installation of pneumatic tubing and related control devices.

(9) Field mechanics for installation of control wiring and related control devices.

(10) Field technicians to startup, calibrate, adjust, and tune control loops.

(11) Field technicians to perform system checkout and testing, and to complete required reports.

(12) Field supervisor during controls installation and startup.

(13) Field technicians to assist Mechanical Contractor and Testing and Balancing (TAB) Contractor in adjusting controls and determining setpoints related to TAB work.

(14) Field representatives and/or classroom instructors to provide Owner training as specified.

F. Control Contractor shall be responsible for complete installation of control devices (except as noted), wiring, and pneumatic terminations at controller locations to accomplish control sequences specified in project manual or on drawings. Control Contractor is required to provide power for air terminal controllers and other field mounted devices that require 24 VAC, 60 Hertz and shall be powered from 120 to 24 VAC transformer panels provided by Control Contractor. Control Contractor shall also be responsible for additional instrumentation described in point schedules found in Contract Documents, which may not be directly related to specified control sequences.

(1) Control contractor shall provide unique tag numbers for all devices under this specification and reference those tag numbers in control sequences and control diagrams.

(2) If Owner has tagging convention, Control contractor shall utilize it. If no tagging convention exists, Control contractor shall provide one for all devices under this specification.

G. Mechanical Contractor shall provide wells, taps, and other mechanical interfaces required for control equipment mounting into piping systems. Mechanical Contractor shall install in-line mounted devices, such as valves, dampers, flow meters, static pressure probes, etc., furnished by Control Contractor. Control Contractor shall be responsible for installation of other control devices, such as actuators, linkages, sensors, air terminal controllers, flow transducers, remote mounted control devices, control panels, control transformers, etc.

H. Electrical work required as integral part of control work is responsibility of Control Contractor. Control Contractor is responsible for providing final power connections, including conduit, wire, and/or disconnect switches, to control devices from appropriate electrical distribution panels.

(1) Electrical Contractor will provide circuit breakers required to provide electrical power to controllers.

(2) 120 to 24 VAC transformer panels shall be provided by Control Contractor and mounted adjacent to controller panels or in Electrical Rooms, Telecommunications Rooms and/or (IDF/EIDF) rooms, or as indicated on plans and powered from dedicated electrical circuit.

(3) Should any change in number of controllers or addition of other electrical equipment after Contracts are awarded, Control Contractor shall immediately notify Electrical Contractor of change. Additional costs due to these changes shall be responsibility of Control Contractor.

(4) Coordinate with Electrical Contractor for additional power requirements.

I. Provide temporary Ethernet network for communications between Ethernet-based controllers and BAS servers (Web & Data Historian) until building IT network is available for use by BAS. Temporary Ethernet network and all other communications required for BAS shall be installed as required for specified operation of mechanical equipment to allow check out and commissioning of equipment in timely manner.

J. Additional BAS data drops (from telecommunication room patch panel to field jacks/patch panels) that are not accounted for in contract documents can be provided by Control Contractor in one of two ways:

(1) Option 1:

(a) Control Contractor shall sub-contract at control contractor’s expense the project’s Structured Cabling Contractor to install additional data drops.

(2) Option 2:

(a) Control Contractor can provide their own data drops but must exactly match all cabling and hardware installed by Structured Cabling Contractor as indicated in the following spec sections:

1) 27 000 – General Communication Requirements
2) 27 0528.33 – Raceway and Boxes for Communication System
3) 27 1000 – Structured Cabling
4) 27 1300 – Communications Backbone Cabling
5) 27 1500 – Communications Horizontal Cabling
6) 27 1600 – Communications Connecting Cords Devices and Adapters

(3) If Control Contactor chooses Option 2, submit to EOR a separate control submittal including all material and proposed locations for data jacks for approval prior to installation.

(4) Coordinate final Telecommunications room patch panel connections with network installation Contractor.

K. Control Contractor shall be responsible for maintaining master IP address list for all BAS devices throughout project to be handed over to Owner upon completion.

L. Materials shall be as specified unless approved through procedures for product substitution specified in Division 01. Control Contractor shall provide components not specifically indicated or specified, but necessary to make system function within the intent of specification.

M. If during the installation period any of the factory equipment or material provided in the system is found to be defective in material or workmanship, it shall be replaced or repaired by Contractor at no additional cost to the Owner within 24 hours from the time the problem was reported/discovered.

N. Any part/device or equipment installed as part of this contract found to be malfunctioning or defective during the warranty period shall be replaced by Contractor within 24 hours from the time the problem was reported.

O. Electrical products shall be listed and labeled by UL and comply with NEMA Standards.

P. All controls and wiring used for smoke control/life safety shall be UL 864 UUKL rated.

Q. Provide weather protection cover or weatherproof control devices where required for control devices located outdoors.

R. Provide tamper resistant screws and fasteners for equipment located in accessible and/or public areas.

S. Contractor is responsible for integration of the following independent systems into BAS:

(1) Electrical Metering:

(a) Electrical Metering provider will provide Modbus TCP connection(s) for interfacing to BAS. Control contractor responsible for a BAS solution to communicate data directly or through a gateway to all suppliers listed in Division 26 for Electrical Metering. Control contractor and Electrical Metering provider responsible for coordination of gateway requirements if needed, translation of network protocols, testing of communications between systems, and joint commissioning of systems. Control contractor to refer to control diagrams, Section 26 2413 Switchboards and Section 26 2713 Electrical Metering for programming and monitoring requirements.

(2) Fire Alarm System (FAS) Monitoring:

(a) FAS provider will provide contact termination points and/or addressable relays for connection to BAS for Smoke Control and Equipment Shutdown. Contractor shall supply cabling, conduit, and hardware necessary to make connections from BAS to FAS. Contractor and FAS provider are responsible for coordination of testing point connections between systems, and joint commissioning of systems. Contractor to refer to Control Diagrams, DDC Point Schedules and Control Sequences for programming and monitoring requirements.

(3) Lighting Control System (LCS):

(a) LCS provider will provide appropriate network termination points for connection to BAS. Contractor shall supply cabling, conduit, and gateway (if necessary) to make an interface connection from BAS to LCS point of connection. Contractor is responsible for a BAS solution to communicate data directly or through a gateway to all suppliers listed in Division 26 for LCS bidders. Contractor and LCS provider are responsible for coordination of gateway requirements if needed, translation of network protocols, testing of communications between systems, and joint commissioning of systems. Contractor to refer to Control Diagrams, DDC Point Schedules, and Division 26 for programming and monitoring requirements.

(4) Variable Frequency Drives (VFD):

(a) VFD provider will provide a termination point for a single point communication connection to the BAS utilizing BACnet MS/TP protocol. Contractor shall provide cabling and conduit to make an interface connection from the BAS to the VFD. Contractor and VFD provider responsible for translation of network protocols, testing of communications between systems, and joint commissioning of systems. Contractor to refer to Control Diagrams, DDC Point Schedules, and Section 20 0514 Variable Frequency Drive (VFD) System for programming and monitoring requirements.

2.07 SUBMITTALS

A. Technical Proposal:

(1) Submit, directly to Engineer on bid day, 3 copies of technical proposal. Technical proposal shall include written and/or graphic representation of proposed BAS architecture including quantity and types of controllers to be used at each location. Show or describe routing of communication networks. Include product data sheets for proposed controllers and sensors. Provide complete, detailed description of software packages to be used. Use pre-printed shop drawing materials with technical details in lieu of sales literature whenever they are available.

(2) Submit resumes of subcontractors to be used for project. List projects of similar size and scope. List shall include name and location of project, dollar value of control contract, date completed, and references. References shall include name and phone number of contact person.

B. Extended Service Agreement:

(1) Control manufacturer shall, upon completion of warranty period, make available to Owner annual service agreement covering all labor and material required to effectively maintain control system after warranty period. Owner reserves the right to accept or reject any such offers and to cancel on-going agreements with 30-day written notice.

(2) During extended service period, Contractor shall maintain Operation and Maintenance manuals to reflect all changes made to BAS.

C. Shop Drawings:

(1) Submit manufacturer's printed product data sheets for control devices and materials listed in bill of material in Control Contractor's control drawings. Datasheets shall be submitted electronically in pdf format with programmed bookmarks. When a manufacturer’s data sheet refers to a series of devices rather than a specific model, the data specifically applicable to the project shall be highlighted or clearly indicated by other means. Data sheets shall include sufficient technical data to describe instrument parameters required as specified.

(a) All submitted PDF documents shall have electronic bookmarks setup to quickly and easily locate documents and submitted information. Bookmarks shall be set up as follows:

1) Shop Drawings:

1. Each major system (AHUs, Heating systems, Cooling systems, etc.) shall have a master bookmark programmed with all documentation for the system grouped in order under a single bookmark for that system. Subgroups under the main bookmark should be divided in a minimum of: flow diagram/bill of material, wiring detail, control sequence, point list.

2. Each minor system (Air Terminals, FCUs, Plumbing systems, Electrical systems etc..) shall have a master bookmark programmed for the type of system with bookmarks under the master for each type of minor system. All documentation for the system shall be grouped in order under a single bookmark for equipment type but subgroups for flow diagrams, control sequences, point list etc. are not required.

2) Device Data Sheets:

1. Device Data Sheets for all equipment specified in 23 0902, 23 0903, and 23 0923 shall have bookmarks organized in alpha numerical order by part number. Part numbers can and should be grouped by major category such as Valves, Dampers, Temperature sensors, Actuators, etc.

3) Hyperlinks:

1. Hyperlinks can be used to enhance the bookmark tools but are not an acceptable substitute for electronic bookmarks.
2. If hyperlinks are used, they should be clearly identifiable as a hyperlink but using a different color text similar to how MS Office documents identify hyperlinks.

(2) Submit data concerning type of signal wiring and installation methods including raceway types and grounding methods.

(a) Submit voltage drop calculations for all low voltage DDC circuits. Voltage drop to include number of devices and wiring run lengths, calculated voltage available at each device.

(3) Submit control drawings in pdf format with bookmarks provided for each system and table of contents with links to each page. Control drawings shall include, but are not limited to, the following:

(a) Overall system/network architecture drawings: Provide block diagram showing relationship of each controller, control panel, or other network devices relative to each other. Label room location of each device. Number and indicate model number of each device. Indicate network types.

(b) Control Drawings: Including graphic representation of systems with major in-line components to properly locate all control devices. Identify controlled devices with their software designation on drawings, including unique valve and damper tag numbers.

(c) Detailed wiring and piping diagrams showing point-to-point hookup details of transducers, relays, outputs, inputs and subsystem components. Label pneumatic lines and control wires with field ID numbers/colors.

(d) Bill of material identifying actual product model number used for each control device for each schematic control drawing.

1) Bill of material shall be included on flow diagrams for each system and on panel layouts showing panel components.

(e) Drawings showing proposed locations of sensors and flow meters in ductwork and piping systems.

(f) Sequence of operation: Provide written narrative describing each control sequence indicating method of control. Identify sensors, controllers, and actuators used with references to tag number of controlled device. Include set points of each control loop.

(g) BACnet Compliance Documentation: The Protocol Implementation Conformance Statement for each component.

(4) Control Instrumentation (23 0903) and Direct Digital Controllers and Networks (23 0923) submittals can be submitted as separate submittals from control shop drawings but must be submitted simultaneously with control shop drawings.

(5) Submit a sample graphic page for each type.

D. Completion Checklist:

(1) Submit with shop drawings, detailed completion checklist including written procedures for adjusting and calibrating each type of instrument and sensor. Engineer reserves the right to request modifications to any procedure, which is incomplete or not adequate to prove system performance.

(2) Checklist shall include references to the following additional requirements:

(a) Instruments and sensors shall be calibrated by comparison to known device, which is traceable to National Institute of Standards and Testing.

(b) Each point shall be checked for calibration, connection to correct control loop, and proper setting of limit and alarm values.

(c) Transducers and other output devices shall be properly zeroed and calibrated at both minimum and maximum output. Document settings for discrete instruments and set points for analog instruments shall include minimum and maximum positions for safe operating conditions where applicable (max. pump speed or max. frequency of fan drive, etc.).

(d) Control loops shall be tuned to maintain controlled process variable at set point through seasonal conditions without operator intervention. Provide multiple sets of tuning parameters if necessary. Controller shall automatically use tuning parameters appropriate to existing ambient conditions. Maintain record on completion checklist, of control loops that require tuning at alternate times of year. Instruct technicians to supply default parameters that can approximate stable control until actual load conditions allow proper tuning of control loops.

(e) Performance tests of analog control loops shall be performed by changing set points and verifying that sequences can come into stable control within reasonable time period appropriate for each sequence. Simulate load changes for pressure and flow control loops.

(f) Performance tests of discrete control loops shall be performed by adjusting set point and verifying sequence action.

(g) Alarms, including network failures, shall be tested for each controller and device connected to network. Ensure that alarms are properly acknowledged at operator's workstation.

(h) Schedules for each system/device shall be verified.

(i) Graphics shall be verified for functionality including password protection, floor plan displays, system displays, alarm messaging, historical trends, report generation and HVAC schedules.

(j) BAS Ethernet network testing and benchmarking documentation showing network performance from switch to switch.

(k) Testing of BAS to ensure cyber security. Coordinate testing requirements with Owner.

E. Control Contractor and Mechanical Contractor shall walk proposed static pressure sensor and flow meter locations and mark up drawings for review and approval by Owner and Engineer prior to installation.

2.08 WARRANTY

A. Warranty period shall begin as authorized by the Owner's representative in writing. Authorization will not be given before the following conditions are met:

(1) All verified completion checklists provided to Owner.

(2) Completion of all punch list items.

(3) Conduction of a preliminary training session for personnel. The training shall consist of an orientation session at the job site to familiarize the personnel with the location and type of controlled equipment and controls on the project, a discussion of the control sequences, and a review of the control drawings.

(4) Completion and distribution of the as-built control drawings, including correction of all items noted by Owner and Engineer after review of the documents.

B. Warranty shall cover all costs for parts, labor, associated travel, and expenses for a period of one year from completion of system acceptance.

C. Hardware and software personnel supporting this warranty agreement shall provide on-site or off-site service in a timely manner after failure notification to the vendor. A telephone number where the service supervisor can be reached at all times shall be provided. The maximum acceptable response time to provide this service at the site shall be 24 hours Monday through Friday, 48 hours on Saturday and Sunday.

D. This warranty shall apply equally to both hardware and software.

E. Service personnel shall be qualified to accomplish work promptly and satisfactorily. Owner shall be advised in writing of the name of the designated service representative, and of any changes in personnel.

F. Scheduled Inspections:

(1) Two inspections shall be performed prior to warranty expiration and all work required shall be performed. Inspections shall be scheduled 6 months after Owner acceptance and one month prior to end of warranty period.

(2) These inspections shall include:

(a) Visual checks and operational tests of equipment.

(b) Clean control system equipment including interior and exterior surfaces.

(c) Check and calibrate each field device. Check and calibrate 50 percent of the total analog inputs and outputs during the first inspection. Check and calibrate the remaining 50 percent of the analog inputs and outputs during the second major inspection. Certify analog test instrumentation accuracy to be twice the specified accuracy of the device being calibrated. Randomly check at least 25 percent of all digital inputs and outputs for proper operation during the first inspection. Randomly check at least 25 percent of the remaining digital inputs and outputs during the second inspection.

(d) Run system software diagnostics and correct diagnosed problems.

(e) Resolve any previous outstanding problems.

(f) Install software upgrades, patches and fixes. Contractor to provide verification to facility personnel that all upgrades, patches and fixes to be installed have been tested in accordance with site testing and deployment procedures.

G. Scheduled work shall be performed during regular working hours, Monday through Friday, excluding holidays.

H. Dated records and logs shall be kept of each task, with cumulative records for each major component, and for the complete system chronologically. A continuous log shall be maintained for all devices. The log shall contain initial analog span and zero calibration values and digital points. Complete logs shall be kept and shall be available for inspection onsite, demonstrating that planned and systematic adjustments and repairs have been accomplished for the control system.

I. Each service call request shall be recorded as received and shall include its location, date and time the call was received, nature of trouble, names of the service personnel assigned to the task, instructions describing what has to be done, the amount and nature of the materials to be used, the time and date work started, and the time and date of completion. A record of the work performed shall be submitted within 5 days after work is accomplished.

J. Recommendations for system modification shall be submitted in writing. No system modifications, including operating parameters and control settings, shall be made without prior approval of the Owner. Any modifications made to the system shall be incorporated into the Operations and Maintenance Instructions, and other documentation affected.

K. During the warranty period, the Contractor shall maintain a backup of all software installed in the system. The backup shall be updated monthly or whenever the Contractor makes a change to the software. A reload of backup software into the system shall be performed by the Contractor immediately upon notification by the Owner. The reload shall be free of charge.

L. At the end of the warranty period, the Contractor shall provide updated copies of the latest versions of all project record documentation as described in Paragraph 1.10, Record Documents. This includes final updated drawings, software documentation, and electronic media backups that include all changes that have been made to the system during the warranty period.

2.09 COORDINATION WITH TAB CONTRACTOR

A. Control Contractor shall allow sufficient time to provide assistance and instruction to TAB Contractor in proper use and setting of control components such as, Operator Workstation computers, static pressure controllers, "K" Factors for VAV boxes, or any other devices that may need set points changes so that TAB work can be performed.

B. Provide required hardware and software related to control system to TAB Contractor to allow testing of systems and continued operation.

2.10 OPERATION AND MAINTENANCE MANUALS

A. Refer to Division 01 - General Requirements.

B. Operation and Maintenance manuals shall provide descriptions of maintenance on all system components, including sensors and controlled devices. Descriptions shall include:

(1) Product manuals for the key software tasks.
  (a) Operating the system
  (b) Administering the system
  (c) Engineering the Operator workstation
  (d) Application programming
  (e) Engineering the network
  (f) Setting up the web server
  (g) Report creation
  (h) Graphics creation
  (i) Data backup & Archiving

(2) List of recommended maintenance tasks associated with the system, controllers, instruments, operator workstations, data servers, web servers, and web clients.
  (a) Define the task.
  (b) Recommend a frequency for the task.
  (c) Reference the product manual that includes instructions on executing the task.

(3) Licenses, guarantees, and warranty documents for equipment and systems.

(4) System architecture diagram for components within the building annotated with specific location information.

(5) As-built drawing for each control panel

(6) As-built wiring design diagram for each control panel

(7) As-built system flow diagram for each system

(8) Sequence of control for each system

(9) Binding map for the building
  (a) A list of the device to device data flow. This shall not include the flow of data from devices to the presentation system.
  (b) Include:
    1) Description of the variable
    2) Sending device
    3) Receiving device

(10) Product data sheet for each component
(11) Troubleshooting guide
(12) Repair parts list
(13) Calibration instructions
(14) Control Contractor's completion checklist
(15) Manufacturer representative's name, address, and phone number
(16) Refer to SUBMITTALS, Shop Drawings above for electronic bookmark requirements for electronically submitted Operation and Maintenance manuals.

2.11 RECORD DRAWINGS

A. Refer to Division 01 - General Requirements.
B. Submit revised shop drawings indicating changes made during Project.
(1) Refer to SUBMITTALS, Shop Drawings above for electronic bookmark requirements for electronically submitted record drawings
C. Record drawing submittals shall be inclusive of BAS as installed and commissioned.
D. Update control diagrams to include tuning parameters and set points applicable to systems depicted as of date of system completion. This information shall be incorporated with sequence of operation for each system.
E. Include floor plans showing location of control panels and routing of BAS network cabling.
F. BACnet systems and devices:
(1) Submit finished device addressing documentation.
(2) Submit finished hardcopy of device binding database.
G. Provide passwords, if used, for back-up and restore functions for each controller.
H. Software (as installed and commissioned)
(1) All software submittals shall be provided in a format suitable for restoration of the programming and configuration of respective digital controllers, servers, workstations and peripheral devices, etc. provided as part of the BAS.
(2) Submit a copy of all software installed on the servers and workstations.
(3) Submit all licensing information for all software installed on the servers and workstations.
(4) Submit a copy of all software used to execute the project even if the software was not installed on the servers and workstations.
(5) Submit all licensing information for all of the software used to execute the project.
(6) All software revisions shall be as installed at the time of the system acceptance.
I. Firmware Files (as installed and commissioned)
(1) All firmware files shall be provided in a format suitable for restoration of the programming and configuration of respective digital controllers, servers, workstations and peripheral devices, etc. provided in the BAS.
(2) Submit a copy of all firmware files that were downloaded to or pre-installed on any devices installed as part of this project. This does not apply to firmware that is permanently burned on a chip at the factory and can only be replaced by replacing the chip.
(3) Submit control listing of firmware version for all firmware that is permanently burned on a chip at the factory.
(4) Submit a copy of all application files that were created during the execution of the project.
(5) Submit a copy of all graphic page files created during the execution of the project.
(6) Submit a copy of all secondary graphic files such as bitmaps, jpegs, etc. that were used in the creation of the graphic pages.

2.12 OWNERSHIP OF PROPRIETARY MATERIAL

A. Owner shall retain all rights to software for this project.
B. Owner shall sign a copy of the manufacturer’s standard software and firmware licensing agreement as a condition of this contract. Such license shall grant use of all programs and application software to the Owner as defined by the manufacturer’s license agreement, but shall protect the manufacturer’s rights to disclosure of Trade Secrets contained within such software.
C. Licensing agreement shall not preclude the use of the software by individuals under contract to the Owner for commissioning, servicing, or altering the system in the future. Use of the software by individuals under contract to the Owner shall be restricted to use on the Owner’s computers and only for the purpose of commissioning, servicing, or altering the installed system.
D. All project developed software, files and documentation shall become the property of Owner. These include but are not limited to:

(1) Server and Workstation software
(2) Application Programming Tools
(3) Configuration Tools
(4) Addressing Tools
(5) Application Files
(6) Configuration Files
(7) Graphic Files
(8) Report Files
(9) Graphic Symbol Libraries
(10) All Documentation.

PART 2 PRODUCTS

3.01 CONTROL WIRING

A. Control wiring shall be in accordance with National Electrical Code and Local Electrical Codes. Final connection points at devices and panels shall be made either at terminal blocks integral to device or at separate terminal blocks mounted inside of control panel enclosures. Use of wire nuts and crimped connections are not allowed for terminating control wiring unless approved by Engineer.

B. Refer to Division 26 for specification requirements for conduits and conductors, except as noted.

C. Terminal Blocks:

(1) Terminal blocks which are not integral to other equipment shall be insulated, modular, feed-through, clamp style with recessed captive screw-type clamping mechanism, shall be suitable for rail mounting, and shall have end plates and partition plates for separation or shall have enclosed sides.

D. Signal and Power Conductors (24 V and Under):

(1) Wires smaller than #18 AWG shall not be used, except for manufacturer supplied instrument specific wire, or where otherwise specified. Use 2-wire stranded twisted/shielded pair 24 VDC for analog and discrete input and 24 VAC/VDC output devices. For 3-lead RTD signal wiring, use #18 AWG stranded, tinned copper twisted/shielded 3-conductor. Provide isolated instrument grounding system as per manufacturer's recommendations.

(2) Conductors not concealed in raceway shall have UL Listed plenum rated Teflon or low-smoke PVC jacket and insulation. Conductors not concealed in raceway used in high temperature applications or harsh environments shall have UL Listed plenum rated Teflon jacket and insulation.

(3) Provide 250 ohm, 5 watt, 0.1% tolerance dropping resistors in 4 - 20 mA circuits as required to generate 1 to 5 volt signals in 24 VDC powered instrument loops.

(4) 24 VAC Power Conductors shall be #18 AWG 2 wire twisted pair or larger. Provide Metal Oxide Varistors (MOVs) on 24 VAC/VDC discrete outputs connected to inductive loads to reduce noise levels (i.e., solenoid valves, motor contactors, relays, damper/valve electric actuators, etc.).

(5) Stranded twisted/shielded control conductors are required with shields to be terminated within variable frequency Drive enclosures to reduce effects of noise from VFD. Follow VFD manufacturer's installation instructions for wiring control conductors to VFD.

E. Communication Cable:

(1) Cable not concealed in raceway shall have UL Listed plenum rated insulation.

(2) Floor Level Network Communication Cable (Twisted Pair): Use control system manufacturer's standard communications cable or #22 AWG to #24 AWG twisted, shielded pairs, coaxial cable, or fiber optics for communications between remote controllers/devices

(3) Interior LAN Horizontal Communication Cable:

(a) Refer to specification 27 1500 - Communications Horizontal Cabling for the following requirements:

1) LAN cable requirements
2) LAN cable color
3) Termination requirements
4) Cable length and slack requirements

F. Transient Voltage Surge Suppression Devices:

(1) Devices shall be designed for 120 V power conditioning devices for electronic equipment. Devices shall be designed, manufactured, tested, and installed in compliance with ANSI/IEEE C62.41 and C62.45, Federal Information Processing Standards Publication 94 (FIPS PUB 94), NEMA, NFPA 70, 75, and 78, and UL 1449 and 1283. Devices shall be labeled for UL 1449.

(2) Clamping voltage for 120 V power systems shall be 400 V.

(3) Provide visual indicator of when surge device has been used.

G. Uninterruptible Power Supply

(1) Manufacturers: MGE UPS Systems, Eaton Powerware, Liebert PowerSure or approved equal

(2) Provide UPS for backup power for Operator Workstations, Building Level Controllers, Floor Level Controllers and field panels required for control of emergency/standby powered equipment, UPS shall maintain control upon loss of normal power and until emergency/standby power supply is brought on line.

(3) Select UPS for minimum of 5 minutes backup time for load connected. This will allow emergency/standby power sources to come on line and provide backup power to emergency/standby powered equipment.

(4) Upon sensing loss of normal power, transfer time shall be 8 milliseconds maximum.

(5) Operating Parameters:

(a) Operating Temperature: 32°F to 104°F

(b) Relative Humidity: 0 to 95% rh, non-condensing

(c) Recharge Time: 8 hours, typical

(6) UPS shall have self-diagnostic capability with DO to BAS to allow remote monitoring/alarming of UPS trouble or alarm conditions.

H. Uninterruptible Power Supply (Servers):

(1) Manufacturers: MGE UPS Systems, Eaton Powerware, Liebert PowerSure or approved equal

(2) Provide rack mounted dual/double conversion UPS for backup power for each rack-mounted Server. UPS shall maintain power to Server upon loss of normal power and until emergency power supply is brought on line.

(3) Select UPS for minimum of 20 minutes backup time for load connected. This will allow emergency power sources to come on line.

(4) UPS shall be provided with power management software and communication cable for interfacing with respective Server.

(5) Upon sensing loss of normal power, transfer time shall be 8 milliseconds maximum.

(6) Operating Parameters:

(a) Operating Temperature: 0 to 40°C

(b) Relative Humidity: 0 to 95% rh, non-condensing

(c) Recharge Time: 8 hours, typical

3.02 LOCAL CONTROL PANELS

A. Control panels shall meet the following minimum requirements:

(1) Outdoors: Control panels located outdoors shall comply with NEMA 3R or 4X requirements.

(2) Mechanical Rooms: Control panels located in mechanical or electrical rooms shall comply with NEMA 4 requirements.

(3) Other Locations: Control panels in other locations, including but not limited to occupied spaces, above ceilings, and plenum returns shall comply with NEMA 1 requirement.

B. Local control panels shall be constructed of steel or extruded aluminum with hinged door and keyed lock, with baked enamel finish of manufacturer's standard color.

C. Provide panels of adequate size to accommodate instruments for future expansion of approximately 25% beyond space required for this scope of work.

3.03 NETWORK HARDWARE

A. Ethernet Switches, Routers, and Bridges:

(1) Network hardware shall be provided and configured to form a campus-wide Fast Ethernet (a combination of 100BASE-TX and 100BASE-BX, -FX, and –SX or higher).

(2) Ethernet devices shall be IEEE Std 802.3 which shall function as the center of a distributed-star architecture and shall be "learning" type with spanning tree algorithms per IEEE Std 802.1D. All devices shall have a non-blocking architecture.

(3) The switch shall support the connected media types and shall have a minimum of 150% the required ports and no fewer than 4 ports. One port shall be switch selectable as an uplink port.

(4) Network hardware shall be compatible with the copper and fiber optic cabling installed by the Division 27 contractor. Refer to specifications 27 1300 and 27 1500 for media types.

(5) Switch located in BAS server rack shall be managed type and shall have a minimum of two fiber optic ports.

(6) Switch shall include N.O./N.C. alarm contact for monitoring by BAS.

B. Network Components:

(1) Network components (Racks, enclosures, patch panels, etc.) shall comply with respective sections of specification 27 1100 – Communications Equipment Room Fittings.

PART 3 EXECUTION

4.01 GENERAL

A. Install control equipment and wiring in neat and workmanlike manner.

B. Coordinate timely delivery of materials and supervise activities of other trade contractors to install devices such as immersion wells, pressure tappings, any associated shut-off valves, flow switches, level switches, flow meters, air flow stations, valves, dampers, and other such items furnished by Control Contractor, which are to be installed by Mechanical Contractor.

C. Install control devices in accessible location.

D. All BAS associated 120 VAC power wiring (including all input and output power supplies) shall originate from clearly-marked, BAS-dedicated circuit breakers. All input/output transducers shall be powered from the same circuit that supplies power to the associated BAS controller. All BAS equipment shall be fused in accordance with manufacturer's recommendations.

E. 120 VAC power shall not be allowed inside BAS controller panels. All 120 VAC to 24 VAC transformers and 120 VAC to 24 VDC power supplies shall be located in enclosures adjacent to the control panel being served. Terminal unit controls shall be served by consolidated 24 VAC transformer panels.

F. BAS controllers shall be labeled with the source of electrical power including panel number, circuit breaker number, and room number where electric panel is located.

G. Devices containing mercury are not allowed.

H. Coordinate mounting height and location of control devices so that NEC workspace clearances are maintained.

I. During construction, Contractor shall take necessary precautions to ensure all panels, wiring, instrumentation, etc. are kept clean and dry. Upon Project completion, control panels shall be clean of wire nuts, trash, and wire stripping. All excess material is to be turned over to Owner BAS group.

J. BAS floor level network to room/equipment controllers shall be confined to the same floor the respective building level controller is located on.

(1) In applications where the floor level network must transition between floors, the transition shall be located in a clearly marked junction box on each floor of appropriate size to accommodate a screw terminal strip. Network cabling shall be labeled to indicate the previous connection prior to entering the junction box with the terminal strip. Terminal strip shall be used as a transition point from one floor to the next. Terminal strip shall be large enough to accommodate transitions to and from the floors below and above if floor transitioning is required.

K. Labels and tags shall be keyed to unique identifiers shown on As-Built drawings. Enclosures and DDC Hardware and controllers shall be labeled. Sensors, valves and actuators shall be tagged. Airflow measurement arrays shall be tagged to show flow rate range for signal output range, duct size, and pitot tube AFMA flow coefficient. Duct static pressure taps shall be tagged at location of pressure tap. Tags shall be plastic or metal and shall be mechanically attached directly to each device or attached by a metal chain or wire. Labels exterior to protective enclosures shall be engraved plastic and mechanically attached to enclosure or DDC Hardware. Labels inside protective enclosures may be attached using adhesive, but shall not be hand written.

4.02 CONTROL WIRING

A. Provide electrical wiring required for complete functional control systems, including power circuit to control panels, both line and low voltage, in accordance with applicable local codes, and latest version of National Electrical Code and NFPA. Refer to Paragraph 1.6.H. for definition of scope of Work.

(1) Voltage drops for all low voltage circuits shall be calculated prior to installing low voltage circuits. Voltage drop calculations shall be made available to Engineer on demand.

B. Control panels serving equipment fed by emergency/standby power shall also be served by emergency/standby power. Equipment fed by emergency/standby power is so indicated on mechanical equipment schedules and electrical motor schedules. Control panels shall be powered by local UPS (Uninterruptible Power Supply) to ensure continued control of equipment powered by site standby power sources when primary power source is lost. Devices such as Operator Workstations, Floor Level and Building Level Controllers, Application Specific Controllers and fume hood controls shall be provided with UPS power.

C. Where multiple controllers reside in a single control panel, provide a separate disconnect (or fuse) for each controller.

D. Install control wiring in metal conduit or raceway system. Refer to Division 26 - Electrical for additional requirements.

E. Where penetrations of fire-rated assemblies are involved, seal penetrations with appropriate firestopping systems as specified in Section 26 0000 – General Electrical Requirements.

F. Color-code each junction box cover plate as to signal type using 1/2" self-adhesive color dot or enamel spray paint. Use green for low voltage signal wiring, blue for pneumatic tubing, and yellow for line voltage wiring used for signal wiring or dedicated power wiring.

G. Tag each wire termination at control panels, junction boxes, and remote control devices with unique wire ID number.

H. Low voltage wiring concealed above accessible ceilings does not require raceway. Cables not in raceway shall be routed along building structure lines using Bridal Rings, J-hooks or other mounting methods as approved by Engineer. Use of wire-ties for attaching cabling to duct brackets, piping or structure is not acceptable. Diagonal routing is not allowed. Label each cable not in raceway with unique wire ID number every 50 feet (1524 cm)

I. Run direct current instrument conductors separately from alternating current conductors. Where allowed by NEC wiring classification, AC-DC route crossings shall be at 90 degrees. Install special sensor to transmitter cables in accordance with manufacturer's installation drawings or in compliance with manufacturer's instructions. Extra precautions shall be taken when pulling and shortening these "vendor furnished" cables. Any extra length on these cables shall be neatly coiled into minimum 3" diameter coils and installed into junction box.

J. All wiring terminating in a control panel/enclosure shall be landed on terminal strips, with one wire per terminal. All I/O points on a DDC/BAS controller shall be wired to panel-side of terminal strip, including all spare I/O points.

K. All communication/power/signal wiring terminating in a control panel/enclosure/junction box shall be provided with a minimum of 3” – 6” extra wiring length. Extra cable shall be loosely folded/looped and stored neatly in wireways or cable tray/headers above control panel.

L. Follow Control Contractor’s Company standard cabling color codes.

M. Electric Signal Cables:

(1) Analog electric signal cables from electronic transmitters to controllers/receivers and from controllers to other analog devices shall be continuously shielded to reduce effects of EMI on control signals residing on those cables. Electric signal cables to discrete devices typically do not require shielding, but for better noise immunity use twisted/shielded pairs.

(2) Shields shall be grounded at power source end only and floated at other end. Pay particular attention to floating shields through termination points, maintaining only one single grounding point, and insulating from ground at other points.

(3) Provide 250 ohm, 5 watt, 0.1% tolerance, dropping resistors as required to generate 1 - 5 VDC signals or 500 ohm, 5 watt, 0.1% tolerance, dropping resistors as required to generate 2 - 10 VDC signals from 4 - 20 mA control loop powered by 24 VDC power supply.

N. BAS Network Communication Cable:

(1) Install special cable connectors in accordance with BAS manufacturer's recommendations.

(2) Typically, #22 AWG, but no smaller than #24 AWG, twisted pairs, twisted shielded pairs, coaxial cable, fiber optics or manufacturer's standard cabling for communications between remote control devices and BAS controllers.

(3) BAS Network communication cable shall not be spliced.

(4) Provide isolated instrument grounding system as necessary per manufacturer's recommendations.

4.03 LOCAL CONTROL PANELS

A. Provide local control panel for each system where more than one control device requires field mounting, (air handling units, exhaust fans, miscellaneous control systems including pump controls, heat exchanger controls, etc.). Single devices may be mounted on piping, wall or ductwork. Install local control panel where indicated on drawings or suitable location adjacent to system served.

B. Mount panels on wall with suitable brackets or on self-supporting stand. Mount top of panels no higher than 6 ft above floor. Install panels so front cover door can swing fully open without interference.

C. Label local control panels with respective unique ID numbers in accordance with Section 20 0553 - Mechanical Systems Identification.

D. All control panels located in accessible areas be provided with keyed locks. Locks shall utilize a single master key. Provide 2 spare key sets to Owner.

E. Panel Layout:

(1) Locate controllers in lower half of panel first and upper half second.

(2) Locate terminal strips either horizontally in upper half of back panel or vertically. Do not locate terminal strips below 2'-0" or above 6' above finished floor.

(3) Provide separate enclosure for 120 VAC power transformer and circuitry.

(4) Enclose wire and cable in wireways or bundle w/ wire ties and secure to back-panel. This does not apply to wire exiting wireways to terminal strips or panel mounted devices.

(5) Space controllers according to manufacturer's requirements with 3" minimum between controllers and other devices on panel and 6" between controller front and door mounted devices. Ensure adequate space is allowed for device heat dissipation.

(6) Do not place controller or control devices on enclosure sides.

(7) Do not use any control panel as wire or cable pass-through to adjacent panel.

4.04 BAS ETHERNET NETWORK TESTING AND BENCHMARKING

A. Test and document connectivity, latency, and integrity of network from each switch to each BAS controller and BAS server switch and from switch-to-switch.

(1) Latency between any ports shall be equal to or less than 1 millisecond.

(2) Packet loss shall be less than 0.5% between any ports when tested with frame sizes between 64 and 1518 frames for duration of 60 seconds.

B. Test and document all telecommunication protection/security techniques employed on system including access control into BAS Ethernet network from other building networks and access control to other building networks from BAS Ethernet network. Coordinate testing procedures with Owner.

4.05 ADJUSTMENT AND COMPLETION CHECKLIST

A. After completion of installation, follow checklist procedure defined in checklist submittal to adjust and calibrate thermostats, control valves, control actuators, controllers, sensors, and other equipment provided in this Contract. Include signed and dated, completed checklist in Operation and Maintenance Manuals.

B. Upon completion of Work but before final acceptance of systems, Engineer or Owner's representative will verify performance of control loops. Control Contractor shall immediately remedy any deficiencies found. Corrective measures may include modification or addition of equipment and devices, control strategies and/or software program. Corrective modifications made by Control Contractor during warranty period shall be incorporated and updated in Operation and Maintenance Manuals.

C. After final acceptance of system, Contractor shall work with Owner to remove all existing user names and passwords for all software and hardware used on project and create new user names and passwords as required.

4.06 OWNER TRAINING

A. Provide minimum of 40 hours of on-site training to Owner's representatives. Conduct training sessions during normal business hours after system start-up and acceptance by Owner. Scheduling of training session(s) will be established by Owner. Portions of training may be performed before system is completely operational, but no sooner than one month before system is planned to be fully operational. Final training session shall be held after systems are complete including all graphics programming.

B. Course content shall include, but not be limited to, the following topics:

(1) Explanation of control sequences. Include which sensors are used and how output device operates.

(2) Explanation of control drawings and manuals, including symbols, abbreviations, and overall organization.

(3) Walk-through of Project to identify controller locations and general routing of network cabling.

(4) Review of operation and maintenance of hardware devices. Include schedule for routine maintenance.

(5) Review of operation of operator's workstation; include hardware (PC's, printers, etc.).

(6) Review of operator's workstation software using specific examples of operating hardware.

(7) Review of portable operator's workstation software using specific examples of operating hardware.

(8) Any additional item(s) specifically requested by Owner.

C. Provide listing of regularly scheduled factory classroom training sessions concerning advanced topics covering proper operation and maintenance of control systems, sensing, monitoring and control equipment. Additional classes travel and lodging will be arranged and paid by Owner.

D. Provide minimum of 16 hours of additional on-site training to Owner's Representatives, 6 months after initial training is completed.

E. Scheduling of training session(s) will be established by Owner.

END OF SECTION 23 09 01

END OF SECTION 23 09 01

SECTION 23 09 02 - CONTROL VALVES AND DAMPERS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 23 0901 - Control Systems Integration

B. Section 23 0993 - Control Sequences

C. Section 23 2118 - Valves

D. Section 23 3314 - Ductwork Specialties

E. Section 23 3600 - Air Terminal Devices

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.]

1.03 GENERAL

A. Devices containing mercury are not allowed.

1.04 SUBMITTALS

A. Product data sheets shall include construction materials and assembly methods, maximum design parameters (temperature, pressure, velocity, etc.), and performance data for full range of actuator stroke. Product data sheets shall include charts, graphics or similar items used in making selections, including damper to duct area ratio and free area ratio. Damper product data sheets shall indicate certified leakage rates for given pressure differentials.

(1) Device data sheets shall be submitted with electronic bookmarks as specified in Section 23 0901 - Control Systems Integration. Refer to PART 1 – GENERAL, subsection SUBMITTALS.

B. Submit valve schedules with shop drawings, indicating unique tag numbers for each device, equipment item or system served, device model numbers, sizes, shut-off head required, actuator air pressure or force required to meet shut-off head, torque requirements for rotary valves, flow coefficients (Cv) for 10% and 100% valve stem travel, actual flow requirements based on equipment shop drawings, calculation of actual pressure drops, actuator model number, actuator torque capacities and pilot positioner locations.

C. Valve and damper Shop Drawing submittals will not be processed unless supporting data and sizing calculations are included.

D. Submit damper schedules with Shop Drawings, indicating unique tag numbers for each device, equipment or system served, device model numbers, duct sizes, damper sizes, flow rates, pressure differentials, calculation of actual damper pressure drops, approach velocities, leakage rates, torque requirements, actuator model number, actuator torque capacities and pilot positioner locations.

E. Select dampers to meet their intended service with respect to maximum approach velocities and maximum pressure differential. Damper materials shall match duct construction materials of systems in which they are installed (galvanized steel, aluminum, 304 or 316 stainless steel, etc.).

F. Aluminum dampers may be used in galvanized steel ductwork.

1.05 VALVE SELECTION AND SIZING

A. General:

(1) Select control valves to meet their intended service without cavitation. Provide cavitation calculations for modulating globe control valves over 250°F and all modulating butterfly valves over 60°F.

(2) Select control valves and actuators for 100% shut-off against system maximum differential pressure.

(3) Valve body ratings indicated in Part 2 are minimum required. Valve body, trim and packing selected shall be designed to withstand maximum pressure and temperature encountered in system.

(4) Submit engineering calculations for sizing modulating control valves unless valves are scheduled. Control valves serving terminal devices may be sized based on flow ranges for each pump system.

(5) Shut-off and 2-position valves shall be full pipe size.

(6) Calculations for sizing modulating valves shall be based on actual characteristics of equipment and system in which valves are installed. Valve calculations shall include information such as pump head or available pressure.

(7) Control Contractor is responsible for obtaining adequate system information necessary for sizing.

B. Instrumentation Valves:

(1) Unless otherwise noted, instrumentation shut-off valves for isolation of gauges, switches, transmitters, etc., shall be as follows:

(a) Water systems: globe-type valves

(b) Ductwork, air handling unit or air terminal device penetrations: ball or plug-type valves

(c) Liquid line sampling valves: multiple turn, metering-type valves.

C. Water Valves:

(1) Select modulating control valves to provide 3-5 psi (34.47 kPa) pressure drop at design flow rate with differential pressure less than 20 psi (137.90 kPa), and pressure drop equal to 25% of total pressure drop with differential pressure equal to or greater than 20 psi.

(2) Select control valves based upon pressure drop calculations and Cv values at 100% stroke.

(3) Size 3-way mixing or diverting valves not directly associated with pump subcircuit for 3-5 psi (34.47 kPa) pressure drop.

(4) Subcircuit is defined as branch supply and return piping to terminal device, including valve, coil, control valve, and balancing valve.

1.06 DAMPER SELECTION AND SIZING

A. Submit engineering calculations for sizing unscheduled modulating control dampers.

B. Calculations for sizing dampers shall be based on actual characteristics of ductwork system being installed. Opposed blade dampers shall be sized for minimum of 10% of duct system pressure drop. Parallel blade dampers shall be sized for minimum of 30% of duct system pressure drop. Duct section is defined as ductwork containing flow control damper starting with inlet or branch tee and ending with outlet or branch tee. Calculate actual duct pressure drops for each duct section containing modulating damper using latest version of ASHRAE Handbook of Fundamentals. If control systems fixes pressure drop, use those pressure setpoints. Use balance damper to provide additional pressure drop as required for obtaining linear damper response.

C. Control Contractor is responsible for obtaining adequate system information necessary for sizing.

D. Two position dampers to be sized as close as possible to duct size, but in no case is damper size to be less than duct area.

E. Submit leakage and flow characteristic data for control dampers along with shop drawings. Leakage ratings shall be based on AMCA Standard 500 and dampers shall bear AMCA Air Leakage Seals.

PART 2 PRODUCTS

2.01 CONTROL VALVES

A. General:

(1) If control valves are not scheduled, refer to Part 1 of this Section for sizing criteria.

(2) Use 2 or 3 port normally open globe type control valves with equal percentage contoured throttling plugs for steam and water applications, except as otherwise noted. Characterized ball valves may be used for water applications.

(3) Butterfly valves may be used for water system control valves 5" and larger provided that valves meet pressure and temperature requirements. High performance butterfly valves shall be used for modulating applications. General purpose butterfly valves may be used for 2 position control.

B. Globe Valves (Commercial Grade):

(1) Manufacturers: Belimo, Honeywell, Johnson Controls, Siemens Building Technologies, or TAC

(2) Valves shall be bronze or brass body, threaded ends for steel piping, solder ends for copper piping, 150 psi (1034.21 kPa) rating for 2" and smaller; iron body, bronze mounted, flanged, 125 psi (861.84 kPa) rating for 2-1/2" and larger.

(3) Two-way valves shall have equal percentage flow characteristics; three-way valves shall have modified equal percentage characteristics with linear flow from B-to-AB.

(4) Valves shall have stainless steel stems, spring-loaded Teflon packing, with replaceable stem/plug and packing kits.

C. Characterized Ball Valves:

(1) Belimo, Valve Solutions Inc., Bray Controls, Neles Controls or approved equal

(2) Provide two-way or three-way modulating control valves as required.

(3) Valves shall be ball-type valves with V-notch, segmented ball or characterizing disks for equal percentage flow response. Characterizing disks shall be securely fastened by a keyed ring or other securing device to prevent the disk from movement during operation.

(4) Valves shall be forged brass body, NPT threaded ends, 150 psi (1034.21 kPa) rating for 2" and smaller. Valve bodies 2-1/2" and larger shall be carbon steel or cast iron.

(5) Valves shall be furnished with stainless steel ball and stem with fiberglass reinforced Teflon (RTFE) seats and Viton, EPDM or RTFE O-rings and seals.

(6) Actuators shall be either mechanical spring return type or electronic fail-safe for valves requiring fail position; floating control, or fail last position type for areas such as animal rooms, offices or conference rooms. Mechanical spring return shall drive the controlled device to an end position upon loss of power. Electronic fail-safe shall incorporate an active balancing circuit to maintain equal charging rates among the Super Capacitors. The electronic fail-safe shall be adjustable in 10 degree increments with a 2-second operational delay.

(7) Actuators for major equipment such as air handling units, heating hot water or chilled water shall be fail-in-place, fail open, or fail closed depending upon service requirements. Size actuators to achieve system shutoff pressures.

(8) Terminal control valves near the end of the reheat supply lines on each floor shall be 3-way diverting type valves to provide minimum flow through the supply mains.

D. General Purpose Butterfly Valves:

(1) Refer to Section 23 2118 - Valves. Refer to Damper and Valve Actuators in this Section for valve actuators.

E. High Performance Butterfly Valves:

(1) Manufacturers: Belimo, DeZurik, Xomox, Jamesbury, Posi-Seal, Bray/McCannalok or Fisher

(2) Carbon steel body, lugged style, ANSI Class 150, adjustable PTFE packing, PTFE seat with suitable metal back-up ring, upper and lower shaft thrust bearings, 316 stainless steel one piece shaft and 316 stainless steel disc with offset shaft/disc design.

(3) Normal and dead end (without downstream flanging) pressure rating shall be 275 psi (1896.06 kPa).

(4) Provide electric/electronic actuator and positioner. Provide limit switches as required.

(5) Valves and actuators shall be manufactured by valve manufacturer. Valve assembly including actuator, positioner and limit switches if used shall be assembled by valve manufacturer.

(6) Use high performance type for modulating control. Be sure to size and schedule control valves and check for cavitation.

F. Two-Position Ball Valves (Isolation Valves):

(1) Belimo, Valve Solutions Inc., Bray Controls, Neles Controls or approved equal

(2) Valves shall be forged brass body, NPT threaded ends, 150 psi (1034.21 kPa) rating for 2” and smaller. Valve bodies 2-1/2” and larger shall be carbon steel or cast iron.

(3) Valves shall be furnished with stainless steel ball and stem with fiberglass reinforced Teflon (RTFE) seats and Viton, EPDM or RTFE O-rings and seals.

(4) Actuators shall be either mechanical spring return type or electronic fail-safe for valves requiring fail position; floating control, or fail last position type for areas such as animal rooms, offices or conference rooms. Mechanical spring return shall drive the controlled device to an end position upon loss of power. Electronic fail-safe shall incorporate an active balancing circuit to maintain equal charging rates among the Super Capacitors. The electronic fail-safe shall be adjustable in 10 degree increments with a 2-second operational delay.

(5) Actuators for major equipment such as air handling units, heating hot water or chilled water shall be fail-in-place, fail open, or fail closed depending upon service requirements. Size actuators to achieve system shutoff pressures.

G. Solenoid Valves:

(1) Manufacturers: Asco, TAC, Honeywell, Johnson Controls, Siemens Building Technologies, Moore Industries, or Schrader Bellows

(2) Valves shall be brass or bronze body. Select valves to match required temperatures and pressures, and to have materials that are compatible with intended working fluids.

(3) Line voltage actuators shall be Class "H" (high temperature), listed by UL or CSA.

H. Terminal Control Valves With Characterizing Disks (Reheat or Chilled Water):

(1) Belimo, Johnson Controls, Siemens Building Technologies, Honeywell, TAC or approved equal

(2) Provide two-way or three-way modulating control valves as required.

(3) Valves shall be ball-type valves with characterizing disks for equal percentage flow response. Characterizing disks shall be securely fastened by a keyed ring to prevent the disk from movement.

(4) Valves shall be forged bass body with nickel plating, NPT threaded ends, 150 psig (1034.21 kPa) rating for 2" and smaller.

(5) Valves shall be furnished with stainless steel ball and stem, and fiberglass reinforced Teflon seats and seals.

(6) Terminal control valves near the end of the reheat supply lines on each floor shall be 3-way diverting type valves to provide minimum flow through the supply mains.

(7) Actuators shall be either mechanical spring return type or electronic fail-safe for valves requiring fail position, floating control with fail last position type for areas such as animal rooms, offices or conference rooms. Mechanical spring return shall drive the controlled device to an end position upon loss of power. Electronic fail-safe shall incorporate an active balancing circuit to maintain equal charging rates among the Super Capacitors.

(8) Manufacturer shall warranty components for period of 5 yrs from date of production, with first 2 yrs unconditional.

I. Terminal Control Valves – Globe Type:

(1) Manufacturers: Siemens Building Technologies, Johnson Controls, Honeywell, Invensys Building Systems, Belimo or approved equal.

(2) Valves shall be globe type forged brass or bronze with threaded body connections. Valves shall be provided with stainless steel stems and trim. Packing shall be Ethylene Propylene Rubber or Teflon.

(3) Provide 3-way mixing control valves at the last 2 reheat coils at the end of each supply main on each floor to provide minimum flow path.

(4) Unless otherwise noted, provide fail open or closed position pneumatic or electric actuators as identified in control documents and shown on project drawings.

2.02 CONTROL DAMPERS

A. General:

(1) If control damper sizes are not shown or scheduled, refer to Part 1 of this Section for sizing criteria.

(2) Unless otherwise indicated, modulating control dampers shall be opposed blade or parallel blade type and 2-position (open/close) dampers shall be parallel blade type.

(3) Blade linkage hardware shall have corrosion-resistant finish and be readily accessible for maintenance.

(4) AMCA Leakage Classification of Control Dampers

CLASS	**STATIC PRESSURE INCHES WATER COLUMN**			
	1	**4**	**8**	**12**
	LEAKAGE RATE CFM/FT2			
IA	**3**	**N/A**	**N/A**	**N/A**
I	**4**	**8**	**11**	**14**
II	**10**	**20**	**28**	**35**
III	**40**	**80**	**112**	**140**

B. Standard Modulating and Two-Position Dampers:

(1) Manufacturers and acceptable model numbers:

(a) Johnson Controls VD-1630 (airfoil type)

(b) Honeywell D2

(c) Ruskin CD50/CD60

(d) Air Balance AC-525/526

(e) Greenheck VCD-43/VCD-33

(2) Damper frames shall be minimum of 16 ga galvanized steel or 14 ga extruded aluminum. Blades shall be minimum of 16 ga galvanized steel or 14 ga aluminum. Blades shall have maximum blade width of 8" with steel trunnions mounted in bronze sleeve, nylon or ball bearings.

(3) Furnish dampers with blade seals and stainless steel side seals. Dampers and seals shall be suitable for maximum system temperature, pressure differential and approach velocity, but not less than temperature range of -40° to 200°F, pressure differential of 6” WC, and approach velocity of 4000 fpm based on 4 ft damper section width.

(4) Leakage rate shall meet AMCA Leakage Class IA or I.

(5) Testing and ratings shall be per AMCA Standard 500-D.

C. Insulated Blade Dampers (Outdoor Air Dampers and Relief/Exhaust Air Dampers):

(1) Manufacturers: Tamco Series 9000 BF, Ruskin CDTI50

(2) Ultra-low leak thermally insulated steel airfoil blade design with flexible silicone side seals and blade gaskets. Damper leakage rates in closed position shall not exceed 6 cfm/square foot at 4” WG differential pressure.

(3) Extruded aluminum 6063T6 damper frame shall not be less than 0.080” in thickness. Damper frame shall be 4” deep x 1", with duct mounting flanges on both sides of frame. Damper frame shall have a 2" mounting flange on the rear of the damper, when installed as Extended Rear Flange install type. Frame to be assembled using zinc-plated steel mounting fasteners. Welded frames shall not be acceptable.

(4) Blades shall be maximum 6.4" deep extruded aluminum (6063-T5) air-foil profiles with a minimum wall thickness of 0.063”. Blades shall be internally insulated with expanded polyurethane foam and shall be thermally broken. Complete blade shall have an insulating factor of R-2.29 and a temperature index of 55 (tested to AAMA 1502.7 Test Method). All blades shall be symmetrically pivoted.

(5) Blade seals shall be extruded EPDM, secured in an integral slot within the aluminum blade extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Adhesive or clip-on type blade seals will not be approved.

(6) Frame seals shall be extruded silicone, secured in an integral slot within the aluminum frame extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Metallic compression type jamb seals will not be approved.

(7) Bearings shall be a dual bearing system composed of a Celcon inner bearing (fixed around a 7/16" aluminum hexagon blade pivot pin), rotating within a polycarbonate outer bearing inserted in the frame. Single axle bearing, rotating in an extruded or punched hole shall not be acceptable.

(8) Hexagonal control shaft shall be 7/16". It shall have an adjustable length and shall be an integral part of the blade axle. A field-applied control shaft shall not be acceptable. All parts shall be zinc-plated steel.

(9) Linkage hardware shall be aluminum and corrosion-resistant zinc-plated steel, installed in frame side, out of the airstream, and accessible after installation. Linkage hardware shall be complete with cup-point trunnion screws to prevent linkage slippage and a Celcon bearing between moving parts to reduce wear and increase longevity. Linkage that consists of metal rubbing metal will not be approved.

(10) Dampers shall be designed for operation in temperatures ranging from -40°C-40°F to 212°F.

(11) Dampers shall be AMCA rated for Leakage Class 1A at 1" w.g. static pressure differential. Standard air leakage data to be certified under AMCA Certified Ratings Program.

(12) Dampers shall be custom made to required size, with blade stops not exceeding 1-1/4" in height. Blade stop shall be a continuous and integral part of the head/sill. Welded and caulked blade stops shall not be acceptable.

(13) Dampers shall be opposed blade action or parallel blade action as indicated on plans.

2.03 SMOKE DAMPERS

A. Refer to Section 23 3314 - Ductwork Specialties, for Smoke Damper Specification.

2.04 DAMPER AND VALVE ACTUATORS

A. General:

(1) Actuators shall have an electronic cut off or other means to provide burnout protection if stalled.

(2) Actuators shall have a visible position indicator and provide position feedback to the controller as shown.

(3) Provide manual hand wheel actuator or hand crank in addition to electric valve actuator to allow manual override.

(4) Actuators located outside shall be provided with internal heaters.

(5) Actuators located outdoors should operate in the ambient temperature range of -40°F to 120°F.

(6) Actuators installed outdoors shall be NEMA 4X or IP66 rated or shall be provided with weatherproof NEMA 4X stainless steel enclosures (Belimo ZS-300 or equal) that have removable covers that have clasps or machine screws (no sheet metal screws) and that do not require removing fasteners from the ductwork.

B. Analog Electronic:

(1) Manufacturers: Belimo, Honeywell, Johnson Controls, Siemens Building Technologies or TAC

(2) Actuators shall be electric motor/gear drives that respond proportionally to analog voltage or current input, or digital floating control signals.

(a) Analog control actuators shall be used for all modulating applications.

(3) Stroke time for major equipment shall be 90 seconds or less for 90° rotation. Stroke time for terminal equipment shall be compatible with associated local controller, but no more than 6 minutes.

(4) Provide spring return or electronic fail-safe feature for fail open or closed positions, as required by control documents, for critical applications such as outside, return, or exhaust dampers, heating and cooling coils on major air handling units, humidifiers, heat exchangers, flow control for major equipment items such as chillers, cooling towers, boilers, etc. Fail-last-position actuators do not have spring return feature.

(5) Provide position feedback potentiometers connected to controller for closed loop control on major equipment analog control loops.

(6) Provide position feedback on all modulating actuators, excluding terminal units.

(7) Actuators for terminal heating/cooling equipment do not require spring return feature.

C. Discrete Two-Position Electric:

(1) Manufacturers: Belimo, Honeywell, Johnson Controls, Siemens Building Technologies or TAC

(2) Actuators shall be electric motor/gear drives for two-position control. Stroke time shall be 90 seconds or less for 90° rotation.

(3) Provide spring return or electronic fail-safe feature for fail open or closed positions as required by control documents. Fail-last-position actuators do not have spring return feature.

PART 3 EXECUTION

3.01 CONTROL VALVES

A. Furnish control valves as shown on drawings and/or as required to perform control sequences specified.

B. Control valves furnished by Control Contractor shall be installed by Mechanical Contractor under coordinating control and supervision of Control Contractor.

C. Increaser and decreaser fittings required to facilitate valve installations shall be provided by Mechanical Contractor.

D. Install control valve with visual indicators in such a manner that the visual indicator is visible to individual standing at floor level.

3.02 CONTROL DAMPERS

A. Furnish control dampers as shown on drawings and/or as required to perform control sequences specified, except those furnished with other equipment.

B. Control dampers furnished by Control Contractor shall be installed by Mechanical Contractor under coordinating control and supervision of Control Contractor.

C. Blank-off plates or transitions required to facilitate dampers shall be provided by Mechanical Contractor.

3.03 SMOKE DAMPERS

A. Refer to Section 23 3314 - Ductwork Specialties

B. Furnish smoke dampers as shown on drawings.

C. Smoke dampers furnished by Control Contractor will be installed by Mechanical Contractor.

3.04 ACTUATORS

A. Provide actuator for each automatic damper or valve with sufficient capacity to operate damper or valve under all conditions. Select actuators to provide tight shut-off against maximum system temperatures and pressure encountered. Each actuator shall be full-modulating or two-position type as required or specified, and shall be provided with spring-return for fail open or fail closed position for fire, freeze, moisture, occupant safety, equipment protection, heating or cooling system protection on power interruption as indicated and/or as required. Smoke dampers and steam valves serving pressure rated heat exchangers or convertors shall fail-closed.

B. Valve and damper operating speeds shall be selected so that actuators will remain in step with controllers without hunting, regardless of load variations. Actuators acting in sequence with other actuators shall have adjustment of control sequence as required by operating characteristics of system.

C. Provide proper linkage and brackets for mounting and attaching actuators to devices. Design mounting and/or support to provide no more than 5% hysteresis in either direction (actual movement of valve stem or damper shaft versus ideal movement) due to deflection of actuator mounting.

D. Provide single actuator on damper section not exceeding torque capacity of actuator.

E. Multiple damper sections where used shall be connected together via jackshaft or other coupling device, not by internal pinned connections at blade shafts of individual damper sections. Where multiple damper sections are connected together via jackshaft or other coupling device, damper actuator shall be mounted directly to jackshaft or other coupling device for operating damper sections. For instances where damper actuator cannot be mounted to jackshaft or other coupling device, damper actuator shall be provided for each damper section.

(1) Mounting multiple actuators to common damper jackshaft or valve stem to meet torque requirements is not allowed.

F. Calibrate position feedback potentiometers, where specified, with range and gain factors as required for proper operation per manufacturer's recommendations.

G. Integral actuator end switches or feedback potentiometers shall not be used. Provide separate end switches/feedback potentiometers that provide actual damper/valve position.

(1) Integral actuator end switches or feedback potentiometers can be used if damper or valve shaft is keyed or directly affixed to the actuator such that the shaft cannot slip and provide false position. U-clamp type actuator mounting always requires separate end switches/feedback potentiometers.

H. Actuators installed outdoors shall be NEMA 4X or IP66 rated or shall be provided with weatherproof NEMA 4X stainless steel enclosures (Belimo ZS-300 or equal) that have removable covers that have clasps or machine screws (no sheet metal screws) and that do not require removing fasteners from the ductwork.

END OF SECTION 23 09 02

SECTION 23 09 03 - CONTROL INSTRUMENTATION

SECTION 23 09 03 – CONTROL INSTRUMENTATION

PART 1 GENERAL

2.01 RELATED WORK

A. Section 23 0901 - Control Systems Integration

B. Section 23 0993 - Control Sequences

C. Section 23 2120 - Piping Specialties

2.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.]

2.03 SUBMITTALS

A. Device data sheets shall be submitted with electronic bookmarks as specified in Section 23 0901 - Control Systems Integration. Refer to PART 1 – GENERAL, subsection SUBMITTALS.

B. Device data sheets shall be submitted simultaneously with Control Systems Integration submittal. Refer to submittals section in 23 0901.

C. Thermostat/Room Temperature Sensor Schedules:

(1) Submit thermostat/room temperature sensor schedule with shop drawings. Thermostat/room temperature sensor schedule shall have detailed listing of which type is used for each room, including data concerning service and model numbers, sizes, cover types, and engineering data sheets for each control device.

D. Warranty

(1) Provide 1 year warranty on all materials and labor.

(2) Warranty requirements shall include furnishing and installing software upgrades issued by the manufacturer during the 1 year warranty period.

2.04 FCC COMPLIANCE

A. Digital equipment furnished under this Contract shall be tested and made to comply with limits for Class A computing devices pursuant to Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against interference when operated in commercial environments. Literature shall so note and equipment shall be so labeled.

PART 2 PRODUCTS

3.01 GENERAL

A. Instruments of same type shall be by same manufacturer, for instance, pressure transmitters, gauge, absolute, and differential pressure shall be of same manufacturer.

B. Pressure and temperature ratings of devices indicated in Part 2 - of this Section are minimum required. Devices shall be designed to withstand maximum pressures and temperatures encountered in respective systems.

C. No devices containing mercury will be allowed under this Specification.

D. All instrumentation located outdoors shall be NEMA 4X rated.

3.02 GENERAL INSTRUMENTATION

A. Pressure Gauges:

(1) Refer to Section 23 2120 - Piping Specialties

B. Thermometers (Dial-Type):

(1) Refer to Section 23 2120 - Piping Specialties

C. Analog Electronic Instrument Indicators:

(1) Electronic indicators, used for displaying sensor and/or output values as measured by current or voltage, shall be panel mount type and at least 2" square. Output may be either analog needle type or digital with 1/2" high LED or backlit LCD displays.

(2) Electronic indicators shall be marked in appropriate units (degrees, psi, % rh, gpm, cfm, etc.) and with appropriate range of values. Panel mounted indicators shall have minimum accuracy of 1% of scale range. Digital units shall be scaled to show 3 digits plus 1 decimal point.

3.03 DISCRETE ELECTRIC INSTRUMENTATION

A. General:

(1) Electrical devices, switches, and relays shall be UL listed and of type meeting current and voltage characteristics of project. Terminal connections shall be made at terminal blocks inside of NEMA 1 enclosures unless otherwise specified. Outdoor units shall be NEMA 4 with concealed adjustment.

(2) Ratings of normally open and normally closed contacts shall be adequate for applied load (minimum 5 amps at 240 Volts).

(3) Accuracy of devices shall be ± 1% of scale with adjustable offset unless otherwise specified.

B. Temperature Low Limit Switches (Freezestats):

(1) Electric 2 position type with temperature sensing element and manual reset. Controls shall be capable of opening circuit if any 1 foot (30.48 cm) length of sensing element is subject to temperature below setting.

(2) Sensing element shall not be less than one lineal foot per square foot of coil surface areas. Unless otherwise indicated, calibrate temperature switch setpoint to 38°F.

(3) Specifications:

(a) Range Cutout 35 to 45 F

(b) Differential 12 F

C. Relays:

(1) Manufacturers: IDEC, Potter Brumfield, Square D, or Allen Bradley

(2) Equal to IDEC Type RH2B-U, miniature 8 blade pilot relay with DPDT silver cadmium oxide contacts rated at 10A, 30 VDC, or 120 VAC. Coil shall match control circuit characteristics. DDC outputs shall be 24 VDC with maximum current burden of 50 milliamps. Rectangular base socket mount with blade type plug-in terminals and polycarbonate dust cover.

(3) Provide DIN rail mountable (Snap type) mounting sockets equal to IDEC SH2B-05.

D. Enclosed Relay (Relay-in-a-Box):

(1) Manufacturers: Veris Industries, Functional devices, Inc. or approved equal

(2) 1 or 2 SPDT relays in NEMA 1 or better enclosure. Coil shall be selected for control circuit characteristics.

(3) Contacts rated at 10A, 28 VDC or 120 VAC. Conduit nipple is 1/2" NPT. Maximum coil current burden 50 milliamps.

E. Pressure Differential Switches (Air Systems):

(1) Manufacturers: Cleveland Controls, Dwyer, Honeywell, Johnson Controls/Penn, Siemens Building Technologies, or TAC

(2) Adjustable set point, differential pressure type. Select switches for accuracy, ranges (20 to 80% of operating range) and dead-band to match process conditions, electrical requirements and to implement intended functions.

(3) Pressure differential switches for air systems shall have pressure rating of at least 10" WC.

(4) Pressure switches shall be automatically reset or manually reset. Refer to 23 0993 – Control Sequences for the specified type.

(5) Pressure indicating differential switches for air systems shall be equal to Dwyer Series 3000 photohelic gauge.

(a) Maximum Temperature Rating: 180°F

(b) Repeatability: ± 1%

(6) Provide pitot tubes on tubing ends that penetrate housings or ductwork.

F. Position Switches (End Switches):

(1) Manufacturers: Allen Bradley, Johnson Controls/Penn, Honeywell, Ruskin, Greystone Energy Systems, Reed National Air Products, NAMCO, Omron or Westlock

(2) Provide damper position switches, as required to meet specified sequence. Rotary switches shall be cam action, lever, or proximity type. Provide damper brackets and connecting rods for connecting position switch actuation levers to damper blades or jackshafts.

(3) "Tip Switches" or other position switches that contain mercury shall not be used for damper end switch applications.

G. E-P Switches (Solenoid Valves):

(1) Manufacturers: Asco, Johnson Controls, Siemens Building Technologies, TAC, or MAC Valves

(2) E-P switches shall provide control air for operation of fan isolation dampers, smoke or smoke/fire dampers, or other On/Off dampers. Line voltage actuators shall be Class "H" (high temperature) and listed by UL or CSA.

(a) Valve Body: Brass or bronze

(b) Valve Type: 2-way or 3-way

(c) Operating Voltage: 24 VDC, 24 VAC, 120 VAC or as specified

(d) Operating Temperature: 32 to 104°F

(e) Operating Pressure: Greater than maximum supply pressure

(f) Pipe Size: 1/4" NPT

(g) Enclosure Rating: NEMA 4 (locally mounted), NEMA 1 (Panel Mounted)

(h) Conduit Connection: 1/2"

H. Current Switches -

(1) Manufacturers: Veris Industries, N-K Technologies, Setra or approved equal

(2) These shall be induction type sensors clamped over single-phase conductor of AC electrical power and shall consist of solid-state sensors with self-calibrating threshold and normally open contacts. Each current switch shall be selected for proper operating range of current.

(a) Output: Solid state relay or relay contacts

(b) Trip Setpoint: Self-calibrating through microprocessor

(c) Operating Temperature: 32 to 131°F

(d) Response Time: < 0.5 seconds

I. Indicator Lights:

(1) Manufacturers: Allen Bradley, GE, Square-D, or Idec

(2) 1/4" minimum size or 1-1/4" maximum size, push-to-test type. Use green for normal, yellow for warning (low/high values), and red for alarm or fail (low-low or high-high conditions). AC or DC type with voltage matched to control circuit without transformers.

J. Drain Pan Moisture Detector:

(1) Manufacturers: Kele and Associates, DiversiTech or approved alternate.

(2) Moisture detector is small, electronic control relay for detecting rising water levels, within drain pans or other containments. Moisture detector shall alarm when water levels reach 0.43” to prevent damage from overflow of drain pans. Relay shall reset when water levels decrease to 0.31” and relay re-energizes.

(3) Relay is normally energized upon powering up and no water is present. When water level reaches the trip point the relay de-energizes for alarming in BAS.

(4) Moisture Detector Relay Module (Model LD1-24):

(a) Supply Voltage: 24 VAC, 60 Hz

(b) Power Consumption: 1 W

(c) Cable length: 18”

(d) Relays Contacts:

1) Type: SPDT

2) Rating: 2.5A at 24 VDC; 5.0A at 120 VAC

(e) Enclosure Rating: Hermetically Sealed

(f) Dimensions: 0.87” H x 2.0” W x 1.25” L

3.04 PNEUMATIC INSTRUMENTATION

A. Multi-Probe Air System Static and Air Flow Sensing Elements:

(1) Manufacturers: Tek-Air Systems, Ultratech or Air Monitor Corporation

(2) Multi-probe type static and/or total pressure sensing station consisting of minimum 16 ga galvanized steel casing with flanged connection and multiple metallic sensors with automatic averaging manifold. Arrange sensors to perform equal area traverse of duct cross section.

(a) Maximum temperature: 250°F

(b) Airflow resistance: less than or equal to 0.25" WC at 4000 fpm

(c) Accuracy: ± 2% of full scale within velocity range from 700 to 4000 fpm

(3) Provide aluminum honeycomb cell air straightener devices for unit installed in supply or filtered air streams.

B. Fan Inlet Airflow Traverse Probe:

(1) Air Monitor Corporation, Tek-Air, Ultratech or approved equal

(2) These shall be averaging differential pressure type flow elements mounted in inlet cone of fan capable of continuously measuring air volume of fan.

(3) Inlet flow element shall consist of:

(a) Sensing tube with two internal chambers. One shall sense upstream pressure (velocity pressure) and one shall sense downstream pressure (static pressure).

(b) These chambers shall have ports of quantity and size to accurately sense flow rate in fan inlet size into which these are specified to be installed.

(c) Sensing tube shall have form so shaped as to minimize measurement inaccuracies.

(4) Sensing assemblies shall be provided with suitable supports to prevent damage to these assemblies at maximum flow-rate.

(a) Accuracy: Error ??? ± 3.0% of actual flow

(b) Materials: Standard extruded aluminum with anodized finish. Optional 316 stainless steel, PVC, Kynar and other materials.

(c) Mounting Hardware: Galvanized Steel

(d) Approved Fan Inlet Installations: Centrifugal Fan

(e) Plug Fan

(f) Ducted Vane Axial Fan

(g) Vane Axial Fan with Bellmouth

C. Single-Probe Air System Static Sensing Elements:

(1) Sensors shall be similar to Dwyer Model A-301 or Tek-Air Model T-5PP7620 with angled tips and 1/4" metal tubing connections.

D. Space Static Pressure Sensor:

(1) Manufacturers: Air Monitor Corporation, Accutrol (Tek-Air), Thermo Electron Corporation, or approved equal.

(2) Space static pressure probe shall be brushed aluminum with anodized finish or stainless steel with polished or painted finish selected by Architect.

(3) Shielded static air probe shall be similar to Air Monitor Corporation Model S.A.P./R for flush ceiling mounting, complete with multiple sensing ports, pressure impulse suppression chamber, air flow shielding, and 1/8" FPT take-off fitting. Sensor shall be capable of sensing static pressure within 1% of actual pressure value while being subjected to maximum air flow of 100 fpm from radial source.

E. Outdoor Static Pressure Sensor:

(1) Manufacturers: Air Monitor Corporation, Ultratech Industries or approved equal

(2) Static outside air probe (SOAP) constructed of stainless steel with 2" diameter FPT connection. SOAP shall be capable of sensing outside atmospheric air pressure to within 2% of actual value when subject to radial wind velocities up to 40 miles per hour with approach angles up to 30 degrees to horizontal.

F. Differential Air Pressure Indicator:

(1) Dwyer model 2000 Series magnehelic gauge for surface or panel mounting. 4" dial readout, die cast aluminum housing. Case and aluminum parts Iridite-dipped. Exterior finish to be baked dark grey hammerloid. Hi/lo 1/8" pressure taps. Provide adapters to match tubing type.

(a) Accuracy: ± 2% of full scale.

(b) Ambient Temperature Range: 20 to 140°F

(c) Rated Total Pressure: -20" Hg to 15 psig (103.42 kPa)

(d) Range: 0-2 times normal setpoint. (Use 0-0.25" WC for building

(e) and space pressure indication.)

G. Plastic Tubing:

(1) Fire resistant virgin polyethylene, meeting stress-crack test ASTM D1693. Individual tube polyethylene or multi-tube instrument tubing bundle shall be classified as flame retardant under UL 94. Polyethylene material shall be rated as self-extinguishing when tested in accordance with ASTM D635.

3.05 ANALOG ELECTRONIC INSTRUMENTATION

A. Space Temperature Sensors:

(1) Sensors shall be platinum RTD type, with the following minimum performance:

(a) Temperature Coefficient of Resistivity (TCR): 0.00385 ohm/ohm/□C

(b) Accuracy: ± .54°F + (0.005 X T) (Class B)

(c) Accuracy: ± .27°F + (0.005 X T) (Class A)

(d) Conformance: DIN-IEC 751

(e) Operating Range: 32 to 122°F, 0 to 99% rh

(2) Thermistors will be acceptable in lieu of RTD provided thermistor carries 5 year guarantee that device will maintain its accuracy within tolerance of ± 0.36°F between 32°F and 150°F, and 0.5°F between -20°F and 212°F.

(3) Unless otherwise stated, space sensor cover shall be manufacturer's standard plastic cover.

B. Duct Mounted or Insertion Temperature Sensors:

(1) Platinum RTD type, with the following minimum performance:

(a) Temperature Coefficient: 0.00385 ohm/ohm/°C

(b) Accuracy: ± .54°F + (0.005 X T) (Class B)

(c) Accuracy: ± .27°F + (0.005 X T) (Class A)

(d) Conformance: DIN-IEC 751

(e) Operating Range: -50 to 170°F, 0 to 99% RH

(2) Sensors mounted in pipes:

(a) Install insertions sensors in stainless steel (carbon or stainless steel pipe) or brass (copper pipe) thermowells. Process coupling to be 3/8" or 1/2" NPT. Extension shall exceed insulation thickness by 1". Thermowell shall project into middle third of the process fluid when installed.

(b) Sheath diameter shall not exceed 5/16". Length shall be such that sheath, containing sensor, projects into middle third of the process fluid when installed.

(c) Connection head to be NEMA 4, cast iron, with screw on cap. Provide internal screw terminations for RTD and wire connection. Conduit connection shall be 1/2" NPT.

(3) Outside air sensors shall be weatherproof of noncorrosive construction and protected with solar shield. Mount outside air sensors on north side of building or in area intake wells for air handling systems to avoid thermal effects from direct sunlight.

(4) Sensors mounted in air streams, such as air handling units, supply ducts, exhaust ducts or return ducts, shall be averaging type. Averaging type sensor to be installed in ducts larger than 24" x 24" or greater than 576 in2. Mount averaging sensor across duct area in a "Z" pattern using mounting clips specific for averaging temperature sensor probes.

(5) Thermistors will be acceptable in lieu of RTD provided thermistor carries 5 year guarantee that the device will maintain its accuracy within a tolerance of ± 0.36°F between 32°F and 150°F, and 0.5°F between -20°F and 212°F.

C. Direct Insertion Temperature Sensors:

(1) Sensor assembly shall be direct insertion, suitable for use with water systems, 150 lb class, minimum rating.

(2) Sensor shall be platinum wound RTD, with the following minimum performance:

(a) Temperature Coefficient: 0.00385 ohm/ohm/°C

(b) Accuracy: ± .54°F + (0.005 X T) (Class B)

(c) Accuracy: ± .27°F + (0.005 X T) (Class A)

(d) Conformance: DIN-IEC 751

(e) Operating Range: -50 to 170°F, 0 to 99% RH

(3) Sheath diameter shall not exceed 5/16". Length shall be such that sheath, containing sensor, projects into middle third of process fluid when installed. Material to be 304 or 316 stainless steel (carbon or stainless steel pipe) or brass (copper pipe). Process coupling to be 3/8" or 1/2" NPT.

(4) Connection head to be NEMA 4, cast iron, with screw on cap. Provide internal termination for RTD and wire connection. Conduit connection shall be 1/2" NPT.

(5) Provide hot tap assembly and extension. Material to be 304 or 316 stainless steel. Support hot tap at minimum of 2 points to eliminate vibration. Extension shall exceed insulation thickness by 1".

D. RTD Temperature Sensor/Transmitters:

(1) Manufacturers: Rosemount, Burns, Minco Products, Weed or Pyromation

(2) Transmitters shall provide 2 wire, 4-20 mA current output signal proportional to specified temperature span of transmitter and compatible with DDC equipment.

(a) These shall be 100 Ohm platinum RTD type temperature instruments for process immersion or air duct mounting

(b) Operating Temperature: -20 to +180°F

(c) Power Supply Voltage: 13 to 35 VDC unregulated

(d) Accuracy or Output Error: 0.1% of span of sensor and transmitter combination

(e) Temperature Coefficient: 0.00385 ohm/ohm/°C

(f) Thermowells: By same manufacturer as Sensor/Transmitter or approved alternate.

E. Duct Mounted Humidity Sensors/Transmitters:

(1) Manufacturers: General Eastern, Automation Components Inc., Versis Industries, Setra, Minco, Rotronic or Vaisala

(2) Probe type, temperature compensated, resistive bulk polymer or thin film capacitive type. Sensor/transmitter shall have the following minimum performance.

(a) Accuracy: ± 2% rh at 25°C over 20-95% rh including hysteresis, linearity and repeatability

(b) Temperature Effect: Less than 0.06% per °F at baseline of 68°F.

(c) Sensitivity: 0.1% rh

(d) Repeatability: 0.5% rh

(e) Hysteresis: Less than 1%

(f) Long Term Stability: Less than 1% drift per year

(g) Adjustment: ± 20% rh zero, non-interactive

(h) ± 10% rh span, non-interactive

(i) Operating Range: 0-99% rh, non-condensing, sensor

(j) 0-95% rh, non-condensing, electronics

(k) Output: 4-20 mA, 0-100% linear, proportional

(l) Power: 12-36 VDC

T = TEMPERATURE OF INTEREST

A. Ducted Air System Static Pressure and Differential Pressure (Velocity) Transmitters:
   (1) Manufacturers: GE Modus, Setra, Belimo, Ashcroft XLDP or approved equal
   (2) Provide transducers/transmitters to convert velocity pressure differential or static duct pressure relative to sensor location into electronic signal.
   (3) Unit shall be capable of transmitting linear 4 - 20 mA DC output signal proportional to differential (total minus static or static minus ambient) pressure input signals with the following minimum performance and application criteria:
      (a) Span: Not greater than twice duct static or velocity pressure at maximum flow rate, or more than 16 times velocity pressure at minimum flow rate.
      (b) Accuracy: ± 1.0% of span or ± 1.0% of full scale
      (c) Dead Band: Less than 0.5% of output
      (d) Hysteresis: Within 0.5% of span or within 0.5% of full scale
      (e) Linearity: Within 1.0% of span or within 0.5% of full scale
      (f) Repeatability: Within 0.5% of output
      (g) Response: Less than 1 second for full span input
      (h) Stability: ± 0.5% of span/year
   (4) Transmitters that require “auto-zeroing” in frequencies less than every 6 months are not acceptable.
   (5) Return and exhaust air system static pressure transducers/transmitters shall be furnished with protective integral air filters on pressure sensing lines from static pressure sensing stations and with static air probes to prevent migration of moisture and particulate matter into transducers. If inputs to pressure transducers/transmitters are dead-ended, integral air filters are not required. Supply air system sensors do not require integral air filters.

B. Space Pressure Monitoring System:
   (1) Manufacturers: Tek-Air Systems, TSI, Siemens Building Technologies, Setra, or approved equal
   (2) Provide directional pressure monitoring system for clean rooms, isolation rooms. Biosafety research labs and hospital rooms. System shall include ultra-low differential pressure transmitter including thermal mass airflow sensor, two space pressure probes, room display for visual monitoring of space pressurization and LCD readout of space differential pressure.
   (3) Space pressure monitoring system shall have the following characteristics:
      (a) Accuracy: ± 2% of set range.
      (b) Pressure Range: 0.100 to -0.100” WC, full scale range, adjustable to ± 0.001, ± 0.005, to 0.010 or 0.10” WC.
      (c) Analog Resolution: 0.0001” WC.
      (d) Digital Resolution: ± 0.00005” WC.
      (e) Output: 4-20 mA DC, self-powered, 5000 ohm load max.
      (f) Power Supply: 24 VAC =/- 4 VAC, <10 VA.
      (g) Communications: RS-485, RS-232, BACnet, Ethernet or LonWorks.

C. Magnetic Flowmeter/Transmitter:
   (1) Manufacturers: Krohne, Siemens, Cadillac, Fisher Rosemount, Invensys Foxboro or Yokogawa
   (2) Electromagnetic induction type with linear response proportional to flow rate. Selected span shall be not greater than twice design flow range. Select units for 10:1 turndown. Note: some meters have limited straight pipe lengths available (before or after meter). Select model for zero pipe lengths in these instances. See mechanical floor plans.
   (3) Unit shall be complete with 150 lb raised face flanged flowtube, PTFE, EPDM neoprene or PFA liner, magnetic coils, self-cleaning 316 stainless steel or Hastelloy C4 electrode, and 4-20 mA transmitter/power supply housed in NEMA 4 enclosure. Transmitter shall be fully field configurable microprocessor based unit.
      (a) Minimum Accuracy: ± 0.5% of Span including hysteresis
      (b) Repeatability: ± 0.1% of reading
      (c) Operating Temperature: 0 to 51°C(0-125°F)
      (d) Power Requirements: 120 VAC / 60 Hz
   (4) Flow meters installed in non-metallic or lined pipe shall be provided with grounding rings per Manufacturer recommendations.
   (5) Transmitter shall be integral mounted on flow meter if meter is below 6 ft from finished floor.
   (6) Provide remote mounted indicator/transmitter when meter is above 6 ft from finished floor. Indicator to be 1/2" LCD or back lit LED type.

D. In-Line Turbine Flowmeter (only use if shown on Control Diagrams)

(1) Manufacturers: Brooks, EMCO, FTI Flow Technology, ABB Instrumentation, Aaliant
(2) These shall be volumetric flow measuring and transmitting flow meters that produce output signals directly proportional to rate-of-flow process being measured.
(3) Accuracy: Error ± 0.5% in linear range
(4) Repeatability: Error ± 0.5%
(5) Min Rangeability (Turndown): 10 to 1
(6) Material of Construction:
  (a) Body: Stainless Steel
  (b) Turbine: Stainless Steel turbine with tungsten carbide bearings
(7) Process Connection:
  (a) Up to 2” line size: NPT
  (b) 2” to 6”: Wafer
  (c) 8”: ANSI Class #150 Raised Face Flange
(8) Output Option 1: 4-20 mA isolated current loop
(9) Outpu Option 2t: Frequency
(10) Calibration Shift and Ambient Effects:
  (a) Position: Transmitter shall operate in any position.
  (b) Vibration: Transmitter shall not be affected by industry normal piping
  (c) vibration when operating within its normal range.
  (d) Ambient Temperature: Transmitter shall not be in error more than 1.0 % of span over
  (e) change in ambient temperature of 100°F.

E. Vortex Flowmeter/Transmitter:
(1) Manufacturers: Invensys Foxboro, Siemens, Yokogawa, Fisher Rosemount, ABB, or EMCO PhD Series
(2) Piezoelectric type with bluff body, separate downstream sensor, and 316 stainless steel wetted parts and NEMA 4 enclosure.
(3) Selected span shall be not greater than twice design flow range. Select units for 10:1 turndown.
  (a) Temperature Range: 0-400°F
  (b) Accuracy:
    1) Liquid: ± 1.0% of calibrated range
    2) Gas and Steam: ± 1.5% of calibrated range
  (c) Power Supply: 14 - 30 VDC unregulated
  (d) Output: 4 - 20 mA DC current
  (e) Connection: ANSI Class 150 SS Raised Face Flange.
(4) Transmitter shall be integral mounted on flow meter if meter is below 6 ft from finished floor.
(5) Provide remote mounted indicator/transmitter if meter is above 6 ft from finished floor. Indicator shall be 1/2" LCD or back lit LED type.

F. Thermal Dispersion Air Flow Measurement Sensor/Transmitter:
(1) Manufacturers: Ebtron or approved equal
(2) Duct Mounted Flow Sensor:
  (a) Multi-probe type thermal dispersion flow sensing station consisting of aluminum probe assembly with flanged connection and multiple hermetically sealed sensors in glass-filled polypropylene housing. Arrangement of sensors along probe assembly factory set to perform equal area traverse of duct cross section.
  (b) Flow Sensor:
    1) Accuracy: ± 2% of reading
    2) Repeatability: ± 0.25% of reading
    3) Materials: Probe – Aluminum
      1. Sensor Housing – Glass-Filled Polypropylene
      2. Mounting Brackets - 204 SS
    4) Calibrated Range: 0 – 5,000 fpm
  (c) Temperature Sensor:
    1) Accuracy: ± 0.15%
    2) Sensor Temperature Range: -20°F to 160°F (0 –1,500 fpm); 30°F to 160°F (>1,500 fpm)
    3) Humidity Range: 0 – 99%, non-condensing

4) Probe Size Range: 8” to 120”

(d) Transmitter:

1) Power Requirements: 24 VAC (22.5 to 29 VAC), 8 VA max.
2) Enclosure: Aluminum Housing
3) Outputs: 4 to 20 mADC
4) Output Resolution: 0.025% of selected range
   1. Output 1: Airflow (0 – 5,000 fpm)
   2. Output 2: Temperature (-20°F to 160°F)
5) Ambient Temperature: -20°F to 120°F

G. Thermal Dispersion Natural Gas Flow Meter

(1) Acceptable Manufacturers: Fluid Components International, Kurz Instruments, Magnetrol, Sage Metering, or Sierra Instruments

(2) Insertion Flow Sensor:

(a) Thermal dispersion type flow sensing element consisting of all welded 316 stainless steel probe assembly with male compression fitting.

(b) Element shall be designed to sense flow of natural gas with specific gravity of 0.60.

(c) Flow sensor and body:

1) Minimum Accuracy: ±1% of Reading
2) Repeatability: ±1% of Reading
3) Pressure Rating: 150-300 psig (2068.43 kPa)
4) Process Temperature Range: -40 to 257°F

(3) Transmitter:

(a) Power Requirement: 15 VDC, 24, VDC, or 120 VAC, 60 Hz

(b) Enclosure: Epoxy Coated Aluminum

(c) Enclosure Rating: NEMA 4X

(d) Display: Back-lit LCD display, 2 lines, 12-16 characters per line

(e) Output: 4-20 mA DC or 0-5 VDC

(f) Output Resolution: 0.5% of selected range

(g) Output Units: Totalized mass flow in cubic feet

(h) Ambient Temperature: -13 to 149°F-25°C to 65°C

H. Rotary (Damper) Position Sensors:

(1) Manufacturers: Kele & Associates, Fisher Controls or Westlock

(2) Provide position 4-20 mA transmitter with potentiometer type (variable resistance) sensor for damper position measurement. Measurement to be linear to damper stroke.

(a) Performance:

1) Power Supply: 24 VDC unregulated
2) Accuracy: ± 1% of output span
3) Repeatability: ± 0.5% of full span
4) Maximum Temperature: 125°F

I. P-E Transducers (Pressure Transmitters for air systems):

(1) Manufacturers: Ashcroft, Mamac, Setra, or GE Modus

(2) Units shall have the following characteristics:

(a) Input: Pressure 0-15 psig (103.42 kPa), minimum

(b) Output Signal: 4-20 mA, 0-5 VDC, 1-5 VDC, 1-10 VDC

(c) Accuracy: 1% of span

(d) Operating Temperature 32 to 125°F

(e) Power Requirements: 24 VDC (10-30 VDC)

(3) Pressure transmitters shall be provided with isolation valve for servicing.

J. Space CO2 Sensors

(1) Manufacturers: Vaisala, Automation Components Inc., Veris, BAPI or approved alternate.

(2) Sensors shall have the following minimum characteristics:

(a) Power Requirements: 24 VAC, 50/60 Hz, 50 VA

(b) Signal Input: Integral Sensor

(c) Signal Output: 4-20 mA DC or 0-10 VDC
(d) Range: 0-2000 ppm
(e) Accuracy: ± 40 ppm at 600 ppm and 1,000 ppm at sea level and 25°C
(f) Drift: ± 5% of range over 5 years
(g) Sensor Infrared CO2 Sensor
(h) Mounting: Wall-mounted

(3) CO2 transmitter may be combined with the space temperature sensor as a single unit.
(4) Provide local display for continuous reading of CO2 levels.
(5) Units shall be certified by manufacturer to require calibration no more frequently than once every 5 years.

K. INSTRUMENT TUBING

(1) Copper Tubing:
(a) Type L, hard or soft seamless, ASTM B88, with wrought copper soldered fittings, ANSI B16.22, except at connections to apparatus, where brass compression-type fittings shall be used. Solder joints shall be made with ASTM B32, 95-5 tin-antimony solder-joint, Bridgit or Silvabrite.

(2) Stainless Steel Tubing:
(a) Manufacturers: Accu-Tube, Parker, Webco Industries, or approved alternate

(3) Plastic Tubing:
(a) Fire resistant virgin polyethylene, meeting stress-crack test ASTM D1693. Individual tube polyethylene or multi-tube instrument tubing bundle shall be classified as flame retardant under UL 94. Polyethylene material shall be rated as self-extinguishing when tested in accordance with ASTM D 635.

PART 3 EXECUTION

5.01 GENERAL

A. Install control equipment, wiring and air piping in neat and workmanlike manner and in accordance with manufacturer's recommendations. Maintain clearances, straight length distances, etc., required for proper operation of each device. Mark and detail on coordination drawings, exact locations of inline devices, wells, and taps to be installed by Mechanical Contractor.

B. Coordinate timely delivery of materials and supervise activities of other trade Contractors to install inline devices such as immersion wells, pressure tappings, any associated shut-off valves, flow switches, level switches, flow meters, air flow stations, and other such items furnished by Control Contractor which are to be installed by Mechanical Contractor.

C. Install control devices in accessible location.

D. Mount motor control devices within 5 ft of disconnect switch, or starting device furnished by Electrical Contractor unless noted otherwise. Maintain required NEC clearances.

E. Control Contractor and Mechanical Contractor shall review proposed static pressure sensor and flow meter locations with Owner and Engineer for approval prior to installation.

F. Install control devices in adherence with manufacturers recommendations.

G. Locations of pressure sensing taps in pipes or ducts above ceilings shall be clearly identified on ceiling. Coordinate preferred identification method with Owner/Architect.

5.02 GENERAL INSTRUMENTATION

A. Thermometers (Temperature Indicators):

(1) Install thermometers at each point of temperature transmission and control, except for those that are indicated at local control panels. Install thermometers to permit easy reading from floor or operating platform (within 3 ft of line of sight). Provide remote bulb thermometers with readout indicators mounted within 3 ft of line of sight whenever sensing point is more than 3 ft from line of sight.

(2) Thermometer wells in piping will be installed by Mechanical Contractor.

B. Local Control Panels:

(1) Install remote mounted devices, controllers, I/O terminal blocks, power supplies, etc., inside of local control panels.

(2) Locate panels as shown on drawings.

(3) Locate panels not shown on drawings adjacent to equipment served with minimum of 3 ft clearance in front of door. Provide sufficient clearances to allow full door swing and full access to internal components. Submit proposed panel locations with shop drawing submittals.

(4) Mount top of panels between 5 and 6 ft above floor so that gauges and indicators are at eye level.

C. Pressure Differential Switches (Static Pressure Safety Switches)

(1) Install static pressure switches in an accessible location where the reset switch can be accessed from the floor without the use of a ladder.

D. Pressure Gauges (Pressure Indicators):

(1) Install pressure gauge for indication of supply and control pressure in pneumatic systems at output of controllers, I/P transducers, electric air solenoid valves, pressure switches and other points where visible indication of air pressure is required for operating and maintenance purposes.

(2) Provide test port for quick connection of test gauges at valve, damper motor and other actuator branch lines.

(3) Pressure gauge tappings in piping will be provided by Mechanical Contractor.

E. General Instrumentation at Local Control Panels:

(1) Provide record control drawings of systems served by each local panel, in location adjacent to or inside of panel cover. Provide protective cover for drawing.

5.03 DISCRETE AND ANALOG INSTRUMENTATION

A. Wall Mounted Space Thermostats/Temperature Sensors:

(1) Install space thermostats/sensors where indicated, as required to perform specified control sequences, and as directed to meet job site conditions.

(2) Provide space temperature sensors without remote setpoint adjustment in all public spaces, hallways, and mechanical rooms unless otherwise specified.

(a) Mount space thermostats/sensors at 5 ft above floor unless otherwise indicated.

(3) Provide space temperature sensors with temperature displays and remote setpoint adjustment in all offices, laboratories, common spaces, and conference rooms.

(a) Mount space thermostats/sensors with accessible setpoint adjustment or temperature reading (thermometer or digital temperature readout) at 4 ft above floor meeting ADA requirements.

(4) Space thermostats/sensors located on exterior walls shall be mounted on thermally insulated sub-base.

(5) Relocate space thermostats/sensors if required due to draft, interferences with cabinets, chalkboards, etc., or improper sensing.

(6) Mount space thermostats/sensors in corridors, stairways and public toilets 7 ft above floor.

(7) Space thermostats/sensors in corridors, stairways, and public toilets shall be protected by heavy-duty cast and die formed guard.

B. Low Limit Temperature Switches (Freeze Stats):

(1) Install low limit controls where indicated on drawings or as specified. Unless otherwise indicated, install sensing element on upstream face of cooling coil where cooling coil is provided, or at downstream side of heating coils where no cooling coil is provided.

(2) Distribute sensing element across entire area of medium being sensed. Install controls at accessible location with suitable mounting brackets and element duct collars where required.

(3) For low limit temperature sensors installed on roof top units and other outdoor equipment, install heaters in enclosures housing freeze stats to prevent freeze stat tripping.

C. Duct Mounted Humidity Sensors:

(1) Duct mounted humidity sensors used for discharge humidity or high limit control shall be mounted at minimum 6’ downstream from the humidifier or no less than the steam absorption distance indicated by the humidifier manufacturer.

D. Static Pressure and Air Flow Stations:

(1) Furnish static pressure and air flow measuring stations to Mechanical Contractor for installation.

(2) Stations shall be installed in strict accordance with manufacturer's published requirements. These stations serve as primary signals for airflow control systems; therefore it shall be responsibility of Control Contractor to verify location and installation to assure that accurate primary signals are obtained.

(3) Pressure differential switches shall be piped across device creating differential between fan discharge and fan suction.

E. Outdoor Static Pressure Sensor:

(1) Furnish outdoor static pressure sensor as specified in control sequence. Mechanical Contractor will install sensor and associated pipe to below roof as shown on detail.

(2) Install sensor so that sensor is pointed down stream.

F. Outside Air Temperature Sensors:

(1) Mount on north side of building or in intake area wells for air handling systems. Provide solar shields for installations where sensors may be exposed to sunlight conditions.

G. Building or Space Static Pressure Control System:

(1) Extend 2" pipe between spaces for room pressure control or between space and outside for building static pressure control. Mount velocity sensor in tee fitting with one foot of straight pipe on either side of sensor. Terminal space and points inside of sheet metal plenum attached to return/exhaust grille. Terminate outside sensors on prevailing windward side of building with flapper type damper and full weather cover shroud constructed of aluminum painted to match building exterior.

H. Flow Meters and Flow Switches:

(1) Install flow measuring devices with recommended straight pipe diameters upstream and downstream of elbows, tees, valves, or other fittings that cause uneven turbulent flow conditions.

(2) If no recommendations are given, provide straight pipe equal to 10 pipe diameters upstream and 5 pipe diameters downstream.

(3) Provide flow straighteners as necessary based on actual flow meter location and piping layout.

(4) Flow meters are to be installed in adherence to manufacturers recommendations.

I. Sensor Wells:

(1) Wells mounted in pipe 3" and larger may be installed in horizontal or vertical lines provided that element is always in flow, (for condensate and other gravity return lines, install in bottom of pipe). Wells mounted in pipe 2-1/2" and smaller shall be installed at elbow tee fittings with well pointed upstream. Minimum of 2" pipe size for elbow tee installation.

J. Transmitters, Indicators, and Transducers:

(1) Locate transmitters at sensing devices or within 100 ft of remote mounted transmitters. For hot systems (150°F and higher) mount electronics on side of pipe or remotely mount.

(2) For indicating type instruments, locate indicating element within 6 ft of floor with readout easily visible from floor level. Provide remote readouts if necessary.

(3) Locate transmitters and transducers within 5 ft of floor to allow for calibration and maintenance.

(4) Provide P-E transducers to convert analog pressure signals to analog electronic signals for input to DDC panels.

K. Static Pressure Transmitters/Temperature Sensors

(1) Transmitters/Sensors shall be hardwired back to controller where logic and control outputs to VFD, valves, dampers, etc. will reside. Sharing the transmitter signal via the network shall not be allowed for direct control.

5.04 INSTRUMENT TUBING

A. Conceal all piping, except for piping in mechanical rooms and other areas where mechanical system piping is exposed.

B. Install exposed piping and conduit parallel to or at right angles to building structure and support adequately at uniform intervals.

(1) Provide tubing clamps with insulated standoffs where metallic tubing may come into contact with other dissimilar metals to prevent galvanic corrosion from occurring. Use of wire ties or hose clamps to fasten tubing to structure or other piping is not allowed.

(2) Use of tubing channel designed for mounting polyethylene tubing shall be allowed.

C. Polyethylene tubing not exceeding 18" exposed may be used for connection to instrument or actuator.

D. Install polyethylene tubing with no concealed splices and number code all tubing.

E. Piping type shall be as follows:

(1) Inside Panels:

(a) Use polyethylene/plastic tubing.

(2) Exposed:

(a) Polyethylene/plastic tubing may be used if run in fully enclosed rigid metal raceway or metal conduit where environment is within temperature limits of polyethylene tubing. Use copper tubing or stainless-steel tubing for wet systems.

END OF SECTION 23 09 03

SECTION 23 09 23 - DIRECT DIGITAL CONTROLLERS AND NETWORKS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 23 0901 - Control Systems Integration

B. Section 23 0903 - Control Instrumentation

C. Section 23 0993 - Control Sequences

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.]

1.03 DEFINITIONS

A. The following abbreviations, acronyms, and definitions may be used in addition to those found elsewhere in Contract Documents.

(1) ASC: Application Specific Controller. A networked device or node that contains a complete, configurable application that is specific to a particular task.

(2) Alarms & Events: The exchange of data between devices related to the occurrence of a predefined condition that meets specific criteria (event).

(3) BC: Building Controller. Provide supervisory control, scheduling, trend logging & alarm handling.

(4) B-OWS: BACnet Operator Workstation

(5) B-BC: BACnet Building Controller. Same as SLC.

(6) B-AAC: BACnet Advanced Application Controller. Same as PPC.

(7) B-ASC: BACnet Application Specific Controller

(8) B-SA: BACnet Smart Actuator

(9) B-SS: BACnet Smart Sensor

(10) BBMD: BACnet Broadcast Management Device

(11) BIBBS: BACnet Interoperability Building Blocks. Specific individual function blocks for data exchange between interoperable devices.

(12) Broadcasting: The propagation of data from a device to the control network. Software objects that broadcast data to the network may include the following parameters:

(13) Send on Delta: An adjustable parameter that defines a requirement to broadcast when the data generated by the software object changes by an amount that exceeds this parameter’s value. For binary data, this parameter defaults to a change of state. The broadcast of data is initiated when this criteria and the minimum send time requirement have been met. Also referred to as a “Change of Value”.

(14) Minimum Send Time: An adjustable parameter that defines a mandatory time period during which no broadcasting of data will occur. Once this time period has been exceeded without a broadcast, the send on delta parameter or the maximum send time parameter shall determine when a broadcast is initiated.

(15) Maximum Send Time: An adjustable parameter that defines the maximum time period between broadcasts of a software object’s data to the network. Should the value of a software object remain constant over an extended period of time, the value will be rebroadcast once every maximum time period.

(16) BTL: BACnet Testing Laboratory.

(17) Channel: One or more segments not containing a router.

(18) Domain: A logical collection of devices on one or more channels.

(19) FLN: Floor Level Network. BACnet MS/TP.

(20) HMI: Human-Machine Interface. Graphical operator BAS interface. Same as Graphical User Interface (GUI).

(21) LAN: Local Area Network. Same as Floor Level Network.

(22) Maximum Send Time: Event driven communication parameter specifying the time period for which data must not be sent more than once.

(23) Minimum Send Time: Event driven communication parameter specifying the time period for which data must be sent at least once.

(24) PICS: Protocol Implementation Conformance Statement. Detailed description for a given BACnet device stating its inherent BACnet capabilities.

(25) Point: Group of data, which corresponds to a hardware input, output, or calculated value.

(26) PPC: Programmable Process Controller. Same as Advanced Application Controller (AAC)

(27) Repetitious Controls: Controls for critical systems where the control is spread across multiple controllers with separate power sources so there is no single point of failure for the entire system.

(28) Scheduling: The exchange of data between devices related to the establishment and maintenance of dates and times at which specified output actions are to be taken.

(29) Send on Delta: Event driven communication parameter specifying the amount of variable change before data is to be sent between the Minimum and Maximum send times.

(30) SLC: Supervisory Level Controller. Same as Building Controller.

(31) Segment: A section of uninterrupted cable where multiple devices may be installed.

(32) Subnet: Logical division of a domain.

(33) Trending: The accumulation of (time, value) pairs at specified rates for a specified period duration.

1.04 SUBMITTALS

A. Shop Drawings:

(1) Submit shop drawings for each hardware device used and submit complete description of software applications used. Submit manufacturer's printed product data sheets for each device or software program used. Datasheets shall be submitted electronically in pdf format with bookmarks provided for each individual device and table of contents listing each device manufacturer and full model number with links to device pages. Organize sheets in order of model number, alphabetically, then numerically. When a manufacturer's data sheet refers to a series of devices rather than a specific model, the data specifically applicable to the project shall be highlighted or clearly indicated by other means.

(2) Submittals shall include points list of each control input and output, controlled devices, locations of devices, and symbol or label of each control point in software.

(3) Device data sheets shall be submitted with electronic bookmarks as specified in Section 23 0901 - Control Systems Integration. Refer to PART 1 – GENERAL, subsection SUBMITTALS.

(4) Device data sheets shall be submitted simultaneously with Control Systems Integration submittal. Refer to submittals section in 23 0901.

B. Operating and Maintenance Manuals: Refer to Section 23 0901 - Control Systems Integration.

C. Software Manual:

(1) As part of operating and maintenance manuals, submit one software manual per workstation plus one extra copy for archive use. Software manuals shall be divided into separate parts with tabs for each part.

(2) Software manual parts shall include:

(a) Complete description of operating system including all commands, configuration programs, printouts, logs, database functions and passwords. Describe general operating procedures, starting with system overview and proceeding to detailed description of each software command feature with sample printed displays and system function description for each option. Include instructions on verifying errors, status, changing passwords and initiating or disabling control programs.

(b) Complete description of programming language including all commands, configuration programs, control loop functions and testing. Describe general programming procedures, starting with system overview and proceeding to detailed description of each software command feature. Include instructions on creating or modifying any control algorithm or parameter, debugging, etc. This shall include all control functions, algorithms, mathematic equations, variables, setpoints, time periods, messages, and other information necessary to load, alter, test and execute custom or pre-written programs.

(c) Software Backup: Upon successful completion of acceptance testing, submit to Owner 2 archive copies of all accepted versions of source code and compiled code for all application programs and data files on CD ROM backup disks. All control software must be readily accessible by Owner using BAS workstation hardware and software.

(d) Web server/data historian SQL database schema (table format) for trend data and event/alarm data.

(e) Control Loop Documentation: Submit indexed summary of each control loop program. Summary shall list in tabular form, name of system, name of control loop, all I/O points used, and reference to sheet number in shop drawings to describe control sequence programmed. For each control loop submit complete printed listing of source code used, all setpoints, high/low alarm points, time event schedules, proportional gains, integrals, derivative values, and other database values.

(f) BAS Points List Summary: Provide detailed summary for each point in the system. Summary shall be cross-index listing of all points in alpha/numerical order with list of control loops which use each point. For each point, include an abbreviated point name, expanded point description, detailed description of each input instrument or output device, and detailed description of exact location of all field hardware. Location descriptions shall include room names, column numbers, elevation (above ceiling, bottom of duct, etc.).

1.05 WARRANTY

A. Provide 1 year warranty on all materials and labor.

B. Warranty requirements shall include furnishing and installing software upgrades issued by the manufacturer during the 1 year warranty period.

1.06 FCC COMPLIANCE

A. Digital equipment furnished under this contract shall be tested and made to comply with limits for Class A computing devices pursuant to Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against interference when operated in commercial environments. Literature shall so note and equipment shall be so labeled to show this compliance.

PART 2 PRODUCTS

2.01 DIRECT DIGITAL CONTROL (DDC) CONTROLLERS

A. General:

(1) DDC controllers shall be microprocessor based, field programmable controllers, capable of performing control and energy management functions, and shall be UL listed as Signaling Systems. Each controller shall include its own microprocessor, power supply, input/output modules, and termination modules as required to perform intended function.

(2) DDC controller shall receive discrete electrical and/or analog electronic field input signals, convert signals for use by controller, perform control sequences, convert controller information into output signals, and provide control output signals to actuators and field control devices. Inputs and outputs, including communication connections, shall be electrically or optically isolated from controllers.

(3) All DDC controllers shall be provided by the same manufacturer.

(4) DDC controller with analog input modules shall be capable of accepting any form of linear or non-linear voltage (0-5 VDC or 0-10 VDC), current (4-20 mA) or resistive input (0-1000 ohm).

(5) DDC controller with discrete input modules shall be capable of accepting discrete inputs from any device with isolated, dry-type contacts (no grounds or no voltage) of either normally open (NO) or normally closed (NC) configuration. Provide visible status lights (LEDs) to indicate input point status.

(6) Provide input modules capable of interfacing with pulsed output type sensors as required.

(7) DDC controller with discrete output modules shall have isolated, dry-type contacts (no grounds or no voltage) of either normally open (NO) or normally closed (NC) configuration. Provide visible status lights (LEDs) to indicate output point status.

(8) DDC controller shall have capability to scale, offset, and display proper analog value without field hardware modification. DDC controller shall convert analog input signals to digital values (A/D conversion) and convert digital values to analog outputs (D/A conversion) for modulating control purposes. Some application specific controllers may utilize tri-state or Triac outputs for floating point control of control devices. Floating point control should be limited to non-critical room temperature control and mechanical space heating and cooling.

(9) Failsafe hardware shall be provided such that BAS failures result in immediate return to local control. If DDC controller uses database values from other DDC controllers and communication network fails or malfunctions, control loop outputs shall continue to function using last value received from BAS.

(10) Failure of network or control devices (i.e. building level controllers, floor level controllers, application specific controllers, routers, repeaters, etc.) shall be alarmed at the Operator Workstation as a Level 3 Critical Alarm.

(11) All DDC Hardware shall meet the following requirements:

(a) All DDC controllers shall be connected to an ASHRAE 135 MS/TP, BACnet over ARCNET or BACnet/IP control network and communicate via ASHRAE 135 exclusively.

(b) MS/TP controllers shall operate at a minimum baud rate of 38.4 kbps.

(c) All DDCP shall implement all required functionality of the application network interface via BACnet objects, properties, and services.

(d) All DDC controllers shall conform to the BACnet Testing Lab's Device Implementation Guidelines and be BTL Listed.

(e) Application programs and configuration settings shall be stored in a manner such that a loss of power does not result in a loss of the application program or configuration settings.

(f) All settings and parameters used by the application shall be fully configurable to the greatest extent possible, via properties of BACnet objects that can be written to via BACnet services or via properties of BACnet objects that can be written to via BACnet services for the following:

1) Setpoint
2) Alarm limit
3) Schedule modification
4) Trend modification

(g) All other settings and parameters that cannot be written to via BACnet services shall be fully configurable via either properties of BACnet objects that can be written to with a configuration tool, or via hardware settings on the controller itself to support the application.

(12) Each DDC panel shall have sufficient I/O capacity to perform specified control sequences and/or include points listed in point schedules. If DDC controller does not have sufficient capacity, provide additional slave I/O panels to achieve required point count.

(13) Analog and critical safety discrete control loops shall have inputs and outputs into/from same DDC panel. Analog control loops for major equipment (chilled water, hot water, convertors, air handling units, etc.) shall have PID control.

B. BACnet Building Controller (B-BC):

(1) BACnet Building Controllers (B-BCs) shall provide direct connection to high speed, BACnet/IP Local Area Network (LAN) and Campus Ethernet network and serve as communications router for other controllers on slower speed BACnet MS/TP or BACnet over ARCNET Floor Level Network (FLN).

(2) Communication between B-BC's shall be through BACnet/IP communication.

(3) B-BC's shall have sufficient processor capabilities, hard-drive storage and RAM to implement all types of custom software applications and shall provide supervisory control, scheduling, trend logging & alarm handling functions as follows:

(a) Scheduling:

1) Each B-BC shall support a minimum of 250 BACnet Schedule Objects and 250 BACnet Calendar Objects.

(b) Trending:

1) Any object in the system (real or calculated) may be logged. Sample time interval shall be adjustable at the operator's workstation.

2) B-BC shall periodically upload trended data to networked BAS Web Application Server for long term archiving.

3) Archived data shall be stored in standard database format and shall be made available for use in third-party spreadsheet or database programs.

(c) Alarm Generation:

1) Alarms may be generated within the system for any object change of value or state either real or calculated. This includes analog object value changes, binary object state changes, and various controller communication failures.

2) B-BC shall periodically upload alarm logs to networked BAS Web Application Server for long term archiving.

(4) B-BC's shall have uninterrupted real time clocks capable of time of day, week, and year information to the system as needed to perform software functions. Clock shall be programmed to reset twice per year to allow for Daylight Savings Time. Clocks in multiple DDC Controllers shall be synchronized to automatically match designated B-BC's or Web server. Accuracy shall be within 1 second per day.

(5) Batteries shall maintain volatile memory and real time clocks for a period of at least 72 hours during power failure. Batteries shall be maintenance free and have minimum life of 2 years. When power has been restored, the following shall occur automatically:

(a) Orderly startup of controlled equipment (user defined)

(b) Continuation of control algorithms

(c) Database revision

(d) Logging of power interruption and restoration times

(e) Battery recharging

(6) Provide local visual indication and system annunciation of low battery power for each battery.

(7) Each B-BC shall include its own micro-processor, power supply, input/output modules, and termination modules as required to perform intended function.

(8) BACnet UDP port number to always be set to 47808 (BAC0).

C. BACnet Advanced Application Controllers (B-AAC):

(1) B-AACs are defined as having sufficient processor capabilities and RAM to implement all types of custom software applications.

(2) B-AACs shall be capable of communicating to BAS network via BACnet MS/TP connected to Building Controller or via BACnet/IP directly.

(3) All B-AACs controlling major mechanical equipment/systems and lab equipment monitoring shall communicate via BACnet/IP as indicated on BAS Network Architecture drawings.

(4) Provide at least one extra communication port at each B-AAC for direct connecting a notebook computer or hand-held terminal.

D. BACnet Router

(1) BACnet MS/TP to BACnet/IP and BACnet/ARCNET to BACnet/IP Routers shall perform layer 3 routing of BACnet MS/TP or BACnet/ARCNET packets over an IP network in accordance with ASHRAE 135 Annex J. The router shall provide the appropriate connection to the IP network and connections to the BACnet MS/TP or BACnet/ARCNET network. BACnet Routers shall be capable of configuration via DHCP and Write-Broadcast-Distribution-Table messages but shall not rely on these services for configuration.

(2) One router in the IP subnetwork shall be designated as the BBMD (BACnet Broadcast Management Device) and shall be indicated as so on the Network Architecture.

(3) BACnet router functionality can also be incorporated into BACnet Building Controllers.

E. BACnet Gateways:

(1) Provide gateways to connect BACnet to non-BACnet devices, and non-BACnet DDC controlled equipment.

(2) Provide with each gateway an interoperability schedule, showing each point or event on the non-BACnet side that the BACnet "client" will read, and each parameter that the BACnet network will write to. Describe this interoperability in terms of BACnet services, or Interoperability Building Blocks (BIBBS), defined in ASHRAE 135 Annex K. Provide two-year minimum warranty for each gateway, including parts and labor.

(3) The following minimum capabilities are required:

(a) Gateways shall be able to read and view all readable object properties listed in the interoperability schedule on the non-BACnet network to the BACnet network and vice versa where applicable.

(b) Gateways shall be able to write to all writeable object properties listed in the interoperability schedule on the non-BACnet network from the BACnet network and vice versa where applicable.

(c) Gateways shall provide single-pass (only one protocol to BACnet without intermediary protocols) translation from the non-BACnet protocol to BACnet and vice versa.

(d) Gateways shall meet the requirements of Data Sharing Read Property (DS-RP-B), Data Sharing Write Property (DS-WP-B), Device Management Dynamic Device Binding-B (DM-DDB-B), and Device Management Communication Control (DM-DCC-B) BIBBs, in accordance with ASHRAE 135.

(e) Gateways shall include all hardware, software, software licenses, and configuration tools for operator-to-gateway communications. Provide backup programming and parameters on CD media and the ability to modify, download, backup, and restore gateway configuration.

F. Power Supplies:

(1) Power supplies shall operate on nominal 120 V, 60 Hz, single-phase power. DDC Controllers shall be provided with surge and noise protection. Power fluctuation shall not affect control system. Include surge protection on telephone line.

(a) Isolation transformers shall be included when connections are being made between 2 separate buildings.

2.02 DIRECT DIGITAL CONTROL SOFTWARE

A. General:

(1) DDC Controller control strategies shall be Owner definable from engineering workstations.

(2) Software functions and algorithms shall be sufficient to enable implementation of control sequences as specified and shall be able to maintain continuous control as intended.

(3) Control functions shall include both mathematical and logical operators. Control algorithms shall include proportional, integral and derivative control (PID). Adaptive (self-tuning) PID loop parameters, if offered by DDC Controller manufacturer, shall not be used unless adaptive limits are used to adjust limit values based on system status; or written request is submitted and approved by Engineer.

(4) Allow operators to assign unique identifiers of their choice to each connected point. Identifiers shall have at least 8 alpha/numeric characters. References to these points in programs, reports and command messages shall be by these identifiers.

(5) Provide access control (user defined passwords) for system operation. There shall be minimum of 3 access levels. First level shall allow system monitoring only. Second level shall allow monitoring, set point adjustment, and scheduling revision. Third level shall allow modification of control algorithms. System shall return to secured (monitoring only) mode after 5 minutes of inactive operation.

(6) Each DDC Controller shall contain self-diagnostics that continuously monitor proper operation of panel.

(7) If microprocessor malfunctions, control loop outputs shall continue to function using last value received from microprocessor.

B. Building Controller Software:

(1) Provide DDC Controller software application program modules for performing energy management control functions such as time of day change of database values (programmed start/stop, temperature setbacks, etc.), supply air temperature reset based on space load demand, economizer control, optimum start/stop based on current indoor and outdoor psychometrics, duty cycling and client tailored programs required for special applications such as VAV fan matching and supply fan control, enthalpy control, intermediate season or "dead band" control, totalizing, and holiday programming.

(2) Provide manufacturer's standard operating system for real time control of system interactions, including database information requests/transfers by system hardware or by operators. Operating system shall also have the following additional capabilities (given that operator has appropriate security access level):

(a) User interface and online system configuration software embedded in Building Controller.

(b) Support for Web services at the automation network level.

(c) Displaying database (point) value including measured values, controlled variables, setpoints, gain factors, and any other adjustable parameters.

(d) Changing or overriding any database value.

(e) Error detection, correction, re-transmission of database values, arithmetic or logical faults.

(f) Alarm reporting including sending alarms to remote workstations, User Interface Web Server or Data Historian on network.

(g) Alarm buffer to retain alarms in order of importance without losing any alarms.

(h) Creating and displaying historical trend logging of any value, limited only by available memory.

(i) Creating new variable database values (soft points) based on arithmetic calculation (including summation or totalizing) on other database values.

(j) Adding new hardware points without overall BAS shutdown.

2.03 OPERATOR'S WORKSTATION

A. Operator Workstations shall communicate with BAS Web Server via standard web interface software. Provide Operator Workstations for operator interface to BAS for monitoring, control, and database management as indicated on BAS Network Architecture Drawings. Proprietary software shall not be required for proper monitoring and control of HVAC systems.

B. Owner will furnish operator's workstations for operator interface to BAS for monitoring, control, and database management. Provide network interface cards, all required cables and other associated hardware for connecting each of Owner's workstations to BAS network and other remote devices specified.

2.04 ENGINEERING WORKSTATION

A. Refer to Operator Workstation section for requirements.

2.05 DDC ENGINEERING (PROGRAMMING) - SOFTWARE

A. Provide engineering software for 1 Engineering Workstations and 1 laptop.

B. Software shall have the same characteristic and capabilities as DDC Controllers. In addition, operator's workstations shall have the following features.

C. User Programmability:

(1) Engineering workstation software shall include field-engineering tools (software & hardware) for programming all controllers supplied.

(2) All application software shall be interactive, fully prompted, and menu driven and shall provide the following functionality as a minimum:.

(a) Determine control strategies, which have been defined for specific piece of equipment.

(b) Add control loops to system using English language type program language equal to BASIC or other easily learned language or function block programming. (PASCAL, C, or other assembly type languages are not acceptable.)

(c) Add points to system.

(d) Create, modify or delete control strategies.

(e) Create, modify or delete system graphics.

(f) Assign sensors and/or actuators to control strategy.

(g) Tune control loops through adjustment of control loop parameters.

(h) Enable or disable control strategies.

(i) Generate hard copy records of control strategies on printer or soft copies to files compatible with Microsoft Office applications.

(j) Select points to be alarmable and define alarm state(s).

(k) Select points to be trended over a period of time and initiate recording of values.

(l) Override Input/Output points for each individual controller.

2.06 OPERATOR WORKSTATION - SOFTWARE

A. Custom Database Functions:

(1) Operator shall be capable of generating long term historical trend logs and displaying information in tabular or graphic formats. Provide all software options for standard and custom report generators.

B. Color Graphics:

(1) Provide color graphics software package compatible with manufacturer’s standard software. Provide mouse or other special hardware required to operate software. Software shall be capable of user editing of text fields, graphics, alarms, and real-time variables.

(2) Software shall be capable of importing files in AutoCAD format, directly or via translators.

2.07 NETWORK HARDWARE

A. Provide network interface hardware for each device connected to network. Each device shall have sufficient performance as not to degrade specified processing speed.

B. Provide network cabling with sufficient performance as not to degrade specified communication speed. Cabling shall be compatible with proposed system and shall comply with requirements specified in Section 23 0901 - Control Systems Integration.

C. Provide other network support devices that are required for proper operation of network, such as file servers, signal repeaters, network hubs, etc.

D. Provide network diagnostic tool for measuring/confirming bandwidth usage on IP layer.

PART 3 EXECUTION

3.01 GENERAL

A. Install control equipment in neat, professional manner to satisfaction of Architect and Engineer.

B. Coordinate timely delivery of materials and supervise installation of DDC Controllers and network cabling and devices.

C. Install DDC Controllers and network control devices in accessible locations.

3.02 OVERALL BAS ARCHITECTURE

A. Provide hardware/software to update database in less than 1 second for fast-acting control loops such as pressure control, air or water flow rate control, and air handling unit temperature control, or 10 seconds or less for other control loops.

B. Control software algorithm and inputs and outputs for a single system or piece of equipment shall reside on a single controller and shall not be distributed amongst multiple controllers. If multiple pieces of equipment are to be interlocked, a single “Master” controller shall provide control for all interlocked pieces of equipment, i.e. an AHU and interlocked return fan and exhaust fans.

C. Control loop software algorithm for each analog control loop shall reside on same controller as inputs and outputs required for that specific control loop.

D. Networks that operate via polled response or other types of protocols that rely on central processors, file servers, or other such devices to maintain or manage peer-to-peer communications, shall have redundant components to maintain network in event of failure at central device. Provide automatic changeover (without operator intervention) to redundant device upon failure of any central type processor.

E. Floor Level Network (FLN) network shall be multi-drop digital transmission network utilizing BACnet MS/TP (38.4kbs) communication.

F. Each multi-drop trunk shall be within manufacturer's allowable line lengths without signal degradation. Multi-drop trunks shall be interfaced to system via standard EIA or other industry recognized interfaces so that single failure does not disrupt or halt network.

G. Communications between Building Level DDC Controllers and operator's workstations shall be peer-to-peer, allowing multiple users to access and use system simultaneously with no loss of system performance.

H. Provide levels of connected networks to connect all DDC Controllers, including terminal DDC Controller. Communications to terminal devices shall be similar to capabilities and functions of other DDC Controllers and shall be transparent to operator.

I. Quantity of nodes (devices connected) on any one FLN (MS/TP) shall not exceed 50% of maximum node capacity published by equipment manufacture and Building Controller processor usage shall not be greater than 30% nominal. Provide additional hardware to meet this requirement.

J. Alarm reports from DDC Controllers shall not be impeded by use of either remote or local monitor, or control stations on network either in access mode or programming mode.

3.03 DIRECT DIGITAL CONTROLLERS

A. DDC Controller Usage:

(1) Select DDC Controller to provide speed of response required for each control loop type. Pressure, flow rate, and air handling unit temperature control must be via Building Level DDC Controller. Application specific DDC Controller may be used for other control loop types.

(2) Each DDC Controller shall have sufficient I/O capacity to perform specified control sequences and/or include points listed in any point schedules. If DDC Controller does not have sufficient capacity, provide additional slave panels to achieve required point count.

(3) Analog and critical safety discrete control loops shall have inputs and outputs into/from same DDC Controller. Analog control loops for major equipment (chilled water, hot water, convertors, air handling units, etc.) shall have PID control. Air terminal control loops may utilize floating point control from tri-state or Triac outputs from the controller, but require some type of feedback device to prove position.

(4) Provide at least one Building Level DDC Controller per mechanical equipment room and, if required, at each PC workstation location.

(5) For valves and dampers within 100 ft of associated DDC Controller, mount current to pneumatic (I/P) converter within DDC Controller panel or in adjacent panel. Otherwise mount I/P converters at valve or damper. Provide pressure gauges on main air, and all control output signals.

B. Point Capacity:

(1) Provide 20% point capacity required plus spare I/O point capacity in each B-AAC. Spare I/O point capacity is defined as terminal connections, which are ready to accept digital or analog inputs, dry contacts for digital outputs, and variable voltage or current terminals for analog outputs. Universal type points are acceptable for both discrete and analog type points. Spare points do not include any input or output conversion devices.

C. Building Controllers:

(1) Provide one BBMD in each IP subnet.

(2) BACnet UDP port number to always be set to 47808 (BAC0).

D. Gateways:

(1) Gateways may be used for communication with non-BACnet control hardware subject to all of the following limitations:

(a) Non-BACnet control hardware shall not be used for controlling built-up units.

(b) Non-BACnet control hardware shall not perform system scheduling functions.

E. Cabinets:

(1) Provide local control cabinets for DDC Controllers. DDC Controller cabinets for air terminals may be used directly if enclosures are rated for NEMA 1. All cabinets shall utilize a single master key. Provide 2 spare key sets to Owner.

(2) All control cabinets shall be labeled. Labels shall be keyed to the unique identifiers shown on the As-Built drawings

F. Controller Firmware

(1) Provide latest version of controller firmware. Include firmware updates for period of one year after system acceptance, coinciding with warranty period. If the upgrade of firmware causes the need to upgrade or reconfigure/reprogram related systems, controllers or software, Contractor shall notify Owner prior to upgrade and provide additional work scope in coordination with other Contractors, as required, at no cost to Owner.

3.04 OPERATOR/ENGINEERING WORKSTATIONS

A. Locate workstations as indicated on plans and Network Architecture.

B. Furniture is provided by others. Provide all necessary connections and extensions to integrate hardware with furniture system.

C. Security access levels for the engineering workstation software shall be setup as follows:

(1) Guest (View-only) access level shall have the ability to perform the following tasks:

(a) View Data

(b) View Trends

(2) Operator access level shall have the ability to perform the following tasks:

(a) View Data

(b) Acknowledge Alarms

(c) View Reports

(d) Override Points

(e) Change Setpoints

(f) View Trends

(g) Edit Schedules

(3) Engineer access level shall have the same access as Operator level with the ability to perform the following additional tasks:

(a) Add Devices

(b) Address Changes

(c) Create Applications

(d) Download Applications

(e) Configure ASCs

(f) Setup Trends

(g) Setup Reports

(h) Modify Alarm Settings

D. Provide security access level setup for 10 users. Coordinate user names, access levels and passwords with Government.

E. System shall provide an Auto Logout Feature that shall automatically logout user when there has been no keyboard or mouse activity for 5 minutes. Time period shall be adjustable by system administrator. Auto Logout may be enabled and disabled by system administrator. Operator terminal shall display message on screen that user is logged out after Auto Logout occurs.

3.05 DDC SOFTWARE INSTALLATION

A. Operating system (OS): Contractor shall configure the OS on workstations and laptops for their software to operate correctly plus configure usernames and passwords.

B. Virus Protection software: Contractor shall coordinate virus protection software with owner.

C. Contractor shall install and configure all software packages required to maintain and configure all types of controllers provided as part of this project on each engineering workstation.

D. Software from panels shall be permanently stored on CD ROM and on at least one hard disk at operator's workstation or Web Application Server. Provide auto re-boot feature on power up from system failure. System failures shall not necessitate manual reprogramming to restore normal system function.

E. Provide the latest version of all standard software, including operating system and control software. Include any software updates for period of one year, coinciding with warranty period. Beta released software shall not be used.

3.06 INITIAL PROGRAMMING

A. Control Contractor shall provide initial programming of controllers to accomplish sequences specified.

B. Provide back-up documentation per software manual submittals for all programs, in both written and electronic media formats.

C. Outputs, whether sequenced or not, shall have separate programmable hardware outputs. For air handling units, minimum outside air, maximum (economizer) outside air, return air, relief air, smoke dampers, heating valves, cooling valves, humidifier valves, etc., shall each have separate output.

D. BACnet Naming and Addressing

(1) Every BACnet device shall have an assigned and documented MAC Address unique to its network. For Ethernet networks, document the MAC Address assigned at its creation. For MS/TP, assign from range as indicated by vendor documentation.

(2) Assign unique numbers to each new network installed on the BACnet internetwork. Provide ability for changing the network number; either by device switches, network computer, or field operator interface. The BACnet internetwork (all possible connected networks) can contain up to 65,534 possible unique networks.

(3) Every BACnet Building Controller (B-BC) and BACnet Router UDP port number shall be set to 47808 (BAC0).

(4) Assign unique Device "Object_Identifier" property numbers or device instances for each device on the BACnet internetwork. Provide for future modification of the device instance number; either by device switches, network computer, or field interface. BACnet allows up to 4,194,302 possible unique devices per internetwork.

(5) The Object Name property field shall support 32 minimum printable characters. Assign Object Name properties with plain-English names descriptive of the application. Examples include "Zone 1 Temperature" and "Fan Start/Stop".

E. Minimum BACnet Object Requirements

(1) For the following points and parameters, use standard BACnet objects, where all relevant object properties can be read using BACnet's Read Property Service, and all relevant object properties can be modified using BACnet's Write Property Service: all device physical inputs and outputs, all set points, all PID tuning parameters, all calculated pressures, flow rates, and consumption values, all alarms, all trends, all schedules, and all equipment and lighting circuit operating status.

(2) The Object Description property shall support 32 minimum printable characters. For each object, complete the description property field using a brief, narrative, plain English description specific to the object and project application. For example: "HW Pump 1 Proof." Document compliance, length restrictions, and whether the description is writeable in the device PICS.

(3) Support and provide Description and/or Device Type text strings matching signal type and engineering units shown on the points list.

(4) Support and provide Inactive Text and Active Text property descriptions matching conditions shown on the points list.

(5) For devices with scheduling capability, provide at least one Calendar Object with ten-entry capacity. Enable the writeable Date List property and support all calendar entry data types.

(6) Use Schedule Objects for all building system scheduling.

(7) Use Loop Objects or equivalent BACnet objects in each applicable field device for PID control. Regardless of program method or object used, allow authorized operators to adjust the Update Interval, Setpoint and all constraints associated with Object, such as Proportional Constant, Integral Constant, and Derivative Constant for Loop Object, using BACnet read/write services.

F. Minimum BACnet Service Requirements

(1) Use commandable BACnet objects to control machinery and systems, providing the priority levels listed below.

	Priority Level	Application
(a)	1	Manual-Life Safety
(b)	2	Automatic-Life Safety
(c)	3	(User Defined)
(d)	4	(User Defined)
(e)	5	Critical Equipment Control
(f)	6	Minimum On/Off
(g)	7	(User Defined)
(h)	8	Manual Operator
(i)	9	(User Defined)
(j)	10	(User Defined)
(k)	11	Load Shedding
(l)	12	(User Defined)
(m)	13	(User Defined)
(n)	14	(User Defined)
(o)	15	(User Defined)
(p)	16	(User Defined)

G. Data Sharing:

(1) Data communication from Building Controllers to Engineering Workstation and BAS web server shall be programmed to use Change of Value (COV) data sending and not continuous data polling to limit net work traffic.

(2) Data communication parameters for analog values shall be operator configurable and setup as follows:

(a) Minimum Send Time: 2 seconds

(b) Maximum Send Time: 60 seconds

(c) Send on Delta (COV) :

1) Space Temperature: ±0.5°F

2) Process Temperature: ±0.5°F

3) Air Pressure, AHU: ±0.05“ W.C.

4) Relative Humidity: ±0.5%

5) Air Flow: ±200 cfm

6) Water Flow: ±50 gpm

7) Water Pressure ±0.2 psi (0.00 kPa)

8) Space Pressure: ±0.01“ W.C.

(3) Digital data points shall be sent whenever a state change occurs.

H. Historical Trending:

(1) All inputs and analog outputs shall be trended and shall fully configured and operational. Sample time shall be one minute.

(2) Program historical file for run-times and quantity of start/stops of motor driven equipment

(3) Trend logs are to be stored at the building controllers and uploaded to the BAS web server or data historian when the building controller trend buffer size reaches 90% full or every 30 minutes (FA).

(4) Data points indicated to as “LEED M&V” in the DDC Point Schedules shall be have a sampling time of one minute and averaged over 15 minutes.

I. Alarm/Event Management:

(1) All alarm handling shall be fully configured with consistent alarm messages and priorities or category numbers to identify the system from which the alarm originates.

J. Provide programming of menus to assist new users in accessing screen displays of each point group. Point groups (user definable) shall be initially arranged by DDC Controller for major equipment and by floor and area for terminal devices. Terminal devices shall also be grouped by air handling system where applicable.

K. When adding to an existing system, groupings, tag names, descriptions, engineering units, etc. shall match the existing system. Transitions from the existing system to the new system shall be seamless in look, functionality, and operation. Controls Contractor shall verify with Owner if any standard naming conventions are being used and continue with those naming conventions when applicable.

L. Program historical file for run-times and quantity of start/stops of motor driven equipment.

M. Program maintenance alarms based on run-times and quantity of start/stops for motor driven equipment.
   (1) Provide the following additional alarms:
      (a) Controller loss of communications for each controller.
      (b) Controller battery alarm for each controller (where available)
      (c) Out-of-range, bad, or missing data (fault) for each device.

N. Program alarms using the following levels:
   (1) Level 1 - Maintenance Alarm, requiring attention within 1 to 2 days. (Examples: 2-3°F temperature variance from set point; 15-25% relative humidity variance; etc.)
   (2) Level 2 - Low Level Alarm, requiring attention within 8 h, preferably during the same shift. (Examples: More than 3°F variance from set point, 30 percent relative humidity or more variance from set points; excess start/stops per day; etc.)
   (3) Level 3 - Critical Alarm, requiring immediate attention. (Examples: Non-operation of primary equipment; H-O-A overrides; failure of controllers, routers and repeaters.)
   (4) Level 1 and 2 alarms shall not interrupt current user operation, but shall be logged into alarm summary file, indicating status, acknowledgment, and by whom. Level 3 alarms shall interrupt user via audible and/or flashing warning until acknowledged, without losing any work in progress. When alarms are acknowledged, program shall display point group or appropriate graphic display. Level 3 alarms shall also be logged into alarm summary file in similar manner as Level 1 and 2 alarms.

O. Time Schedules:
   (1) Provide time schedules for HVAC components/systems as indicated in Control Sequences.
   (2) All time schedules shall be fully configured with weekly schedules and all holidays identified by the Owner.
   (3) Time schedules are to reside in the Building Controllers.

3.07 POINT LIST

A. Provide points required to implement control sequences specified, whether or not they are listed in schedules. In addition to control points, provide additional points listed in point schedules or defined in Control Sequences.

B. All points shall be programmed with a point name and detailed description. Control contractor shall submit point naming convention to Laboratory/Engineer for approval prior to system programming.

C. Work jointly with Owner to develop point naming convention prior to start of programming.

3.08 AUTO-DIAL ALARM MESSAGES

A. Program up to 30 types of prerecorded voice and text messages assigned to different alarm types. Assign up to 10 phone numbers for each message. BAS shall automatically call phone numbers without answering machines in predetermined order. If an acceptable phone response is not received after 6 rings (adjustable), system shall automatic retry 3 times (adjustable) before calling next number. Systems shall print level 3 alarm message if no phone numbers were reached.

3.09 GRAPHICS PROGRAMMING

A. Graphics shall be designed to match any existing graphic displays on the existing system when new system is to fully integrate with existing system. Transition from existing graphics to new graphics shall be seamless transition for operator in look, functionality, and operation.

B. On new system, program color graphic displays for each system as described herein. Graphic displays shall consist of pictorial presentations on display monitor/workstation with text description, system schematic, or picture; alarm fields; and database fields for all associated points, including dynamic input values, output values, set points, gains, time schedules, etc. Provide single keystroke access to text file description of control sequence(s) in detail.

C. Make use of color to highlight system components. Components of similar type shall be of same color for all graphics (example: dampers shall be purple, valves yellow, etc.). Alarm fields shall be flashing white letters on red background. Affected component shall also turn red whenever alarm status is indicated. Database fields shall be white letters on black background and shall be dynamically updated and re-displayed on screen by periodically polling database points not less than once every minute.

D. Display time, date, outside temperature and humidity on displays in same location on each graphic. Display command line with English prompt in same location on each graphic. Provide command to direct specific displays without accessing main menu. Provide means of displaying directory of screens. Arrange displays by group and type.

E. Graphic displays shall be designed to be easily understood. When display screen is too cluttered due to size, limit information to important monitoring data. Provide sub-graphic(s) to display data not displayed on main display.

F. Graphics shall include, but not be limited to:
   (1) Site Plans, including each building, building name, and status of all exterior points such as lighting, etc.

(2) Overall building plan of each building. Indicate location of mechanical rooms and areas served by each air handling unit.

(3) Floor plans for each area depicting locations of terminal units, areas served by terminal units, and other remotely located points. Plans shall include full height partitions, column numbers, room numbers, and room names with special functions (not offices, corridors, toilets, storage, etc.).

(4) Schematic type graphics for:

(a) Each air handling system

(b) Supply fan control loop

(c) Return fan control loop

(d) Cooling coil control loop

(e) Heating coil control loop

(f) Humidifier control loop

(g) Damper control loops

(h) All air terminal devices shown on floor plans

(i) Main chilled water system showing all components

(j) Each heating hot water system showing all components

(5) Indicate systems to be graphically represented.

(6) Submit sample graphics (one per type) for review and approval by Owner prior to starting graphics programming.

END OF SECTION 23 09 23

SECTION 23 21 16 - PIPE AND PIPE FITTINGS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 01 8113 – Certification Requirements

B. Section 20 0573 – Mechanical Systems Firestopping

C. Section 23 0594 - Water Systems Test Adjust Balance

D. Section 23 0902 - Control Valves and Damper (Valves)

E. Section 23 0903 - Control Instrumentation (Wells, Taps or In-line Devices)

F. Section 23 2118 - Valves

G. Section 23 2120 - Piping Specialties

H. Section 23 2514 - Chemical Treatment Systems (Pipe Cleaning)

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESCRIPTION

A. Specification of an item in this or any other sections shall not relieve Contractor from providing all items, articles, materials, operations, methods, labor, equipment and incidentals necessary for a complete and functional system.

B. Use only new material, free of defects, rust and scale, and guarantee for services intended.

C. Use material meeting the latest revision of ASTM specifications as listed in this specification.

D. Follow local codes if they require other types of pipe or joints.

E. Use only long radius elbows having centerline radius of 1.5 pipe diameters unless otherwise indicated.

F. Manufacturer, pressure class, size and heat code of each fitting and flange shall be permanently identified on its body in accordance with MSS SP-25.

G. Where size for a pipe segment is not indicated, the pipe segment size shall be equal to the largest pipe segment to which it is connected. Transition to smaller size shall occur on the side of fitting where smaller size is indicated.

H. Unless otherwise indicated, fittings and accessories connected to pipe shall be of the same material as the pipe.

I. Unless otherwise indicated, construct piping for highest pressures and temperatures in respective system in accordance with the latest revision of the applicable Sections of ASME Code for pressure piping, ASME B31 including the following:

(1) B31.9 Building Services Piping

(2) B31.3 Process Piping

J. Boiler external piping shall comply with the latest revision of Section 1 of ASME Boiler and Pressure Vessel Code. This Contractor shall be responsible for materials, installation, testing and certification in accordance with the Code.

K. Non-metallic piping is acceptable only for services indicated. It is not acceptable in occupied spaces and ventilation plenum spaces.

1.04 LEED PERFORMANCE REQUIREMENTS

A. VOC Emissions Evaluation: For adhesives and/or sealants used for installation, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: For adhesives and sealants, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for Adhesive and Sealant Applications, as per the SCAQMD Rule 1168, October 6, 2017, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

1.05 SUBMITTALS

A. Please embed pdf bookmarks in submittals to enhance navigation and facilitate review process.

B. Shop Drawings for each piping system for all pipe sizes including, but not limited to, the following:

(1) Name of system
(2) Pipe; ASTM number, grade if known, type, wall thickness, material
(3) Fittings; ASME number, grade if known, class, type, wall thickness, material
(4) Joint type
(5) Flanges; ASTM number, grade, class, type, material
(6) Bolts and nuts; material
(7) Thread joint sealants; material
(8) Flange gaskets; material, rating
(9) Unions; ASTM number, type, material, rating
(10) Type of welding
(11) Welding Quality Control Program
(12) Test pressure and media
(13) Pipe flushing/cleaning plan
(14) Pipe cleaning method
(15) All other appropriate data

C. Submit pipe certification as specified under Pipe Certification in this Section.

D. Submit required documents as specified under Pipe Welding in this Section.

E. Provide Flushing and Cleaning Plan:

(1) Submit pipe flushing/cleaning plan for water, fluid, steam and condensate systems for approval. Plan shall detail methods for compliance with requirements of this section, including:
(a) Flushing and cleaning procedure narratives.
(b) Size, power source, and connection points of contractor provided pumps that will be used for flushing and cleaning.
(c) If Contractor proposes to utilize project system pumps, method of protecting pumps from damage and developing required velocity of section of piping to be flushed.
(d) Method of sectionalizing piping to obtain required velocity.
(e) Minimum velocities at each section of pipe, clearly indicating any sections where 6 fps cannot be achieved.
(f) Location and means of temporary bypasses for coils, control valves and other equipment.
(g) Flushing schedule and drawings or diagrams that will be used for inspection and sign off prior to and after procedure, at Owner's option.
(2) Submit documents showing verification of flushing/cleaning following specified requirements and results.

F. LEED Submittal

(1) Complete provided Product Data Reporting Form in spec section 01 8113 and provide the following:
(a) VOC Emissions Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.
(b) VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Furnish pipe with plastic end-caps/plugs on each end of pipe. Maintain end-caps/plugs through shipping, storage and handling to prevent pipe-end damage and eliminate dirt and construction debris from accumulating inside of pipe.

B. Where possible, store materials inside and protect from weather. Where necessary to store outside, elevate well above grade and enclose with durable, waterproof wrapping.

C. Before shipping, all carbon steel piping shall be free of rust and scale, and furnished with plastic end caps/plugs on each end of pipe.

1.07 PIPE WELDING

A. Procedure and Welding Qualification Records:

(1) Submit Welding Procedure Specifications (WPSs) and their supporting Procedure Qualification Records (PQRs) to be used on the work to Engineer for review and approval prior to performing any welding. These documents shall meet requirements of ASME B31.1 and B31.9, as applicable.

(2) Unless otherwise indicated, welding shall be done using only the following processes:

(a) Shielded Metal Arc Welding (SMAW), also known as "stick" welding

(b) Gas Tungsten Arc Welding (GTAW), also known as TIG and Heliarc welding

(c) Gas Metal Arc Welding (GMAW), also known as MIG welding

(d) Flux-Cored Arc Welding (FCAW), a variation of GMAW

(e) Submerged Arc Welding (SAW)

(3) Unless otherwise stated, fabrication, installation, inspection, examination and testing shall be in accordance with ASME B31.1 or B31.9, as applicable.

(4) Backing rings (chill rings) or consumable inserts are not allowed, unless specifically requested by Owner or Engineer.

B. Quality Control Program:

(1) Submit written quality control program for review and approval prior to implementing any welding on this project. Quality control program shall include the following as minimum:

(a) Explanation of how Contractor will assure proper fit-up for each weld.

(b) Explanation of how Contractor will document welds performed by individual welding operators for systems under ASME B31.1.

(c) Explanation of how Contractor will assure that proper welding procedure is being followed.

(d) Credentials of personnel responsible for required weld examinations.

C. Weld Inspection and Examination:

(1) Provide examination services for all welding for this Project. Examination shall be in accordance with requirements of ASME B31.1, Table 136.4 or B31.9, as applicable.

(2) Periodically, as welding progresses, submit report, signed by weld examiner, indicating status of project welding quality.

(3) Arrange with Owner's Inspector for observation of fit-up and welding methods prior to implementing any welds, including shop welds, on this Project.

(4) In addition, Owner's Inspector will perform any additional observations deemed necessary before, during, or after fabrication to assure, to Owner's satisfaction, that proper welding is provided. Owner reserves the right to perform independent examination of welds. If Owner has any concern as a result of such examination Owner reserves the right to stop in progress welding work, without any cost to Owner, until resolution satisfactory to Owner is reached.

D. Welder Qualifications:

(1) Each welder and welding operator must qualify by passing required procedure test before performing any project welds. Submit copy of Manufacturer's Record of Welder or Welding Operator Qualification Tests (WPQS) as required by Section IX of ASME Boiler and Pressure Vessel Code for all welding procedures to be performed by welding operator.

(2) Welder qualifications must be current. If qualification test is more than 6 months old, provide record of welding continuity for each welder.

(3) Record of welding continuity is intended to show that welder has performed welding at least every 6 months since the date that welder qualification test was passed for the submitted welding procedure specification.

(4) Record of welding continuity shall include, at minimum, the following:

(a) Welder's employer name and address

(b) Date Welder Qualification Test was passed

(c) Dates indicating welding continuity

(5) Welders shall be qualified as required by ASME B31.1 or B31.9, as applicable. In addition, there shall be an independent witness of welder tests. That witness shall be representative of independent testing laboratory, Authorized (Code) Inspector, Owner's or Engineer's Inspector or consultant approved by National Certified Pipe Welding Bureau.

(6) Welder qualifications must cover all pipe sizes and wall thickness used on this project. Test segments or coupons shall be appropriately selected for qualification. Test position shall be arranged in "6G position."

1.08 PIPE CERTIFICATION

A. Certification is required for all pipe within scope of ASME B31.1. Submit certification papers, as outlined below, within 30 days of delivery of pipe to project site.

B. Type E or S Pipe:

(1) Furnish manufacturer's mill certificates (material test report) including dimensions, heat numbers, chemical analysis and tensile test results for pipe shipped to project site.

1.09 FLANGES

A. Use either flat faced or raised-face flanges for mating with flat-faced or raised-face flanges.

B. Welding Neck Flanges:

(1) All flanges shall be welding neck type unless otherwise indicated.

C. Slip-on Flanges:

(1) Slip-on flanges shall not be used without specific approval of Engineer. Contractor shall submit written request for use of slip-on flange for specific instance where use of welding neck flange is problematic. Slip-on flanges over 4” pipe size are prohibited for any application under ASME B31.1.

D. Bore dimension of flange shall match inside diameter of connecting pipe.

E. Bolts and Nuts:

(1) Threads shall be in accordance with ANSI/ASME B1.1, Class 2A tolerance for external threads and Class 2B tolerance for internal threads. Threads shall be coarse-thread series except that alloy steel bolting 1-1/8" and larger in diameter shall be 8 pitch thread series.

(2) Threaded rods are not allowed in lieu of bolts.

PART 2 PRODUCTS

2.01 HEATING HOT WATER (THROUGH 250 PSIG/250°F)

A. 2" and Smaller:

(1) Pipe: ASTM B88 seamless, Type L, hard temper copper tube

(2) Fittings: ASME B16.22, wrought copper solder joint

(3) Joint: ASTM B32, lead free solder, similar to Bridgit, Silvabrite, Silverflow or Canfield

(4) Unions: ASME B16.18 cast copper alloy or ASME B16.22 wrought copper solder joint, Class 125. No unions to be used for line sizes 3/4" and smaller. Unions shall be used for line sizes over1"and larger.

(5) Flanges: Class 150, ASME B16.24, ASTM B61 or ASTM B62 cast copper alloy

(6) Bolts and Nuts

(a) Type 316 stainless steel bolts conforming to ASTM A193 Grade B8M Class 1 or Class 2 with Type 316 stainless steel nuts conforming to ASTM A194 Grade 8M. Use 316 SS washers.

(7) Gaskets:

(a) ASME B16.21 and ASTM F104 flat ring type, asbestos-free, compressed inorganic fiber with nitrile binder.

(b) Gasket thickness 1/16”

(c) Maximum Seating Stress (y) 3050 psi (21029.02 kPa)

(d) Minimum Gasket Factor (m) 4.2

(8) Use solder joints for valves and piping specialties in copper piping, unless otherwise specified.

(9) Press Joint Option:

(a) Contractor may use press copper fittings as manufactured by Viega, Other acceptable manufacturers are Nibco and Elkhart. “Push-to-connect” or “push-in” fittings, which are not press-type, will not be accepted.

(b) Fittings: Copper press fittings with EPDM seal, 0 to 250°F, maximum 200 psi (1378.95 kPa).

(c) Joints: Press joints by fitting manufacturer approved tool.

B. 2-1/2” and Larger:

(1) Pipe: ASTM A53 Grade B, Type E or S or ASTM A106 Grade B, standard weight, carbon steel

(2) Fittings: ASTM A234 Grade WPB/ASME B16.9, standard weight, seamless, carbon steel weld

(3) Flanges:

(a) ANSI Class 150, ASTM A105 Grade II, ASME B16.5 or ASME B16.47 Series A or B, welding neck

(4) Bolts and Nuts:

(a) ASTM A193 Grade B7 or B16 with nuts conforming to ASTM A194 Grade 2H.

(5) Gaskets

(a) ASME B16.21 and ASTM F104 flat ring type, asbestos-free, compressed inorganic fiber with nitrile binder.

(b) 2-1/2” thru 8”

1) Gasket thickness 1/16”

2) Maximum Seating Stress (y) 3050 psi (21029.02 kPa)
3) Minimum Gasket Factor (m) 4.2

(c) Garlock, Klingersil or J.M. Clipper, similar to Garlock 3000.

2.02 PRIMARY CHILLED WATER, CHILLED WATER, AND IMAGING CHILLED WATER

A. 2" and smaller:

(1) Pipe: ASTM B88 seamless, Type L, hard temper copper tube
(2) Fittings: ASME B16.22, wrought copper solder joint
(3) Joint: ASTM B32, lead free solder, similar to Bridgit, Silvabrite, Silverflow or Canfield
(4) Unions: ASME B16.18 cast copper alloy or ASME B16.22 wrought copper solder joint, Class 125. No unions to be used for lines sizes 3/4" and smaller. Unions shall be used for line sizes 1"and larger.
(5) Flanges: ASME B16.24, Class 150, ASTM B61 or ASTM B62 cast copper alloy
(6) Bolts and Nuts:
(a) Bolts conforming to ASTM A193, Grade B8M Class 1 or Class 2 with nuts conforming to ASTM A194, Grade 8M. Use 316 SS washers.
(7) Use solder joints for valves and piping specialties in copper piping, unless otherwise specified.
(8) Press Joint Option:
(a) Contractor may use press copper fittings as manufactured by Viega. Other acceptable manufacturers are Nibco and Elkhart.
(b) Fittings: Copper press fittings with EPDM seal, 0 to 250°F, maximum 200 psi (1378.95 kPa).
(c) Joints: Press joints by fitting manufacturer approved tool.

B. 2-1/2" and Larger:

(1) Pipe: ASTM A53 Grade B, Type E or S or ASTM A106 Grade B, standard weight, carbon steel
(2) Fittings: ASTM A234 Grade WPB/ASME B16.9, standard weight, seamless, carbon steel weld
(3) Flanges:
(a) ANSI Class 150, ASTM A105 Grade II, ASME B16.5, welding neck
(4) Bolts and Nuts:
(a) ASTM A193 Grade B7 or B16 with nuts conforming to ASTM A194 Grade 2H.
(5) Gaskets
(a) ASME B16.21 and ASTM F104 flat ring type, asbestos-free, compressed inorganic fiber with nitrile binder.
(b) 2-1/2” thru 10”
1) Gasket thickness 1/16”
2) Maximum Seating Stress (y) 3050 psi (21029.02 kPa)
3) Minimum Gasket Factor (m) 4.2
(c) Garlock, Klingersil or J.M. Clipper, similar to Garlock 3000.

2.03 VENTS AND RELIEF VALVES

A. Unless otherwise indicated, use pipe and pipe fittings as indicated for the system to which relief valve or vent is connected.

B. ASTM A53, Grade B, Type E or S, carbon steel pipe with standard weight, carbon steel fittings may be used for steam vents smaller than 4”.

2.04 PRESSURE GAUGES AND TAPPINGS

A. Use pipe and pipe fittings as indicated for the system to which pressure gauge or tapping is connected. Use "Threadolets", "Sockolets" or tee fittings for tappings. Refer to Part 3 under General for use of "Threadolets" and "Sockolets".

B. Gauge pipe shall be 1/4" unless otherwise indicated.

2.05 COOLING COIL CONDENSATE DRAIN

A. Piping shall be the following, unless otherwise indicated on drawings:

(1) Copper
(a) Pipe: ASTM B88 Type M, hard temper copper tubing
(b) Fittings: ASTM B16.22 wrought copper fittings
(c) Joint: ASTM B32, 95-5 tin-antimony solder, Bridgit or Silvabrite

2.06 POLYVINYL CHLORIDE (PVC) PIPING

A. All Sizes:

(1) Pipe: Schedule 80, ASTM D1785, and D-2467

(2) Fittings: ASTM D3467 socket type, 125 psi (861.84 kPa) rating fittings

(3) Joint: ASTM D2564 PVC solvent cement

2.07 DIELECTRIC UNIONS, FLANGES AND FITTINGS (STEEL PIPE TO COPPER PIPE)

A. 2" and Smaller:

(1) Use bronze ball valves specified in Section 23 2118 for dielectric purpose.

(2) Dielectric fittings similar to Victaulic Style 647 or Clearflow Dielectric Waterway fittings may be used in lieu of dielectric unions for pipe sizes 2" and smaller.

(a) Clearflow fittings shall be ASTM A53 electro zinc-plated steel pipe with high temperature polyolefin polymer liner, suitable for continuous use at temperatures up to 230°F and pressures up to 300 psig (2068.43 kPa).

(3) ASTM A197/ASME B16, equal to Stockham Figure 693-1/2, Watts Series 3000 or Wilkins (Zurn) Model DU series dielectric unions with EPDM dielectric gasket, 250 psi (1723.69 kPa) at 180°F.

B. 2-1/2” through 4”:

(1) Watts dielectric flange fittings Series LF 3100/LF 3110 with dielectric gasket, 175 psi (1206.58 kPa) at 180°F.

(2) Dielectric fittings similar to Victaulic Style 647 or Clearflow Dielectric Waterway fittings may be used in lieu of dielectric unions for pipe sizes 2-1/2” and larger.

(a) Clearflow fittings shall be ASTM A53 electro zinc-plated steel pipe with high temperature polyolefin polymer liner, suitable for continuous use at temperatures up to 230°F and pressures up to 300 psig (2068.43 kPa).

2.08 DIELECTRIC UNIONS, FLANGES AND FITTINGS (STEEL TO STEEL PIPE)

A. 1" and Smaller: Similar to Epco model HA-B with dielectric gasket, 250 psi (1723.69 kPa) at 210°F

B. 1-1/2" and Larger: Similar to Epco model W with bolt insulators, dielectric gasket, bolts and nuts, 175 psi (1206.58 kPa) at 210°F). Pikotek model VSC dielectric gasket with viton sealing element, G-10 sleeve and double washers, suitable to 350°F, may be used with specified flanges.

2.09 THREADED JOINT SEALANTS

A. Paste type for brush application or cord type. Products shall be non-toxic, chemically inert, non-hardening, rated for -50°F to 400°F and up to 10,000 psi (68947.60 kPa) and 2000 psi (13789.52 kPa), certified by UL, CSA, and NSF.

B. Use sealant similar to Loctite Model 54531 for piping handling oil or petroleum products.

2.10 WELD BRANCH OUTLET FITTINGS (WELDOLETS, THREADOLETS AND SOCKOLETS)

A. Weld branch outlet fittings shall conform to MSS-SP-97, ASME B16.9 for weldolets, ASME B1.20.1 for threadolets and ASME B16.11 for sockolets.

B. Materials shall match material of header piping and wall thickness of outlet or branch end shall match wall thickness of branch pipe.

PART 3 EXECUTION

3.01 GENERAL

A. Remove foreign materials before erection. Ream ends of piping to remove burrs.

B. Install piping parallel to building walls and ceilings and at such heights so as not to obstruct any portion of window, doorway, stairway, or passageway. Install piping to allow adequate service space for equipment. Refer to drawings and/or manufacturer's recommendations. Install vertical piping plumb. Where interferences develop in field, offset or reroute piping as required to clear such interferences. In all cases, consult drawings for exact location of pipe spaces, ceiling heights, door and window openings or other architectural details before installing piping.

C. Provide anchors, expansion joints, swing joints and expansion loops so that piping may expand and contract without damage to itself, equipment or building.

D. Mitered elbows, welded branch connections, notched tees and "orange peel" reducers are not allowed. Unless specifically indicated, reducing flanges and reducing bushings are not allowed. Reducing bushings may be used for air vents and instrumentation connections.

E. Unless otherwise indicated, use fittings as specified in Part 2 of this Section for elbows, tees, reducers, etc.

F. "Weldolets" with outlet size 2-1/2” and larger and "Threadolets" or "Sockolets" with outlet size 2" and smaller may be used for branch connections up to one pipe size smaller than main. Use "Threadolets" where threaded fittings are specified and use "Sockolets" where socket weld fittings are specified. Install in accordance with PFI (Pipe Fabrication Institute) Standard ES49.

G. Install drains throughout systems to permit complete drainage of entire system.

H. Do not install piping over electrical panelboards, switchgear, switchboards or motor control centers.

I. Install valves, control valves and piping specialties, including items furnished by others, as specified and/or detailed.

J. Make connections to equipment installed by others where that equipment requires piping services indicated in this Section.

K. For piping within the scope of ASME B31.1 Power Piping, transfer piping material specification and "Heat Number" to each segment of pipe prior to cutting.

3.02 THREADED PIPE JOINTS

A. Threads of pipe and fittings shall conform to ASME B1.20.1.

B. Ream pipe ends after cutting and clean before erection. Apply thread sealants to cleaned male threads. Assemble joint to appropriate depth and remove any excess pipe joint compound from tightened joint.

3.03 FLANGED JOINTS

A. Clean flange surfaces and align them parallel. Bolt holes of gaskets shall be cut slightly larger than bolt diameter. Gasket ID shall be slightly larger than flange ID.

B. Position gasket concentrically so compression is equally distributed over entire gasket surface.

C. Lubricate bolts and run nuts down by hand.

D. By using torque wrench, tighten nuts in the proper sequence so gasket is compressed evenly, and to the appropriate torque specified by bolt manufacturer.

E. Re-torque bolts 12 to 24 h after start up.

3.04 WELDED PIPE JOINTS

A. Inspect pipe and pipe fittings for roundness before they are fit-up or set in place.

B. Properly clean and prepare pipe base material before fit-up. Verify joint land and bevel.

C. Preheat pipe base material as required by welding procedure specification. Temperature of pipe material must be minimum of 50°F before welding.

D. Properly align and adjust joint as required by welding procedure and thickness of material. Verify tolerances after tacking sequence.

E. Use weld material diameter as procedurally required for type and thickness of work being done.

F. Use sufficient argon pre-purge and argon post-purge for GTAW processes. Post purge should be until weld is no longer glowing plus 5 seconds. Maintain purge for at least 2 layers of weld material.

G. Properly store welding materials.

H. Clean tacks before welding out. Remove slag after each pass by grinding to avoid slag inclusion.

I. Weld reinforcement shall not exceed limits established in Chapter V of ASME B31.1.

J. Brush each weld free of rust and paint with rust resistant product that matches piping surface color.

K. For piping within scope of ASME B31.1, each weld shall be permanently marked by welder performing weld. Each welder shall sign and date field welding log record for all welds performed by welder as indicated in Part 1.

L. Conduct radiographic test for sections or joints that cannot be tested by hydrostatic test methods (such as joints cut into existing piping systems) by qualified radiographic testing firm.

3.05 COPPER PIPE JOINTS

A. Cutting of tubing shall not make tubing out of round. Ream cut tube ends to full inside diameter.

B. Remove slivers and burrs remaining from tube cut by reaming and filing both pipe surfaces. Clean fitting and tube with emery or sand cloth. Remove residue from cleaning operation, apply flux and assemble joint. Use solder or brazing to secure joint as specified for specific piping service.

C. Press Joint Option:

(1) Cut pipe square and ream before assembly

(2) Insert pipe fully into fitting and mark on pipe at shoulder of fitting

(3) Check fitting alignment against mark on pipe to ensure pipe is fully engaged

(4) Press joint with press tool approved by fitting manufacturer

3.06 POLYVINYL CHLORIDE (PVC) PIPING

A. Install PVC piping in strict accordance with pipe and fitting manufacturer's recommendations, including support spacing, compensation for thermal expansion and contraction and solvent cementing.

3.07 WATER SYSTEMS

A. Unless otherwise indicated, install horizontal piping level. Install manual air vents at all high points where air may collect. If vent is not in accessible location, extend air vent piping to nearest code acceptable drain location with vent valve located at nearest accessible location to pipe.

B. Main branches and runouts to terminal equipment may be made at top, top 45°, side or bottom 45° of main provided that there are drain valves suitably located for complete system drainage and manual air vents are located as described above.

C. Unless otherwise indicated, use top or top 45° connection to main for upfeed risers, and use side or bottom 45° connection to main for downfeed risers. Bottom connection is not allowed.

D. Use minimum of 3 elbows in each pipeline to terminal equipment to provide flexibility for expansion and contraction of piping systems. Offset pipe connections at equipment to allow for service, such as removal of terminal device.

E. Unless otherwise indicated, use concentric fittings for changes in pipe sizes and for valves smaller than pipe sizes.

F. Notch and dimple branch tubes. Braze joints. Apply heat properly so that pipe and tee do not distort. Remove distorted connections.

G. Where mechanically formed tee fittings are allowed, form mechanically extracted collars in continuous operation, consisting of drilling pilot hole and drawing out tube surface to form collar having height of not less than 3 times thickness of tube wall. Collaring device to be adjustable.

3.08 VENTS AND RELIEF VALVES

A. Install vent and relief valve discharge lines as indicated on drawings, as detailed, and as specified for each specific valve or piping specialty item.

3.09 COOLING COIL CONDENSATE DRAIN

A. Cooling coil condensate drains shall be provided with waterless traps as specified in specification sections . Extend drain piping to nearest code approved drain location. Construct trap with plugged tee for cleanout purposes.

B. Pitch pipe down at not less than 1/8" per foot for proper drainage.

C. Where copper piping is allowed, joints and fittings may be secured with 95-5 tin-antimony solder or brazing alloys.

3.10 DIELECTRIC UNIONS AND FITTINGS

A. Install dielectric unions, flanges or fittings in main and branch piping of water systems at each point where copper to steel pipe connection occurs. Dielectric unions or fittings shall not be used at terminal device connections.

B. Concealed dielectric unions and fittings are not allowed.

C. Install steel to steel pipe dielectric unions or flanges in hot water and chilled water piping at each point where interior steel piping is connected to exterior underground steel piping.

3.11 UNIONS AND FLANGES

A. Install union or flange at each automatic control valve and at each piping specialty or piece of equipment that requires tube pull or removal for maintenance, repair or replacement. If required, provide additional unions or flanges in order to facilitate removal of piping sections that interfere with tube pulls or equipment removal. Where valve is located at piece of equipment, provide flange or union connection on equipment side of valve.

B. Concealed unions or flanges are not allowed.

3.12 PIPING SYSTEM PRESSURE TESTS

A. Owner and/or Owner's representative may elect to witness pressure test. Notify Owner and/or Owner's representative at least 3 days in advance.

B. Conduct pressure test prior to flushing and cleaning of piping systems.

C. Conduct hydrostatic (HYDRO) test in accordance with ASME B31.1 137.4. Test pressure shall be in accordance with ASME B31.1, but shall not be lower than the minimum test pressure listed below.

D. If leaks are found, repair with new materials and repeat test until leaks are eliminated. Caulking will not be acceptable.

E. Pressure tests may be made of isolated portions of piping systems to facilitate general progress of installation. Any revisions made in piping systems require retesting of affected portions of piping systems.

F. No systems shall be insulated until it has been successfully tested. If required for additional pressure load under test, provide temporary restraints at expansion joints or isolate them during test. Unless otherwise noted, minimum test time shall be 4 h plus such additional time as may be necessary to conduct examination for leakage.

G. No pressure drop shall occur during test period. Any pressure drop during test period indicates leakage.

H. Provide pumps, gauges, instruments, test equipment, temporary piping and personnel required for tests and provide removal of test equipment and draining of pipes after tests have been made.

I. For hydrostatic tests, remove air from piping being tested by means of air vents. Measure and record test pressure at high point in system. Where test pressure at high point in system causes excessive pressure at low point in system due to static head, portions of piping system may be isolated and tested separately to avoid undue pressure. However, every portion of piping system must be tested at the specified minimum test pressure.

J. Conduct pressure tests with parameters indicated below:

SYSTEM	MINIMUM TEST PRESSURE	REMARKS
HEATING HOT WATER	**100 PSIG (689.48 KPA)**	**HYDRO**
PRIMARY CHILLED WATER, CHILLED WATER, AND IMAGING CHILLED WATER	**100 PSIG (689.48 KPA)**	**HYDRO**

K. Contractor shall provide all pumps, gauges, instruments; test equipment, flow meters, temporary piping and personnel required for tests and provide removal of test equipment and draining of pipes after tests have been made.

L. If piping system is drained after testing and left empty or untreated for more than 3 days, provide vapor phase corrosion inhibitor, such as Cortec VpCI, or engineer approved equivalent, at recommended dosages for dry system lay-up. Provide specific treatment compatible with type of pipe installed following manufacturer's recommendations. Provide isolation valves or other provisions to isolate lay-up portions from non-lay-up portions. Re-apply lay-up treatment at intervals according to manufacturer's recommendations. Prior to placing lay-up piping into service, remove lay-up treatment and prepare system in accordance with manufacturer's recommendations.

(1) Confirm all piping system materials and components receiving treatment are compatible with applied inhibitor and lay-up treatment.

(a) Note: High heat may cause VpCI to "cake". If piping system will be exposed to heat alternative treatment shall be used.

(2) Provide cleaning and treatment plan for owner's review and approval. Plan shall include duration of lay-up and maintenance of lay-up through anticipated lay-up period(s).

3.13 FLUSHING AND CLEANING PIPING SYSTEMS

A. Notify Owner and/or Owner's representative at least 7 days in advance.

B. Flush new water, fluid, steam and condensate systems thoroughly for 15 minutes or longer, as required to ensure removal of dirt and foreign matter from piping system. Bypass pumps and equipment and remove strainers from strainer bodies. Provide circulation by Contractor-supplied portable pumping apparatus.

C. Provide temporary piping or hose to bypass coils, control valves, heat exchangers, other factory-cleaned equipment, and any component that may be damaged.

D. Sectionalize system to obtain minimum velocity of 6 fps. Provide temporary piping to connect dead-end supply and return headers as necessary. Flush bottoms of risers.

E. After initial flushing of system, use portable pumping apparatus to circulate cold water detergent for water systems. Refer to Section 23 2514 - Chemical Treatment Systems for pipe cleaning.

F. After initial flushing of system, use portable pumping apparatus for continuous 24 h minimum circulation of cold water detergent similar to Nalco 2567 cleaner. Flush detergent clear with continuous draining and raw water fill for additional 12 h or until all cleaner is removed from system. Dispose of all cleaning and rinse water per local jurisdiction requirements and Facility Owner's requirements. Replace strainers and reconnect permanent pumping apparatus and all apparatus bypassed.

G. Refer to Section 23 2514 - Chemical Treatment Systems for water analysis.

3.14 INITIAL SYSTEM FILL AND VENT

A. Fill and vent systems with proper working fluids.

B. Use fluids chemically treated as specified in Section 23 2514 - Chemical Treatment Systems.

C. Glycol system shall be filled with treated glycol as specified in Section 23 2514 - Chemical Treatment Systems.

END OF SECTION 23 21 16

SECTION 23 21 18 - VALVES

PART 1 GENERAL

1.01 RELATED WORK

A. Section 20 0700 - Mechanical Systems Insulation

B. Section 23 0902 - Control Valves and Dampers

C. Section 23 2120 - Piping Specialties (Flow Sensors and Meters)

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SUBMITTALS

A. Shop Drawings for each system for all sizes including, but not limited to, the following:

(1) Name of system

(2) Manufacturer's name

(3) Type

(4) Model number

(5) Materials of construction

(6) Temperature/pressure ratings

(7) Manufacturer's data sheets clearly cross-referenced

(8) All other appropriate data

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Gate valves, globe valves, check valves, and drain valves: Crane, Nibco, Stockham, Powell, Milwaukee, Hammond, or Grinnell equal to manufacturer's Figure number listed. Provide valves of same make for these services.

B. Other valves: acceptable manufacturers and Figure Number listed under each item.

2.02 WATER SYSTEM VALVES

A. General:

(1) Valves 2" and smaller in steel piping shall have threaded ends.

(2) Valves 2" and smaller in copper piping shall have solder ends.

(3) Press Ends:

(a) Valves with press ends will be acceptable where press joints are allowed, provided valves meet requirements specified in this section. Temperature and pressure ratings shall be equal to or exceed ratings of press fittings used.

(4) Provide valve stem extensions with sufficient length to allow for insulation where insulation is specified.

B. Ball Valves:

(1) 2" and Smaller: ASTM B584 bronze body, chrome plated brass/bronze or stainless steel ball, full port for 3/4" and smaller and conventional port for 1” and larger, Teflon seat rings, blowout-proof stem, 2-piece construction, 600 psi (4136.86 kPa) WOG, 150 psi (1034.21 kPa) SWP, Nibco Fig. T(S)-580-70, Apollo No. 70, Watts, Milwaukee BA-150, Hammond, FNW or Anvil

C. Spring Loaded Check Valves:

(1) 2" and Smaller: bronze or iron body, Class 125 200 psi (1378.95 kPa) WOG), Nibco Figure T(S)-480, Mueller Figure 303-AP or Metraflex No. 700

(2) 2-1/2" and Larger: cast iron or ductile iron body, flanged or wafer type, 302/304 or 316 stainless steel spring, aluminum bronze, carbon steel or ductile iron totally encapsulated in EPDM disc, Buna-N or electroless nickel plated seat, Class 125 200 psi (1378.95 kPa) WOG), Nibco Figure F-910 or W-910, Milwaukee 1800 or 1400, Metraflex No. 700, Stockham Figure WG-970, Mueller Sure Check Model No. 71, or Crane Duo-check II

(3) For valves 8” and larger, provide lifting lugs or threaded holes for lifting eye bolts.

D. Shut-Off Valves:

(1) 2" and Smaller: ball valves as specified in this Section

(2) 2-1/2" and Larger: butterfly valves as specified in this Section

E. Balancing Valves (Multi-Turn Type):

(1) 2" and Smaller:

(a) Variable orifice with multiple turn valve type as manufactured by Armstrong Series CBV or ABV, Tour & Andersson (Victaulic) Series 786 or 787, NIBCO 1709 or 1710. Maximum Allowable Working Pressure, 250°F Maximum Allowable Operating Temperature. Furnish valve with adjustable memory stop and quick disconnect taps with built-in check valve for pressure differential measurement, integral valve setting index and memory locking device.

(b) Valves shall measure down to 0.3 gpm with accuracy of ±5%.

(c) Valves shall be leak-tight at full rated working pressure.

(d) Unless otherwise indicated, size balancing valves so that at design flow rate, pressure drop across balancing valve with valve approximately 50% open will be at minimum 25% of reading range of meter used for balancing.

(2) 2-1/2" and Larger:

(a) Armstrong Series CBV or Tour and Anderson (Victaulic) Series 788/789, ductile iron body, ASME/ANSI B16.42 Class 150 flange, 250 psi (1723.69 kPa) Maximum Allowable Working Pressure (MAWP), 250°F maximum operating temperature.

(b) Fixed orifice with ball valve or butterfly valve as manufactured by FDI, Presco or Gerand, Class 150 flange, 225 psi (1551.32 kPa) maximum working pressure, 250°F maximum operating temperature will be acceptable up to 4" size. Butterfly valves, as specified in this Section, together with averaging Pitot tube flow sensors, as specified in Section 23 2120 - Piping Specialties, under Flow Sensors and Meters may be used when sizes for Armstrong or T/A valves are not available. Locate flow sensor in common pump discharge pipe with hot tap. Furnish butterfly valves with adjustable memory stops to limit return of valves to preset open position after shut-off.

(3) Furnish portable meter kit within durable case similar to Gerand Model "R". Furnish meter with minimum 4-1/2" diameter aluminum or brass body/brass internals with reading range of either 0" to 50" or 0" to 100" water column differential as appropriate, 200°F maximum temperature, 300 psi (2068.43 kPa) working pressure. Meter accuracy shall be ± 2% full scale. Provide in kit: equalizing valves, 10 ft purge hose and size devices specified. Meter shall become property of Owner.

F. Terminal Unit Valve Assembly

(1) Terminal unit valve assembly may be used instead of individual valve and other components, provided each valve and component meets specified requirements.

(2) Victaulic, Nexus, Griswold, HCi, IMI Flow Design or Hays are acceptable.

(3) Inlet Assembly: combination of isolation ball valve, y-strainer with 20 mesh SS screen and blowdown valve, union, and PT test port.

(4) Outlet Assembly: Union assembly consisting of union, manual air vent and PT test port at coil outlet (control valve inlet) and ball valve, union, PT test ports and balancing valve at control valve outlet. Balancing valves shall be as specified under Balancing Valves in this Section.

(5) Components: Assembly shall have minimum pressure/temperature ratings to 400 psi (2757.90 kPa)/ 230°F.

(6) Flexible Hose:

(a) Flexible hoses up to 18” in length may be used in inlet and outlet assemblies for 1” and smaller.

1) EPDM Core:

1. Flexible hose shall be constructed of EPDM core, stainless steel braided cover, stainless steel ferrules, and brass end connections. Maximum Allowable Operating Pressure (MAOP) shall be not less than 300 psi (2068.43 kPa) at 230°F.

2) Stainless Steel (Corrugated) Core:

1. Flexible hose shall be constructed of corrugated 300 series stainless steel core, 300 series stainless steel braided cover, stainless steel ferrules, and 304 stainless steel end connections. Maximum Allowable Operating Pressure (MAOP) shall be not less than 400 psi (2757.90 kPa) at 600°F.

G. Butterfly Valves:

(1) 2-1/2" through 10”:

(a) Manufacturers: DeZurik, Keystone, Nibco, Milwaukee, or Bray

(b) Ductile iron body, stainless steel shaft, aluminum-bronze disc, or Nylon 11 coated ductile iron disc, upper thrust bearing, EPDM resilient seat, rated at 200 psi (1378.95 kPa) bidirectional shut-off pressure , suitable for continuous operation at temperature up to 225°F, compatible to ANSI B16.1 Class 125/150 flange standards, conforming to MSS-SP-67.

(c) Dead end pressure rating shall be 150 psi (1034.21 kPa) with no downstream flange/piping attached.

(d) For valves 6" and smaller, provide 10-position lever actuators with locking devices. For valves 8" and larger, provide worm gear operators with adjustable position stop and position indicators. Size hand wheel operators with no higher than 80 lb rim pull at full valve pressure rating.

(e) External disc-to-stem connections using screws or pins are not allowed.

(f) Valve necks shall be of sufficient length to allow for insulation where insulation is specified. Wheel shaft shall be sufficient length so wheel does not touch insulation.

(g) Provide full lug type valves permitting removal of down stream piping while using valve for system shut-off.

(h) Furnish valves used for balancing with adjustable memory stops.

H. Water Pressure Regulating Valves:

(1) Manufacturers: Thrush, Watts, Cash-Acme, Taco, or B & G

(2) Brass or bronze body, spring and diaphragm operated, pressure adjustable with check valve and inlet strainer and designed for Maximum Allowable Working Pressure (MAWP) of 125 psig (861.84 kPa) and Maximum Allowable Operating Temperature (MAWT) of 160°F.

I. Drain Valves:

(1) Ball valve as specified above with threaded hose adapter and cap. If 3-piece ball valves are specified, use 2-piece ball valves with same construction.

J. Automatic Flow Control (limiting) Valves:

(1) All metal construction, factory set to automatically maintain flow rate within plus/minus 5% accuracy over operating pressure differential range of at least 2 - 30 psi (206.84 kPa), self-contained spring loaded perforated cartridge control mechanism, passivated stainless steel internal working parts, rated for not less than 200 psi (1378.95 kPa) pressure at 250°F.

(2) Valves 2" and under shall have threaded ends with ground joint union; 2-1/2"and larger to have flanged ends.

(3) Each automatic flow control valve shall have pressure tappings with quick disconnect fittings suitable for use with portable measuring instrument specified, to verify pressure differential across flow control orifice.

(4) Certified performance data based on independent laboratory tests shall be available.

(5) Manufacturers: Griswold, IMI Flow Design (FDI) or Dole

(6) Hays Fluid Controls automatic flow-control valves utilizing elastomeric diaphragm and polyphenylsulfone orifice is acceptable.

(7) Furnish to Owner portable pressure-temperature measuring kit consisting of 2 pressure gauges with 4-1/2" dial, air bleed device, hoses, quick-connect fittings, protected thermometer, instructions and carrying case. Kit to be used to read pressure drop across flow control orifice and temperature at that point.

2.03 WATER PRESSURE RELIEF VALVES

A. Closed-Loop Fluid System (Pump Inlet) Applications:

(1) Bronze or iron body, direct pressure actuated, non-metallic seat, stainless steel stem and spring. Valve shall be provided with plain lever-type manual lifting device.

(2) ASME stamp not required, but valve carrying ASME “UV” Stamp will be acceptable.

(3) Valve setpoint, overpressure, and capacity shall be as scheduled.

(4) Manufacturers: Kunkle, Watts,

PART 3 EXECUTION

3.01 GENERAL

A. Install valves as shown on plans, details and according to manufacturer's installation recommendations.

B. After piping systems have been pressure tested and put into service, but before final adjusting and balancing, inspect valves for leaks. Adjust, replace packing or replace valves to stop leaks.

C. Install control valves furnished under Control Systems. Provide reducing fittings as required.

D. Refer to Section 23 2116, Part 3 for reducing fittings requirement for valves smaller than pipe size.

E. Provide chain operators for manually operated valves furnished with gear operators, which are located more than 8 ft above equipment room floor.

3.02 SHUT-OFF VALVES

A. Provide shut-off valves at all equipment, at riser take-offs at each floor, and at each automatic valve for servicing.

B. Install steam system shut-off valves in horizontal piping. Shut-off valves are not allowed in vertical piping.

3.03 BALANCING VALVES

A. Provide balancing valves where indicated on drawings and as required for complete balancing of water systems.

B. Provide straight inlet and outlet pipe length in accordance with manufacturer's recommendation.

C. Balancing valve at pump discharge line is not required where pump is driven by variable frequency drive (VFD).

D. For buildings with multiple stories, provide balancing valve in return line at riser take-offs at each floor. Provide shut off valve in supply line at each riser take-off.

3.04 GAUGE VALVES

A. Provide gauge valves at each pressure gauge as shown and at each pressure tapping where pressure sensing tubing is connected.

3.05 DRAIN VALVES

A. Provide drain valves at all low points of piping systems for complete drainage of systems.

B. Unless otherwise indicated, provide 1/2" drain valve for 1/2" piping and minimum 3/4" drain valve for 3/4" and larger piping, except strainer blowdown valves shall be blowdown connection size.

3.06 WATER PRESSURE REGULATING VALVES

A. Set valves for pressure required or as scheduled.

3.07 SPRING LOADED CHECK VALVES

A. Provide spring loaded check valve in each pump discharge line.

3.08 SWING CHECK VALVES

A. Provide swing check valves at steam condensate lines if lifted at outlet of traps. Install check valve between trap and gate valve.

B. Install check valves in horizontal piping.

3.09 AUTOMATIC NON-RETURN STOP VALVES

A. Install automatic non-return stop valve in each steam boiler outlet before header in high pressure steam systems. Automatic non-return stop valves shall be properly sized and furnished by boiler manufacturer or supplier.

3.10 LIQUID OR WATER PRESSURE RELIEF VALVES

A. Closed Loop Pump Suction Application:

(1) Provide non-code relief valve in each closed water system in the pump inlet piping. ASME UV Stamped pressure relief valve will be acceptable in lieu of non-code valve.

(2) Locate relief valve on main piping between expansion tank branch connection and pump suction isolation valve.

(3) Install valves in accordance with manufacturer’s instructions.

(4) Unless otherwise indicated, pipe discharge to within 8" of floor with outlet of discharge pipe pointing down.

B. Bypass Relief Application:

(1) Provide bypass relief valve where indicated on drawings.

(2) Install valves in accordance with manufacturer’s instructions.

(3) Valve discharge piping shall be as indicated on drawings.

3.11 SAFETY RELIEF VALVES

A. For liquid-to-liquid heat exchangers, provide safety relief valve on each liquid circuit of heat exchanger between heat exchanger and isolation valve.

B. Install safety relief valve in accordance with manufacturer’s instructions.

C. Unless otherwise indicated, pipe discharge to within 8" of floor with outlet of discharge pipe pointing down.

D. No stop valves shall be installed between safety relief valve and pipe main or on outlet side of safety relief valve.

3.12 TERMINAL UNIT VALVE ASSEMBLY

A. Flexible hoses used in terminal unit valve assemblies shall be installed with lateral offset not to exceed 4" from centerline of pipe.

END OF SECTION 23 21 18

SECTION 23 21 20 - PIPING SPECIALTIES

PART 1 GENERAL

1.01 RELATED WORK

A. Section 01 8113 – Certification Requirements

B. Section 23 0594 - Water Systems Test Adjust Balance

C. Section 23 0903 - Control Instrumentation (Temperature and Pressure Sensing Requirements)

D. Section 23 2118 - Valves

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 REFERENCE STANDARDS

A. Metal bellows expansion joints shall be constructed and applied in accordance with "Standards of the Expansion Joint Manufacturer's Association", 10th Edition.

1.04 LEED PERFORMANCE REQUIREMENTS

A. VOC Emissions Evaluation: For adhesives and/or sealants used for installation, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: For adhesives and sealants, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for Adhesive and Sealant Applications, as per the SCAQMD Rule 1168, October 6, 2017, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

1.05 SUBMITTALS

A. Shop Drawings for all items in this Section including, but not limited to, the following:

(1) Manufacturer's name and model number

(2) Identification as referenced in the Documents

(3) Materials of construction

(4) Dimensional data

(5) Capacities/ranges

(6) Temperature/pressure ratings

(7) Pressure drop

(8) Expansion joint schedule indicating joint tag no., system, proximity to rotating or reciprocating equipment, required movement in all planes, service pressure, test pressure, service temperature, fluid velocity and cycles to failure (both thermally and seismically, if applicable).

(9) All other appropriate data.

B. LEED Submittal

(1) Complete provided Product Data Reporting Form in spec section 01 81 13 and provide the following:

(a) VOC Emissions Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

(b) VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant.

PART 2 PRODUCTS

2.01 MATERIALS

A. Unless otherwise specified, select devices for highest pressures and temperatures existing in respective systems in accordance with ANSI Specifications.

B. Piping specialties in copper piping shall have bronze or brass body with solder ends.

2.02 THERMOMETERS

A. Manufacturers: Trerice, Weksler, Miljoco, Winters, or Weiss

B. Pipeline mounted thermometers: 9" scale cast aluminum case and frame, clear acrylic plastic window front, permanently stabilized glass tube with mercury free indicating fluid, adjustable angle stem, extended neck suitable for insulated piping as required, and compatible with sockets as specified herein.

SERVICE	SCALE RANGE	INCREMENT
PRIMARY CHILLED WATER, CHILLED WATER, AND IMAGING CHILLED WATER	**0°F TO 100°F**	**1°F**
HEATING HOT WATER	**30°F TO 180°F**	**2°F**

C. Range of thermometers shall be:

D. Thermometers by temperature control manufacturer meeting above Specification will be acceptable.

2.03 THERMOWELLS AND TEST WELLS

A. Brass construction with threaded connections suitable for thermometer stems or bulbs and temperature control sensing elements, well length suitable for pipe diameter with extended neck as required to suit pipe insulation. For test well, furnish with brass cap and short chain to secure cap to body.

B. Stainless steel construction for stainless steel piping.

2.04 PRESSURE GAUGES

A. Manufacturers: Ashcroft, U.S. Gauge, Marsh, Trerice, Miljoco, Marshalltown, Weksler, Winters or Weiss equal to Trerice 600 Series

B. Minimum 4-1/2" diameter die cast aluminum case, glass or acrylic plastic window, phosphor bronze bourdon tube with bronze bushed movement, recalibration from front of gauge dial and 1/4" NPT forged brass socket.

C. Gauge accuracy shall meet ANSI B40.100 Grade 1A (±1% full scale).

D. Select gauge range so that normal operating pressure is at midpoint of gauge.

SERVICE	SCALE RANGE
PRIMARY CHILLED WATER, CHILLED WATER, AND IMAGING CHILLED WATER	**0 TO 200 PSIG (1378.95 KPA)**
HEATING HOT WATER	**0 TO 200PSIG**

E. Reading range of gauges shall be:

F. Pressure Snubbers:

(1) 1/4" or 1/2" size, matching gauge pipe size as specified in Section 23 2116 - Pipe and Pipe Fittings, 1000 psig (6894.76 kPa) WP. Brass for carbon steel pipe or copper pipe. Stainless steel for stainless steel pipe.

G. Coil Syphons:

(1) 1/4" or 1/2" size, matching gauge pipe size as specified in Section 23 2116, 500 psig (3447.38 kPa) WP. Material shall match gauge pipe material.

PIPE SIZE	PERFORATION SIZE
2" AND SMALLER	**1/50" (30 MESH)**
2-1/2" TO 10"	**3/64"(.045")**

2.01 BASKET STRAINERS

A. Cast steel body with Class 150 260 psi (1792.64 kPa)/200°F) flanged ends, full pipeline size with bolted covers. Furnish stainless steel baskets with 1/8" perforations. Provide valved drain connection from each blowdown tapping.

2.02 EXPANSION TANKS

A. Manufacturers: Amtrol, Taco, Bell and Gossett, Armstrong, Wheatley, or Wessels

B. Tanks shall be replaceable bladder type air pre-charged to initial fill pressure as scheduled. Furnish tank suitable for 125 psig (861.84 kPa) WP, constructed, tested and stamped in accordance with ASME Code, and sealed-in elastomer bladder suitable for operating temperature of 240°F. Bladder shall be compatible with water and with ethylene and propylene glycol. Furnish mounting saddles for horizontal tanks and mounting base for vertical tanks. Furnish tanks with system connections; drain connections for floor-mounted tanks, and air charging valves.

2.03 AIR AND DIRT SEPARATORS

A. Manufacturers: Spirotherm Spirovent or approved equal.

B. Coalescing type combination air and dirt separator, designed for 150 psig (1034.21 kPa) WP, temperature up to 270°F stamped and registered in accordance with ASME Section VIII, Division 1 for unfired pressure vessels. Connections 2-1/2" and larger shall be flanged. Connections 2" and smaller may be flanged or threaded.

C. Coalescing medium shall consist of copper core tubes or stainless steel tubes with enhanced surface to facilitate coalescing action.

D. Coalescing medium shall be removable for inspection.

E. Provide Standard-velocity or High-velocity units as indicated in Schedule.

(1) Standard-velocity units shall be rated up to 4 fps and pressure drop shall not exceed 2 ft water head.

(2) High-velocity units shall be rated up to 10 fps and pressure drop shall not exceed12 ft water head.

F. Unit air and dirt removal performance shall be certified by independent third-party testing agency.

(1) Air elimination efficiency shall be certified for 100% of free and entrained air.

(2) Dirt separation efficiency shall be certified for 80% removal of particles 30 microns and larger within 100 passes.

G. Venting chamber shall be provided with integral full-port float actuated venting mechanism or high capacity air vent, similar to B&G Model 107A, with isolation ball valve located between separator and air vent.

H. Unit shall include valved side tap for flushing of floating dirt or liquids and for quick venting of air during system fill or refill.

I. Drain valve at bottom of unit for flushing/dirt removal, 1" for units size 12" and smaller, 2" for units size 14" and above.

2.04 PUMP SUCTION DIFFUSERS

A. Manufacturers: Bell & Gossett, Armstrong, Mueller Steam Specialty, Wheatley or Taco

B. Cast iron or ductile iron body with angle pattern flow straightening vanes and combination diffuser-strainer-orifice cylinder with 3/16" diameter openings, 175 psig (1206.58 kPa) WP, at 250°F. Threaded ends for 2" and smaller and flanged ends for 2-1/2" and larger. Orifice cylinder shall have free area of at least 5 times cross section area of pump suction opening. Furnish each unit with disposable 16 mesh start-up strainers, gauge tappings, blow down connection, and adjustable support foot to carry weight of suction piping.

2.05 AIR VENTS

A. Manual Air Vents:

(1) Manufacturers: Bell & Gossett Model 4V, 125 psig (861.84 kPa) at 210°F or approved equal. Use 1/2" ball valve for main pipes.

B. Automatic Air Vents:

(1) Manufacturers: Amtrol, Watson McDaniel, B&G, or Hoffman

(2) Metal construction, non-corrosive working parts, 150 psig (1034.21 kPa) WP at 240°F

(3) Normal capacity vent shall be similar to B&G Model 87

(4) High capacity vent shall be float actuated and shall have minimum air elimination rate of 10 cfm at 100 psig (689.48 kPa), similar to B&G Model 107A.

C. Thermostatic Air Vents:

(1) Balanced pressure type, cast bronze body, bronze bellows caged in stainless steel, stainless steel valve and seat, 1/2" threaded connection, 125 psig (861.84 kPa) WSP, equal to Armstrong Model TV-2.

2.06 VACUUM RELIEF/BREAKERS

A. Kadant Johnson Series VB-8 with brass body, stainless steel ball, EPR seat, stainless steel spring, suitable for pressures to 300 psig (2068.43 kPa) at 365°F, or Sarco Model VB-14.

2.07 FLOW ELEMENTS (MEASURING STATIONS) AND METERS

A. Venturi Flow Elements:

(1) Manufacturers: Hyspan, Gerand, or Preso

(2) Elements shall be flanged ends for 2-1/2" and larger and threaded ends 2" and smaller. Furnish tubes with quick disconnect taps and shut off valves, suitable for 125 psig (861.84 kPa) WP. Select tubes for size and pressure drop as scheduled and tag for mark number, flow and pressure drop as specified.

(3) Provide portable meter kit within durable case. Furnish with 6" diameter forged brass meter having dial range from 0" to 50" WG. Provide in kit equalizing valves, vent hose and size devices specified. Meter shall become property of Owner.

2.08 STRAIGHTENING VANES

A. Manufacturers: Daniel Industries, Inc., Houston, Texas or approved equal

B. Straightening vane assembly shall consist of series of carbon steel pipes firmly welded together and to line size pipe. Furnish vanes with class 150 psi (1034.21 kPa) flanges for insertion into piping system.

PART 3 EXECUTION

3.01 GENERAL

A. Install piping specialties as indicated on plans, details and according to manufacturer's recommendations.

3.02 THERMOMETERS

A. Install thermometers in thermowells in locations indicated.

3.03 THERMOMETER TEST WELLS

A. Install test wells in locations as shown and at each point where temperature-sensing device is required under Control Systems.

3.04 PRESSURE GAUGES

A. Install gauges for services other than steam with pressure snubbers and gauge valves.

B. Install gauges for steam service with coil syphons and gauge valves.

3.05 PRESSURE GAUGE TAPPING

A. Install tappings with gauge valves at each point where sensing device is required under Control Systems and at gauge locations as shown.

B. Use threadolets or tee fittings to mount gauge tappings or test stations. Install fittings for side mounting to avoid collection of air or dirt.

3.06 PRESSURE/TEMPERATURE TEST STATIONS

A. Pete's plug may be used in lieu of thermometer test well and pressure gauge tappings.

B. Use threadolets or tee fittings to mount gauge tappings or test stations. Install fittings for side mounting to avoid collection of air or dirt.

3.07 PIPE EXPANSION DEVICES

A. Stretching of expansion joints or connectors to correct for piping misalignment is not allowed.

B. Install expansion loops, where shown on drawings and as necessary to allow expansion and contraction in piping systems.

C. Flexible Expansion Loops:

(1) Install loops in neutral or pre-extend condition as required for application. For steam service, install loops with flexible legs horizontal to prevent condensate buildup. Install and guide per manufacturer's recommendations.

D. Flexible Ball Joints:

(1) Unless otherwise indicated, use minimum 2 ball joints at each station to accomplish required off set.

(2) Manufacturer's authorized representative shall be available for inspection of ball joints installation.

3.08 PIPELINE STRAINERS

A. Provide drain valve at each strainer blowdown connection with hose threaded adapter and cap. Valve size shall be same as blowdown connection size.

B. Install strainers in steam system on entering side of all automatic control valves and as indicated elsewhere. Install Y-type strainers in horizontal lines so that basket is in horizontal plane to prevent condensate build-up in basket.

C. Install strainers in water systems on suction side of all pumps, entering side of automatic control valves of heating and cooling coils of air handling units, and as indicated elsewhere.

D. Install clamped cover basket strainers in condenser water system as indicated.

3.09 AIR SEPARATORS

A. Provide valved blow down connections and extend drain piping to nearest floor drain.

3.10 PUMP SUCTION DIFFUSERS

A. Pipe blow down to the nearest floor drain with drain valve at unit.

B. Remove disposable fine mesh start-up strainers after start-up. Clean permanent strainer and replace after pipe cleaning process.

3.11 AIR VENTS

A. Install manual air vents at all high points in water systems where air may collect and where shown on drawings.

B. Install automatic air vent at top of air separator and where shown on drawings. Provide shut-off valve to isolate air vent from system. Pipe automatic air vent to the nearest floor drain.

C. Install high capacity automatic air vent at air separator.

3.12 THERMOSTATIC AIR VENTS

A. Install thermostatic air vents where shown. Install vents at the highest points of steam chambers. Locate vents higher than outlet connections to chambers.

3.13 VACUUM BREAKERS

A. Install vacuum breakers as required for proper condensate drainage at any steam using apparatus.

3.14 FLOW ELEMENTS/FLOWMETERS

A. Flow elements/flowmeters located in common piping after multiple pump discharge lines shall be furnished with hot tap feature.

B. If flow elements/flowmeters are furnished by Control Contractor, this Contractor shall install them in accordance with manufacturer's installation instructions. Wiring of flowmeters will be provided by Control Contractor.

3.15 STRAIGHTENING VANES

A. Provide straightening vanes where flow sensor manufacturer's installation instructions require greater length of straight upstream piping than can be obtained in available space.

(10) All other appropriate data

1.04 DESIGN CRITERIA

A. Pump sizes, capacities, pressures and operating characteristics shall be as scheduled.

B. Pumps shall meet or exceed operating efficiencies scheduled.

C. Furnish pumps complete with motors, impellers, drive assemblies, bearings and accessories as hereinafter specified. Furnish pump couplings with OSHA compliant coupling guards.

D. Where pump is indicated for parallel operation, scheduled conditions are for that pump with two pumps operating; i.e., total system flow rate is twice that scheduled for single pump. When only one of two pumps are operating, operating point of that pump must fall within manufacturer's recommended operating range.

E. Select motor with sufficient hp rating for non-overloading operation over entire pump curve.

F. Furnish each pump and motor with nameplate giving manufacturer's name, serial number of pump, capacity in gpm and head in ft at design condition, hp, voltage, frequency, speed and full load current.

G. Test pumps hydraulically at 150% of rated pressure per Hydraulic Institute Standards, clean and paint before shipment. Manufacturer shall certify all pump ratings.

H. Pumps shall operate without objectionable noise or vibration.

I. After completion of balancing, if water balancing results in pump discharge balancing valve being closed 50% or more, replace or trim impeller so that balancing valve is opened at least 75% to maintain design flow rate. Where pumps are driven by VFDs, balancing should be performed with pumps at design speed.

J. Furnish one spare seal for each pump to Owner.

K. Head for pumps submitted for pumping through evaporators and condensers of chillers and water coils shall be increased, if necessary, to match the equipment approved for project.

PART 2 PRODUCTS

2.01 VERTICAL IN-LINE CENTRIFUGAL PUMPS

A. Manufacturers: Armstrong Series 4300 or approved equal.

B. Pumps shall be pipeline mounted, single suction type with cast iron casing, bronze fitted with working pressure of 175 psi (1206.58 kPa) and continuous operating temperature of 225°F.

C. Casings shall have tapped and plugged openings for vent, drain, and suction and discharge gauge connections.

D. Impellers to be single suction enclosed type made of bronze, hydraulically and dynamically balanced, keyed and locked to pump shafts and protected by replaceable bronze shaft sleeves.

E. Impellers shall be directly hung from motor shafts without using flexible couplings.

F. Pump shafts shall be high strength carbon steel or alloy steel, sealed and gasketed from pumped fluid.

G. Pump seals shall be stainless steel multi-spring outside balanced type with Viton secondary seal, carbon rotating face and silicon carbide stationary seat. Provide with 316 stainless steel gland plate.

H. Coupling shall be designed to be easily removed on site to reveal a space between the pump and motor shafts sufficient to remove all mechanical seal components for servicing and to be replaced without disturbing the pump or motor.

I. Bearing assemblies and motors shall have oil lubricated sleeve bearings or regreasable ball bearings.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install pumps in strict accordance with manufacturer's instructions to avoid any stress and misalignment.

B. Install full line size spring loaded check valve in pump discharge piping. Provide balancing valve in pump discharge piping for pumps without VFDs.

C. Where pump connection size and indicated line sizes are not identical, provide reducing fittings at pump connection. Unless otherwise indicated, use concentric reducers. Use eccentric reducers, installed flat-on-top, for horizontal pump suction pipe. Valves and piping specialties shall be full line size.

3.02 STARTUP

A. Verify that piping system has been flushed, cleaned and filled.

B. Prime pump, vent air from casing and verify that rotation is correct. To avoid damage to mechanical seals, never start or run pump in dry condition.

C. Verify lubrication of motor and pump bearings and lubricate properly in accordance with manufacturer’s recommendation and Section 20 0000, Part 3, under LUBRICATION.

D. After several days' operation, verify removal of disposable startup strainer in suction diffuser and turn them over to Owner.

E. Perform field mechanical balancing, if necessary, to meet vibration tolerance specified in Section 23 0550 - Vibration Isolation.

END OF SECTION 23 21 23

SECTION 23 31 14 - DUCTWORK

PART 1 GENERAL

1.01 RELATED WORK

A. Section 01 8113 – Certification Requirements

B. Section 20 0529 - Piping and Equipment Supporting Devices

C. Section 20 0700 - Mechanical Systems Insulation

D. Section 23 0550 - Vibration Isolation

E. Section 23 0595 - Air Systems Test Adjust Balance

F. Section 23 0902 - Control Valves and Dampers

G. Section 23 3314 - Ductwork Specialties

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 LEED PERFORMANCE REQUIREMENTS

A. VOC Emissions Evaluation: For adhesives and/or sealants used for installation, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: For adhesives and sealants, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for Adhesive and Sealant Applications, as per the SCAQMD Rule 1168, October 6, 2017, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

1.04 SUBMITTALS

A. For each duct system, submit schedule utilizing reinforcement tables from SMACNA HVAC Duct Construction Standards Metal and Flexible where applicable. Each duct system schedule shall include, but not be limited to, the following:

(1) Name of Contractor/manufacturer fabricating each duct system

(2) Material and gauge

(3) Pressure class

(4) Transverse joint type and length and reinforcement rigidity class with designated joint T number or proprietary duct connection if utilized for each system

(5) Certified test results of proprietary joint products, if used, tested in accordance with SMACNA procedures

(6) Intermediate reinforcement spacing and rigidity class with metal angle dimensions and gauge

(7) Type of longitudinal seam

(8) Fitting construction details

(9) Support methods including spacing, upper attachments, and lower attachments

(10) Sealant and gasket

(11) Sealing class

B. Duct leakage testing methods, apparatus and apparatus certification signifying meter is in conformance with ASME Requirements for testing meters.

C. Submit shop drawings for manufactured duct system products

D. Submit the following information for welded sheet metal ductwork:

(1) Welding Procedure Specification (WPS) for welded joints. Form to be similar to ANSI/AWS D9.1-2006 Code, Appendix "D".

(2) Procedure Qualification Record (PQR) for each WPS. Form to be similar to ANSI/AWS D9.1-2006 Code, Appendix "E".

(3) Welder and Welding Operator Qualification Test Record (satisfactory performance) for each field or shop welder. Form to be similar to ANSI/AWS D9.1-2006 Code, Appendix "F".

E. LEED Submittals:

(1) Complete provided Product Data Reporting Form in spec section 01 8113 and provide the following:

(a) VOC Emissions Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

(b) VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant.

1.05 DELIVERY, STORAGE AND HANDLING

A. Protect duct and fittings from damage due to normal handling during shipment and storage. Protection shall be applied to ends of duct to prevent dirt and moisture from entering ducts and fittings.

1.06 DESCRIPTION

A. Furnish and erect ductwork free of objectionable vibration, chatter, and pulsations. Verify dimensions at site, making field measurements and drawings necessary for fabrication and erection.

B. Duct sizes indicated are net inside dimensions.

C. Where size for a duct segment is not indicated, the duct segment size shall be equal to the largest duct segment to which it is connected. Transition to smaller size shall occur on side of fitting where smaller size is indicated.

1.07 DESIGN CRITERIA

A. All products shall conform to NFPA 90A, and shall possess flame spread rating of not over 25 and smoke developed rating no higher than 50.

B. Unless otherwise indicated, construct all ductwork of galvanized sheet metal for pressure class not less than 2” WG for positive pressure ductwork and not greater than -2” WG for negative pressure ductwork.

C. Ductwork shall comply with Local, State and Federal requirements.

D. Unless otherwise indicated, pressure class for VAV system supply ductwork between supply fan discharge and air terminal device inlet shall be equal to static pressure at fan discharge but not less than 4” WG; pressure class for ductwork on suction side of air handling unit and suction side of return fan shall be equal to static pressure at inlet of return fan but not less than -2” WG.

E. Unless otherwise indicated, pressure class for fume hood exhaust ductwork between exhaust fan inlet and exhaust air terminal device outlet shall be equal to static pressure at exhaust fan inlet but not less than -4” WG.

F. Duct transverse joints and reinforcement material, including angle ring flanges and stiffeners, shall be of same material as duct.

G. Except as modified in this Section of specifications or on drawings, use material, weight, thickness, gauge, construction and installation methods as outlined in the following SMACNA publications:

(1) HVAC Duct Construction Standards Metal and Flexible, 3rd Edition, 2005, for rectangular and round ductwork up to positive 10” WG and negative 10” WG and flat oval ductwork up to positive 10” WG.

(a) Tie rods shall be 1/2” or 3/4”, galvanized steel EMT/conduits with bolt assembly consisting of rubber washer and friction anchored threaded insert similar to Ductmate Easyrod or PPI Condu-Lock.

(b) Internal tie rods are not allowed for welded ductwork and special exhaust systems, such as fume hood exhaust, BSC exhaust, animal room exhaust, BSL-3 exhaust, cagewash exhaust, shower room exhaust, kitchen hood exhaust, dishwasher exhaust, etc.

(2) Round Industrial Duct Construction Standards, 2nd Printing 1999

(3) Rectangular Industrial Duct Construction Standards, 2nd Edition, 2004

(4) Accepted Industry Practice for Industrial Duct Construction, 2nd Edition, 2008, for round ductwork -4” to 20” WG (Table 1-A) and for rectangular ductwork -4” to 20” WG (Table 2-A).

(a) Adhesives and sealants used on installation of ducts shall comply with South Coast Air Quality Management District (SCAQMD) Rule #1168; Indoor Environmental Quality Section, Credit EQ-4.

1.08 WELDING REQUIREMENTS

A. The following requirements cover arc and braze welding of nonstructural sheet metal ductwork for HVAC, architectural metal and other FDA process applications where pressures do not exceed 120" WG (positive or negative). These requirements also apply to welding of structural members whose sole purpose is stiffening, supporting, or reinforcing of sheet metal material, as well as attachment of brackets or other accessories/components required to provide complete systems.

B. Procedure and Qualification:

(1) Welding Procedure Specification (WPS) and Procedure Qualification Record (PQR) shall be prepared by installing contractor and/or fabricator prior to execution of related work. Qualification of welding procedure shall meet or exceed requirements of the latest revision of American Welding Society, Sheet Metal Welding Code ANSI/AWS D9.1.

(2) Provide certification of satisfactory performance testing for all welders and welding operators, which provide welding services on Project.

(3) Establish and provide written quality assurance/quality control (QA/QC) procedures to ensure compliance with specification requirements. Clearly identify appropriate steps for safe welding procedures (review Appendix J of D9.1) including additional safety material, screens, eye, personnel and clothing protection, fire suppression equipment, and fume extraction equipment needed adjacent to welding work area.

PART 2 PRODUCTS

2.01 GALVANIZED STEEL SHEET

A. Lock Former Quality (LFQ), cold rolled, open hearth soft steel sheet capable of double seaming without fracture, ASTM A924/A924M or ASTM A653/A653M. Galvanized coating shall be G90.

B. Use G90 Galvaneal or Zinc grip where painting is specified.

2.02 ALUMINUM SHEET

A. Aluminum alloy, ASTM B209, Type 3003H-14 capable of double seaming without fracture.

2.03 STAINLESS STEEL SHEET

A. First quality, cold rolled annealed, pickled, ASTM A240 and A480, Finish No. 2B for concealed work and Finish No. 4 for exposed work. Unless otherwise indicated, use Type 304L where welded duct construction is specified and Type 304 where non-welded duct construction is allowed.

2.04 FLEXIBLE DUCT

A. Manufacturers: Thermaflex, or Flexmaster

B. Factory fabricated, UL listed under UL-181 as Class 1 duct, meeting requirements of NFPA 90A with flame spread of 25 or less and smoke developed rating of 50 or under.

C. Flexible duct shall have minimum ratings as follows:

(1) Operating Temperature: -20ºF to 250ºF

(2) Internal Working Pressure: Positive: 6" WG

(3) Negative: 1" WG

(4) Burst Pressure: 2-1/2 times working pressure

(5) Velocity: 5000 fpm

D. Unless otherwise indicated, duct shall be nonmetallic insulated type composed of polyester film, polyethylene film, nylon film, CPE film, or coated woven fiberglass liner bonded permanently to corrosion resistant coated steel wire helix without adhesive.

E. Insulation shall be flexible fiberglass insulation with minimum R-value of 6 at mean temperature of 75ºF. Vapor barrier jacket shall be aluminum foil reinforced, polyethylene, or metalized polyester film with maximum perm rating of 0.05 permper ASTM.

F. Insulation material shall not be exposed to air stream.

G. Lined flexible duct shall have the following minimum acoustical performance in accordance with ARI Standard 885. Dynamic Insertion Loss in each octave band of 5 ft or 10 ft straight duct shall not be less than the following:

Duct Diameter (in)	Dynamic Insertion Loss (dB) Octave Band Center Frequency (Hz) (Based on 5 ft length)					
	125	250	500	1000	2000	4000
6"	6	9	18	22	24	15
8"	6	10	18	20	21	12

10”	5	11	18	18	18	9

2.05 MANUFACTURED ROUND DUCTWORK (POSITIVE PRESSURE)

A. Single Wall:

(1) Manufacturers: Lindab, Semco or McGill AirFlow, equal to McGill AirFlow Uni-Seal duct and fittings suitable to positive 10” WG.

(2) Ducts shall be machine formed round and/or flat oval as shown on drawings, constructed of G90 galvanized steel. Use spiral lockseam construction. Longitudinal seam construction may be used for ductwork over 80” diameter with minimum 16 ga. Use fittings as indicated on drawings, as specified, and as required in accordance with manufacturer's published data.

(3) Unless otherwise indicated, connection shall be slip type with minimum 2” insertion length or flanged joint in accordance with manufacturer's recommendations. When flange joints are required, use Van Stone angle rings welded to duct.

(4) Internal bracing is not allowed.

(5) Pre-sealed snaplock pipe system “Greenseam +” as manufactured by Ductmate Industries may be used for low pressure supply air duct.

B. Double Wall (insulated):

(1) Manufacturers: Lindab, Semco or McGill AirFlow duct and fittings suitable to positive 10” WG.

(2) Ducts shall be machine formed round as shown on drawings, constructed of G90 galvanized steel. Use spiral lockseam construction. Inner liner shall be perforated or solid as indicated, and annular space shall be filled with 1” thick fiberglass insulation. Use fittings with solid liner as indicated on drawings, as specified, and as required in accordance with manufacturer's published data.

(3) Unless otherwise indicated, connection shall be slip type connection with minimum 2” insertion length or flanged joint in accordance with manufacturer's recommendations. When flange joints are required, use Van Stone angle rings welded to duct.

(4) Internal bracing is not allowed.

2.06 MANUFACTURED ROUND DUCTWORK (NEGATIVE PRESSURE)

A. Manufacturers: McGill AirFlow Industrial duct and fittings. Semco and Lindab are acceptable manufacturers, provided meeting requirements in this Section.

B. Ducts shall be machine formed round duct constructed of G90 galvanized steel. Use spiral lockseam construction unless otherwise indicated. Use fittings as indicated on drawings, as specified, and as required in accordance with manufacturer's published data.

C. Connection shall use slip coupling, angle ring or Van Stone connectors in accordance with manufacturer's recommendations.

D. Fitting gauge shall be one even gauge heavier than the lightest allowable gauge of connecting downstream section of duct.

2.07 MANUFACTURED SELF-SEALING ROUND DUCTWORK SYSTEM

A. Single-wall:

(1) Manufacturers: Lindab Spirosafe, Eastern Sheet Metal (ESM) Eastern Tight, or Tambe Metal Products Zip Seal

(2) Ductwork system shall consist of fittings with factory-fitted sealing gasket and spiral duct which will seal duct joints without use of duct sealer.

(3) Ducts shall be machine formed round as shown on drawings, constructed of G90 galvanized steel. Use spiral lockseam construction. Use fittings as indicated on drawings, as specified, and as required in accordance with manufacturer's published data.

(4) Unless otherwise noted, duct and fittings shall be constructed per SMACNA’s Duct Construction Standards (+10” WG) shown in the following table:

DIAMETER (”)	GALVANIZED SPIRAL DUCT	GALVANIZED FITTINGS
3 - 14	**26 GA**	**24 GA**
16 - 26	**24 GA**	**22 GA**
28 - 36	**22 GA**	**20 GA**
38 - 50	**20 GA**	**20 GA**

(5) All fitting ends shall have factory equipped with double-lipped, U-profile or tubular EPDM rubber gasket. Gasket shall be classified by Internationally Recognized Laboratory Authority to conform to ASTM E84-91a and NFPA 90A flame spread and smoke developed ratings of 25/50.

(6) Ductwork system performance shall meet SMACNA’s Leakage Class 3 Requirements from -20” WG to +12” WG.

2.08 DUCT SEALANTS AND GASKETS

A. Sealant:

(1) Flexible, water based, adhesive sealant compounded specifically for sealing joints and seams in ductwork. Hardcast, McGill AirSeal, Ductmate PROseal, Mon-Eco Industries, Childers, DP1010 or H.B. Fuller/Foster.

(2) Sealants shall be UL 723 (ASTM E84) classified, and meet NFPA 90A and 90B.

(3) Sealants shall comply with requirements for LEED EQ 4.

(4) Select sealants as recommended by manufacturer for specific application.

(5) Submit sealant manufacturer's data sheets including performance data, pressure ratings, surface burning characteristics data, VOC compliance with LEED EQ 4, detailed installation instructions.

(a) Sealants for exterior ductwork shall include explicit statement by manufacturer indicating suitability for application.

(b) Sealants for exposed (uninsulated) exterior ductwork shall be UV resistant and include explicit statement by manufacturer indicating suitability for exposed exterior application.

(6) Duct tapes are not allowed.

B. Gaskets:

(1) Butyl, copolymer or neoprene based tape similar to Ductmate 440 Gasket Tape or Neoprene Gasket Tape for flanged joints.

C. Duct Sealant and Gaskets for Fume Hood Exhaust Ductwork:

(1) Sealant shall be similar to Hardcast Sure-Grip 404 or Ductmate Proseal.

(2) Gasket material shall be Butyl tape similar to Ductmate 440 Gasket tape or neoprene gaskets.

(3) Gasket thickness and width shall be as required for flange and surface irregularities to seal joint air tight.

D. Duct sealant for high temperature ductwork:

(1) Sealant shall be 100% silicone and rated to 500°F continuous operation, similar to Surebond SB-188 or ASI 600.

2.09 CABLE SUSPENSION SYSTEM

A. Suspension system shall be similar to Gripple Hang-Fast as manufactured and supplied by Gripple Incorporated or Ductmate Industries “Clutcher” cable hanging system.

B. Suspension system shall be load rated and verified by SMACNA Testing and Research Institute to be in compliance with SMACNA HVAC Duct Construction Standards, 2005, Chapter 5.

2.10 ACOUSTIC DUCT COVERING

A. Sound barrier material shall be similar to Kinetics Model KNM-100B or EAR Lag-10. Barrier material to have acoustic ratings of STC-27, 1.0 lb/ft2 weight, and minimum continuous operating range from -10°F to 180°F.

B. Minimum sound transmission loss at each octave band shall be as follows:

SOUND TRANSMISSION LOSS (DB)					
OCTAVE BAND CENTER FREQUENCY (HZ)					
125	**250**	**500**	**1000**	**2000**	**4000**
15	**18**	**21**	**27**	**32**	**37**

PART 3 EXECUTION

3.01 GENERAL

A. Unless otherwise indicated, install ductwork level, parallel , and/or perpendicular to building structure, walls, and ceilings and at such heights not to obstruct any portion of ceiling, window, doorway, stairway, or passageway. Install ductwork to allow adequate access and service space for equipment. Refer to drawings and/or manufacturer's recommendations. Install vertical ductwork plumb. Where interferences develop in field, offset or reroute ductwork as required to clear such interferences. In all cases, consult drawings for exact location of duct spaces, ceiling heights, door and window openings or other architectural details before installing ductwork.

B. Make allowances for beams, pipes or other obstructions in building construction and for work of other contractors. Check plans showing work of other trades and consult with Engineer in event of interference. Transform, divide, or offset ducts as required, in such a manner as to maintain same cross sectional area of duct as indicated on drawings. Where it is necessary to install pipes or similar obstructions through ducts, consult with Engineer and obtain written approval from Engineer and Owner. If approved, provide streamlined encasement or collar designed in accordance with SMACNA Standards and seal to prevent air leakage.

C. Ductwork shall be free of kinks and dents.

D. Fabricate and install duct, fittings, joints, seams, reinforcement, supports, sealing, liner, etc., in sizes indicated on drawings and in accordance with manufacturer's published data and SMACNA Standards except as modified in this section of specifications or on drawings.

E. Provide transitions where different size or different shape ductwork segments are connected. Use concentric transitions unless otherwise shown. Unless otherwise indicated, make diverging transitions with maximum angle of 15□ per side (30□ total diverging) and converging transitions with maximum angle of 25□ per side (50□ total converging).

F. Provide transitions at ductwork system components and connections to equipment. Refer to Specification Section 23 3713 – Diffusers, Registers, and Grilles, for additional information regarding diffuser/register/grille connections.

G. Refer to ductwork symbols list on drawings for additional and dimensional requirements for fittings.

H. Seal duct seams and joints to meet SMACNA Class A as minimum for all ductwork including low-pressure ductwork.

I. Construct ductwork so that interior surfaces are smooth. Internal duct hangers and internal bracing are not allowed. Refer to Part 1, Design Criteria for internal tie rods.

J. Support coils, filters, air terminals, dampers, sound attenuator devices or other devices installed in duct systems with angles or channels, and make all connections to such equipment including equipment furnished by others. Secure frames with gaskets, nuts, bolts and washers.

K. Air terminal devices may be supported by strap hangers if air terminal manufacturer approves. Strap hangers are not allowed for fan powered devices, double wall type and Titus Steri-Loc type devices.

L. Install outside air intake duct to pitch down at minimum 1” per 20 ft toward intake louver or plenum and to drain to outside of building. Solder or seal seams to form watertight joints.

M. Install exhaust air duct to pitch down at minimum 1” per 20 ft toward exhaust louver.

N. Blank off unused portion of outside air intake or exhaust louvers.

O. Where 2 different metal ducts meet, install joint in such a manner that metal ducts do not contact each other by using proper gasket seal or compound.

P. Install motor operated dampers and connect to or install equipment furnished by others. Provide necessary blank-off plates or transitions to mount control dampers as specified in Section 23 0901 - Control Systems Integration.

Q. Do not install ductwork over electrical panelboards, switchgear, switchboards or motor control centers.

R. When original galvanized finish is altered or damaged, apply field galvanizing paint as follows:

(1) Prepare surface with use of power sanders or wire brushes to remove rust, paint, etc.

S. Apply cold galvanizing material equal to ZRC Products, Inc.

3.02 ELBOWS

A. Rectangular Duct (SA/RA/EA):

(1) Use radius elbows with centerline radius to width ratio of 1.5 (SMACNA Type RE 1).

(2) Where 1.5 centerline radius elbows do not fit, use radius elbows with centerline radius to width ratio of 1.0 (SMACNA Type RE 3).

(3) Where 1.0 centerline radius elbows do not fit, use radius elbows with centerline radius to width ratio of 0.75 (SMACNA Type RE 3) or 45° throat with radius heel elbows (SMACNA Type RE 8).

(4) Use splitter vanes for 1.0 radius elbows, 0.75 radius elbows and 45° throat with radius heel elbows as follows;

(a) No vanes for duct with width less than 24”

(b) Single vane for duct with width 24” to 36”

(c) Two vanes for duct with width over 36”

(5) Fabricate splitter vanes in accordance with SMACNA HVAC Duct Construction Standards, Chart 4-1, (p. 4.11) and Figure 4-9 (p. 4.13).

(6) Square throat elbows with or without turning vanes are not allowed unless specifically indicated. Square throat elbows without turning vanes may be used for transfer air ducts.

B. Round and Oval Duct:

(1) Unless specific type is indicated, use radius elbows with centerline radius to diameter ratio of 1.5 regardless of duct velocity. Where 1.5 radius elbows do not fit, use 1.0 radius elbows.

3.03 LONGITUDINAL SEAM

A. Rectangular Duct:

(1) Unless otherwise indicated, use Pittsburgh lock seam.

(2) Seal longitudinal seams with approved sealant or pre-sealed with encapsulated mastic.

(3) Button punch snap lock construction (SMACNA L-2) may be used for ductwork that is both 2” WG (+ or -) and lower, and 36” and smaller in width or height. For ductwork over 24” in width or height, add screw 4” from each end.

(4) Button punch snap lock construction is not allowed for ductwork in chases, areas above inaccessible ceiling, and aluminum ductwork.

B. Round and Oval Duct:

(1) Unless otherwise indicated, longitudinal seams shall be in accordance with SMACNA HVAC Duct Construction Standards with the following exceptions.

(a) SMACNA seam types RL-3, 6A, 6B, 7 and 8 shown in Figure 3-2 are not allowed.

3.04 TRANSVERSE JOINT

A. Rectangular Duct:

(1) Transverse joints shall be in accordance with SMACNA HVAC Duct Construction Standards.

(2) Ductmate 25/35/45 connection systems with corner clips or optional nuts and bolts may be used. Incorporate use of all Ductmate accessories to ensure integrity of transverse connection. Install joints in strict accordance with the latest edition of Ductmate 25/35/45 Assembly and Installation Instruction Manual and Duct Construction Standards. Nexus or WDCI will be acceptable.

(3) Lockformers TDC or Engles TDF may be used in accordance with T-25 flanges of SMACNA HVAC Duct Construction Standards Metal and Flexible, 2005, provided that corner pieces with bolts are used. If TDF/TDC flanges are damaged, replace the damaged joint(s) by straightening and reinforcing with minimum 1-1/2” x 1-1/2” x 1/4" angle at each side of transverse joint.

(4) Where any type of flanged transverse joint is used for exterior uninsulated ductwork, top flange shall have continuous sheetmetal cap or continuous cleat to protect joint.

B. Round Duct:

(1) Unless otherwise indicated, use beaded sleeve joints (SMACNA RT-1) with minimum 2” insertion length or flange joints (SMACNA RT-2 or RT-2A).

(2) Connection systems manufactured by Ductmate Industries (Spiralmate and Ovalmate) or McGill AirFlow (Uni-flange) may be used for supply air ductwork.

(3) AccuFlange connected systems may be used with gaskets specified in Part 2 of this Section.

3.05 DUCT SUPPORTS

A. Unless otherwise indicated, use straps or Z bar hangers with 3/8” rods to support rectangular ducts 60” wide and smaller and trapeze hangers with rods or angles to support rectangular ducts over 60” wide.

(1) Use trapeze hangers to support externally insulated ductwork with weight bearing inserts. Refer to Section 20 0700 – Mechanical Systems Insulation and details.

B. For round ducts 24” diameter or smaller, use single hanger.

(1) Cable Suspension System may be used up to 24” diameter at spaces higher than 8 ft above floor or platform.

(2) Round Duct Strap Bracket by Ductmate Industries may be used up to 24” diameter.

C. For round ducts 25” diameter or larger, use 2 minimum 3/8” rods, with trapeze in accordance with the following schedule:

Duct Size	Trapeze (Half Round)
25” to 36”	1-1/2” x 1-1/2” x 1/8"
37” to 48”	1-1/2” x 1-1/2” x 1/4" or 2” x 2” x 1/8"
49” to 60”	2” x 2” x 1/4"
61” to 84”	2-1/2” x 2-1/2” x 1/4"

D. Refer to Section 20 0700 - Mechanical Systems Insulation for ductwork insulation, weight bearing inserts and insulation protection shield requirements.

E. Support ducts located on roof as detailed.

F. Support vertical ducts at every floor, but not exceeding 12 feet (365.76 cm)

G. The following upper attachments, upper attachment devices, lower hanger attachments, hanger devices, and/or hanger attachments are not allowed except where specifically indicated:

(1) Hook or loop

(2) Nailed pin fasteners

(3) Expansion nails without washers

(4) Powder actuated fasteners (forced entry anchors). Forced entry anchors may be used for upper attachments of flexible ductwork supports.

(5) Beam or "C" clamps without retaining clips or friction clamps (provide retaining clips for "C" clamps)

(6) Non-factory manufactured upper attachments for metal pan deck including wire coil and double circle (Items 16 and 17 of Fig 5-4 of SMACNA HVAC Duct Construction Standards 2005)

(7) Wire hanger

(8) Trapeze hangers supported by wires or straps

(9) Rods, straps or welded studs directly attached to metal deck

(10) Drilled hole with attachment to structural steel
(11) Lag screw expansion anchor
(12) Rivets
(13) Non-metallic hangers or straps

H. Supporting devices shall be standard products of manufacturers having published load ratings.

I. Refer to Section 20 0529 - Piping and Equipment Supporting Devices for additional support requirements including attachments to structures.

J. For welded ducts, soldered ducts or ducts with water tight joints, do not use supports utilizing screws or other penetrations into ductwork.

K. Unless Architectural Documents indicate the required framing, provide angle iron framing around roof opening where duct penetrates through roof decking, to maintain roof decking structural integrity in accordance with roof decking manufacturer's recommendations. This is not required for concrete decking. For concrete decking, consult with the project structural engineer for location and size of opening prior to execution of Work.

3.06 SHEET METAL WELDING

A. Welded ductwork shall be butt-welded unless otherwise indicated.

B. Attach welding cable leads directly to base metal to be welded. Do not jumper welding cable leads through building structure, to avoid emission of stray voltage/current through building structure.

C. Welds on exposed ductwork in occupied spaces shall be brush polished with stainless steel brush.

D. Welds at exterior of building shall be ground smooth and brush polished with stainless steel brush to prevent atmospheric contamination and rust formation.

3.07 PROTECTION OF DUCTWORK

A. Protect ductwork during construction against entry of foreign matter and construction dirt.

B. Keep ductwork capped when work is complete for the day or when duct is not being worked on or added to. Use of polyvinyl (VISQUEEN) with duct tape wrap is an adequate measure as long as it is secure with no openings or tears in product.

C. If ductwork is not protected, remove dirt and foreign matter from the duct system and obtain inspection and approval from Engineer upon completion of cleaning before operating fans.

D. Return fans are not allowed to operate during construction to avoid intake of construction dirt/dust into return air ductwork.

3.08 DUCT LEAKAGE TEST

A. Refer to Test and Balancing portion of Section 20 0000 - General Mechanical Requirements.

B. Owner and/or Owner's representative may elect to witness leakage tests. Notify Owner and/or Owner's representative at least 3 days in advance.

C. Test each supply, return, and exhaust ductwork as follows, unless otherwise indicated in this section or in schedules.

(1) Test 25% of total installed duct area for duct pressure positive or negative Class 3” wg and higher.
(2) Test 10% of total installed duct area for duct pressure positive or negative Class 2” wg.
(3) Test 100% of total installed duct area for ductwork located in inaccessible spaces including shafts.
(4) Engineer will select sections of ductwork to be tested.
(5) If test results are acceptable to Engineer, remainder of ductwork is permitted to proceed without further testing. If ductwork fails test, repair all ductwork including ductwork not tested. Then repeat leakage tests for new sections of ductwork as described above.

D. Leakage test procedures shall be in accordance with test method described in Section 3 of SMACNA HVAC Air Duct Leakage Test Manual, except as modified in this Section. Test apparatus shall be in accordance with Section 5 of SMACNA HVAC Air Duct Leakage Test Manual.

E. Test pressure shall be equal to duct pressure class. Negative pressure ductwork shall be tested with negative test pressure.

F. Air leakage shall not exceed limits specified or scheduled. If leakage exceeds allowable limits, identify leaked areas, repair, seal and retest.

G. Provide filter system on duct inlet to test blower. Filter system shall be equal to final filtering efficiency of AHU supply air duct system. Filters are not required for negative pressure testing.

H. Do not insulate ductwork until it has been successfully tested.

I. Maximum permitted leakage (L) in cfm/100 sf duct surface area of each ductwork shall be calculated by:

(1) $L = CL \times P0.65$

(2) P = test pressure (duct pressure class).

(3) CL = duct leakage class, 2 for round/oval ducts and 4 for rectangular ducts and flexible ducts.

(4) Total allowable leakage in a duct section:

(5) = L x (total duct surface area of the section)

J. Welded ductwork shall be air and watertight and shall have no air leakage with allowance stated below.

(1) When using test apparatus and procedure described in SMACNA HVAC Air Duct Leakage Test Manual, 1st Edition, Chapter 5 (modified for negative pressure), the following losses can be expected during testing and are acceptable:

(a) 1 cfm per 1” WG of static pressure is allowed for the test equipment and test connections (e.g. 3 cfm when testing at 3” WG).

(b) 0.10 cfm per inch of diameter of temporary caps, regardless of pressure (e.g. 1 cfm for a cap on 10” diameter duct).

(2) To the extent possible, walk and observe welded ductwork under test to check for cracked or hissing welds. All leaks in welded sections of ductwork shall be reported to the Client’s Representative and repaired by welding. No caulking or sealing is allowed.

3.09 LOW PRESSURE DUCT CONSTRUCTION (PRESSURE CLASS 2” WG AND UNDER)

A. Use welds, rivets or nuts, and bolts for fabricating ductwork. Fully threaded sheet metal screws may be used on duct hangers, transverse joints and other SMACNA approved locations if screw does not extend more than 1/2” into duct. Sheet metal "TEK" screws 3/4” in length may be used as fasteners in conjunction with factory made transverse joints.

B. Unless otherwise indicated, construct branch take-off fittings as follows:

(1) For branch take-offs including branch ducts serving more than one diffuser or grille, use 45□ entry fittings. For supply air ducts, conical taps may be used.

(2) For take-offs serving single diffuser, register or grille, use straight spin-in collars with manual balancing dampers.

C. Splitter dampers and/or extractors are not allowed.

3.10 HIGH PRESSURE DUCT CONSTRUCTION (GREATER THAN PRESSURE CLASS 2” WG)

A. Use manufactured ductwork or contractor fabricated ductwork meeting specified Construction Standards and fitting performance.

B. Submit construction details including materials, type of service, reinforcing methods, and sealing procedures.

C. Use elbows, tees, laterals, crosses and accessory fittings as shown on drawings and as required to fabricate duct system.

D. Use conical tees for round ductwork and 45 degree entry fittings for branch take-offs from mains unless otherwise indicated.

E. Provide manufactured bellmouth fittings at each fan supply air plenum to provide smooth entrance of air into duct system.

3.11 AIR HANDLING UNIT SYSTEM DUCTWORK PRESSURE CLASS

A. Air Handling Unit AHU-1, AHU-2, AHU-3, AHU-4

(1) Duct pressure class to be as follows:

(a) Outside air intake plenum to AHU inlet -2” WG

(b) Ductwork located in shafts, mechanical room +4” WG

(c) From shaft riser take-off to inlet of air terminal device +4” WG

(d) From air terminal device to diffuser +2” WG

3.12 FLEXIBLE DUCT

A. Install flexible ducts in accordance with manufacturer's installation instructions and SMACNA Standards, except as modified in this Section of Specifications.

B. In supply air systems with air terminal devices, flexible ducts shall be used for duct connections to diffusers, grilles, and registers for sound attenuation purposes, except above non-accessible ceilings. Flexible ducts shall be 5 feet (152.4 cm) long.

C. In exhaust air systems with air terminal devices, flexible ducts shall be used for duct connections to grilles and registers for sound attenuation purposed, except above non-accessible ceilings and in laboratory spaces. Flexible ducts shall be 5 feet (152.4 cm) long.

D. Centerline radius of bends shall not be less than one duct diameters. FlexFlow Elbow supports by Thermaflex or similar products shall be used at diffuser/grille connection to assure full radius elbow.

E. Support flexible ductwork as recommended by manufacturer and with minimum 0.5” wide saddles with maximum sag of 0.5” per ft between supports. Spacing of supports shall beat a maximum of 5 ft on center , with no portion lying on ceiling supporting system.

F. Individual sections of flexible ductwork shall be of one-piece construction. Splicing of short sections is not allowed.

G. Connect flexible duct liner to collars and rigid duct in accordance with manufacturer’s installation instructions. If manufacturer’s installation instructions do not include stainless steel draw-bands, provide stainless steel draw-bands in addition to manufacturer’s installation instructions. One draw-band shall secure flexible duct to rigid duct and another shall secure flexible duct outer jacket to rigid duct. If collars have beads, position draw bands behind beads.

H. Pull insulation and vapor barrier jacket over liner connection and secure with draw band. For terminations at externally insulated ductwork, fittings, grilles, diffusers, etc., secure flexible duct jacket to ductwork insulation jacket with compatible vapor barrier tape.

I. Flexible ducts are not allowed above non-accessible ceilings.

J. Flexible ducts are not allowed in high pressure ductwork.

K. Flexible ducts are not allowed for supply air systems serving BSL-3, BSL-3Ag, or BSL-4 spaces.

L. Flexible ducts are not allowed to pass through any partition, wall, floor or ceiling.

3.13 ACOUSTIC DUCT COVERING

A. Wrap outside of duct with inner layer material. Apply outer layer material over inner layer material. Do not rigidly tie outer layer material to ductwork.

B. If manufactured barrier materials are used, install in accordance with manufacturer's installation instruction.

C. Apply covering to the following ductwork:

END OF SECTION 23 31 14

SECTION 23 33 14 - DUCTWORK SPECIALTIES

PART 1 GENERAL

1.01 RELATED WORK

A. Section 01 8113 – Certification Requirements

B. Section 23 0595 - Air Systems Test Adjust Balance

C. Section 23 0902 - Control Valves and Dampers (Control Dampers)

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 LEED PERFORMANCE REQUIREMENTS

A. VOC Emissions Evaluation: For adhesives and/or sealants used for installation, products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1-2010 or CDPH Standard Method v1.2-2017, using the applicable exposure scenario. The manufacturers' or third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

B. VOC content requirements for wet-applied products: For adhesives and sealants, in addition to meeting the general requirements for VOC emissions (above), on-site wet-applied products must meet the applicable VOC limits for Adhesive and Sealant Applications, as per the SCAQMD Rule 1168, October 6, 2017, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168. If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may be intentionally added in paints, coatings, adhesives, or sealants.

1.04 SUBMITTALS

A. Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name and model number

(2) Capacities

(3) Temperature/pressure ratings

(4) Materials of construction

(5) Dimensions

(6) Manufacturer's installation instructions and/or detailed drawings

(7) All other appropriate data

B. LEED Submittals:

(1) Complete provided Product Data Reporting Form in spec section 01 81 13 and provide the following:

(a) VOC Emission Evaluation: Provide documentation that product complies with one of the following: SCS Indoor Advantage Gold, FloorScore, MAS Certified Green, UL Greenguard Gold or CRI Green Label Plus. The third-party certification must state the exposure scenario used to determine compliance. Claims of compliance for wet-applied products must state the amount applied in mass per surface area. The Claims of compliance must also state the range of total VOCs after 14 days, measured as specified in CDPH Standard Method v1.1 or CDPH Standard Method v1.2-2017.

(b) VOC content requirements for wet-applied products: Provide MSDS or manufacturers cutsheet showing VOC requirements testing and compliant according to SCAQMD Rule 1168, October 6, 2017, or Canadian VOC Concentration Limits for Architectural Coatings (SOR/2009-264) or the CARB 2007 SCM for Architectural Coatings, SCAQMD Rule 1113, February 5, 2016, or European Decopaint Directive (2004/42/EC). If a product cannot be reasonably be tested as specified above, testing of VOC content must comply with ASTM D2369-10; ISO 11890, Part 1; ASTM D6886-03; or ISO 11890-2. Methylene chloride and perchloroethylene may not be intentionally added in paints, coatings, adhesives, or sealant

1.05 DESIGN CRITERIA

A. Products and materials shall conform to NFPA Section 90A, possessing flame spread rating of not over 25 and smoke developed rating no higher than 50.

B. Ductwork specialties exposed to air stream, such as dampers, turning vanes and access doors, shall be of same material as duct or unit at where the specialties are mounted, unless otherwise noted.

C. Unless otherwise noted, ductwork specialties shall be designed and constructed for pressure class of ductwork in which they are installed.

PART 2 PRODUCTS

2.01 MANUAL BALANCING DAMPERS

A. Manufacturers: Ruskin, Greenheck, Vent Products, Pottorff or Air Balance, constructed in accordance with SMACNA HVAC Duct Construction Standards, except as modified below.

B. Rectangular Dampers:

(1) For low pressure ductwork, for damper blade height up to 12”, use single blade type with minimum 22 ga galvanized steel blade with minimum 3/8” rod for blade width up to 18”, and with minimum 18 ga galvanized steel blade with minimum 1/2” continuous rod for blade width from 19” to 48”. For damper blade height more than 12”, use multiple blade type with minimum 16 ga galvanized steel channel frames, opposed blade linkage operation, with blades minimum 16 ga and 6” to 8” maximum blade width, minimum 1/2” continuous rod and 1/2” x 1/2" galvanized steel angle blade stops. Bearings shall be nylon or molded synthetic. Construct dampers over 48” in width or height in multiple sections with mullions.

(2) For high pressure ductwork, dampers shall be constructed to withstand maximum pressure of 5” WG WG at closed position and maximum velocity of 2000 fpm at open position. Frame and blades shall be constructed of minimum 16 ga with minimum 1/2” diameter or square rod.

C. Single Blade Round Dampers:

(1) For low pressure ductwork, damper shall have blade 24 ga, but no less than two gauges more than duct gauge. Rod shall be minimum 3/8” diameter or square continuous. Bearings shall be nylon or molded synthetic.

(2) For high pressure ductwork, damper blade shall be minimum 16 ga. Rod shall be minimum 1/2” square continuous and tack welded to blade. Provide sealed end bearing similar to Ventlok #609 and acorn nut type dial regulator similar to Ventlok #635 or 641.

D. Provide damper operators with locking devices and damper position indicators. Sheet metal screws are not allowed in construction or installation of dampers. Use rivets or tack welds.

E. Dampers shall be properly stiffened and fabricated to prevent vibration, flutter or other noise.

F. Extend damper shafts through duct insulation or use elevated regulators for externally insulated ducts to accommodate specified insulation thickness.

G. Segmented Blade (Iris) Dampers:

(1) Damper shall be segmented blade (iris) type with 22 ga galvanized steel or 316 stainless steel frame and blades. Casing leakage shall not exceed 6 cfm.

(2) Iris blade segments shall be internally linked and driven by manual adjustment knob. Linkage parts shall be fully encapsulated and out of air stream. Manual adjustment knob shall be factory calibrated to the exact aperture position and aligned with the K factor set point to provide linear response flow control.

(3) Accuracy of flow measurement shall be ±5%. Assembled units shall be furnished with specific charts designed for exact size and blade aperture configuration. Air pressure taps shall be integral to damper frame and positioned on either side of blade segments.

(4) Dampers shall be similar to Ruskin Model VFBD35.

2.02 SPLITTER VANES AND TURNING VANES

A. Radius Elbow Splitter Vanes (SMACNA Type RE-3):

(1) Splitter vanes for radius elbows shall be constructed in accordance with SMACNA HVAC Duct Construction Standards Chart 4-1, (p. 4.11) and Figure 4-9 (p. 4.13).

B. Turning Vanes (SMACNA Type RE-2):

(1) Turning vanes are not allowed unless specifically indicated.

2.03 BACKDRAFT DAMPERS

A. Manufacturers: Ruskin or Greenheck

B. Dampers shall be multi-blade, weighted type with counter-balanced blades and with 12 ga galvanized steel frame and extruded aluminum airfoil-shaped blades equal to Ruskin Type CBS 92. Blade edges shall have silicon rubber seals with ball bearings. Dampers shall be suitable for flange and gasket connection to ductwork or fan outlet.

C. Dampers shall be rated to maximum velocity of 4000 fpm, maximum temperature of 250°F and maximum system pressure of 5” WG for damper width of 60” and 14” WG for damper width of 12”.

D. Maximum damper leakage shall be 13.5 cfm/sf based on pressure differential of 1” WG.

2.04 FIRE DAMPERS

A. Manufacturers: Air Balance, NCA, Greenheck, Nailor, Cesco, Pottorff, Prefco, United Air, or Ruskin

B. Fire damper assemblies shall be listed by UL 555 with 165°F fusible link and shall meet construction standards as set forth in NFPA 90A.

C. Dampers shall be dynamic type dampers suitable for maximum air velocity and pressure to which they are subjected, but not less than 2000 fpm and 4” WG.

D. Dampers shall be curtain type with blades out of air stream when in open position. Where curtain type dampers are not available because of size, use multiple blade type dampers Fire damper shall be style B (High free area).

E. For round ducts, dampers similar to Ruskin Model FDR25 may be used where products are suitable for duct size, velocity and static pressure.

F. Damper fire rating shall be compatible with rating of building surface in which damper is used.

G. Submit UL installation details showing mounting method and duct connection method.

H. Where ceiling fire dampers are used, they shall be similar to Ruskin CFD(R) 2 or 3, UL Classified for installation in fire rated floor or roof/ceiling assemblies.

2.05 COMBINATION FIRE AND SMOKE DAMPERS

A. Manufacturers: Air Balance, NCA, Greenheck, Nailor, Cesco, Pottorff, Prefco, United Air, or Ruskin, similar to Ruskin FSD 60.

B. Dampers shall meet requirements of NFPA 90A. Dampers shall be 1-1/2 or 3 h rated as shown on drawings, smoke dampers and actuators shall be qualified for up to 30 minutes exposure at 250˚F, leakage rated at no higher than leakage Class I (4 cfm/ft2 at 1" WG and 8 cfm/ft2 at 4" WG) under UL 555/555S at temperature category 350°F, and compatible with system static pressures. Furnish dampers with factory-mounted, caulked sleeves and damper operators.

C. Dampers shall use airfoil shaped damper blades. Dampers shall be suitable for maximum air velocity and pressure to which they are subjected, but not less than 4” WG static pressure and 4000 fpm air velocity.

D. For round ducts, dampers similar to Ruskin Model FSDR 25 may be used up to air velocity 4000 fpm and pressure 4” WG.

E. Operators shall be 120 V electric powered with auxiliary switch built in for position indication, factory installed outside airstream, linked to dampers for fail closed operation, and be UL Listed and labeled for the application. Operators to be capable of closing damper at pressures encountered in system.

F. Dampers shall be furnished with heat sensor set at 165°F.

G. Furnish damper test switch similar to Ruskin Model DTS.

H. Duct smoke detectors shall not be provided for combination fire and smoke dampers per University of Arkansas fire marshal.

I. Submit UL installation details showing mounting method and duct connection method.

2.06 SMOKE DAMPERS

A. Manufacturers: Air Balance, Johnson Controls, Greenheck, Nailor, NCA Manufacturing, Cesco, Pottorff, Prefco, United Air, or Ruskin, similar to Ruskin SD-60.

B. Dampers shall be leakage rated at no higher than Leakage Class I (4 cfm/ft2 at 1" WG and 8 cfm/ft2 at 4" WG) under UL 555S at temperature category 250°F. Smoke damper and actuators shall be qualified for up to 30 minutes exposure at 250˚F. Furnish dampers with factory-mounted, caulked sleeve and actuator assemblies. Damper shall have 16 ga or heavier frame with air foil-shaped blades, rated to minimum 4” WG in closed position and to 4000 fpm in open position.

C. For round ducts, dampers equal to Ruskin Model SDRS 25 may be used.

D. Actuator assemblies shall be installed outside airstream, linked to damper for fail (normally) closed operation. Actuator shall be capable of closing damper at pressures encountered in system.

E. Size smoke dampers as close as possible to duct size, but in no case is damper size to be less than duct size.

F. Actuators shall be 120 V electric powered with auxiliary switch built in for position indication.

G. Furnish damper test switch similar to Ruskin Model DTS.

H. Duct smoke detectors shall not be provided for smoke dampers per University of Arkansas fire marshal.

2.07 ACCESS DOORS

A. Access doors shall be rectangular, minimum 22 ga frame and minimum 24 ga door, fit air tight with neoprene gasket and shall be suitable for duct pressure class. When access doors are installed in insulated ductwork or equipment provide insulated doors with insulation equivalent to what is provided for adjacent ductwork or equipment. Access doors constructed with sheet metal screw fasteners are not acceptable.

B. Low Pressure Ducts (Pressure Class 2” and Under):

(1) Doors shall be hinged type with sash lock for exposed application and non-hinged type with cam latches for concealed application.

(2) Access doors constructed in accordance with SMACNA HVAC Duct Construction Standard (Figure 7-2) or similar to Ruskin Model ADC or ADH will be acceptable.

(3) Sandwich style access doors made by Ductmate, Ward Industries, Greenheck, or Flexmaster are acceptable, provided that they meet insulation requirements.

C. High Pressure Ducts (Pressure Class 3" and Over):

(1) Use access doors factory fabricated and rated by manufacturer's published literature for installation in systems with pressures to positive or negative 10" WG.

(2) Sandwich access doors made by Ductmate, Ward Industries, Pottorf, Greenheck, or Flexmaster are acceptable, provided that they meet insulation requirements.

2.08 DUCT FLEXIBLE CONNECTIONS

A. Manufacturers: Unless specifically indicated, Ventfabrics, Inc., Ductmate or Duro Dyne. Material shall be glass fabric, fire retardant, waterproof, air tight and comply with NFPA 90A and 701 (formally UL 214).

B. General Supply, Return and Exhaust Ductwork:

(1) Material for indoor use to be 30 oz per square yard, double coated with neoprene, tensile strength (warp/fill) of 475 lbs / 375 lbs, tear strength of 13 lbs x 13 lbs, suitable for -40°F to 200°F continuous operation.

(2) Material for outdoor use shall be combination of inner layer of Duro Dyne Neoprene or similar and outer layer of 24 oz per square yard, coated with Hypalon, UV resistant, suitable for -40°F to 250°F, similar to Duro Dyne Durolon.

2.09 SOUND ATTENUATING DEVICES

A. Manufacturers: Semco, United McGill, Aeroacoustic, Vibro-Acoustics, VAW Systems, Price, or Ruskin

B. Units shall be tested in accordance with ASTM E-477-99 silencer test standard in aero-acoustic test facility which is NVLAP accredited for ASTM E-477-99 Standard. Each test shall have been conducted within last 12-month period. Submit copy of laboratory's NVLAP accreditation certificate on dynamic insertion loss, self-noise power levels, and aerodynamic performance.

C. Outer casing of units shall be not less than 22 ga G90 galvanized steel in accordance with recommendations in the latest edition of ASHRAE Guide and Data Book for high pressure rectangular ductwork for 8" WG or pressure class indicated for duct system, if it is higher than 8" WG. Seams shall be lock formed or continuously welded and mastic filled.

D. Acoustic Materials:

(1) Media shall be long fiber fiberglass protected with covering material and lined with not less than 26 ga galvanized perforated steel. Filler and facing material shall meet requirements of NFPA 90A with flame spread rating of 25 or less, and smoke development rating of 50 or less.

(2) Media shall be non-fiberglass containing 100% natural cotton fibers treated with EPA registered, non-toxic borate solution, "flash dried" to actively inhibit growth of mold, mildew, bacteria and fungi. Media shall not contain any formaldehydes, phenolic resins or Volatile Organic Compounds (VOC's) that can off-gas, and/or cause health concerns. Media shall be 100% recyclable. Media shall comply with UL181 and NFPA 90A. Media shall not cause or accelerate corrosion of aluminum or steel.

E. Covering Materials:

(1) Covering material shall be glass fiber cloth, high tensile strength, long strand glass fiber woven to thread count of 44 x 32 and have minimum weight of 6 oz per square yard, minimum breaking strength 250 x 200 lbs/in, similar to Burlington Style 1675, BGF Industries Style 1528, or JP Stevens Style 7628.

(2) Covering material shall be Mylar film.

(3) Provide spacers between covering material and perforated metal.

F. Ends of attenuators shall be covered at factory with plastic, heavy-duty paper, cardboard, or other appropriate material to prevent entrance of dirt, water, or any other foreign matter to inside of attenuators. Caps shall not be removed until attenuator is installed in duct system.

G. Unless otherwise indicated, sound attenuating devices shall meet acoustical performance requirements as scheduled in each octave band frequency under the flow conditions.

H. Sound Attenuating Devices for Exhaust Air Terminal Units Serving Fume Hood and Snorkel Exhaust:

(1) Tubular type constructed entirely of Type 304 stainless steel, in accordance with recommendations in the latest edition of ASHRAE Guide and Data Book for high pressure rectangular ductwork. Seams shall be continuously welded. Units shall contain no sound absorptive material. Attenuation shall be accomplished by controlled impedance membranes and broadly tuned resonators. Units shall not fail structurally when subjected to differential air pressure of 8" WG, inside to outside of casing.

(2) Unless otherwise indicated, sound attenuating devices shall meet acoustical performance requirements as scheduled in each octave band frequency under the flow conditions.

I. Sound Attenuating Devices for General Exhaust Air Terminal Units of Laboratory or Vivarium Exhaust Systems:

(1) Tubular type constructed entirely of galvanized steel, in accordance with recommendations in the latest edition of ASHRAE Guide and Data Book for high pressure rectangular ductwork. Seams shall be continuously welded. Units shall contain no sound absorptive material. Attenuation shall be accomplished by controlled impedance membranes and broadly tuned resonators. Units shall not fail structurally when subjected to differential air pressure of 8" WG, inside to outside of casing.

(2) Unless otherwise indicated, sound attenuating devices shall meet acoustical performance requirements as scheduled in each octave band frequency under the flow conditions.

J. Sound Attenuating Devices for Fume Hood Exhaust Fans:

(1) Provide units at exhaust fan intakes and discharges as scheduled. Unit length shall be as scheduled.

(2) Rectangular type constructed entirely of Type 304 stainless steel, in accordance with recommendations in the latest edition of ASHRAE Guide and Data Book for high pressure rectangular ductwork. Seams shall be continuously welded. Units shall contain no sound absorptive material. Attenuation shall be accomplished by controlled impedance membranes and broadly tuned resonators. Units shall not fail structurally when subjected to differential air pressure of 8" WG inside to outside of casing.

2.10 LOUVERS

A. Louvers will be provided by General Contractor.

2.11 BIRD AND INSECT SCREENS

A. Bird screens shall be 1/2" square mesh formed with 0.063" diameter aluminum wire. Insect screen to be 18 x 16 with 0.017" diameter aluminum mesh.

B. Frame shall be removable type of minimum 12 ga, extruded aluminum.

2.12 AIR FLOW MEASURING UNITS

A. Furnished by Control Contractor.

2.13 ELECTRONIC REMOTE OPERATED VOLUME CONTROL DAMPERS

A. Similar to Pottorff Model RD-10 or Greenheck Model RBDR-50, furnished with handheld remote and wall/ceiling plates.

2.14 PRESSURE RELIEF DOORS

A. Similar to Ruskin Model PRD 18, Kees Model BO, or Pottorff Model PPR-B0 for positive pressure and Ruskin Model NRD 18, Kees Model BI, or Pottorff Model NPR-BI for negative pressure applications.

B. Doors and frames shall be 12 ga galvanized steel with seal around door perimeter. Use galvanized steel or stainless steel to match ductwork material. Doors shall be double-wall, insulated, when installed in insulated ductwork.

C. Doors shall open automatically to relieve excess pressure above set point and to close when pressure is reduced to less than 3" WG. Setting shall be adjustable from 3" to 8" WG with 1" WG increments in between.

2.15 INSTRUMENT TEST HOLES

A. Manufacturers: Ventlok 699 (up to 1" insulation thickness) or Ventlok 699-2 (over 1" insulation thickness).

B. Use concave gaskets for round ductwork.

2.16 CONTROL DAMPERS

A. Furnished by Control Contractor.

PART 3 EXECUTION

3.01 MANUAL BALANCING DAMPERS

A. Install manual balancing dampers in supply, return and exhaust branch ducts, as shown on drawings and as required to regulate airflow to meet air balance requirements.

B. Install manual balancing damper in branch duct to each diffuser and grille. Install dampers as close as possible to take-offs.

C. Install balancing dampers so as not to flutter or vibrate and as far as possible upstream from the air outlet.

D. Do not install balancing dampers in supply ductwork upstream of air terminal devices.

E. Balancing dampers are not required for exhaust ductwork at outlet side of air terminal devices.

F. Balancing damper is not required where terminal air device serves a single diffuser or grille.

G. Do not install manual balancing dampers in the following exhaust ductwork:

(1) Fume hood exhaust ductwork.

3.02 SPLITTER VANES AND TURNING VANES

A. Install splitter vanes (SMACNA Type RE-3) as shown on drawings and as specified in Section 23 3114 – Ductwork, for rectangular radius elbows. Install splitter vanes in accordance with SMACNA Standards and/or manufacturer's recommendations.

B. Turning vanes (SMACNA Type RE-2) are not allowed unless specifically indicated.

3.03 BACKDRAFT DAMPERS

A. Install backdraft dampers where indicated on drawings.

B. Where motorized dampers are shown in exhaust fan discharge duct, or in duct connecting to relief or exhaust louver, backdraft dampers are not required unless specifically indicated. Where motorized dampers are not shown, provide backdraft dampers in these locations.

3.04 FIRE DAMPERS AND COMBINATION FIRE/SMOKE DAMPERS

A. Install dampers where shown on drawings in accordance with manufacturer's installation instructions and requirements of NFPA 90A. Install dampers complete with mounting collars, retaining angles, connections to adjoining ductwork and duct access doors. Install duct access door at each damper with door size large enough to permit replacement of fusible links and resetting of dampers.

B. Test and demonstrate proper operation of each damper after system is installed and ready for operation.

(1) Manually test each damper for proper operation by removing fusible link or actuating EFL or PFL. Repair or replace any damper that does not close completely. Replace fusible link and certify in writing that each damper was installed according to manufacturer's installation instructions and that each damper can be expected to close completely when fusible link melts.

(2) Notify Owner and/or Owner’s representative at least 48 h prior to testing to allow for witnessing.

C. Contractor shall provide letter from manufacturer's representative indicating that dampers are installed per manufacturer's installation instructions.

3.05 ACCESS DOORS

A. Install access doors where specified, indicated on drawings, and in locations where maintenance, service, cleaning or inspection is required, including automatic dampers, fire dampers, smoke dampers, fan bearings, heating and cooling coils, reheat coils, humidifiers, filters, bird/insect screens, valves and control devices within duct or casing, at outside air intake duct and at inlet side of turning vanes in return ductwork.

B. Locate access doors for greatest ease of access.

C. Size and quantity of duct access doors shall be sufficient to perform intended service, but not less than the following:

Rectangular Duct Size	Minimum Access Door Quantity and Size
10”and smaller	(1) 8” x 8”
12” to 15” and smaller	(1) 10” x 10”
16” to 21”	(1) 14” x 14”
22” to 27”	(1) 18” x 18”
28” to 51”	(1) 24” x 24”
52” to 96”	(2) 24” x 24”
Round Duct Size	Minimum Access Door Size
10” and smaller	8” x 4”
15” and smaller	12” x 8”
29” and smaller	16” x 12”
30” and over	24” x 18”

D. Increase duct size to accommodate access door size indicated above where required.

E. Access doors for life safety dampers shall be adequate size for inspection and maintenance, but not less than 12” x 12”. If adjacent duct or damper is smaller than 12” x 12”, provide larger size duct or damper to accommodate minimum access door size without transition.

3.06 DUCT FLEXIBLE CONNECTIONS

A. Connect ductwork to fans or casings containing rotating equipment or mounted on vibration isolators with duct flexible connections. Installed width shall be suitable for specific application but shall not be less than 4”. Install flexible connections in accordance with SMACNA Standards with double lock or "Grip Loc" connection.

3.07 SOUND ATTENUATING DEVICES

A. Install sound attenuating devices as indicated on drawings and/or as scheduled.

B. For modular installation of sound attenuators, install galvanized steel holding frame, gaskets, seals, supports and fasteners in accordance with manufacturer's recommendations for multiple unit installation.

3.08 BIRD AND INSECT SCREENS

A. Provide bird screens or insect screens as indicated on drawings at louvers and at intake/exhaust openings.

B. Unless otherwise indicated, provide bird screens where filters are specified and insect screens where filters are not specified.

3.09 AIR FLOW MEASURING UNITS

A. Install where indicated on the drawings and/or as scheduled and in accordance with manufacturer's recommendations.

3.10 REMOTE OPERATED VOLUME CONTROL DAMPERS

A. Install remote operated volume control dampers and remote operators as indicated on drawings and where manual balancing dampers cannot be accessed.

B. Install connecting wire in the wall.

3.11 PRESSURE RELIEF DOORS

A. Install doors vertically where shown on drawings and in accordance with manufacturer's recommendations.

3.12 CONTROL DAMPERS

A. Install dampers in locations indicated on drawings, as detailed and according to manufacturer's instructions.

B. Install blank-off plates or transitions as specified in Control Sections.

C. Provide adequate operating clearance and access to operators.

D. For dampers located outdoor, provide weather protection enclosure for parts of damper such as linkage and actuator located outside of duct. Enclosure shall be removable and made of galvanized steel sheet.

3.13 SMOKE DAMPERS AND DETECTORS

A. Install smoke dampers in locations indicated on drawings. Allow room for operator installation and access to operator. Install access door in ductwork for access to damper. When damper is installed in location other than in smoke or fire rated wall, use SMACNA seal class A for ductwork between smoke damper and smoke rated wall for affected zone.

3.14 INSTRUMENT TEST HOLES

A. Provide instrument test holes at air entering and air leaving side of all internal air handling system components for static pressure differential (Delta P) or temperature differential (Delta T) measurements.

B. Provide ductwork instrument test holes as shown on drawings, or as directed by TAB personnel, or Engineer.

END OF SECTION 23 33 14

SECTION 23 34 00 - FANS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 20 0513 - Motors

B. Section 20 0514 - Variable Frequency Drive (VFD) System

C. Section 23 0550 - Vibration Isolation

D. Section 26 2816 - Enclosed Switches and Circuit Breakers

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SUBMITTALS

A. Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name and model number
(2) Identification as referenced in the documents
(3) Capacities/ratings
(4) Fan curves
(5) Materials of construction
(6) Sound power levels
(7) Fan type, size, class, drive arrangement, discharge/rotation, bearings, drives
(8) Wheel type, diameter, rpm, tip speed
(9) Required fan hp including drive losses
(10) Motor data (refer to Section 20 0513 - Motors)
(11) Vibration isolators furnished with fans
(12) Dimensions and weights
(13) Special coatings where applicable
(a) Product descriptive data
(b) Complete chemical resistance charts
(c) Coating manufacturer’s base metal preparation requirements (cleaning/pretreatment)
(d) Facility where special coatings will be applied
(e) Recommended method of repairing damaged coating
(14) Color selection charts where applicable
(15) Manufacturer's installation instructions
(16) All other appropriate data

B. Fan curves shall include series of curves indicating relationship of flow rate (cfm) to static or total pressure for various fan speeds, brake hp curves, and selection range (surge curves, maximum rpm, etc.).

C. Indicate performance data, based on both design air quantity and 110% of design air quantity.

D. For variable air volume application, indicate operating points at 100, 80, 60 and 40% of design capacity on fan curves including data to indicate effect of variable frequency drives on flow, pressure and hp.

1.04 DESIGN CRITERIA

A. Fan ratings shall be tested and certified in accordance with AMCA Standards 211 and 311 and fans shall bear AMCA Seal.

B. Fans shall be furnished complete with motors, wheels, drive assemblies, bearings and accessories as hereinafter specified. Motors for V-belt drives shall be furnished with adjustable rails or bases.

C. Where backward Inclined or backward curved (BI) centrifugal fans are indicated, fans shall have solid (single-thickness) blades.

D. Each fan wheel shall be statically and dynamically balanced to Balance Quality Grade G6.3 per ANSI S2.19 and AMCA 204-05. Complete fan assembly shall be factory balanced statically and dynamically in accordance with Standard AMCA 204-05 for Balance Quality and Vibration Levels for Fans and meet or exceed guidelines in Application Category BV-3.

E. For fans furnished with 5 hp or larger hp motors, each fan assembly shall have factory run test including vibration signatures taken on each bearing in horizontal, vertical and axial direction. Filter-in reading as measured at fan's scheduled rpm shall not exceed the following values when fan is rigidly mounted.

(1) Belt Drive (except Vane Axial) 0.15 inch (3.81 mm)/sec peak velocity

(2) Belt Drive Vane Axial 0.08 inch (2.03 mm)/sec peak velocity

(3) Direct Drive 0.08 inch (2.03 mm)/sec peak velocity

(4) Written records of run test and vibration test shall be available upon request.

F. Unless otherwise indicated, vibration level of installed fan assembly flexibly mounted shall not exceed 0.35 inch (8.89 mm)/sec.

G. Unless otherwise indicated, belt drives shall be V-belt drives selected for 150% of motor nameplate hp.

H. Furnish fans specified with V-belt drives with either variable-pitch or fixed-pitch sheaves for drives 3 hp and smaller and fixed-pitch sheaves for drives 5 hp and larger. Select variable pitch sheaves to drive fan at such speed as to produce specified capacity at approximate midpoint of sheave adjustment.

I. When fixed-pitch sheaves are furnished, system air balancing shall be accomplished by either trial of different fixed-pitch sheaves or use of temporary adjustable-pitch sheaves. This Contractor shall provide necessary trial and final sheaves and drive belts as required by TAB Contractor.

J. Select each fan to operate at single stable operating point as predicted by fan curve. Fans having 2 potential operating points on fan curves are not acceptable.

K. Provide OSHA Compliant belt and shaft guards for belt driven fans. Provide speed test openings at shaft locations. Paint guards bright yellow.

L. Sound power levels shall be based on tests performed in accordance with AMCA Standards 300 and 301.

M. Each fan and motor combination shall be capable of delivering 110% of air quantity scheduled at scheduled static pressure. Motor furnished with fan shall not operate into motor service factor in any of these cases.

N. Consider drive efficiency in motor selection according to manufacturer's published recommendation, or according to AMCA Publication 203, Appendix L.

O. Where inlet and outlet ductwork at any fan is changed from that shown on drawings, submit scaled layout of change and system effect factor calculations indicating increased static pressure requirements as described in AMCA Publication 201. This Contractor shall be responsible for costs associated with any motor, drive, and/or wiring changes required as a result of duct configuration changes at fan.

P. Exhaust fans serving fume hoods shall be marked with arrows to indicate proper direction of rotation.

Q. Fans having spark resistant construction shall be electrically grounded so as to prevent static electricity from building up.

PART 2 PRODUCTS

2.01 CENTRIFUGAL SIDEWALL EXHAUSTER

A. Manufacturers: Greenheck, Twin City, Cook, PennBarry, Jenn-Air, ACME, or Carnes.

B. Exhausters shall be dome type with spun aluminum housing, solid (single-thickness) backward inclined (BI), non-overloading centrifugal wheel, and motor housed in separate ventilated compartment.

C. Exhausters shall be belt or direct driven, as scheduled, with factory mounted NEMA standard disconnect switches.

D. Provide with gravity backdraft dampers and birdscreen.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install units as shown on drawings, and according to manufacturer's installation instructions. On units provided with drain connection, install drain valve and cap discharge of drain.

B. Verify lubrication of motor and fan bearings and lubricate properly in accordance with manufacturer's recommendation and Section 20 0000, Part 3 under LUBRICATION.

C. Perform field mechanical balancing, if necessary, to meet vibration tolerance specified in Part 1 of this Section.

END OF SECTION 23 34 00

SECTION 23 36 00 - AIR TERMINAL DEVICES

PART 1 GENERAL

1.01 RELATED WORK

A. Section 23 0901 - Control Systems Integration

B. Section 23 0993 - Control Sequences

C. Section 23 3114 - Ductwork (Support)

D. Section 23 3314 - Ductwork Specialties (Access Doors)

E. Section 23 8214 - Heating and Cooling Terminal Devices

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SUBMITTALS

A. Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name and model number

(2) Identification as referenced in the documents

(3) Capacities/ratings

(4) Materials of construction

(5) Sound rating data

(6) Dimensions

(7) All other appropriate data

B. LEED Submittal:

(1) Product Data for IEQ Prerequisite 1: Documentation indicating that units comply with ASHRAE 62.1 – 2010, Section 5 – “Systems and Equipment.”

1.04 QUALITY ASSURANCE

A. Electrical Components, Devices and Accessories: Listed and labeled as defined in NFPA 70 by qualified testing agency and marked for intended location and application.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1 – 2010, Section 5 – “Systems and Equipment” and Section 7 – “Construction and System Start-Up.”

1.05 DESIGN CRITERIA

A. Where any of air terminal devices are indicated on drawings to control space conditions in conjunction with reheat coil, that reheat coil may be furnished as integral part of or standard accessory to devices specified below. See related work above.

B. When air terminal devices are furnished with reheat coils, either integrally or remotely mounted, control panels of terminal devices shall be mounted on the same side of air terminal device as reheat coil piping connection.

C. Unless otherwise stated, units shall be system pressure independent and maintain air volume within ± 5% of required airflow regardless of system air pressure. Inlet velocity pressure sensor shall be multi-point center averaging type and be capable of amplifying pressure signals.

D. Unless otherwise stated, unit casings shall be constructed of galvanized steel or aluminum meeting SMACNA or ASHRAE Standards, but not lighter than 22 ga.

E. Joints and seams of air terminal devices shall be sealed with appropriate sealant to minimize casing air leakage.

F. Unit leakage test shall comply with ASHRAE Standard 130 – Laboratory Methods of Testing Air Terminal Units.

G. Unit performance shall be certified in accordance with AHRI Standard 880 including sound rating data certified for both casing discharge and radiated sound levels from 125 through 4000 Hz.

H. Supply air units shall be capable of operating from minimum inlet static pressure scheduled to 3” WG.

I. Provide supply air units with internal thermal insulation faced with minimum 0.001” thick aluminum foil. Insulation shall be compressed glass fiber with minimum 3/4” thick, 4 lb/ft3 density with R-value of 3.5(h·ft2·°F)/Btu. Insulation and facing shall meet requirements of UL 181 (Air Erosion, Mold growth and Humidity), and NFPA 90A (Flame 25/Smoke 50) and ASTM C665 (Fungi Resistance). Secure liner with full-seam-length, galvanized steel angles or Z-strips, which enclose and seal all edges. Tape or adhesive will not be acceptable. Liner assembly shall be similar to Titus Steri-Loc.

J. Supply air units shall be lined with engineered polymer foam insulation, minimum 3/4" thick, 1.5 lb/ft3 density and thermal conductivity not more than 0.25(h·ft2·°F)/Btu at 75°F. Insulation shall meet requirements of UL 181 (Air Erosion, Mold Growth and Humidity), NFPA 90A (Flame 25/Smoke 50) and ASTM C665 (Fungi Resistance).

K. Sound attenuators, where specified or required to meet sound performance specified for air terminal devices, shall be constructed of all metal or sound attenuating fiber material with erosion protection liner as required to meet sound requirement specified. Refer to Section 23 3314 - Ductwork Specialties for sound attenuators and erosion protection.

L. Unit manufacturer or manufacturer's designated representative will be required to verify air terminal device performance and adjust or replace device within warranty period when it is determined that problem exists in area served by device.

1.06 CONTROLS COORDINATION

A. Unit manufacturer shall provide unit inlet flow sensor, pneumatic tubing and control enclosure for Control Contractor's use.

B. Control Contractor shall furnish all actuators, linkages if required, differential pressure transmitters, controllers and any other devices required for unit control that are not provided by unit manufacturer for unit manufacturer's factory mounting. Unit manufacturer and Control Contractor shall coordinate for proper factory installation.

C. Unit manufacturer shall factory install devices furnished by Control Contractor to result in complete functioning unit. Unit manufacturer shall be responsible for reviewing compatibility of devices furnished by Control Contractor with units being provided.

D. Control Contractor's field mounting will be acceptable, provided Control Contractor coordinates proper installation with unit manufacturer. Control Contractor shall be responsible for complete functioning unit.

PART 2 PRODUCTS

2.01 VARIABLE VOLUME AIR TERMINAL DEVICES

A. Manufacturers: Titus, Price, Krueger, Enviro-Tec (ETI), Nailor, Carnes, Tuttle and Bailey, Metalaire, Trane, JCI or Carrier

B. Units shall be suitable for 24 V electric control system. Control Contractor shall be responsible for wiring from control panels to each terminal unit.

C. Furnish units with reheat coils having capacities as indicated in schedules.

D. Casing leakage rates shall not exceed the following maximum values:

A. Unit Size	Max. Casing Leakage (cfm)	
	0.5" WG	1.0" WG
4, 5, 6	2	3
7, 8	4	5
9, 10	4	6
12	5	7
14	6	9
16	7	10

E. Provide access doors for all air terminal devices with reheat coils at inlet side of coils. Refer to Section 23 3314 - Ductwork Specialties for access doors. Unit manufacturer's standard access doors are acceptable, provided that access doors are appropriately sized and internally lined with same materials as unit casing. If access doors are provided in separate sections as extension of units, these sections shall be internally lined in same manner as units.

2.02 RETURN OR EXHAUST AIR TERMINAL DEVICES

A. Manufacturers: Titus, Price, Krueger, Enviro-Tec (ETI), Nailor, Carnes, Tuttle and Bailey, Metalaire, Trane, JCI or Carrier

B. Units shall be suitable for 24 V electric control system. Control Contractor shall be responsible for wiring from control panels to each terminal unit. Units shall be similar to Titus Model ECV.

C. Unit casing shall be minimum 22 ga galvanized steel unless otherwise specified.

D. Damper shall be heavy gauge steel. Shaft shall be steel with bronze iolite self-lubricating bearings. Damper shall incorporate mechanical stop to prevent overstroking and synthetic seal to limit close-off leakage to 2% of the nominal catalog rating at 3" water gauge inlet static pressure when tested in accordance with ASHRAE 130.

E. Unit shall incorporate multi-point, center averaging velocity sensor. Sensor shall provide signal measurable by controller at inlet velocities of 500 fpm. Sensor shall provide control signal accuracy of ±5%, with the same size inlet duct at any inlet condition. Multi-point flow sensor shall be able to be readily removable for servicing and replacing without removal of connected duct.

2.03 VENTURI TYPE AIR TERMINAL DEVICES

A. Refer to Specification 23 3614 Laboratory Temperature and Airflow Control System.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install units as shown on drawings and according to manufacturer's installation instructions.

B. Install units with sufficient service space to unit control, actuators and access panels.

C. Provide minimum length of 3 times box inlet diameter of straight rigid duct at box inlet.

D. Provide access doors for terminal devices with reheat coils at inlet side of coils.

E. Provide access panels compatible with ceiling for all units located above non-accessible ceilings.

F. If air terminal devices that are not factory lined with thermal insulation are used for supply air application, provide external insulation in accordance with Section 20 0700 - Mechanical System Insulation.

END OF SECTION 23 36 00

SECTION 23 37 13 - DIFFUSERS, REGISTERS AND GRILLES

SECTION 23 37 13 – DIFFUSERS, REGISTERS AND GRILLES

PART 1 GENERAL

2.01 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

2.02 SUBMITTALS

A. Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name and model number
(2) Identification as referenced in the Documents
(3) Capacities/ratings
(4) Materials of construction
(5) Sound ratings
(6) Dimensions
(7) Finish
(8) Color selection charts where applicable
(9) Manufacturer's installation instructions
(10) All other appropriate data

2.03 DESIGN CRITERIA

A. Performance data shall be based on tests conducted in accordance with ASHRAE Standard 70-2006.

B. Screw holes on surface shall be counter sunk to accept recessed type screws.

PART 2 PRODUCTS

3.01 MANUFACTURERS

A. Titus, Price, Carnes, Nailor, Anemostat, Metalaire, Krueger, Tuttle & Bailey, Trane, and Envirotec.

B. Acceptable manufacturers for specialty products are listed under each item.

3.02 CEILING DIFFUSERS

A. Diffusers shall be aluminum or steel as scheduled, unless otherwise indicated, and furnished with frame type appropriate to installation. Furnish diffusers with equalizing grids where it is not possible to maintain minimum 2 times duct diameter straight duct into diffuser. Equalizing grids shall consist of individually adjustable vanes designed for equalizing airflow into diffuser neck and providing directional control of airflow.

B. Diffuser models, sizes and finishes shall be as shown on drawings and/or as scheduled. Unless noted otherwise, diffusers shall have baked enamel or powder coat finish with color selected by Architect.

C. Perforated face ceiling diffusers shall have minimum 51% free face area and pattern controllers accessible through removable or hinged faceplate. Unless otherwise indicated, pattern controllers shall be curved vane type mounted in neck of diffuser. Unless otherwise indicated, furnish diffusers with round neck inlets with minimum 1” depth.

3.03 ARCHITECTURAL SQUARE PANEL CEILING DIFFUSERS

A. Architectural square panel ceiling diffusers shall be similar to Titus Model OMNI diffuser.

B. Diffusers shall have one piece 18 ga face panels. Face panel shall be removable by means of four positive locking posts. Exposed surface of face panel shall be smooth, flat, and free of visible fasteners and have rounded off corners. Face panel shall project no more than 3/8” below outside border of diffuser back pan. Back of face panel shall have an aerodynamically shaped, roller edge to ensure tight horizontal discharge pattern.

C. Ceiling diffusers with 24” x 24” full face shall have no less than 18” x 18” face panel size.

D. Back pan shall be one piece die-stamped and shall include integrally drawn round inlet. Diffuser back pan shall be constructed of 22 ga steel. Diffuser neck shall have minimum of 1-1/4” depth available of duct connection. Back pan shape with face panel shall deliver 360□ radial horizontal air pattern.

E. Unless otherwise indicated, diffusers shall have baked enamel or powder coat finish with color selected by Architect.

3.04 REGISTERS AND GRILLES

A. Registers and grilles shall be aluminum or steel as scheduled unless otherwise indicated, and furnished with frame type appropriate to installation.

B. Supply registers and grilles shall be double deflection type blades to provide for air deflection adjustment in all directions.

C. Exhaust registers and grilles shall have fixed blade core.

D. Exhaust registers and grilles shall include roughing filters where scheduled.

E. Registers shall be furnished complete with opposed blade volume control dampers, operable from face.

F. Register and grille models, sizes and finishes shall be as shown on drawings and/or as scheduled. Unless noted otherwise, registers and grilles shall have baked enamel finish with color selected by Architect.

3.05 ADJUSTABLE LINEAR DIFFUSERS

A. Linear diffusers shall be extruded aluminum and furnished with frame type appropriate to installation with diffuser elements being removable from frame. Diffuser vanes shall provide both air pattern and flow rate adjustment with air pattern having full 180° adjustment. Diffuser vanes of single slot shall be segmented on 2 ft or 3 ft centers.

B. Diffuser models, lengths and slot sizes shall be as shown on drawings and/or as scheduled. Unless otherwise indicated, frame face shall have baked enamel or powder coat finish with color selected by Architect. Diffuser vanes and frame interior shall be finished in flat black.

3.06 FIXED BLADE LINEAR DIFFUSERS AND GRILLES

A. Linear diffusers and grilles to be extruded aluminum with frame type appropriate to sidewall, sill or ceiling installation as indicated.

B. Diffuser and grille models, lengths, blade spacing and blankoff strips to be as shown on drawings and/or as scheduled.

C. Diffusers used for supply air to be furnished with straightening or equalizing vanes. Blades to be fixed at 0 or 15□ deflection as scheduled.

D. Unless otherwise indicated, diffusers and grilles shall have anodized aluminum finish with color selected by Architect.

PART 3 EXECUTION

4.01 INSTALLATION

A. Install grilles, registers and diffusers as shown on drawings and according to manufacturer's instructions.

B. Unless otherwise indicated, size ductwork drops to diffusers or grilles to match unit collar sizes.

C. Seal connections between ductwork drops and diffusers/registers/grilles air tight.

D. Support independently diffusers and grilles designed for T-bar mounting that exceed weight limit of ceiling suspension system in which they are to be installed.

E. Unless otherwise shown, provide wire mesh screen at end of each open ended duct (OED) that is exposed in occupied spaces.

F. Blank off unused portion of linear diffusers and grilles.

G. Where diffusers, registers and grilles cannot be installed to avoid seeing inside duct, paint inside of duct with flat black paint to reduce visibility.

H. Protect diffusers, registers and grilles from construction dirt. Clean or replace those soiled or stained prior to turnover to Client.

I. In clean rooms and animal holding rooms, caulk space between diffuser or grille and ceiling or wall to be air and water tight. Use clear, non-hardening silicone sealant compatible with ceiling or wall surface. Sealant shall be resistant to microbiological growth and shall meet CGMP requirements. Refer to Section 20 0000 – General Mechanical Requirements for sealant.

END OF SECTION 23 37 13

SECTION 23 41 14 - FILTERS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 01 8113 – Certification Requirements

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 LEED PERFORMANCE REQUIREMENTS

A. Provide MERV 13 or greater filters on all equipment that supplies outdoor air. Refer to filter schedules on drawings for required MERV ratings.

1.04 SUBMITTALS

A. Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name and model number
(2) Identification as referenced in the Documents
(3) Capacities/ratings; cfm, area, face velocity
(4) Efficiencies and initial/final pressure drop
(5) Materials of construction
(6) Dimensions
(7) Filter gauges data
(8) Manufacturer's installation instructions
(9) All other appropriate data
(10) LEED Submittals: Provide filter cut sheets highlighting MERV rating of 13 or higher. Refer to filter schedules on drawings for required MERV ratings.

1.05 DELIVERY, STORAGE AND HANDLING

A. Ship filters in original package to prevent damage or entrance of foreign matter. Perform handling and shipping in accordance with manufacturer’s recommendations. Provide protective coverings during construction.

1.06 DESIGN CRITERIA

A. Filters shall have UL 900 Listing.

B. Holding frames or housings specified in this Section may be furnished by filter manufacturers listed below, or where applicable, as part of factory packaged air handling units.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. American Air Filter/Flanders, Camfil, Flanders Precisionaire, Glasfloss, Airguard or Filtration Group unless otherwise noted under individual filter.

2.02 DISPOSABLE PANEL FILTERS

A. Similar to Camfil Farr 30/30 or Flanders Precisionaire PrePleat 40.

B. Media shall be non-woven, fine fibered material laminated to rigid backing to hold pleat formation, having minimum efficiency MERV 8 based on ASHRAE Test Standard 52.2 (average dust spot efficiency of 30 to 35% based on ASHRAE Test Standard 52.1).

C. Filter housing shall consist of air handling or cabinet fan unit manufacturer's low velocity filter section, or holding frame, as scheduled. When holding frame is indicated, it may be furnished by filter manufacturer or it may be contractor fabricated.

D. Filters shall be 2” thick of size and capacity as scheduled. Clean filter pressure drop shall not exceed 0.31” WG based on 500 fpm face velocity.

2.03 DISPOSABLE RIGID CARTRIDGE TYPE AIR FILTERS

A. Similar to Camfil Durafil ES RIGA-FLO or Flanders Precisionaire

B. High performance deep pleated, rigid, disposable type filters. Each filter shall consist of high efficiency media, enclosing frame, contour stabilizers on both air entering and exiting sides and support grilles. Filters shall be designed to withstand minimum differential pressure of 6” WG without structural damage to filter frame, seals or media.

C. Filter thickness, size and capacity shall be as scheduled.

D. Filters shall have minimum efficiency MERV 14 based on ASHRAE Test Standard 52.2 (average efficiency of 90-95% based on ASHRAE Test Standard 52.1). Initial resistance at 500 fpm face velocity shall not exceed 0.57" WG.

2.04 SIDE ACCESS FILTER HOUSINGS

A. Provide for all prefilter and afterfilter banks as scheduled.

B. Construct housings with galvanized steel with aluminum or galvanized steel filter mounting tracks. Mounting tracks shall have gaskets to minimize air bypass around filters.

C. Each housing shall have door on both sides to facilitate changing filters. Doors shall have perimeter gaskets to minimize air leakage, shall be hinged, and shall have cam-lock or lever handle latches to secure the door. Doors shall not be secured with nuts and bolts or sheet metal screws.

D. Each prefilter housing in 2 filter bank air handling unit or each filter housing in single filter bank air handling unit shall include integral prefilter track for 2" prefilters.

E. Each prefilter housing in 2 filter bank air handling unit shall be internally insulated by manufacturer or externally insulated in the field. Factory applied internal insulation shall have thermal resistance equivalent to that specified for duct in which housing is located, shall have internal vapor barrier, and shall have flame spread and smoke developed ratings as specified in Section 20 0700 - Mechanical Systems Insulation. Afterfilter housings in air handling units shall be externally insulated in the field.

2.05 FILTER HOLDING FRAMES

A. Frames shall be minimum 16 ga galvanized steel construction with provisions for assembly in a bank. Frames shall be suitable for filters scheduled and incorporate replaceable gaskets. Filter frames for all AHU filters shall be similar to Camfill Fast frame or approved equal.

2.06 LOW VELOCITY FILTER SECTIONS

A. Provide for factory packaged, air handling units and cabinet fans as indicated.

B. Housing shall consist of modular steel section with hinged access doors for filter replacement. Each housing shall be internally insulated by manufacturer or externally insulated in the field. Factory applied internal insulation shall have thermal resistance equivalent to that specified for duct in which housing is located, shall have internal vapor barrier, and shall have flame spread and smoke developed ratings as specified in Section 20 0700 - Mechanical Systems Insulation.

2.07 FILTER PRESSURE DROP GAUGES

A. Dwyer Series 3000 MRS Photohelic pressure switch/gauge. Differential pressure switch shall be SPST (NO) solid state relay and will be used by BAS contractor for dirty filter alarm. Switch setting shall be externally adjustable.

B. Unless otherwise indicated below, select scale range to be most appropriate to clean and dirty filter pressure drops.

Filter Type	Scale Range (" WG)
Throwaway filters	0-0.5
Filters with 25 to 30% efficiency based on atmospheric dust spot test	0-1.0
Filters with 31 to 99% efficiency based on atmospheric dust spot	0-2.0

C. Provide gauges for each filter bank, including gauges across each individual filter bank in built-up rack assemblies, suitable for flush mounting in a panel, including air filter gauge accessory package for use with 1/4" OD copper tubing.

D. Provide 3/4" spacer at one 2' x 2' filter section between filter elements in built-up rack, adjacent to unit wall for placement of intermediate pressure probe.

2.08 ADDITIONAL FILTER MEDIA

A. For disposable panel filters, enough media for 3 filter changes, shall be provided for each air handler. Media used during construction shall be replaced when system is air balanced. Third set of media not used shall be turned over to Owner as spare.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install filters as shown on drawings and according to manufacturer's instructions.

B. Provide supports as required and necessary clearance for changing filters.

C. Provide structural supports, outside casing and blank-off materials for all field assembled filter banks, and filter banks where housings are not furnished by filter manufacturer.

3.02 FILTER PRESSURE DROP GAUGES

A. Mount gauge near each filter bank and install static pressure sensors according to manufacturer's instructions.

B. Mount gauge on control panel.

3.03 FILTER HOLDING FRAMES

A. Provide frames for all filter banks as required. Install built-up filter banks in accordance with manufacturer's installation instructions.

END OF SECTION 23 41 14

SECTION 23 72 14 - HEAT RECOVERY EQUIPMENT

PART 1 GENERAL

1.01 RELATED WORK

A. Section 23 33 14 Ductwork Specialties

B. Section 23 73 28 Factory Fabricated Custom Air Handling Units

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SUBMITTALS

A. Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name and model number

(2) Capacities/ratings/efficiencies

(3) Pressure/temperature rating

(4) Materials of construction

(5) Dimensions and weights

(6) All other appropriate data

1.04 CHECK, TEST AND START

A. Heat recovery equipment installed within air handling unit shall be inspected and verified by heat recovery equipment manufacturer’s representative to ensure installation in accordance with manufacturer’s recommendation.

B. AHU manufacturer shall provide cost for commissioning field testing and certification of heat recovery equipment.

1.05 WARRANTY

A. Standard 5 year material and labor warranty shall be provided for heat pipe heat exchanger. Components such as valves and dampers shall have 12 month warranty.

PART 2 PRODUCTS

2.01 AIR-TO-AIR HEAT EXCHANGERS (HEAT PIPE TYPE)

A. General:

(1) Manufacturers: Heat Pipe Technology, Carolina Heat Pipe, or approved equal

(a) Heat pipes serving DOAS-1 shall be similar to Innerygy Tec with refrigerant modulating control valves for capacity control. Ducted exhaust air bypass with modulating damper shall be provided for each energy recovery unit as shown on mechanical drawings.

B. Unit’s capacity, efficiency and operating characteristics to be as scheduled.

C. Units shall be capable of operating at temperatures from minimum of -60ºF up to maximum of 125ºF.

D. Entire unit must be capable of withstanding entrained moisture from outside air.

E. Casings:

(1) Construct casings from minimum #16 ga galvanized steel, of design proven to mount and support such coils in ductwork or in a piece of apparatus. Furnish all casings with minimum of 1-1/2” wide flange on each of 4 sides, both front and back for mounting. Punch both slots for mounting on 3” centers throughout. Furnish intermediate core supports to prevent sagging or bowing when mounted in recommended manner.

(2) Furnish protective end covers to protect tube ends, which extend through casing. End covers to be constructed of #20 ga galvanized steel and will be factory sealed.

(3) Furnish units with condensate drain pans.

F. Coils:

(1) Construct tubes of 1/2” OD copper. Construct fins of continuous aluminum plate, 0.006” thick, and of corrugated design of product maximum heat transfer efficiency.

(2) Use refrigerants classified as Group I in ASHRAE/ANSI Standard for Mechanical Refrigeration.

(3) Furnish vertical partition to completely isolate exhaust and supply airstreams from each other so that there will be no cross contamination.

G. Special Requirements:

(1) Finish units exposed to exhaust airstream with baked phenolic coating for corrosion protection.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install units as shown on drawings, and in accordance with manufacturer's installation instruction.

B. Install Dwyer Series 2000 magnehelic pressure gauge across unit in supply air stream.

C. Install thermometer at each side of unit in both supply and exhaust.

3.02 AIR-TO-AIR HEAT EXCHANGERS (HEAT PIPE TYPE)

A. Provide filter racks upstream of supply and exhaust air as scheduled.

B. Pipe condensate drain pan to nearest floor drain.

END OF SECTION 23 72 14

SECTION 23 73 25 - FACTORY FABRICATED HEAT RECOVERY UNITS

PART 1 - GENERAL

1.01 SUBMITTALS

A. Product Data for all equipment including, but not limited to, the following:

(1) Appropriate identification
(2) Complete drawings showing plans and sections including details of construction
(3) Overall unit dimensions and individual components and sections dimensions
(4) Shipping and operating weight of unit and/or sections
(5) Structural design load
(6) Details of component support
(7) Capacities/ratings
(8) Materials of construction
(9) Thermal and acoustical performance of wall, roof and floor panels
(10) Pressure ratings and leakage ratings
(11) Thermal break construction details and performance calculations or test data
(12) Each component manufacturer's name, model number and data.
(13) Air leakage rates and test data
(14) Fan balance report
(15) Wiring diagrams and terminal points for control panels provided with units
(16) Manufacturer’s installation instructions
(17) Unit manufacturer’s local representative and phone number

B. All submitted PDF documents shall have electronic bookmarks. Bookmarks shall be set up as follows:

(1) Shop Drawings:
(a) Each major system shall have a master bookmark programmed with all documentation for the system grouped in order under a single bookmark for that system. Subgroups under the main bookmark should be divided in a minimum of: flow diagram/bill of material, wiring detail, control sequence, point list.
(2) Device Data Sheets:
(a) Device Data Sheets for all equipment specified.
(3) Hyperlinks:
(a) Hyperlinks can be used to enhance the bookmark tools but are not an acceptable substitute for electronic bookmarks.
(b) If hyperlinks are used, they should be clearly identifiable as a hyperlink but using a different color text similar to how MS Office documents identify hyperlinks.

1.02 MAINTENANCE MATERIALS SUBMITTALS

A. Furnish one spare set of MERV 8 filters per unit.

1.03 DESIGN CRITERIA

A. Manufacturer shall provide equipment as specified and install equipment furnished by others to result in complete and operational unit. Manufacturer shall assume single source responsibility for all components and accessories.

B. Furnish units complete with fans, piping, valves, piping specialties, motors, coils, drain pans, filter sections, damper sections and interior lighting, meeting configuration and as shown on drawings, specified and as scheduled.

C. Unit performance shall be in accordance with AHRI 430 (I-P)and shall be Third Party certified and labeled.

D. All systems shall meet NFPA 90A flame and smoke generation requirements.

E. Unless otherwise indicated, galvanized steel shall be G90 according to ASTM A924/A924M (formerly ASTM A525), ASTM A653/A653M and ASTM A90 and aluminum sheet shall be 3003-H14 alloy, conforming ASTM B209/B209M.

F. Fan(s) shall comply with AMCA Publication 11 and bear the AMCA Certified Ratings Program seal for air performance and sound performance according to AMCA 211 and AMCA 311.

G. Damper(s) shall be licensed to bear the AMCA Certified Ratings Program seal for air performance, air leakage and efficiency in accordance with AMCA 511.

H. Motor furnished with fan shall not operate into motor service factor in any cases.

I. Where inlet and outlet ductwork at any fan is changed from that shown on drawings, submit scaled layout of the change and system effect factor calculations, indicating increased static pressure requirement as described in AMCA 201. This Contractor shall be responsible for any motor drive and/or wiring changes required as result of duct configuration changes at fan.

J. Unit static pressure to take into consideration actual static pressure loss of components furnished within unit and average pressure drop of the installed filters.

K. Wire brush all welds with solvent and wipe clean all bare metal before painting.

L. Units shall be constructed for ____ application and shall be designed for roof mounting on ____. For outdoor applications, allow for and wind loading in accordance with the governing building code when calculating allowable deflections.

(1) For outdoor applications, allow for and wind loading in accordance with the governing building code when calculating allowable deflections.

M. Units shall have a method of fan motor removal. Method shall allow for motors to be disconnected, handled and placed in an area that fully support the weight of the motor. Provide method of fan removal in shop drawings.

1.04 DELIVERY, STORAGE AND HANDLING

A. Delivery: The Contractor upon receipt of the equipment shall immediately verify that the equipment has not received damage during shipping and that all items listed on the bill of lading and the equipment manufacturer Shipping Documents are included in the shipment. If damage has occurred or if items are missing, the Contractor must note this on the equipment manufacturer Shipping List before accepting delivery of the equipment.

B. Storage and Protection: Store equipment and protect it from exposure to harmful weather conditions and at temperature conditions as recommended by equipment manufacturer. See the equipment manufacturer Equipment Storage Instructions included in the Operations and Maintenance Manual, and raw material and component manufacturer’s instructions and Operations and Maintenance Manuals.

C. The equipment manufacturer shall seal fluid and air openings prior to shipment. Blow all coils free of water. Coils damaged by freezing to be replaced not repaired.

D. The equipment manufacturer shall protect coils with sheet metal blank-offs secured to both upstream and downstream faces of coils.

E. The equipment manufacturer shall deliver products to site with protective coverings and factory installed lifting lugs.

1.05 DOCUMENTATION

A. Provide the following information within the unit as it ships for Contractor use:

(1) As Built Electrical Drawings
(2) All O&M Information including coils, fans, damper actuators, pressure gauges, etc.
(3) Factory test results
(4) Control Points List
(5) Unit Submittal

1.06 MANUFACTURER QUALIFICATIONS

A. Unit manufacturer shall be held responsible for specified performance of units.

B. Each unit shall bear a third party label indicating the complete unit is listed as an assembly. Third party listing of individual components, or control panels only, is not acceptable.

(1) Third party agencies shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) to Label Electrical & Mechanical Equipment.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. TMI, CAHS, Haakon or Buffalo with operating characteristics as scheduled and physical dimensions as shown on drawings and/or detailed.

2.02 UNIT CONFIGURATION

A. Exhaust Inlet with Isolation Damper

B. Coil Bypass with Isolation Damper

C. MERV 8 Filter Rack

D. Heat Recovery Coil

E. Discharge Plenum with OA Make-Up Damper

F. Piping Vestibule

2.03 LABELING

A. Label all coil connections (e.g. “Heat Recovery Supply”, “Heat Recovery Return”, etc.).
   (1) Phenolic Nameplates:
      (a) ASTM D709, Type I, cellulose, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore.
      (b) Nameplates shall be approximately 1-1/2” x 4”, 1/16” thick, and have 1/2” high lettering. Face of plastic shall be black with white letters.
      (c) Fasteners shall be self-tapping, stainless steel screws.

B. Heat recovery unit access doors shall have warning label stating “Do not enter without appropriate training and PPE.”

2.04 UNIT BASE

A. Unit base shall be fabricated of structural steel around unit perimeter and all section splits with additional structural members to support installed equipment. Breakformed shapes or channels in base will not be accepted.
   (1) Base shall be 6"(min).

B. Weld bases solid at connection points to assure rigidity. Size perimeter members to allow for rigging and handling.

C. Locate and size base cross supports to support internal components. Breakformed cross supports will not be acceptable.

D. Each section shall be equipped with a minimum of four permanently welded lifting lugs attached to perimeter base steel. Incorporate means of attaching cable or chain into each lug.

E. Base shall be split in maximum size pieces to allow for economical shipment to jobsite and placement within building. Provide bolting members on both sides of split for field joining. Welding of sections for reassembly will not be permitted.

2.05 UNIT FLOOR

A. Unit floor shall be constructed to meet the maximum allowable deflection, and constructed of no lighter than:
   (1) 3/16” (min) aluminum checker plate

B. Floor joints and seams shall be continuously welded water tight. Each section shall have turned up lip on the inside of the panels around section perimeter with welded corner to form drain pan type floor capable of retaining minimum 1-1/2” of water without leakage.

C. Locate 1-1/2” aluminum floor drain with aluminum or stainless steel strainer in each pan type floor section. 1-1/2” aluminum or stainless steel pipe shall extend through perimeter base channel and be welded water tight. Provide threaded end and removable cap on each drain connection.

D. Weld flooring material to structural members below. Drive screw attachment is not acceptable.

E. Entire floor including floor drain piping and drain pans shall be insulated on underside to have same thermal and acoustical performance specified for unit housing. Insulation shall be supported by minimum 20 ga aluminum liner with joints sealed to provide continuous vapor barrier.

F. Base Drain Pans:
   (1) Provide recessed drain pans as integral part of unit floor under all coils.
   (2) Drain pans shall be constructed from 16 ga (min) Type 304 SS sheet, all seams continuously welded.
   (3) Drain pan shall be triple sloped to drain connection.
   (4) Locate drain connections at lowest point of pan. Connections shall extend through perimeter base channel and be continuously welded to insure air-tight seal as well as eliminate requirement for backup wrench during field piping. Provide removable cap on each drain connection.
   (5) Total drain pan height shall be 3” (min).
   (6) Provide walk on aluminum bar grating over base drain pan(s). Bar grating to be attached via bolt on clips to allow removal for cleaning and unit maintenance.

2.06 UNIT HOUSING

A. Unit housing shall be constructed of 4" (min) thick double wall, insulated panels meeting thermal, acoustical and structural requirements specified.

B. Panels shall utilize modular panel type construction. Panels may be self-supporting with internal support structure or supported by structural frame work. Structural frame work to be fully insulated and thermally broken from unit exterior.

C. Panel joints and seams shall be sealed with proper gasket and caulking to meet maximum allowable housing leakage rate specified.

D. Panel system shall incorporate thermal break design at panel frames, joining mullions, supporting base, or corners. Thermal break is defined as prevention of condensation on outside surface of unit casing with 95°F dry bulb and 85°F wet bulb temperature in adjacent space and 65°F dry bulb temperature inside unit.

E. Unit manufacturer shall submit, as part of shop drawings, details of thermal break construction and calculations or test data indicating that thermal break design will prevent condensation on outside surface of unit casing with specified air temperatures at outside of unit and specified air temperature at inside of unit.

F. Outer face of unit housings shall be constructed of no lighter than:

(1) 0.050" stucco embossed aluminum.

G. Solid inner face of panels shall be constructed of no lighter than:

(1) 0.050" flat aluminum.

H. Insulation

(1) Composite panel shall have heat transfer factor not greater than 0.055 Btu/hr/sq ft/°F. All products as applied shall meet NFPA 90A possessing flame spread rating of not over 25, fuel contributed rating of not over 50 and smoke developed rating of not over 50.

(2) Insulation: Closed Cell Foam.

I. Provide vertical partition to divide units into modules, as detailed on drawings. Partition panels shall be same construction as housing wall panels.

J. Provide blank-off panels with proper gaskets and sealants to prevent air bypass around equipment such as filters and coils. Blank-off panels shall be constructed of galvanized steel no lighter than 16 ga unless otherwise noted. Blank-off panels at coil sections shall be 16 gauge, Type 304 stainless steel construction with 1” closed cell insulation to prevent condensation.

K. Manufacturer shall have published literature available describing load-carrying capabilities and thermal characteristics of the panel system.

L. Roof of outdoor units shall be constructed with standing seam, water-tight joints and sloped 1/8” per foot (min).

2.07 PIPING VESTIBULE

A. Piping vestibule shall be constructed using the same materials as the unit housing and unit floor.

B. Provide _____.

C. Provide (2) LED marine lights in the section.

(1) Install lights on sidewalls of piping vestibule.

(2) Lights shall be controlled by a dedicated mechanical timed light switch.

2.08 ACCESS DOORS

A. Each unit section shall have 24” x 72” (min) access door. When the unit plenum height is less than 72”, the door shall be no shorter than the plenum height less 12” with the shortest door acceptable being 30” in height.

B. Access doors and door frames shall have same thermal break construction as specified under Unit Housing.

C. Access doors and door frames shall have same thermal break construction as specified under Unit Housing.

D. Access doors shall be same construction as housing panels.

E. Access doors shall be guaranteed tight closing through use of seals around entire periphery. Provide replaceable gasket between door frame and housing for air tight seal.

F. Each access door shall contain 1/4” thick wire glass or double glazed tempered glass window minimum size of 12” x 12” or equivalent round with centerline of window at 5’-6” from adjacent walking surface. Window shall be double paned with vapor seal construction.

(1) Piping vestibule doors do not require view windows.

G. Each access door shall be furnished with stainless steel metal hinges or stainless steel continuous piano hinge and shall have at least three handles per door operable from either side. Provide locking capability at each access door either integrated into door hardware or provide hardware for padlock by others.

(1) Door handles shall be Allegis 2650-304 pad lockable with handles on both sides of door.

(2) Where a single door has multiple handles, they shall be interconnected via a handle rod such that a single handle turns all handles simultaneously.

H. Doors shall open against higher air pressure.

I. Provide all access doors with door tie-backs.

J. Provide access doors of pressurized sections with test ports.

2.09 ACCESS SECTIONS

A. Access sections shall allow minimum of 30” between adjoining equipment. Provide access doors as indicated on the plans.

2.10 REMOVABLE ACCESS PANELS

A. Removable access panels shall be provided for removal of coils and fans or as indicated on drawings and where equipment removal is not possible through access door. Removable panels shall be same construction as housing panels.

B. Removable access panels shall be screwed in place on 6” centers.

2.11 PRESSURE RELIEF DOORS

A. Provide (_____) 18x18 negative pressure relief door. Door and frame shall be 12 ga (min) galvanized steel with seal around door perimeter.

B. Doors shall open automatically to relieve excess pressure above 6” WG set point (FA) and to close when pressure is reduced to less than 3” WG. Setting shall be adjustable from 3” to 8” WG with 1” WG increments in between.

2.12 FILTER SECTIONS

A. Holding frames shall be installed by unit manufacturer to raise filters off floor and to prevent leakage as specified by unit manufacturer.

B. Frames shall be minimum 16 ga galvanized steel construction with provisions for assembly in a bank. Frames shall be suitable for filters scheduled and incorporate gaskets and spring clips to prevent air bypass.

C. All filter frames shall be designed for face loading of filters.

D. MERV 8 Filters:

(1) Provide AAF MEGApleat M8 or Farr 30/30.

(2) Filters shall be 24x24x2.

(3) Furnish three full sets for each unit.

(a) Install one set during construction.

(b) Install one set prior to TAB.

(c) Deliver one set to the Owner for stock.

2.13 DIFFERENTIAL AIR PRESSURE INDICATORS

A. Provide _____ Differential Pressure Transmitter.

B. Range shall be 0 - 3" WG.

C. Provide gauges across each individual filter bank in built-up rack assemblies, suitable for surface mounting, including air filter gauge accessory package for use with 1/4” OD copper tubing.

D. Provide 2” spacer at one 2' x 2' filter section between filter elements in built-up rack, adjacent to unit wall for placement of intermediate pressure probe.

E. Mount gauges on side of casing at ±5’-6” above adjacent walking surface.

2.14 COIL SECTION

A. Provide coils, piping and internal piping as specified and indicated on drawings.

B. Install coils, internal piping, and specialties not to block face area of coils. Where coils are required to be dual-width coils due to length limitation, provide header connection piping to unit exterior and coil removal track assemblies to guide dual-width coils within the unit to unit exterior. Terminate piping 3” outside of unit casing for connection by Contractor. Provide necessary pipe supports and hangers. All piping specialties, valves, insulation, etc. to be provided by Contractor and installed in piping exterior to unit.

C. Provide for individual coil removal using stainless steel slide racks and/or I-beam immediately downstream of coil section. Coils shall be removable through unit access doors or removable access panels.

D. Tubes: Copper, 5/8 inch O.D., 0.035-inch wall thickness. Return bends shall be 0.049-inch wall thickness before bending.

E. Fin Thickness: Aluminum, 0.010 inch minimum.

F. Fin Spacing: 10 per inch maximum (continuous plate fins).

G. Maximum Fin Length: 10 feet per section. Die formed intermediate tube supports with oversized I.D. tube collars or with brass or nylon grommets shall be used when finned tube lengths equal or exceed 60 inches.

H. Maximum Fin Height: 54 inches.

I. Maximum Rows: 8 rows.

J. Minimum Tube Velocity: 6 ft/s.

K. Headers: Copper or Red Brass. Each header shall have a vent and a drain. Each vent and drain shall be individually extended through the unit-housing wall and constructed complete with shut-off valve and cap.

L. Channel frame casing, frame structure, slide rack and fasteners shall be constructed of 16 gauge (min), Type 304 stainless steel.

M. Mount coils in a channel frame casing designed for bolting to other sections of equipment.

N. Provide bolted frame structure to support and allow for individual coil removal.

O. All water coils shall be fully drainable incorporating vents and drains on all headers, including intermediate headers.

P. Coils shall be tested at 315 psig under water.

Q. Corrosion Protection Coating

(1) Provide _____ on coils.

2.15 DISCHARGE AIR SECTION

A. Provide all air discharge connections with spun bellmouth discharge opening conforming to size and configuration of the ductwork. Abrupt 90 degree duct discharge connections are not acceptable.

2.16 CONTROL DAMPERS (BYPASS DAMPERS)

A. Acceptable Manufacturers: TAMCO Series 1000 or Ruskin Model CD50.

B. Control dampers shall be installed by unit manufacturer at factory. Coordinate electric actuator requirements with Controls Contractor.

C. Bypass control dampers shall be parallel blade type.

D. Dampers shall be AMCA rated for Leakage Class 1A at 1 in w.g. static pressure differential. Standard air leakage data to be certified under the AMCA Certified Ratings Program.

2.17 INSULATED CONTROL DAMPERS (MAKEUP AIR)

A. Acceptable Manufacturers: TAMCO Series 9000 or Ruskin TED50XT.

B. Control dampers shall be installed by unit manufacturer at factory. Coordinate electric actuator requirements with Controls Contractor.

C. Modulating control dampers shall be opposed blade.

D. Dampers shall be AMCA rated for Leakage Class 1A at 1 in w.g. static pressure differential. Standard air leakage data to be certified under the AMCA Certified Ratings Program.

2.18 STATIONARY LOUVER

A. Provide extruded aluminum stationary drainable louver with drain gutters in each blade and head with downspouts in jambs and mullions with all welded construction.

(1) Color to match unit housing.

B. Frame Depth shall be 6 inches.

C. Provide aluminum bird screen behind louver.

D. Provide rain hood.

(1) Color to match unit housing.

2.19 ROOF CURB

A. Roof curb shall be _____ high and constructed from minimum 12ga galvanized steel. At each of 4 corners, curb shall be joined together with corner post that is welded to one section of curb and then field bolted to adjacent section. Wood nailer shall be attached to inside flange of curb for field attachment of flashing and roof membranes.

2.20 CONTROLS

A. Control devices shall be by same manufacturer providing control devices for the remainder of the building.

B. Control devices will be furnished by Contractor and shall be field installed as shown on plans and as described in control section of specifications.

C. Seal all conduit penetrations with neoprene grommets or other professional method. Sealing conduit penetrations with caulk alone is not acceptable. Fill inside of conduit with silicone sealant to prevent air leakage.

D. All wiring penetrations through the casing shall be protected in ‘RIGID’ type metal conduit.

2.21 FACTORY TESTING

A. Notify Owner, Designer and Contractor of factory test date at least 30 days in advance. Submit certified test data to Designer for approval.

B. Manufacturer shall provide factory tests to verify casing deflection and leakage after units are assembled.

C. Pay for all expenses for _____ representative, designated by Owner, to travel to the factory to witness casing deflection and leakage tests. Construction of units shall be coordinated such that testing of the following equipment can be accomplished in a single factory trip. All other equipment specified in this section that is not selected for witness testing shall be tested without Owner representative witnessing the testing.

D. Casing leakage tests shall verify that unit casing leakage is less than of _____ design air flow at _____ WG.

(1) Seal all unit openings. Connect unit to fan developing _____ WG and read air flow of this fan using approved air flow measuring device. Fan air flow measurement shall be considered casing leakage.

(2) Conduct leakage test for both positive and negative pressure. In either case, the casing leakage shall not exceed maximum allowable rate specified above.

E. Unit manufacturer shall provide factory panel deflection test. Conduct this test in conjunction with casing leakage testing.

(1) Panel deflection test for panels shall verify that unit casing deflection is less than _____ of the longest plane being measured at _____ WG negative.

(2) Deflection shall be measured at 8 total points at mid-point of panel height around unit.

2.22 FIELD TESTING

A. Notify Owner, Designer and Contractor of factory test date at least 30 days in advance. Submit certified test data to Designer for approval.

B. Contractor shall provide field tests to verify casing leakage after units are assembled on site.

C. Casing leakage tests shall verify that unit casing leakage is less than _____ of design air flow at _____ WG.

(1) Seal all unit openings. Connect unit to fan developing _____ WG and read air flow of this fan using approved air flow measuring device. Fan air flow measurement shall be considered casing leakage.

(2) Conduct leakage test for both positive and negative pressure. In either case, the casing leakage shall not exceed maximum allowable rate specified above.

D. Owner hall provide field panel deflection test. Conduct this test in conjunction with casing leakage testing.

(1) Panel deflection test for panels shall verify that unit casing deflection is less than _____ of the longest plane being measured at _____ WG negative.

(2) Deflection shall be measured at 8 total points at mid-point of panel height around unit.

2.23 ELECTRICAL SERVICE

A. The unit shall be power wired for independent power source for lights and GFCI receptacles on one switch, separate from the motor power source entrance. Lighting/convenience outlet circuit shall receive power from a dedicated 20 amp, 120 volt circuit.

B. Lights, switches, GFCI receptacles, wiring and conduit shall meet requirements of appropriate specification sections of Division 26.

(1) Provide one mechanical timed light switches to automatically turn off all lights after preset time. Timer shall be similar to Intermatic Model FF32HH with 0-2 hour range and hold feature to override automatic shut-off function.

(2) Provide one GFCI duplex receptacle on the pipe connection side of the unit and one GFCI duplex receptacle within the pipe vestibule.

(3) All wiring penetrations through the casing shall be protected in ‘RIGID’ type metal conduit.

C. LED Marine Lights:

(1) Provide two (min) per access section

(2) UL listed for wet locations, IP66 rated

(3) Housing: marine-grade or painted cast aluminum housing with guards and gasketed seal

(4) Lens: glass globe

(5) Lamps: light emitting diode with 50,000 hr (min) life at L70

(6) Light Output: 600 lumens (min); 60 lumens/W (min)

(7) Color Temperature: 4000K

D. Wiring and conduit inside of unit shall be provided by unit manufacturer meeting requirements of appropriate specification sections of Division 26. Conduit within unit shall be EMT, with 12” (min) to 24”(max) of flexible metal conduit for final motor connections. Conduit on exterior of unit shall be galvanized Rigid Metal Conduit. Wiring shall be stranded copper THHN/THWN.

E. Seal all conduit penetrations with neoprene grommets or other professional method. Sealing conduit penetrations with caulk alone is not acceptable. Fill inside of conduit with silicone sealant to prevent air leakage.

F. Provide laminated as built electrical wiring diagrams affixed to the backside of high voltage electrical panel door.

2.24 PIPED SERVICE

A. Interior piping and equipment installation shall be complete. Piping shall be installed and tested per appropriate specification section. Unit manufacturer shall be responsible for any leaks in factory installed piping, which occur in unit during system testing which occurs before system startup.

B. Extend piping for each coil through panel casing. Terminate piping 3” into piping vestibule with flange for pipe 2-1/2” and larger or threaded connection for pipe 2” and smaller with caps.

C. Seal all piping penetrations with neoprene grommets or other professional method. Sealing piping penetrations with caulk alone is not acceptable.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Units shall be assembled in modules in unit manufacturer's plant to allow for testing of complete unit.

B. Unit manufacturer shall supervise and be responsible for all field joining of the modules, including sheet metal, electrical and piping. Local trades may provide labor for unit assembly and installation.

C. Joints in floor between modules shall be air and water tight.

D. Unit manufacturer shall furnish and install all equipment within unit as specified including fans, motors, coils, dampers, sound attenuating devices, piping, piping specialties, ductwork specialties, lights, switches and all equipment necessary to complete equipment contained within housings. Mechanical and electrical connections (i.e., piping and conduit) shall be stubbed through housing so that appropriate contractor may provide service to unit. Electrical wiring and control wiring shall terminate in junction boxes on accessible side of unit.

E. Field mounting of any equipment on housing walls or roof is not allowed without prior approval of Designer.

F. Unit manufacturer and Contractor shall coordinate all necessary requirements to assure proper unit installation.

3.02 PROTECTION OF OPENINGS

A. Protect openings on housings during construction against entry of foreign matter and construction dirt.

3.03 ON-SITE STORAGE

A. The Contractor shall either place the units in a controlled indoor environment or shall loosely but securely cover the units with protective coverings and place them in a covered and well-drained area so that they can breathe. Covering units with shrink wrap shall not be acceptable.

B. Under no circumstance shall the units be left in a state that water can enter the unit.

C. Provide a desiccant media in a plastic pan/bucket in each access section to prevent moisture build up in the unit. Change out desiccant media monthly or as needed until the unit is operational.

D. Provide a dehumidifier in each section to prevent moisture build up in the unit.

3.04 PRESSURE RELIEF DOORS

A. Install _____pressure relief door in the fan section dividing wall in accordance with the manufacturer's instructions.

B. Pressure relief door shall have an end switch that sends an alarm to the BAS when it is tripped.

3.05 DIFFERENTIAL AIR PRESSURE INDICATORS

A. Install static pressure sensors according to manufacturer's instructions.

3.06 MANUFACTURER'S FIELD SERVICES

A. Installation Supervision: Provide services of factory authorized service representative to provide installation supervision. Installation supervision is included for three eight-hour weekdays unless additional days are included in the purchase agreement. The Contractor is to notify the Manufacturer 30 days in advance of the installation.

B. Startup Supervision: Provide services of factory authorized service representative to provide start-up supervision. Start-up supervision is included for three eight-hour weekdays unless additional days are included in the purchase agreement. The Contractor is to notify Manufacturer 30 days in advance of the Start-up.

3.07 FIELD QUALITY CONTROL

A. Provide field test to verify casing leakage after units are installed at jobsite with supervision of test by Manufacturer. Coordinate power to unit test fan. Notify Owner, Designer, CM and Manufacturer of test date at least 2 weeks in advance. Submit certified test data to Designer for approval.

B. Perform casing leakage tests to verify integrity of the unit casing.

(1) Seal all unit openings. Connect unit to fan developing specified pressure and read air flow of this fan using approved air flow measuring device. Fan air flow measurement shall be considered casing leakage.

(2) Conduct leakage test for both positive and negative pressure. In either case, the casing leakage shall not exceed maximum allowable rate specified above.

C. Contractor shall be responsible for repair of any deficiencies found during field testing. Submit proposed corrections and certified test data to Designer for approval.

3.08 FINAL CLEANING

A. Outside and inside casings and all interior and exterior components of each unit shall be thoroughly cleaned. Use industrial grade cleaners to remove construction dust, sheet metal mil finish or grease. All proposed cleaning materials shall have contents identified and approved prior to use. Cover unit openings with sheet metal or other proper material until ductwork is connected to maintain unit cleanliness.

3.09 CLOSEOUT ACTIVITIES

A. Training:

(1) Provide services of factory authorized service representative to instruct Owner's personnel in operation and maintenance of units. Instruction includes 4 hours of training. Unless otherwise defined in the purchase agreement, the Owner's Instruction is to occur concurrent with the Installation Supervision or Start-Up Supervision.

END OF SECTION 23 73 25

SECTION 23 73 28 - FACTORY FABRICATED CUSTOM AIR HANDLING UNITS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 20 05 13 - Motors
B. Section 20 05 14 - Variable Frequency Drive (VFD) System
C. Section 20 05 29 - Piping and Equipment Supporting Devices
D. Section 20 07 00 - Mechanical Systems Insulation
E. Section 23 05 50 - Vibration Isolation
F. Section 23 09 01 - Control Systems Integration
G. Section 23 09 02 - Control Valves and Dampers
H. Section 23 09 03 - Control Instrumentation
I. Section 23 09 23 - Direct Digital Controllers and Networks
J. Section 23 09 93 - Control Sequences
K. Section 23 21 16 - Pipe and Pipe Fittings
L. Section 23 21 18 - Valves
M. Section 23 21 20 - Piping Specialties
N. Section 23 33 14 - Ductwork Specialties
O. Section 23 34 00 - Fans
P. Section 23 41 14 – Filters
Q. Section 23 72 14 – Heat Recovery Equipment
R. Section 23 82 16 - Coils
S. Section 23 84 13 - Humidification Equipment
T. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
U. Section 26 05 33 - Raceway and Boxes for Electrical Systems
V. Section 26 27 26 - Wiring Devices
W. Section 26 28 16 - Enclosed Switches and Circuit Breakers
X. Section 26 29 13 - Enclosed Controllers

1.02 SUBMITTALS

A. Shop Drawings (Product Data) for all equipment including, but not limited to, the following:
   (1) Appropriate identification
   (2) Complete drawings showing plans and sections including details of construction
   (3) Overall unit dimensions and individual components and sections dimensions
   (4) Shipping and operating weight of unit and/or sections
   (5) Structural design load
   (6) Details of component support
   (7) Capacities/ratings
   (8) Materials of construction
   (9) Thermal and acoustical performance of wall, roof and floor panels
   (10) Pressure ratings and leakage ratings
   (11) Thermal break construction details and performance calculations or test data
   (12) Each component manufacturer's name, model number and data (Refer to each component section for submittal requirements.)
   (13) Air leakage rates and test data
   (14) Wiring diagrams and terminal points for control panels provided with units
   (15) Manufacturer’s installation instructions
   (16) Air handling unit manufacturer’s local representative and phone number

1.03 DESIGN CRITERIA

A. For housings and floors operating under positive pressure (fan discharge side), maximum allowable deflection at panel midpoint shall not exceed 1/240th of any span in any direction at +10” WG.

B. For housings and floors operating under negative pressure (fan inlet side), maximum allowable deflections at panel midpoint shall not exceed 1/240th of any span in any direction at -10″ WG.

C. Furnish units complete with fans, piping, valves, piping specialties, actuators, motors, coils, humidifiers, drain pans, filter sections, damper sections and interior lighting, meeting configuration and as shown on drawings, specified and as scheduled. All unit components shall meet this Section of specification and all requirements specified in each section and division listed under Related Work. Control dampers shall be provided by unit manufacturer. Control dampers actuators will be furnished by Control Contractor for factory mounting by unit manufacturer.

D. All materials shall meet NFPA 90A Flame and Smoke Generation Requirements.

E. Units shall be UL or ETL listed in accordance with UL Standard 1995.

F. Unless otherwise indicated, galvanized steel shall be G90 according to ASTM A924 (formerly ASTM A525), A653 and ASTM A-90 and aluminum sheet shall be 3003-H14 alloy, conforming ASTM B209.

G. Each fan and motor combination shall be capable of delivering 110% of air quantity scheduled at scheduled total static pressure without operating into motor service factor.

H. Motor furnished with fan shall not operate into motor service factor in any cases.

I. Where inlet and outlet ductwork at any fan is changed from that shown on drawings, submit scaled layout of the change and system effect factor calculations, indicating increased static pressure requirement as described in AMCA Publication 201. This Contractor shall be responsible for any motor drive and/or wiring changes required as result of duct configuration changes at fan.

J. Air handling unit static pressure to take into consideration actual static pressure loss of components furnished within unit.

K. Structural integrity of unit's casing shall be sufficient to support piping and ductwork that are mounted above unit as shown on drawings.

1.04 FINAL CLEANING

A. Outside and inside of each air handling unit shall be thoroughly cleaned. Use industrial grade cleaners to remove construction dust, sheet metal mill finish or grease. All proposed cleaning materials shall have contents identified and approved prior to use. Cover unit openings with sheetmetal or other proper material until ductwork is connected to maintain unit cleanliness.

1.05 MANUFACTURER QUALIFICATIONS

A. Air handling units shall be manufactured by qualified unit manufacturer that has been making custom units for at least 10 yrs and shall carry manufacturer's nameplate. Unit manufacturer shall be held responsible for specified performance of units.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Alliance, Climate Craft, Engineered Air, Haakon, Nortek, Scott Springfield or approved equal with operating characteristics as scheduled and physical dimensions as shown on drawings and/or detailed.

2.02 UNIT BASE

A. Unit base shall be fabricated from structural or welded tubular steel.

B. Base shall be sized to provide sufficient height above floor to accommodate cooling coil gravity drain. Provide waterless trap similar to Des Champs Technologies N-Series HVAC Air-Trap at each cooling coil condensate drain.

C. Weld steel solid at connection points to assure rigidity. Size perimeter steel to allow for rigging and handling.

D. Locate and size base cross supports to support internal components.

E. Provide lifting lugs to perimeter base steel. Incorporate means of attaching cable or chain into each lug.

F. Base shall be split in maximum size pieces to allow for economical shipment to jobsite and placement within building. Provide bolting structural steel on both sides of split for field joining.

G. Unit base shall be primed and finished with rust inhibiting epoxy paint.

2.03 UNIT FLOOR

A. Unit floor shall be constructed to meet the maximum allowable deflection, and constructed of no lighter than:

(1) Floor plate shall be all welded 1/8" aluminum with diamond-tread.

B. Floor joints and seams shall be continuously welded water tight. Each section shall have turned up lip around section perimeter with welded corner to form drain pan type floor capable of retaining minimum 1-1/2" of water without leakage. Locate drain connection at lowest point of each pan type floor section. Connections shall extend through perimeter base channel and be welded water tight. Provide removable cap on each drain connection.

C. Entire floor including base drain pans shall be insulated on underside to have same thermal and acoustical performance specified for unit housing. Insulation shall be supported by minimum 22 ga galvanized steel liner with joints sealed to provide continuous vapor barrier.

D. Base Drain Pans:

(1) Provide recessed drain pans as integral part of unit floor in pre-heating coils, outside air sections and humidifier sections.

(2) Drain pans shall be constructed from minimum 1/8" aluminum with diamond tread or 16 ga 304 SS sheet, all seams continuously welded with minimum 2" turned up.

(3) Drain pan shall be double sloped; pitched down in direction of air flow and pitched sideways to drain connection.

(4) Locate drain connections at lowest point of pan, one on either end. Connections shall extend through perimeter base channel and be continuously welded to insure air-tight seal as well as eliminate requirement for backup wrench during field piping. Provide removable cap on each drain connection.

(5) Refer to Cooling Coil Section for cooling coil drain pan requirements.

2.04 UNIT HOUSING

A. Unit housing shall be constructed of minimum 4" thick double wall panels meeting thermal, acoustical and structural requirements specified.

B. Panels shall utilize modular panel type construction. Panels may be self-supporting with internal support structure or supported by structural frame work.

C. Panel joints and seams shall be sealed with proper gasket and caulking to meet maximum allowable housing leakage rate specified.

D. Panel system shall incorporate thermal break design at panel frames, joining mullions, supporting base, or corners. Thermal break is defined as prevention of condensation on outside surface of unit casing with 95.9ºF dry bulb and 74.3ºF wet bulb temperature in adjacent space and 50°F dry bulb temperature inside air handling unit.

E. Unit manufacturer shall submit, as part of Shop Drawings, details of thermal break construction and calculations or test data indicating that thermal break design will prevent condensation on outside surface of unit casing with specified air temperatures at outside of unit and specified air temperature at inside of unit.

F. Manufacturer's standard wash down liner is considered acceptable in lieu of thermally broken panel system as specified above.

G. Outer face of panels for indoor units shall be constructed of no lighter than:

(1) 16 ga galvanized steel.

H. Solid inner face of panels shall be constructed of no lighter than:

(1) 20 ga galvanized steel

(2) Unit casing shall be insulated with minimum 3 pcf density glass fiber, or 3 pcf density polyurethane foam insulation. Composite panel shall have heat transfer factor not greater than R-16 or 0.06 Btu/(h·ft2·°F.All products as applied shall meet NFPA 90A possessing flame spread rating of not over 25 and smoke developed rating of not over 50.

I. Use solid inner surface for all sections

J. Provide blank-off panels with proper gaskets and sealants to prevent air bypass around equipment such as filters, coils, and humidifiers. Blank-off panels shall be constructed of galvanized steel no lighter than 16 ga unless otherwise noted. Blank-off panels at cooling coil sections shall be insulated with 3/4" thick insulation similar to AP Armaflex SA Duct Liner. Do not insulate blank-off panels between cooling coils located above drain pans.

K. Panel manufacturer shall have published literature available stating sound absorption coefficient of panel system obtained using ASTM Method of Test for Sound Absorption of Acoustical Materials in Reverberation Rooms (ASTM Designation C423-66), and sound transmission loss obtained using procedures conforming to ASTM Designation E90-70, E413-70T and other pertinent standards.

(1) Sound Transmission Loss in accordance with ASTM E90 shall equal or exceed the following:

	Octave Band Center Frequency (Hz)					
	125	250	500	1000	2000	4000
Transmission Loss (dB) of 4" Panels	21	24	34	44	51	53

(2) Sound performance tests must be documented by independent laboratory (ETL, Riverbank Laboratories, Kideras Labs, etc.).

L. Manufacturer shall also have published literature available describing load-carrying capabilities and thermal characteristics of the panel system.

2.05 ACCESS DOORS

A. Each unit section shall have 24” x 72” access door, unless shown differently on drawings.

B. Fan section access door shall be sized to allow removal of fan wheel and motor through door, but not smaller than 30” x 72”. If access door needs to be wider than 36”, removable access panel may be provided.

C. Access doors and door frames shall have similar thermal break construction as specified under Unit Housing.

D. Access doors shall be same construction as housing panels.

E. Access doors located downstream of cooling coils shall be true thermal break design with no metal to metal contact.

F. Access doors shall be guaranteed tight closing through use of seals around entire periphery. Provide neoprene gasket between door frame and housing for air tight seal.

G. Each access door shall contain 1/4” thick wire glass or double glazed tempered glass window minimum size of 10" x 12" or 12" round. Window shall be double paned with vapor seal construction.

H. Each access door shall be furnished with corrosion resistant metal hinges or continuous piano hinge and shall have at least 2 stainless steel or aluminum alloy handles operable from both sides.

I. Doors shall open against higher air pressure to affect seal.

2.06 ACCESS SECTIONS

A. Access sections shall allow minimum of 30” between adjoining equipment. Provide access doors as indicated on the plans.

2.07 REMOVABLE ACCESS PANELS

A. Removable access panels shall be provided as indicated on drawings and where equipment removal is not possible through access door. Removable panels shall be same construction as housing panels.

2.08 FILTER SECTIONS

A. Filters shall be provided as specified and scheduled. Holding frames shall be installed by unit manufacturer to raise filters off floor and to prevent leakage in accordance with filter manufacturer’s installation recommendation by unit manufacturer. Filters shall be equipped with sensing tubes and differential pressure gauges to monitor filter loading. Filters shall be furnished with magnehelic differential pressure gauges to monitor filter pressure drop and loading. Frame shall be similar to Camfill Fast frame or approved equal.

2.09 HEAT RECOVERY SECTION

A. Provide heat recovery equipment and exhaust energy recovery section integral to air handling unit as shown on drawings and as specified in Specification 23 7214. Vertical sheet metal partition shall be provided between supply and exhaust tunnels and shall be completely sealed to prevent cross contamination between supply and exhaust airstreams.

2.10 PREHEAT COIL SECTION

A. Provide preheat coils, piping and internal piping as specified and indicated on drawings.

B. Install coils, piping, and specialties not to block face area of coils. Terminate piping outside of unit casing for connection by Mechanical Contractor. Provide necessary pipe supports and hangers.

C. Each coil shall be supported by galvanized steel frame which is independent of unit casing. Support frame shall allow individual coil removal. Coils shall be removable through unit access doors. Blank-off panels shall be galvanized steel sheets.

2.11 COOLING COIL SECTIONS

A. Provide cooling coils, piping and piping specialties specified, and indicated on drawings.

B. Install coils, internal piping, and specialties not to block face area of coils. Terminate piping outside of unit casing for connection by Mechanical Contractor. Provide necessary pipe supports and hangers.

C. Each coil shall be supported by 304 stainless steel frame which is independent of unit casing. Support frame shall allow individual coil removal. Coils shall be removable through unit access doors or removable access panels. Blank-off panels shall be 304 stainless steel sheet with insulation as specified.

D. Each coil shall be provided with minimum 16 ga 304 stainless steel all welded condensate drain pan extending min. 6", but no more than 12" downstream of coil face. Each drain pan shall have sufficient depth to hold condensate water but not less than 2". Bottom drain pan shall extend min 18". Drain pans shall cover U bends of coil and any other pipes and components that form condensation. Drain pan shall be sloped in 2 directions (pitched down in direction of airflow and pitched sideways to drain connection) for self-drainage at minimum 1/4" per foot. Drain pan shall be individually piped down to drain pan located below, and bottom drain pan to be piped to hub drain at exterior of unit. Drain connection opening shall be flush with bottom of pan. Side pan connection located at lowest point of pan may be used only where bottom pan connection cannot be used. Drain pipes of intermediate and main drain pans shall be 304 stainless steel with sufficient size, but not less than 1-1/2"

E. Instead of drain pan under bottom coil, recessed pan, integral with unit floor may be used. It shall be constructed as specified above including thermal insulation and drain lines, and shall incorporate required drain trap height.

2.12 FAN SECTION

A. Fan and motor shall be provided as scheduled and meet requirements of appropriate Specification Sections.

B. Fan and motor shall be factory mounted on vibration isolation equipment meeting requirements of Section 23 05 50 - Vibration Isolation. Vibration base shall include integral adjustable motor base. If inertia bases are required, provide required concrete in factory.

C. Vibration isolation base shall have seismic restraints capable of containing fan in all directions with up to 1G of force applied.

D. Unit manufacturer shall provide flexible connection between fan and discharge wall.

E. Motor Removal:

(1) Provide motor removable winches per fan array.

(2) For motors 15 hp and larger, provide motor removal rail sized for L/400 deflection when fully extended and subjected to weight of motor at furthest extreme position.

(3) Removal rail shall be mounted in fan section, directly over motor, perpendicular to side of AHU.

(4) Removal rail shall be designed with roller so motor can be fully removed from unit to distance motor diameter plus minimum of 6", and lowered onto dolly with traversing arm able to freely move while carrying motor weight.

(5) Motor shall be able to be removed through access door or access panel.

F. Fan Array:

(1) Fan array system shall consist of multiple, direct driven, arrangement 4 plenum fans constructed per AMCA requirements for duty specified. Fans shall be selected to deliver scheduled airflow quantity at scheduled operating total static pressure and scheduled fan/motor speed. Fan array shall be selected to operate at system total static pressure that does not exceed 90% of scheduled fan's peak static pressure producing capability at scheduled fan/motor speed. Each fan/motor cube shall include 11 ga, A60 Galvanized steel intake wall, 14 ga spun steel fan inlet funnel, and 11 ga G90 Galvanized steel motor support plate and structure. Motors shall be standard pedestal mounted type, T-frame motors selected at specified operating voltage, rpm, and efficiency as needed to meet performance requirements. Motors shall include isolated bearings or shaft grounding. Each fan/motor cartridge shall be dynamically balanced to meet AMCA standard 204-96, category BV-5, to meet or exceed Grade 2.5 residual unbalance.

(2) Fan array shall provide uniform air flow and velocity profile across entire air way tunnel cross section. Airflow and velocity shall not exceed scheduled cooling coil and/or filter bank face velocity when measured at a point 12" from intake side of fan wall array intake plenum wall, and distance of 48" from discharge side of fan wall intake plenum wall.

(3) Fan array includes manufacturer-provided individual air flow meters for each fan with totalization display panel mounted to unit. Refer to Section 23 09 03 Control Instrumentation.

(4) Provide partition between fans to minimize system effect.

(5) Provide structural frame to support upper fans with solid floor panel partition between fans as shown on drawings to minimize system effect.

(6) Each fan/motor cube shall be equipped with metal grating fan outlet guard.

(7) Each fan in array shall be provided with back flow prevention means that produces less than 0.10" of static pressure drop and/or system effect when that fan is enabled. Any such system effects and/or pressure drops shall be submitted and included as component in determining fan system total static pressure as submitted. Manufacturer's pressure drop ratings of any such equipment, developed from straight run test conditions will not be accepted.

(8) Provide one VFD per fan.

(9) Provide local electrical disconnect for each fan.

(10) Contractor shall provide all wiring to air handling unit components that require power.

(11) Static regain diffuser

(a) For each fan in array provide static regain diffuser similar to Aero Acoustic Diffuser or approved equal. If static regain diffuser is not provided, fan manufacturer shall provide selections to show efficiencies are equivalent to fans provided with static regain diffuser.

(b) Fully galvanized construction features two diffuser sections mounted at the front and back of the fan wheel. Acoustic attenuating material inserted within a solid housing and perforated frontplate directs airflow across the diffuser to reduce discharge sound power levels and increase static efficiency.

G. Fan Array Airflow Measuring Station:

(1) Unit manufacturer shall provide airflow measurement pressure taps for each individual fan in array and shall provide the factory determined flow coefficient for the fans being furnished. If pressure taps are not available for the fans being supplied, the use of Pitot-type fan inlet airflow sensors is acceptable. Airflow meter shall not create system effect that adversely affects fan performance.

(2) Furnish and install fan array airflow totalizing system which monitors the airflow capacity of each individual fan based on the differential pressure and flow coefficient, and shall provide a totalized airflow rate to the BAS for control and monitoring purposes.

(a) Fan array airflow totalizing system

1) Manufacturers: Ebtron, Paragon Controls Inc., Model FAATS-1000 or equal as approved by the Engineer.

2) Accuracy: ±0.25 percent of full scale including non-linearity, hysteresis, deadband and non-repeatability for each fan in the array.

3) Signal Conversion Resolution: 16-bit A/D and 12 bit D/A.

4) Outputs:

1. Analog total CFM output: 0 – 5 VCD, 0 – 10 VDC, or 4 – 20 mA (Field selectable)

2. Digital alarm output: single dry contact rated for 5 amps @ 30 VAC/VDC & 10 amps @120 VAC/VDC

5) Human-Machine-Interface (HMI) Panel: For air volume indication and configuration of the fan array airflow totalizing system. The HMI shall provide continuous on screen indication of each individual fan's airflow rate and operational status, and shall display the totalized airflow rates for each fan array numerically and graphically as a percent of total design flow. The graphic screen shall be configured to match the fan array layout. Individual fan diagnostics via the HMI panel to indicate the measured differential pressure being reported by each individual fan as well as transducer output. Automatic zero and span calibration for each individual differential pressure transducer performed via the HMI.

6) Alarms: Individual fan failure alarms and warning alarms for when an individual fan's airflow rate is either above or below the average for all fans by a programmable percentage value. A failed fan alarm initiated when the airflow rate for an individual fan goes to zero. The fan (or fans) that are in an alarm state shall be shown on the HMI graphics screen in flashing yellow for warning and red for failed.

7) Network Communication: For monitoring and control purposes via BACnet®-MS/TP Master Communication network to the BAS. The network information shall provide individual fan information and remote configuration of all programmable values.

8) Enclosure: NEMA 4 Steel

9) Remote Panel: For fan array monitoring systems measuring both supply and return fan arrays in a single air handling unit, provide a remote transducer panel to minimize the pneumatic tubing.

2.13 HUMIDIFIER AND EVAPORATIVE PRECOOLING SECTIONS

A. Provide humidifiers, piping and supports as specified, and indicated on drawings.

B. Provide required absorption distance between humidifier and downstream equipment or housing wall.

2.14 DISCHARGE AIR SECTION

A. Provide with framed discharge opening or spun bellmouth fitting conforming to size and configuration of the ductwork.

2.15 CONTROL DAMPERS

A. Refer to Section 23 09 02 - Control Valves and Dampers, for control dampers.

B. Outside air dampers shall be similar to Tamco Series 9000 BF or Ruskin TED.

(1) Bearings shall be composed of Celcon inner bearing fixed to 7/16" aluminum hexagon blade pin, rotating within polycarbonate outer bearing inserted in frame, resulting in no metal-to-metal or metal-to-plastic contact.

(2) Linkage hardware shall be installed in frame side and constructed of aluminum and corrosion-resistant, zinc-plated steel, complete with cup-point trunnion screws for slip-proof grip.

(3) Dampers shall be designed for operation in temperatures ranging between -40°F and 212°F.

(4) Air leakage through 48" x 48" damper shall not exceed 4.12 cfm/ft2 against 4" WG differential static pressure at standard air.

(5) Pressure drop of fully open 48" x 48" damper shall not exceed .03" WG at 1000 fpm.

2.16 SMOKE ISOLATION DAMPERS

A. Refer to Section 23 33 14 – Ductwork Specialties for Smoke Damper specification

B. All Air Handling Units to be provided with discharge smoke/isolation dampers.

2.17 CONTROLS

A. Control devices, will be furnished by Control Contractor and shall be factory installed by unit manufacturer as shown on plans and as described in control section of Specifications. Control devices may be field installed by the Controls Contractor as long as all necessary conduit and sleeved openings for control devices are coordinated between AHU manufacturer and Controls Contractor.

B. Control devices will be provided by Control Contractor. Unit manufacturer shall coordinate with Control Contractor and provide sleeved openings on unit housing for control devices as required and as shown on submittal drawings.

C. Control devices shall be provided by equipment manufacturer. Control devices shall meet quantities, specifications and requirements as indicated in Sections 23 09 01, 23 09 02, 23 09 05, 23 09 23, and 23 09 93.

(1) For new construction where new control system is specified, unit controllers shall be by same manufacturer/control contractor providing control devices for remainder of building.

2.18 TESTING

A. Owner and/or Owner's representative may elect to witness tests. Notify Owner and/or Owner's representative of test date at least 2 weeks in advance. Submit certified test data to Engineer for approval.

B. Unit manufacturer shall provide factory tests to verify casing leakage after units are assembled.

C. Unit manufacturer and installing contractor shall jointly provide field tests to verify casing leakage after units are installed at jobsite. Coordinate with Electrical Contractor for power to unit test fan.

D. Casing leakage tests shall verify that unit casing leakage is less than 0.5% of design air flow at specified static pressure. Supply and exhaust sections of AHU shall be tested separately.

(1) Seal duct openings in positive pressure section. Connect this section to fan developing 10"WG positive static pressure, and read air flow of this fan using approved air flow measuring device. Fan air flow measurement shall be considered casing leakage of this section.

(2) Seal duct openings in suction side of unit. Connect this section to fan developing 10" WG in negative static pressure, and read fan air flow of this fan using approved air flow measuring device. Fan air flow shall be considered casing leakage of this section.

(3) Conduct casing leakage test individually for each air handling unit. Total casing leakage shall be calculated as sum of positive pressure section leakage and negative pressure sections leakage. Total casing leakage shall not exceed the allowable rate specified above.

(4) Blank off panels required for testing to be provided by unit manufacturer.

2.19 ELECTRICAL SERVICE

A. Provide adequate lighting and switching so equipment can be observed and maintained in safe manner. Combination lighting and convenience outlet circuit is required for each section of unit. Each access section shall contain a minimum of one light fixture. Sections wider than 12 ft shall have multiple light fixtures with maximum spacing of 6 feet (182.88 cm)

(1) Provide two light switches with pilot light. Locate switch near supply fan and return fan section.

(2) Wire all lights to single junction box with single switch with pilot light.

(3) Provide timer for light switch to automatically turn off lights after preset time. Timer shall be similar to Intermatic Model FF2H with 0-2 h range and hold feature to override automatic shut-off function.

(4) Light fixtures shall be: LED type. Provide bulbs for each fixture.

B. Lights, switches, convenience outlets, wiring and conduit shall meet requirements of appropriate Specification Sections of Division 26.

C. Wiring inside of unit shall be provided by unit manufacturer meeting requirements of NEC and appropriate Specification Sections of Division 26. In addition, wiring shall be in metallic conduits.

(1) Provide junction box for each fan motor at outside of unit wall for 3 Ph, 480 V power connection and separate junction box for 1 Ph, 120 V power connection.

(2) Provide two points of power connection, one for 3 Ph, 480 V and one for 1 Ph, 120 V power connection.

D. Seal electrical penetrations into unit air-tight.

2.20 PIPED SERVICE

A. Interior piping and equipment installation shall be complete. Piping shall be installed and tested per appropriate specification section. Unit manufacturer shall be responsible for any leaks, which occur in unit during system testing which occurs before system startup.

B. Extend piping for each coil and humidifier if used through panel casing. Terminate piping with flange for pipe 2-1/2" and larger or threaded connection for pipe 2" and smaller with caps.

PART 3 EXECUTION

3.01 INSTALLATION

A. Units shall be assembled in unit manufacturer's plant to allow for testing of complete unit.

B. Unit manufacturer shall supervise and be responsible for all field joining of the modules, including sheet metal, electrical and piping. Local trades may provide labor for unit assembly and installation.

C. Joints in floor between modules shall be air and water tight.

D. Unit manufacturer shall provide and install all equipment within unit as specified including fans, motors, coils, humidifiers, dampers, sound attenuating devices, piping, piping specialties, ductwork specialties, lights, switches and all equipment necessary to complete air handling equipment contained within housings. Mechanical and electrical connections (i.e., piping and conduit) shall be stubbed through housing so that appropriate Contractor may provide service to air handling unit. Electrical wiring and control wiring shall terminate in junction boxes on accessible side of unit.

E. Provide structural steel sub-base as required. Refer to Unit Base in Part 2.

F. Field mounting of any equipment on housing walls or roof is not allowed without prior approval of Engineer.

G. Unit manufacturer and installing contractor shall coordinate with other trade Contractors, all necessary requirements to assure proper air handling unit installation.

3.02 INSTRUMENT TEST HOLES

A. Provide instrument test holes at air entering and air leaving side of all internal air handling unit components for static pressure differential or temperature measurements. Refer to Section 23 33 14 - Ductwork Specialties, for instrument test holes.

3.03 PROTECTION OF OPENINGS

A. Protect openings on housings during construction against entry of foreign matter and construction dirt.

3.04 FIELD TESTING

A. Unit manufacturer and installing contractor shall jointly perform field casing leakage test on each completed housing assembly as previously specified and shall be responsible for repair of all leaks. Submit certified test data to Engineer for approval.

B. Temporary sealing of access doors, condensate drains, etc. is not allowed during field testing except to troubleshoot leakage points.

END OF SECTION 23 73 28

SECTION 23 81 26 - SPLIT-SYSTEM AIR CONDITIONERS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 23 05 50 - Vibration Isolation

1.02 SUBMITTALS

A. Shop Drawings including the following:

(1) Manufacturer's name and model number
(2) Identification as referenced in the Documents
(3) Capacities/ratings
(4) Materials of construction
(5) Dimensions and weights
(6) Wiring diagrams
(7) Manufacturer’s installation instructions
(8) All other appropriate data

B. LEED Submittals:

(1) Product Data for IEQ Prerequisite 1: Documentation indicating that units comply with ASHRAE 62.1 -2007, Section 5 – “Systems and Equipment.”
(2) Product Data for EA Credit 4: Documentation required by EA Credit 4 indicating that equipment and refrigerants comply.

1.03 OPERATION AND MAINTENANCE DATA

A. Manufacturer shall provide for services of factory trained service engineer to supervise and approve installation; start-up, test and adjust unit for proper operation; and instruct Owner's representative in operation and maintenance of machine. This shall include furnishing start-up and test log showing all initial settings and readings; signed by manufacturer's service representative. Before acceptance by Owner, unit manufacturer shall approve, in writing, complete installation including piping and wiring connections, and proper functioning of all operational and safety controls.

B. Manufacturer shall include additional 4-yr compressor warranty.

PART 2 - PRODUCTS

2.01 MINI-SPLIT SYSTEM

A. Manufacturers: Mitsubishi, Toshiba, Carrier, Daikin or LG. Manufacturer shall be responsible for entire system consisting of direct expansion cooling fan coil unit and condensing unit.

B. Unit data shall be certified in accordance with AHRI 210/240.

C. Provide factory assembled and tested, outdoor mounted, air-cooled condensing unit suitable for installation on grade. Include compressor, air cooled condenser, refrigerant, lubrication system, interconnecting wiring, safety and operating controls, motor starting components and additional features as specified herein or required for safe, automatic operation. Capacity and operating characteristics as indicated in the equipment schedule. Coil performance data shall be in accordance with AHRI 410. Refrigerant shall be R-32.

D. Condensing unit cabinet shall be constructed of heavy gauge, galvanized steel coated with weather resistant paint. Provide removable access panels to facilitate full access to the compressor, fan and control components.

E. Furnish head pressure control to operate compressor satisfactorily at ambient temperature to -20ºF (-29ºC) at minimum compressor load.

F. Provide factory assembled indoor fan coil unit. Cabinet shall be impact resistant and fully insulated. Supply fan shall be direct drive tangential blower. Motor shall be multi-speed, ODP with permanently lubricated bearings. Cooling coil shall be copper tube with aluminum fin and galvanized steel tube sheets. Drip pan under coil shall have drain connection with internal trap. Unit shall have filter rack with factory supplied cleanable filters. Unit shall be furnished with integral wall mounting bracket and mounting hardware.

G. Indoor fan coil unit shall be powered by outdoor condensing unit.

H. Provide with complete electronic microprocessor control system that shall control space temperature, determine optimum fan speed, and run self-diagnostics. The temperature shall be controlled by a programmable wired remote thermostat with integral temperature sensor and wall mounting bracket.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install units as shown on Drawings and according to manufacturer's instructions.

B. Start-up units in accordance with manufacturer’s start-up instructions. Test controls and demonstrate compliance with requirements.

C. Extend cooling coil condensate drain to nearest code approved drain location; provide trap at drain pan.

END OF SECTION 23 81 26

SECTION 23 82 14 - HEATING AND COOLING TERMINAL DEVICES

PART 1 GENERAL

1.01 RELATED WORK

A. Section 20 0513 - Motors

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SUBMITTALS

A. Shop Drawings for all items in this Section including, but not limited to, the following:

(1) Manufacturer's name and model number
(2) Identification as referenced in the documents
(3) Capacities/ratings
(4) Materials of construction
(5) Dimensions and weights
(6) Color selection chart where applicable
(7) Wiring diagrams
(8) Motor data (refer to Section 20 0513 - Motors)
(9) For chilled beams, submit performance data from independent testing agency. Performance data to include cooling capacity at supply water temperatures scheduled, air pressure drop, sound data, and water pressure drop for each beam length.
(10) All other appropriate data

1.04 REFERENCE STANDARDS AND DESIGN CRITERIA

A. Duct Reheat Coils: Ratings shall be certified in accordance with AHRI Standard 410.

B. Finned-Tube Radiation: Ratings shall be IBR Certified.

C. Units including electrical work shall be UL Listed.

1.05 ELECTRICALLY COMMUTATED (EC) MOTORS

A. Where EC motors are indicated in Part 2 of this Section, such motors shall comply with Section 20 0513 – Motors.

PART 2 PRODUCTS

2.01 DUCT REHEAT COILS (HOT WATER)

A. Manufacturers: Carrier, Trane, Greenheck, Aerofin, RAE, Temtrol, or Heatcraft

B. Reheat coils furnished with air terminal devices will be acceptable, provided coils are meeting requirements specified in this section.

C. Coils shall be constructed of 0.016” minimum tube wall, 1/2" or 5/8" OD copper tubes with aluminum fins suitable for minimum working pressure to 200 psig (1378.95 kPa) and temperatures to 220°F.

D. Coils having steel nipples for connection are not allowed.

E. Coil fins shall be continuous serpentine or plate fin type.

F. Coil headers shall be heavy seamless copper with all tubes brazed to header.

G. Casing shall have G90 galvanized steel end supports and top and bottom channels of rigid construction with allowance for expansion and contraction of finned tube section.

H. Coil frame shall be suitable for drive slip or flange and gasket connection to ductwork.

2.02 UNIT HEATERS

A. Manufacturers: Modine, McQuay, Sterling, Vulcan, Sigma, Rittling or Trane

B. Heating elements shall be constructed of copper tubing with aluminum fins and tested at 250 psig (1723.69 kPa) air under water.

C. Casings shall be steel phosphatized and finished in baked enamel.

D. Furnish directional louvers for horizontal units and louver cone diffuser for projection units.

E. Fans shall have aluminum blades, factory balanced and quiet in operation and furnished with safety guard.

F. Electrical

(1) Unit shall have junction box for motor terminals factory mounted on unit or integral to motor.

(2) Provide unit mounted non-fused electrical disconnect switch.

G. Motors:

(1) Motors shall be TEFC.

(2) Single phase motors shall have built-in thermal overload.

2.03 CABINET UNIT HEATERS

A. Manufacturers: Vulcan, McQuay, Sigma, Rittling, Sterling or Trane

B. Water coils shall be constructed of 3/8", 1/2", or 5/8" OD seamless copper tubes with aluminum fins suitable for maximum working pressure to 300 psig (2068.43 kPa) and temperature to 200°F.

C. Cabinet front panels shall be 18 ga steel for horizontal units and 16 ga steel for vertical units.

D. Exposed ceiling type units shall be furnished with hinged access panels to provide complete access to entire unit.

E. Units shall be furnished with filter rack and 2 sets of 1/2" or 1" thick glass fiber or aluminum filter.

F. Cabinets shall have baked enamel finish, colors to be selected by Architect.

G. Fan wheels shall be centrifugal forward-curved and double-width type, statically and dynamically balanced.

H. Units shall be furnished with 3-speed direct drive motor(s) and 3-speed manual switch settings.

I. Disconnect switches shall be factory-mounted at units.

2.04 FAN COIL UNITS

A. Manufacturers: Enviro-Tec, York, JCI, Carrier, Trane, McQuay, Rittling, International Environmental Corporation (IEC), Greenheck, or Modine

B. Unit data shall be certified in accordance with AHRI Standard 430 or 440.

C. Coils shall be constructed of 3/8", 1/2" or 5/8" OD seamless copper tubes with aluminum fins suitable for maximum working pressure to 300 psig (2068.43 kPa) and temperatures to 200ºF. Coil stub outs shall be 5/8" OD copper tubing. Furnish coils with manual air vents. Coil performance data shall be in accordance with AHRI Standard 410.

D. Units shall be furnished with centrifugal fans, separate hot and chilled water coils as scheduled, speed selection switches, condensate drain pans, and galvanized steel casings.

E. Drain Pans

(1) Primary condensate drain pans shall be single wall; heavy gauge galvanized steel for corrosion resistance and extend under the entire cooling coil. Drain pans shall be of one-piece construction and be positively sloped for condensate removal.

(2) Drain pans shall be field reversible for right-hand or left-hand connections.

(3) Drain pan shall be externally insulated with fire retardant, closed cell foam insulation. Insulation shall carry no more than 25/50 Flame Spread and Smoke Developed Rating per ASTM E-84 and UL 723 and Antimicrobial Performance Rating of 0, no observed growth, per ASTM G-21.

(4) Furnish drain pan with condensate overflow switch conforming to UL 508 for condensate overflow unit fan shut off. Locate switch just below secondary drain connection. Pipe secondary drain to primary drain line before p-trap.

(5) Pipe drain line to nearest floor drain where shown on drawings. Fan coil units served by elevated temperature chilled water loop do not require condensate drain lines.

(6) Provide waterless trap similar to Des Champs Technologies N-Series HVAC Air-Trap at each cooling coil condensate drain.

(7) Where required to lift condensate, furnish condensate pump for removal of accumulated condensate in drain pan. Condensate pump shall have capability to lift produced condensate minimum of 15 feet (457.2 cm)

F. Units shall be furnished with 18 ga steel cabinet and access to all internal mechanical and electrical devices. Cabinets of exposed units shall have baked enamel finish in one of manufacturer's standard colors, selected by Architect. Cabinets of concealed units may be prime coated or galvanized steel. Ducted units shall be furnished with supply and return duct collars.

G. Fan wheels shall be aluminum or galvanized steel construction, centrifugal forward-curved and double-width type, statically and dynamically balanced.

H. Units shall be acoustically and thermally insulated with minimum 1/2" glass fiber insulation. Drain pans shall be constructed of galvanized steel insulated with minimum 1/4" fire retardant closed cell foam. Drain pan shall be constructed in compliance with ASHRAE 62.1-2010 and insulation shall meet requirements of NFPA 90A.

I. Each unit shall include readily accessible filter rack. Furnish 2 sets of 2" thick minimum efficiency MERV-8, based on ASHRAE Test Standard 52.2, throwaway glass fiber filter for each unit.

J. Motors:

(1) Unless otherwise indicated, furnish units with 3-speed permanent split capacitor motors with thermal overload protection with automatic reset.

K. Electrical:

(1) Provide factory mounted non-fused disconnect switch.

2.05 ACTIVE CHILLED BEAMS

A. Manufacturers: Dadanco, Semco, Price, or approved equal.

B. Units shall be induction type with primary air connection(s), induction nozzles, chilled water coil(s), heating hot water coil(s) (where scheduled), integral air diffuser(s) and removable induction inlet grille for access to coil face(s). Units shall be designed for 2-pipe, cooling only duty or 4-pipe heating and cooling duty as scheduled.

C. All components of chilled beam shall meet NFPA 90A requirements for flame spread and smoke developed.

D. Housing shall be formed/stamped aluminum or galvanized steel.

E. Units shall be complete with flush mounted, removable induction grille for access to coil(s), supply air plenum with inlet duct collars, induction nozzles, and slotted supply diffusers in 1-way or 2-way throw configuration as scheduled.

F. Induction inlet grille shall be removable for coil access. Grilles shall have safety cables or chains to support grille core during coil access or grilles shall be hinged along one side, allowing grille core to swing down 90 degrees minimum for coil access.

G. Provide minimum of 4 adjustable support tabs/brackets per unit, for hanger support from building structure Each beam shall be individually supported to building structure as recommended by manufacturer. Installation hardware shall be in accordance with manufacturer's recommendations and any local codes that dictate hanging requirements.

H. Units shall have removable and interchangeable plastic induction nozzles.

I. Diffuser and induction grille face shall be constructed of aluminum or pressed steel components. Induction grille shall be perforated steel or aluminum, of sufficient gauge to avoid sagging. Air plenum shall be constructed of minimum 22 ga galvanized steel. Interior of plenum shall be painted black if visible from room side.

J. Diffuser and induction grille face shall be powder coat or baked enamel finish with color selected by architect.

K. Units shall be designed with standard US (IP) dimensions and NPT pipe connections.

L. Units shall be of nominal length and width scheduled and shall be compatible with ceiling type scheduled or specified by Architect.

M. Units for installation without a ceiling, shall be provided with diffuser extension (Coanda) wings to assist horizontal throw.

N. Unit face shall be drop-face or flat-face as scheduled.

O. Water coils shall be constructed of 1/2" or 5/8" OD seamless copper tubes with minimum wall thickness of 0.016" with aluminum fins suitable for minimum working pressure to 300 psig (2068.43 kPa) at 75ºF temperature. Coil connections shall be NPT threaded.

P. Coils shall be rated according to AHRI Standard 410. Coils shall be delivered factory clean, flushed and capped. Water pipes shall be factory fitted with one vent and one drain valve.

Q. Coil shall be factory painted flat black.

R. Where dual coils are used to meet scheduled capacity, provide dual coils with factory pre-piped single point supply and return connections.

S. Accessories:

(1) Provide flexible metal hose assemblies for cooling and heating water connections for each chilled beam. Minimum length of metal hose assembly shall be 18" and maximum length shall be 24".

(a) Flexible Hose:

1) Stainless Steel (Corrugated) Core:

1. Flexible hose shall be constructed of corrugated 300 series stainless steel core, 300 series stainless steel braided cover, stainless steel ferrules, and 304 stainless steel end connections. Maximum Allowable Operating Pressure (MAOP) shall be not less than 400 psi (2757.90 kPa) at 600°F.

T. Submittals shall include performance data from independent testing agency. Performance data to include cooling/heating capacity at supply water temperatures scheduled, air pressure drop, supply air throw performance, sound data and water pressure drop for each chilled beam length and throw configuration.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install units as indicated on drawings, and according to manufacturer's installation instructions.

B. Install branch piping to each unit with minimum of 3 elbows to allow for expansion and contraction.

C. Protect units during construction against entry of foreign matter and construction dirt.

D. Unless otherwise shown on drawings, mount vertical type wall mounted heating units 12" above finished floor.

3.02 DUCT REHEAT COILS

A. Comb out fins when bent or crushed before enclosing coils in ductwork. Clean dust and debris from each coil to ensure its cleanliness.

B. Seal or gasket coil connection to ductwork to meet maximum allowable leakage rate specified in Section 23 3114 - Ductwork, Part 3.

C. Protect units during construction against entry of foreign matter and construction dirt.

D. Unless otherwise specified, connect piping to coils with multiple rows for counter-flow arrangement.

3.03 FIN TUBE RADIATION

A. Unless otherwise shown on drawings, mount units with manufacturer's recommended minimum height above finished floor to provide capacities scheduled.

3.04 FAN COIL UNITS

A. Mount units above concealed ceilings or as shown on drawings with ample clearances for coil pull and filter service.

B. Provide vibration isolation hangers for support of each unit.

C. Duct connections to fan coil units shall use flexible duct connections.

3.05 ACTIVE CHILLED BEAMS

A. Mount units in ceilings as shown on drawings and on reflected ceiling plans.

B. Support units independently of ceiling grid and directly from building structure, with minimum of 4 supports per chilled beam, using threaded rod or approved cable supported system. Wire supports are not allowed.

C. Where necessary, provide strut supports spanning under wide obstructions (ducts) to allow for proper alignment of chilled beam to ceiling grid.

D. Install manual air vents for complete venting of air from system. Provide drain valves at low points of main or branch main piping.

E. Multiple chilled beams may be zoned to match associated supply air terminals and controlled through single control valve. Refer to chilled beam schedule and/or drawings for chilled beams served by common control valve.

END OF SECTION 23 82 14

SECTION 23 82 16 - COILS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 23 8214 - Heating and Cooling Terminal Devices (Reheat Coils)

1.02 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 SUBMITTALS

A. Shop Drawings including, but not limited to, the following:

(1) Manufacturer's name and model number
(2) Identification as referenced in the documents
(3) Capacities/ratings
(4) Flow rate and pressure drop
(5) Materials of construction
(6) Dimensions and weights
(7) Manufacturer's installation instructions
(8) All other appropriate data

1.04 DESIGN CRITERIA

A. This Section covers coils in factory-packaged air handling unit, custom air handling units and field-erected air handling units.

B. Coil sizes, capacities, configuration and operating characteristics to be as shown on plans and/or as scheduled. Coil performance data shall be certified in accordance with AHRI Standard 410, unless scheduled coil performance is outside range of standard rating conditions.

C. Coils shall be counter flow design, air to water.

D. Unless otherwise specified, temperature profile of discharge air from entire coil face shall be uniform within 12" of coil face.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: Carrier, McQuay, Trane, Marlo, Heatcraft, Aerofin, RAE, Temtrol, Cancoil or Precision Coils

2.02 HOT WATER COILS

A. Coils shall be constructed of 0.024" tube wall, 1/2" or 5/8" OD seamless copper tubes with aluminum fins suitable for working pressures to 200 psig (1378.95 kPa) and temperatures to 220°F. Coils shall be tested at 250 psig (1723.69 kPa) under water.

B. Coil fins shall be continuous serpentine or plate fin type.

C. Coil headers shall be Type L seamless copper conforming to ASTM B88, with tubes brazed to header.

D. Coil connections shall be Schedule 40 seamless red brass conforming to ASTM B43, threaded end for 2" and smaller and flanged end for 2-1/2" and larger.

E. Casings shall be minimum 16 ga galvanized steel having galvanized steel end supports and top and bottom channels of rigid construction with allowance for expansion and contraction of finned tube section.

F. Coils shall be equipped with bronze spring turbulators where required to provide capacities indicated.

2.03 CHILLED WATER COILS

A. Coils shall be constructed of 0.035” tube wall, 5/8”OD seamless copper tubes with 0.0095” aluminum fins suitable for working pressures to 200 psig (1378.95 kPa). Coils shall be tested at 250 psig (1723.69 kPa) under water.

B. Coil fins shall be continuous plate fin type.

C. Coil headers shall be constructed of Type L seamless copper conforming to ASTM B88, with tubes brazed to header.

D. Coil connections shall be Schedule 40 seamless red brass conforming to ASTM B43, threaded end for 2" and smaller and flanged end for 2-1/2" and larger.

E. Casings shall be minimum 16 ga 304 stainless steel having steel end supports and top and bottom channels of rigid construction with allowance for expansion and contraction of finned tube section. Support and channels shall be same metal as casing.

F. Select coils for tube velocity not less than 3.0 fps.

G. Maximum allowable fin spacing shall be 10 fins per inch. Coil depth shall not exceed 8 rows.

H. If more than two cooling coils are stacked due to casing height, each coil shall be fitted with a condensate pan in order to prevent flooding the bottom coil with condensate. Coat condensate pans with ½" thick foamed-in-place, cellular insulation.

PART 3 EXECUTION

3.01 GENERAL

A. Install coils as indicated on drawings and/or as detailed. Pitch coils for proper drainage according to manufacturer's installation instructions. Install shims as required.

B. Clean oil film from coil fins with hot water/detergent as recommended by coil manufacturer.

C. Comb out fins when bent or crushed before enclosing coils in housing. Clean dust and debris from each coil to ensure its cleanliness.

D. Provide offsets in piping to facilitate coil removal. Unless otherwise specified, pipe coils for counter flow arrangement.

E. Install piping flexible connections and/or piping vibration isolation supports as specified in Section 23 0550 - Vibration Isolation.

F. Provide piping flexible connections for floor-mounted coils.

G. Provide air vent and drain valve at each water coil.

H. Provide shut-off valves, balancing valve, drain valve and air vent for each coil for air handling unit with multiple coils as shown on drawings.

I. Pipe condensate drain pan to the nearest drain with trap.

END OF SECTION 23 82 16

SECTION 23 82 39 - UNIT HEATERS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 23 05 13 - Motors for Mechanical Equipment

1.02 SUBMITTALS

A. Shop Drawings for all items in this Section including the following:
   (1) Manufacturer's name and model number
   (2) Identification as referenced in the documents
   (3) Capacities/ratings
   (4) Materials of construction
   (5) Dimensions and weights
   (6) Color selection chart where applicable
   (7) Wiring diagrams
   (8) Motor data (refer to Section 23 05 13 - Motors for Mechanical Equipment)
   (9) All other appropriate data

B. LEED Submittal:
   (1) Product Data for IEQ Prerequisite 1: Documentation indicating that units comply with ASHRAE 62.1 -2007, Section 5 – “Systems and Equipment.”

1.03 REFERENCE STANDARDS AND DESIGN CRITERIA

A. AHRI 1240 Standard for Performance Rating of Active Chilled Beams.

B. Units including electrical work shall be UL Listed.

C. Electric Heaters: Shall be listed by UL, bear appropriate UL Label, contain the latest devices for protection of installation, and shall be installed in strict accordance with the latest revision of National Electric Code and other applicable State and Local Codes. Provide grounding lugs on all apparatus.

1.04 ELECTRICALLY COMMUTATED (EC) MOTORS

A. Where EC motors are indicated in Part 2 of this Section, such motors shall comply with Section 23 05 13 - Motors for Mechanical Equipment.

PART 2 - PRODUCTS

2.01 HYDRONIC UNIT HEATERS

A. Manufacturers: Vulcan, Daikin, Sigma, Rittling, Sterling, Modine or Jaga

B. Heating elements shall be constructed of copper tubing with aluminum fins and tested at 250 psig (1720 kPa) air under water.

C. Casings shall be minimum 20 ga (0.912 mm) steel with epoxy or polyester powder coat finish, or baked enamel finish

D. Furnish adjustable horizontal and vertical discharge louvers for horizontal units and adjustable cone diffuser for projection units.

E. Fans shall have aluminum blades, factory balanced and quiet in operation and furnished with finger-proof safety guard.

F. Electrical
   (1) Unit shall have junction box for motor terminals factory mounted on unit or integral to motor.
   (2) Provide unit mounted fused electrical disconnect switch.
   (3) Provide (unit-mounted) line voltage thermostat (suitable for wall mounting).

G. Motors:
   (1) Motors shall be TEFC with characteristics as scheduled.
   (2) Single phase motors shall be permanently lubricated and have built-in thermal overload.

2.02 CABINET UNIT HEATERS

A. Manufacturers: Vulcan, Daikin, Sigma, Rittling, Sterling, Modine or Trane

B. Water coils shall be constructed of 3/8” (9 mm), 1/2" (13 mm), or 5/8" (16 mm) OD seamless copper tubes with aluminum fins suitable for maximum working pressure to 300 psig (2070 kPa) and temperature to 200°F (93°C).

C. Steam coils shall be constructed of 1“ (25 mm) OD seamless copper tubes with aluminum fins suitable for maximum working pressure to 100 psig (689 kPa) and temperature to 325°F (162°C). Coil stub outs shall be 5/8" (16 mm) OD copper tubing.

D. Cabinet front panels shall be 18 ga (1.214 mm) steel for horizontal units and 16 ga (1.519 mm) steel for vertical units.

E. Exposed ceiling type units shall be furnished with hinged access panels to provide complete access to entire unit.

F. Ducted units shall be furnished with supply and return duct collars.

G. Units shall be furnished with filter rack and 2 sets of 1/2” (12 mm) or 1" (25 mm) thick glass fiber or aluminum filter.

H. Cabinets of exposed units shall have epoxy or polyester powder coat finish, or baked enamel finish in one of manufacturer's standard colors to be selected by Architect.

I. Cabinets of exposed units shall have epoxy or polyester powder coat finish, or baked enamel finish, colors to be selected by Architect.

J. Cabinets of concealed units shall be prime coated or galvanized steel.

K. Fan wheels shall be aluminum or galvanized steel construction, centrifugal forward-curved and double-width type, statically and dynamically balanced.

L. Units shall be furnished with 3-speed direct drive motor(s) and 3-speed manual switch settings.

M. Furnish units with direct-drive variable speed electrically commutated (EC) motor with manual speed control. Refer to Section 23 05 13 - Motors for Mechanical Equipment. Number and horsepower of motor(s) shall be as scheduled.

N. Disconnect switches shall be factory-mounted at units.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install units as indicated on Drawings, and according to manufacturer's installation instructions.

B. Install branch piping to each unit with minimum of 3 elbows to allow for expansion and contraction.

C. Protect units during construction against entry of foreign matter and construction dirt.

PART 1 - GENERAL

1.01 DESCRIPTION

A. Intent of drawings and Specifications is to obtain complete systems tested, adjusted, and ready for operation.

B. Except as otherwise defined in greater detail, the terms “provide”, “furnish” and “install” as used in Division 26 Contract Documents shall have the following meanings:

(1) “Provide” or “provided” shall mean “furnish and install”.

(2) “Furnish” or “furnished” does not include installation.

(3) “Install” or “installed” does not include furnishing.

C. Include incidental details not usually shown or specified, but necessary for proper installation and operation.

D. Check, verify and coordinate work with drawings and specifications prepared for other trades. Include modifications, relocations or adjustments necessary to complete work or to avoid interference with other trades.

E. Included in this Contract are electrical connections to equipment provided by others. Refer to Architectural, Mechanical, Plumbing, and final shop drawings for equipment being furnished under other sections for exact locations of electrical outlets and various connections required.

F. Information given herein and on drawings is as exact as could be secured but is not guaranteed. Do not scale drawings for dimensions.

G. Where architectural features govern location of work, refer to Architectural Drawings.

H. Perform work in “neat and workmanlike” manner as defined in ANSI/NECA 1, Standard Practices for Good Workmanship in Electrical Contracting.

1.02 RELATED WORK

A. Utility Services:

(1) Include costs for temporary service, temporary routing of service or other requirements of a temporary nature associated with utility service.

B. Temporary Services:

(1) Division 01 - Temporary Facilities and Controls.

C. Continuity of Service:

(1) No service shall be interrupted or changed without permission from Architect and Owner. Obtain written permission before work is started.

(2) When interruption of services is required, Architect, Owner and other concerned parties shall be notified and shall determine a time.

D. Demolition:

(1) Division 02 - Selective Demolition

(2) Division 02 - Building Demolition

(3) Perform required demolition to accomplish new work.

(a) Remove abandoned wiring to source of supply.

(b) Remove exposed abandoned conduit, including abandoned conduit above accessible ceiling finishes. Cut conduit flush with walls and floors, and patch surfaces.

(c) Disconnect abandoned outlets and remove devices.

(d) Remove abandoned outlets if conduit servicing them is abandoned and removed.

(e) Provide blank cover for abandoned outlets that are not removed.

(f) Disconnect and remove electrical devices and equipment serving utilization equipment that has been removed.

(g) Disconnect and remove abandoned luminaires. Remove brackets, stems, hangers, and other accessories.

(h) Disconnect electrical systems in walls, floors, and ceilings scheduled for removal.

(4) Accomplish work in neat workmanlike manner to minimize interference; annoyance or inconvenience such work might impose on Owner or other Contractors.

(5) Unless otherwise noted, remove from premises materials and equipment removed in demolition work.

(6) Equipment noted to be removed and turned over to Owner, shall be delivered to Owner at place and time Owner designates.

(7) Where materials are to be turned over to Owner or reused and installed by Contractor, it shall be Contractor's responsibility to maintain condition of materials and equipment equal to that existing before work began. Repair or replace damaged materials or equipment at no additional cost to Owner.

(8) Where demolition work interferes with Owner's use of premises, schedule work through Architect, Owner and with other Contractors to minimize inconvenience to Owner. Architect must approve schedule before Contractor begins such work.

E. Concrete Work:

(1) Provide cast-in-place concrete as required by Contract Documents unless otherwise noted.

(2) Concrete shall comply with Division 03 - Concrete.

(3) Provide anchor bolts, metal shapes and templates to be cast in concrete or used to form concrete as required for anchoring and supporting electrical equipment.

F. Painting:

(1) Furnish equipment with factory-applied finish coats or paint equipment per Division 09 – Finishes unless specified otherwise.

(2) Furnish equipment with factory applied prime finish unless otherwise specified.

(3) If factory finish on equipment furnished by Contractor is damaged in shipment or during construction, refinish equipment to satisfaction of Architect.

(4) Furnish one can of touch up paint for each final factory-applied finish coat of product.

G. Sustainable Architecture and LEED Requirements:

(1) Provide services, documentation, and product data required to meet LEED credits involving an electrical component such as:

(a) Prerequisite SS – Construction Activity Pollution Prevention

(b) Credit SS – Light Pollution Reduction

(c) Credit WE – Water Metering

(d) Prerequisite EA – Fundamental Commissioning of the Building Energy Systems

(e) Prerequisite EA – Minimum Energy Performance

(f) Prerequisite EA – Building-Level Energy Metering

(g) Credit EA – Enhanced Commissioning

(h) Credit EA – Optimize Energy Performance

(i) Prerequisite MR – Construction and Demolition Waste Management Planning

(j) Credit MR – Building Product Disclosure and Optimization – Environmental Product Declarations

(k) Credit MR – Building Product Disclosure and Optimization – Sourcing of Raw Materials

(l) Credit MR – Building Product Disclosure and Optimization – Material Ingredients

(m) Credit MR – Construction and Demolition Waste Management

(n) Credit MR 4 – Recycled Content

(o) Credit MR 5 – Regional Materials

(p) Credit EQ – Low Emitting Materials

(q) Credit EQ – Construction Indoor Air Quality Management Plan

(r) Credit EQ – Interior Lighting

(s) Credit EQ – Daylighting

(t) Credit EQ – Acoustic Performance

(u) Credit ID – Innovation

1.03 REQUIREMENTS OF REGULATORY AGENCIES

A. Rules and regulations of Federal, State and local authorities and utility companies, in force at time of execution of Contract shall become part of this specification.

1.04 REFERENCE STANDARDS

A. Agencies or publications referenced herein refer to the following:

(1) Association of Edison Illuminating Companies

(2) American National Standards Institute

(3) American Society of Mechanical Engineers

(4) American Society for Testing and Materials

(5) Building Industry Consulting Services International

(6) Electronic Industries Association

(7) Federal Information Processing Standards

(8) Federal Communications Commission

(9) Insulated Cable Engineers Association

(10) Institute of Electrical & Electronics Engineers

(11) Illuminating Engineering Society of North America
(12) National Electrical Code
(13) National Electrical Contractors Association
(14) National Electrical Manufacturers Association
(15) National Electrical Safety Code
(16) National Electrical Testing Association
(17) National Fire Protection Association
(18) National Institute of Standards & Technology
(19) Telecommunications Industries Association
(20) Underwriters Laboratories, Inc.

B. Work shall be in accordance with latest edition of codes, standards or specifications unless otherwise noted.

1.05 LISTING

A. Install materials bearing UL label or UL listing, unless UL label or listing is not available for that type of material.
B. Other nationally recognized testing agencies, acceptable to AHJ, are approved.

1.06 ENCLOSURES

A. Typical NEMA Enclosures and Usage
(1) NEMA 1 - Indoors. Falling dirt.
(2) NEMA 2 - Indoors. Falling dirt. Falling liquids. Light splashing.
(3) NEMA 3 - Outdoors. Sleet, snow, rain. Windblown dust.
(4) NEMA 3X - Same as NEMA 3 plus corrosion resistant.
(5) NEMA 3S - Same as NEMA 3 plus mechanism operable when ice covered.
(6) NEMA 3SX - Same as NEMA 3S plus corrosion resistant.
(7) NEMA 3R - Outdoors. Rain, snow, sleet.
(8) NEMA 3RX - Same as NEMA 3R plus corrosion resistant.
(9) NEMA 4 - Indoors: Falling dirt. Falling and light splashing liquids. Flying dust, lint and fibers. Hose down. Outdoors: Rain, sleet, snow. Windblown dust. Hose down.
(10) NEMA 4X - Same as NEMA 4 - Indoors / Outdoor plus corrosion resistant.
(11) NEMA 5 - Indoors. Falling Dirt. Falling Liquids. Settling dust, lint and fibers.
(12) NEMA 6 - Indoors: Falling dirt. Falling and light splashing liquids. Flying dust, ling and fibers. Hose down. Temporary submersion. Outdoors: Rain, snow, sleet. Windblown dust. Hose down. Temporary
(13) NEMA 6P - Same as NEMA 6 - Indoors plus corrosion resistant. Prolonged submersion.
(14) NEMA 6P - Same as NEMA 6 - Outdoors plus corrosion resistant. Prolonged Submersion.
(15) NEMA 7 - Indoors. Class I, Division 1 or 2, Groups A, B, C or D. (Flammable gas).
(16) NEMA 9 - Indoors. Class II, Division 1 or 2. Groups E, R, or G. (Combustible dust).
(17) NEMA 12 - Indoors. Falling Dirt. Falling liquids. Flying dust, lint and fibers. Oil or coolant seepage.
(18) NEMA 13 - Same as NEMA 12 plus oil or coolant spraying or splashing.

1.07 SUBMITTALS

A. Shop Drawings (Product Data):
(1) Refer to Division 01 - Submittal Procedures.
(2) Note that for satisfying submittal requirements for Division 26, “Product Data” is usually more appropriate than true “Shop Drawings” as defined in Division 01. However, the expression “Shop Drawings” is generally used throughout Specification.
(3) Submit shop drawings for equipment and systems as requested in respective specification sections. Submittals which are not requested may not be reviewed.
(4) Specifically mark general catalog sheets and drawings to indicate specific items submitted and its correlation to specific designation for product in drawings.
(5) Specifically indicate proper identification of equipment by name and/or number, as indicated in specification and shown on drawings.
(6) When manufacturer's reference numbers are different from those specified, provide correct cross-reference number for each item. Clearly mark and note submittal accordingly.
(7) Submit complete record of required components when luminaires, equipment and items specified include accessories, parts and additional items under one designation.
(8) Include wiring diagrams for electrically powered or controlled equipment.

(9) Submit electrical equipment room layouts drawn to scale, including equipment, raceways, accessories and required working clearances. Submit electrical equipment room layouts concurrently with electrical distribution equipment submittals.

(10) Where submittals cover products containing non-metallic materials, include “Material Safety Data Sheet” (MSDS) from manufacturer stating physical and chemical properties of components and precautionary considerations required.

(11) Submit shop drawings or product data as soon as practicable after signing contracts. Submittals must be approved before installation of materials and equipment.

(12) Submittals that are not complete, not permanent, or not properly checked by Contractor, will be returned without review.

(13) Bidders shall provide a full compliance review of specifications. Compliance review shall accompany submittals. Compliance review shall include paragraph-by-paragraph review of specifications with the following information “C”, “D”, “E” marked in the margin of the specification section. Unless a deviation or exception is specifically noted in the compliance review, it is assumed that Bidder is in complete compliance with plans and specifications. Lack of these requirements in the submittal shall result in rejection of submittal. Text shall be provided accompanying compliance review as follows:

(a) “C” – Comply with no exceptions

(b) “D” – Comply with deviations. For each of the deviations, provide numbered footnote with reasons for proposed deviation

(c) “E” – Exceptions; do not comply

B. Bookmarks:

(1) Submitted documents greater than 50 pages in length shall include electronic bookmarks setup to quickly navigate and easily locate submitted information. Each major series of equipment shall have a bookmark.

(2) Hyperlinks can be used to enhance bookmark tools but are not an acceptable substitute for electronic bookmarks. If hyperlinks are used, they should be clearly identifiable as a hyperlink by using a different color text similar to how MS Office identifies hyperlinks.

C. Certificates and Inspections:

(1) Obtain and pay for inspections required by authorities having jurisdiction and deliver certificates approving installations to Owner unless otherwise directed.

D. Operation and Maintenance Manuals:

(1) Refer to Division 01 - Operation and Maintenance Data.

(2) Upon completion of work but before final acceptance of system, submit electronic copy to Architect for approval. After securing approval, submit 3 copies to Owner.

(3) Organize manuals by specification section number and furnish table of contents and tabs for each piece of equipment or system.

(4) Manuals shall include the following:

(a) Copies of shop drawings

(b) Manufacturer's operating and maintenance instructions. Include parts lists of items or equipment, with component exploded views and part numbers. Where manufacturer's data includes several types or models, designate applicable type or model.

(c) Flash/thumb drives of O&M data with exploded parts lists where available

(d) Phone numbers and addresses of local parts suppliers and service companies

(e) Internet/WEB page addresses where applicable

(f) Wiring diagrams

(g) Start up and shut down procedure

(h) Factory and field test records

(i) Additional information, diagrams or explanations as designated under respective equipment or systems specification section

(5) Instruct Owner's representative in operation and maintenance of equipment. Instruction shall include complete operating cycle on all apparatus.

(6) Furnish O&M manuals and instructions to Owner prior to request for final payment.

(7) Include bookmarks as indicated above.

E. Record Documents:

(1) Refer to General Conditions of Contract and Division 01 - Project Record Documents. Prepare complete set of record drawings in accordance with Division 01.

(2) Use designated set of prints of Contract Documents as prepared by Architect to mark-up for record drawing purposes.

1.08 JOB CONDITIONS

A. Building Access:

(1) Arrange for necessary openings in building to allow for admittance of all apparatus.

B. Coordination:

(1) Equipment provided under other Divisions of these specifications.

(a) Motors

(b) Electrically powered equipment

(c) Electrically controlled equipment

(d) Starters, where specified

(e) Variable frequency drives, where specified

(f) Control devices, where specified

(2) Provide the following devices required for control of motors or electrical equipment, unless otherwise noted:

(a) Starters

(b) Disconnect devices

(c) Control devices:

1) Pushbuttons

2) Pilot lights

3) Contacts

(d) Conduit, boxes and wiring for Power wiring

(e) Conduit, boxes and wiring for Control wiring, except for control wiring systems as defined in Section 23 09 01 - Control Systems Integration.

(3) Connect and wire equipment complete and ready to operate according to wiring diagrams furnished by various trades.

(4) Wire starters or other similar control devices furnished by others.

(5) This Contractor's drawings and/or specifications show number and hp (kW) rating of motors furnished by others, together with their actuating devices. Should any change in size, hp (kW) rating, voltage, or means of control be made to any motor or other electrical equipment after Contracts are awarded, Contractor responsible for change shall immediately notify this Contractor. Additional costs due to these changes shall be responsibility of Contractor initiating change.

(6) Equipment and wiring shall be selected and installed for conditions in which it will be required to perform. (i.e., general purpose, weatherproof, rain tight, explosion proof, dust tight, or any other special type as required.)

(7) Comply with local utility motor starting requirements and provide starters for motors furnished by others as specified herein or under various trade sections of those specifications.

C. Housekeeping and Cleanup:

(1) Refer to Division 01 - Closeout Procedures.

(2) As work progresses or as directed by Architect, periodically remove waste materials from building and leave area of work broom clean. Upon completion of work, remove tools, scaffolding, broken and waste materials, etc. from site.

1.09 WARRANTY

A. Refer to Division 01 for general warranty requirements.

B. Refer to technical sections for warranty requirement for each system.

(1) Where no warranty requirements are called out, warrant as called out in Division 01 equipment, materials, and workmanship to be free from defect. _____ Warranty period shall begin on date of substantial completion.

C. Repair, replace, or alter systems or parts of systems found defective at no extra cost to Owner.

D. In any case, wherein fulfilling requirements of any guarantee, if this Contractor disturbs any work guaranteed under another contract, this Contractor shall restore such disturbed work to condition satisfactory to Architect and guarantee such restored work to same extent as it was guaranteed under such other contract.

E. Warranty shall include labor, material, and travel time.

PART 2 - PRODUCTS

2.01 PRODUCT SUBSTITUTIONS

A. Refer to Division 01 - Product Requirements.

PART 3 - EXECUTION

3.01 GENERAL

A. Verify elevations and dimensions prior to installation of materials.

B. Where conduits are shown on plans, they are shown for reference only. Conduit routes shown on plans may not show all required junction boxes, pull boxes, control conduits, or coordination with other trades. Contractor is responsible for coordination of all conduit routes with other trades and providing junction boxes and pull boxes as required by code.

3.02 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the site under provisions of Division 01.

B. Store and protect products under provisions of Division 01.

C. Store in clean, dry space.

D. Maintain factory wrapping or provide cover to protect units from dirt, water, construction debris, and traffic.

E. Handle in accordance with manufacturer's written instructions.

F. Handle carefully to avoid damage to components, enclosure, and finish. Lift only with lugs provided for the purpose.

G. Provide supplemental heat if required to prevent moisture contamination. Provide temporary circuits as required.

3.03 FLOOR, WALL, ROOF AND CEILING OPENINGS

A. Coordinate location of openings, chases, furred spaces, etc. with appropriate Contractors. Provide sleeves and inserts that are to be built into structure during progress of construction.

B. Remove temporary sleeves, if used to form openings, prior to installation of permanent materials. Utilize minimum 24 ga (0.71 mm) galvanized sheet metal for permanent sleeves unless otherwise noted.

C. Provide Schedule 40 carbon steel pipe with integral water stop for steel sleeves required below grade or to exterior.

D. Submit to Structural Engineer for review and approval size and location of core-drilled holes prior to execution.

E. Submit product data and installation details for penetrations of building structure. Include schedule indicating penetrating materials, (steel conduit, PVC conduit, cables, cable tray, etc.), sizes of each, opening sizes and sealant products intended for use.

F. Where penetrations of fire-rated assemblies are involved, seal penetrations with appropriate firestopping systems as specified in 26 05 93 - Electrical Systems Firestopping.

G. Adhesives and sealants used on the interior of the building shall comply with VOC limits per section 01352 LEED requirements.

H. Provide 2" (50 mm) clearance around penetration openings intended for raceways and cables. Where fire resistant penetrations are required, size openings in accordance with written recommendations of firestopping systems manufacturer.

I. Seal non-fire-rated floor penetrations with non-shrink grout equal to Embeco by Master Builders, or urethane caulk, as appropriate.

J. Seal non-rated wall openings with urethane caulk.

K. Where penetrations occur through exterior walls into building spaces, use steel sleeves with integral water stop, similar to type "WS" wall sleeves by Thunderline Corporation. Seal annular space between sleeves and pipe with "Link-Seal" modular wall and casing seals by Thunderline Corporation or sealing system by another manufacturer approved as equal by Engineer. Sealing system shall utilize Type 316 stainless steel bolts, washers and nuts.

L. Finish and trim penetrations as shown on details and as specified.

M. Provide chrome or nickel-plated escutcheons where raceways pass through walls, floors or ceilings and are exposed in finished areas. Size escutcheons to fit raceways for finished appearance. Finished areas shall not include mechanical/electrical rooms, janitor's closets, storage rooms, etc., unless suspended ceilings are specified.

3.04 EQUIPMENT ACCESS

A. Install raceways, cable tray, junction and pull boxes, and accessories to permit access to equipment for maintenance. Relocate raceways or accessories to provide maintenance access at no additional cost to Owner.

B. Install equipment with sufficient maintenance space for removal, repair or changes to equipment. Provide ready accessibility to equipment and wiring without moving other future or installed equipment.

C. Access doors in walls, chases, or inaccessible ceilings will be provided under Division 08 - Access Doors and Frames, unless otherwise indicated. Access doors for equipment shall provide access for servicing, repairs and/or maintenance.

D. Provide necessary coordination and information to the Trade Contractor under Division 08 - Access Doors and Frames. This information shall include required locations, sizes and rough-in dimensions.

E. Provide access doors in walls, chases or inaccessible ceilings for equipment requiring access for servicing, repairs and maintenance, unless otherwise noted. Access frames and doors shall be as manufactured by Milcor, Incorporated, or similar, of style applicable to surface. Provide access doors used in fire-rated construction with UL label. Provide steel, prime-coated access doors in dry locations. Provide stainless steel access doors for use in ceramic tile walls, toilet rooms, locker rooms, and in areas subject to excessive moisture. Provide access doors of sufficient size to allow complete maintenance. Coordinate location of access doors with General Contractor and rough-in equipment accordingly.

F. Locate electrical outlets and equipment to fit details, panels, decorating or finish at space. Architect reserves right to make minor position changes of outlet locations before work has been installed.

G. Verify door swings before installing room light switch boxes. Install boxes on latch side of door unless otherwise noted

3.05 EQUIPMENT SUPPORTS

A. Provide supporting steel not indicated on drawings as required for installation of equipment and materials including angles, channels, beams, hangers, etc.

B. Provide steel shell with plug type concrete anchors for attaching equipment to concrete. Plastic, rawhide or anchors using lead are not allowed.

C. Do not support equipment or luminaires from metal roof decking.

3.06 SUPPORT PROTECTION

A. In occupied areas, mechanical and electrical rooms and areas requiring normal maintenance access, guard certain equipment to protect personnel from injury.

B. Provide minimum 1/2” (13 mm) thick Armstrong Armaflex insulation or similar product applied with Armstrong 520 adhesive on lower edges of equipment, including bus duct, cable tray, pull boxes and electrical supporting devices suspended less than 7 ft (2.13 m) above floors, platforms or catwalks in these areas.

C. Protect threaded rods or bolts at supporting elements as described above. Trim threaded rods or bolts such that they do not extend beyond supporting element.

3.07 ELECTRICAL SYSTEMS IDENTIFICATION

A. Refer to Section 26 05 53 - Identification for Electrical Systems

3.08 ACCEPTANCE TESTING

A. When testing is to be witnessed by Architect/Engineer or Inspector, notify them at least 10 days prior to testing date.

B. When equipment or systems fail to meet minimum test requirements, replace or repair defective work or materials as necessary and repeat inspection and test until equipment or systems meet test requirements. Make repairs with new materials.

C. Contractor is responsible for certifying in writing equipment and system test results. Certification shall include identification of portion of system tested, date, time, test criteria and name and title of person signing test certification documents.

D. Maintain copies of certified test results, including those for any failed tests, at project site. At completion of project, include copies of test records and certifications in O&M Manuals.

3.09 START-UP

A. Systems and equipment shall be started, tested, adjusted, and turned over to Owner ready for operation. This includes “Owner-Furnished, Contractor-Installed” (OFCI) and “Contractor-Furnished, Contractor-Installed” (CFCI) systems and equipment.

B. Follow manufacturer's pre-start-up checkout, start-up, trouble shooting and adjustment procedures.

C. Contractor shall provide services of technician/mechanic knowledgeable in start-up and checkout of types of systems and equipment on project.

D. Provide start-up services by manufacturer's representative where specified or where Contractor does not have qualified personnel.

E. Coordinate start-up with all trades.

3.10 CLEANING

A. Clean systems after installation is complete.

B. Vacuum debris from panelboards, switchboards, motor starter and disconnect switch enclosures, junction boxes and pull boxes two weeks before energization and again prior to completion.

C. Where louvers are provided in switchgear or transformer enclosures, vacuum louvers free of dust and dirt.

D. Clean luminaire lenses and lamps at time of installation and clean lens exteriors just prior to final inspection.

E. Thoroughly clean equipment of stains, paint spots, dirt and dust. Remove temporary labels not used for instruction or operation.

F. During construction, maintain indoor air quality per general contractors IAQ plan for LEED credit.

END OF SECTION 26 00 00

SECTION 26 01 26 - MAINTENANCE TESTING OF ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements

1.02 DESCRIPTION

A. Test the following systems:

(1) Medium voltage distribution equipment from point of service
(2) 480Y/277 V substations
(3) 208Y/120 V substations
(4) Power distribution monitoring, control and relay equipment
(5) Overcurrent protection device settings
(6) Starters feeding motors 40 hp (30 kW) or greater
(7) Motors 40 hp (30 kW) or greater
(8) Feeders from service point through feeders serving panelboards of 400 A or greater
(9) Emergency or standby generators
(10) Grounding system from service point through branch panelboard feeders
(11) Computer room grounding system

1.03 INITIAL ACCEPTANCE TEST AND INSPECTION

A. Perform acceptance test per NETA ATS - 1987 except as modified herein.

B. Perform on-site testing after equipment installation, unless otherwise noted.

C. Provide material, equipment, labor, and technical supervision to perform such tests and inspections.

D. Provide test power required.

E. Coordinate testing schedule and equipment availability with Owner.

F. Notify Owner 1 week before testing.

G. Prepare test results with comparison to industry and manufacturer's values and tolerances.

H. Assure electrical equipment is operational and within industry and manufacturer's tolerances and is installed in accordance with Contract Documents.

I. Provide recommendations for suitability of continued energization.

1.04 WORK NOT INCLUDED

A. Prime mover testing (turbines or engines) will be performed by others.

B. Uninterruptible Power Systems

1.05 APPLICABLE CODES, STANDARDS AND REFERENCES

A. Perform inspections and tests in accordance with the following Codes and Standards:

(1) National Electrical Code - NEC
(2) National Electrical Manufacturer's Association - NEMA
(3) American Society for Testing and Materials - ASTM
(4) American National Standards Institute - ANSI
(5) Institute of Electrical and Electronic Engineers - IEEE
(6) National Electrical Testing Association - NETA
(7) State and Local Codes and Ordinances
(8) Insulated Cable Engineers Association - ICEA
(9) Association of Edison Illuminating Companies - AEIC
(10) OSHA - Part 1910: Subpart S - 1910.308

B. Perform inspections and tests in accordance with the following references.

(1) Project Design Specifications
(2) Project Design Drawings
(3) Manufacturer's instruction manuals
(4) Manufacturer's shop drawings

C. Qualifications of Testing Agency

(1) Member of NETA.

(2) Meet Federal Department of Commerce requirements for independent testing laboratory accreditation.

(3) Submit proof of above qualifications to Engineer.

1.06 SUBMITTALS

A. Provide 5 copies of complete testing report using NETA printed forms. Test report includes the following: summary of project, description of equipment tested, description of test, test results, conclusion and recommendation, and signature of responsible test organization authority.

B. Submit completed report to Engineer no later than 30 days after completion of testing, unless directed otherwise.

PART 2 - PRODUCTS

2.01 NOT APPLICABLE TO THIS SECTION

PART 3 - EXECUTION

3.01 THE FOLLOWING INDICATES APPLICABLE NETA STANDARD ATS - 1987 SECTIONS FOR THIS PROJECT.

ELECTRICAL ACCEPTANCE TESTS

5. GENERAL
   - 5.1 Test Instrument Calibration
   - 5.2 Test Report
     - 5.2.2.: 5 copies of Test Report
   - 5.3 Safety & Precautions

8. INSPECTION AND TEST PROCEDURES:
   - 8.1 Metal Enclosed Switchgear and Switchboard Assemblies
   - 8.2 Transformers
     - 8.2.1 Transformers - Dry Type
     - 8.2.3 Small Transformers - Dry Type, Air Cooled (600V and Below)
   - 8.3 Cables
     - 8.3.1 Cables - Low Voltage - 600 Maximum
     - 8.3.2 Cables - Medium and High Voltage - 69 kV Maximum
   - 8.4 Metal Enclosed Busways
     - 8.4.1 Visual and Mechanical Inspection
     - 8.4.2 Electrical Tests
     - 8.4.3 Test Values
   - 8.5 Switches
     - 8.5.1 Air Switches
     - 8.5.2 Air Switches - Medium Voltage - Metal Enclosed
   - 8.6 Circuit Breakers
     - 8.6.1 Circuit Breakers - Low Voltage
       - 8.6.1.1 Circuit Breakers - Low Voltage - Insulated Case
       - 8.6.1.2 Circuit Breakers - Low Voltage Power (600V Service Class)
     - 8.6.2 Circuit Breakers - Medium Voltage
       - 8.6.2.3 Circuit Breakers - Medium Voltage - Vacuum
   - 8.9 Protective Relays
     - 8.9.1 Visual and Mechanical Inspection
     - 8.9.2 Electrical Tests
   - 8.10 Instrument Transformers
     - 8.10.1 Visual and Mechanical Inspection
     - 8.10.2 Electrical Tests - Current Transformers
     - 8.10.3 Electrical Tests - Voltage Transformers
     - 8.10.4 Test Values
   - 8.11 Metering and Instrumentation
     - 8.11.1 Visual and Mechanical Inspection
     - 8.11.2 Electrical Tests
   - 8.13 Grounding Systems
     - 8.13.1 Visual and Mechanical Inspection

8.13.2 Electrical Tests
8.13.3 Test Values
8.14 Ground Fault System
8.14.1 Visual and Mechanical Inspection
8.14.2 Electrical Tests
8.14.3 Test Parameters
8.15 Rotating Machinery
8.15.1 AC Motors 40 hp (30 kW) or Greater)
8.16 Motor Control
8.16.2 Motor Control Centers (VFD's)
8.19 Surge Arrestors
8.19.1 Low Voltage Surge Protection Devices
8.19.2 Medium and High Voltage Surge Protection Devices
8.20 Capacitors
8.20.1 Visual and Mechanical Inspection
8.20.2 Electrical Tests
8.20.3 Test Values
8.22 Emergency Systems
8.22.1 Engine Generator
8.22.4 Automatic Transfer Switches
9. SYSTEM FUNCTION TESTS
10. THERMOGRAPHIC SURVEY
11. TABLES

END OF SECTION 26 01 26

SECTION 26 04 77 - POWER MODULE SWITCH-ELEVATOR DISCONNECT

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements
B. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
C. Section 26 05 26 - Grounding and Bonding for Electrical Systems
D. Section 26 05 29 - Hangers and Supports for Electrical Systems
E. Section 26 05 33 - Raceway and Boxes for Electrical Systems
F. Section 26 05 53 - Electrical Systems Identification
G. Section 26 05 73 - Power System Studies
H. Section 26 08 12 - Power Distribution Acceptance Tests
I. Section 26 24 16.13 - Lighting and Appliance Panelboards
J. Section 26 24 16.16 - Distribution Panelboards
K. Section 26 27 26 - Wiring Devices
L. Section 26 28 13 - Fuses
M. Section 26 28 16 - Enclosed Switches and Circuit Breakers

1.02 DESCRIPTION

A. This Section includes Power Module Switch(es), and accessories required to distribute electrical power to elevators.

1.03 REFERENCE STANDARDS

A. ANSI/ASME A17.1, 102.2(4)
B. NETA ATS
C. NEMA AB 1 – Molded-Case Circuit Breakers, Molded-Case Switches and Circuit Breaker Enclosures
D. NEMA FU 1 – Low Voltage Cartridge Fuses
E. NEMA BS 31047 – Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)
F. NFPA 70 – National Electrical Code
G. UL 98 – Enclosed and Dead Front Switches
H. UL 486A-486B – Wire Connectors
I. UL 512 - Fuseholders

1.04 SUBMITTALS

A. Product Data:
   (1) Include catalog cutsheet information showing voltage, amperage, short circuit current ampere rating, enclosure type and dimensions, configurations, and methods of mounting and installation. Submit listing of all types, sizes and quantity of fuses which will be installed including the location of each.
B. Manufacturer's Installation Instructions:
   (1) Wiring diagrams detailing wiring for power and control systems and differentiating between manufacturer-installed and field-installed wiring. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation and starting of product.
C. Qualification data for firms and persons specified in the "Quality Assurance" Article to demonstrate their capabilities and experience.
D. Closeout Submittals:
   (1) Project Record Documents:
      (a) Record actual locations with ratings of installed Power Modules Switches .
   (2) Operation and Maintenance Data:
      (a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      (b) Include spare parts data listing, source, and current prices of replacement parts and supplies.
      (c) Include Manufacturer Seismic Qualification Certification and Installation Seismic Qualification Certification.
E. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

1.05 QUALITY ASSURANCE

A. Testing Agency Qualifications: In addition to the requirements specified in Division 1 Section –Quality Control, an independent testing agency shall meet OSHA criteria for accreditation of testing laboratories, Title 29, Part 1907, or shall be a full member company of the InterNational Electrical Testing Association (NETA).

(1) Testing Agency's Field Supervisor: Person currently certified by NETA or the National Institute for Certification in Engineering Technologies, to supervise on-site testing specified in Part 3.

B. Obtain all elevator power module switch(es) from a single manufacturer.

C. Comply with NFPA 70 for components and installation.

D. Listing and Labeling: Provide disconnect switches and circuit breakers specified in this Section that are listed and labeled.

(1) Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Bussmann

B. Eaton

C. Littelfuse

2.02 POWER MODULE SWITCH

A. Provide Power Module Switch in a single NEMA Type 1 enclosure with necessary relay(s), control transformer and other options as required and as shown on drawings.

B. Power Module Switch shall have an ampere rating as shown on drawings and shall include horsepower rated switch with shunt trip capabilities.

C. Power Module Switch shall include as an accessory, a control power transformer with primary voltage rating of 480 volts and 120 volt secondary.

D. Module shall have been successfully tested to a short circuit rating with Low-Peak Class J fuses at 200,000 amps RMS Symmetrical.

E. Switches shall have shunt trip capabilities at 120V AC for remote fire safety signal. Since fire safety control voltage is normally 24 V DC, include for each shunt trip one control power transformer and relay to activate shunt trip solenoid.

F. Switches shall include a key to test switch red "ON" pilot light and 2 normally open and 2 normally closed mechanical interlock auxiliary contacts.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install power module switches in locations as indicated, according to manufacturer's written instructions.

B. Install switches level and plumb.

C. Install wiring between switches and any control, and indication devices.

D. Connect switches and components to wiring system as indicated and instructed by manufacturer.

(1) Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

E. Identify each power module switch according to requirements specified in Division 26 Section 26 05 53 - Electrical Systems Identification. Attach nameplate to exterior of each switch using small corrosion-resistant metal screws or rivets. Do not use contact adhesive.

F. Install the top of the switch handle a minimum of 3'-6" (1 m) and maximum of 6' 6" (2 m) above finished floor.

3.02 CONNECTIONS

A. Check connectors, terminals, bus joints, and mountings for tightness. Tighten field-connected connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening valves. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL 486A-486B.

B. Provide equipment grounding connections for individually mounted overcurrent protective devices as indicated, as required by the NEC and per section 26 05 26 - Grounding and Bonding for Electrical Systems. Tighten connectors to comply with tightening torques specific in UL 486A-486B to assure permanent and effective grounding.

3.03 FIELD QUALITY CONTROL

A. Inspect for physical damage, proper alignment connections, anchorage, and grounding.

B. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, remove and replace with new units and retest.

C. Test disconnect switches and/or enclosed circuit breakers per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

D. Interpret test results in writing and submit to Engineer.

3.04 CLEANING

A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, vacuum dirt and construction debris, and repair damaged finish including chips, scratches, and abrasions to match original finish, using manufacturer-supplied paint kit. Do not use compressed air to assist in cleaning.

END OF SECTION 26 04 77

SECTION 26 05 13.16 - MEDIUM-VOLTAGE, SINGLE- AND MULTI-CONDUCTOR CABLES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 26 - Grounding and Bonding for Electrical Systems

B. Section 26 05 43 - Underground Ducts And Raceways For Electrical Systems

C. Section 26 05 53 - Electrical Systems Identification

D. Section 26 05 93 - Electrical Systems Firestopping

E. Section 26 08 12 - Power Distribution Acceptance Tests

F. Section 26 08 13 - Power Distribution Acceptance Test Tables

1.02 DESCRIPTION

A. Section includes cables and related splices, terminations, and accessories for medium-voltage electrical distribution systems.

B. Cables are for use in wet or dry locations applications.

C. Conductors shall be rated to operate at conductor temperature of 105°C for continuous normal operation, 140°C for emergency overload conditions, and 250°C for short circuit conditions, based on 40°C maximum ambient temperature.

D. Conductor sizes in Section are based on copper wire, and only copper wire shall be used.

1.03 REFERENCE STANDARDS

A. AEIC CS8 – Specification for Extruded Dielectric Shielded Power Cables Rated 5 through 46kV.

B. IEEE 48 – Standard Test Procedures and Requirements for Alternating-Current Cable Terminations 2.5kV through 765kV.

C. IEEE 386 – Standard for Separable Insulated Connector Systems for Power Distribution Systems above 600 V (ANSI).

D. IEEE 404 – Standard for Extruded and Laminated Dielectric Shielded Cable Joints Rated 2500 – 500000 V (ANSI)

E. IEEE 576 – Recommended Practice for Installation, Termination, and Testing of Insulated Power Cable as Used in Industrial and Commercial Applications (ANSI)

F. ICEA S-93-639 – 5-46kV Shielded Power Cables for the Distribution and Transmission of Electrical Energy

G. ICEA S-94-649 – 5-46kV Concentric Neutral Cables Rated 5000 to 46000 Volts

H. ICEA S-97-682 – Utility Shielded Power Cables Rated 5000 to 46000 Volts

I. NFPA 70 – National Electrical Code

J. UL 1072 – Medium-Voltage Power Cable

1.04 SUBMITTALS

A. Product Data: For each type of cable indicated. Include splices and terminations for cable and cable accessories.

(1) Include cable drawings with the following data:

(a) Longitudinal cutback and cross-sectional view of cable.

(b) Identification and structure of cable components.

(c) Dimensions of cable components in English and SI units.

B. Material Certificates: For each cable and accessory type, signed by manufacturer.

C. Manufacturer Testing Certificate: For each type and voltage class of cable indicated.

D. Certified Field Quality Control Test Reports per requirements in Section 26 08 12 - Power Distribution Acceptance Tests and Section 26 08 13 - Power Distribution Acceptance Test Tables for each type and voltage class of cable indicated. Indicate applicable standards compliance. Interpret test results and corrective action taken for compliance with specification requirements.

E. Qualification Data: For 15 KV.

F. Manufacturer’s Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation.

G. Installation Guide: Include the following:

(1) Maximum allowable pulling tension (in pounds and newtons)

(2) Minimum allowable bending radius

(3) Recommended pulling compounds

(4) Splicing and termination instructions with diagrams, dimensions, and material lists

(5) Weight per 1,000 ft (305 m)

(6) Standard “packaging” of reels (i.e., lengths, lagging, banding, etc.)

(7) Reactance and AC resistance (ohms to neutral) of each size and voltage class of cable, both in magnetic and non-magnetic duct, based on 3-1/C cables or 1-3/C cable in one duct.

H. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations of cables, splices, and terminations.

(2) Operation and Maintenance Data:

(a) Include manufacturer’s recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

1.05 QUALITY ASSURANCE

A. Installer: Engage cable splicer, trained and certified by splice material manufacturer, to install, splice, and terminate medium-voltage cable, having not less than 3 yrs experience as licensed electrician.

B. Regulatory Requirements:

(1) Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Source Limitations: Obtain cables and accessories through one source from single manufacturer.

D. All cables shall be of a single type and configuration. Date of manufacture shall not precede contract date by more than one year.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Coordinate with manufacturer to provide protective covering over cable and reel to prevent damage during shipping, storage, or handling.

B. Store in clean, dry space. Protect from dirt, fumes, water, corrosive substances, and construction debris.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Cables:

(1) Okonite Company

B. Cable Splicing and Terminating Products and Accessories:

(1) Raychem Corporation

(2) RTE Components; Cooper Power Systems, Inc.

(3) Prysmian Group

(4) Thomas & Betts Corporation/Elastimold

(5) 3M; Electrical Products Division

(6) Approved equal

2.02 CABLES

A. Cable Type: MV105

B. Comply with UL 1072, AEIC CS8, ICEA S-93-639 and ICEA S-97-682

C. Conductor: Copper

D. Conductor Stranding: Compact round, concentric lay, Class B

E. Strand Filling: Conductor interstices are filled with impermeable compound

F. Conductor Insulation: Ethylene-propylene-rubber

G. Voltage Rating: 15 kV

H. Insulation Thickness: 133 percent insulation level

I. Shielding: Copper tape, helically applied over semiconducting insulation shield. 25% overlap.

J. Three-Conductor Cable Assembly: Three insulated, shielded conductors cabled together with ground conductors

K. Circuit Identification: color-coded tape (black, red, blue) under the metallic shielding

L. Cable Armor: Interlocked aluminum applied over cable

M. Cable Jacket: Sunlight-resistant PVC. Color: red, unless otherwise designated

N. Cable lengths shall be supplied with factory-installed, moisture-proof end seals on conductors on each end. Cable seals shall be rubber or plastic caps and shall prevent moisture from seeping into cable ends.

O. Each cable reel shall be tagged with the following:

(1) Manufacturer
(2) Cable Size
(3) Cable Type
(4) Voltage Class
(5) Manufacture Date
(6) Cable Length
(7) Tolerances
(8) Reel Number
(9) Customer Order No.
(10) Customer Name

P. Surface Marking:

(1) Cables shall be permanently printed (or imprinted) on jacket surface at regular intervals over entire length of cable with the following:
(a) Manufacturer’s name
(b) Conductor size
(c) Voltage class
(d) Insulation type
(e) UL designation

Q. Cables shall be constructed and rated for continuous and intermittent submersion in water and shall be suitable for installation in conduit and underground duct.

R. Cable shield shall be capable of withstanding fault current indicated on drawings for 1/10 second.

2.03 SPLICE KITS

A. Connectors and Splice Kits: Comply with IEEE 404; type as recommended by cable or splicing kit manufacturer for application.

B. Splicing Products: As recommended, in writing, by splicing kit manufacturer for specific sizes, ratings, and configurations of cable conductors. Include components required for complete splice, with detailed instructions.

(1) Combination tape and cold-shrink-rubber sleeve kit with rejacketing by cast-epoxy-resin encasement or other waterproof, abrasion-resistant material.
(2) Heat-shrink splicing kit of uniform, cross-section, polymeric construction with outer heat-shrink jacket.
(3) Premolded, cold-shrink-rubber, in-line splicing kit.
(4) Premolded EPDM splicing body kit with cable joint sealed by interference fit of mating parts and cable.

2.04 SOLID TERMINATIONS

A. Multi-conductor Cable Sheath Seals: Type recommended by seal manufacturer for type of cable and installation conditions, including orientation.

(1) Compound-filled, cast-metal body, metal-clad cable terminator for metal-clad cable with external plastic jacket.
(2) Cold-shrink sheath seal kit with preformed sleeve openings sized for cable and insulated conductors.
(3) Heat-shrink sheath seal kit with phase- and ground-conductor rejacketing tubes, cable-end sealing boot, and sealing plugs for unused ground-wire openings in boot.
(4) Cast-epoxy-resin sheath seal kit with wraparound mold and packaged, two-part, epoxy-resin casting material.

B. Shielded-Cable Terminations: Comply with the following classes of IEEE 48. Insulation class is equivalent to that of cable. Include shield ground strap for shielded cable terminations.

(1) Class 1 Terminations: Modular type, furnished as kit, with stress-relief tube; multiple, molded-silicone rubber, insulator modules; shield ground strap; and compression-type connector.
(2) Class 1 Terminations: Heat-shrink type with heat-shrink inner stress control and outer non-tracking tubes; multiple, molded, non-tracking skirt modules; and compression-type connector.

(3) Class 1 Terminations: Modular type, furnished as kit, with stress-relief shield terminator; multiple-wet-process, porcelain, insulator modules, shield ground strap; and compression-type connector.

(4) Class 1 Terminations, Indoors: Kit with stress-relief tube, non-tracking insulator tube, shield ground strap, compression-type connector, and end seal.

(5) Class 2 Terminations, Indoors: Kit with stress-relief tube, nontracking insulator tube, shield ground strap, and compression-type connector. Include silicone-rubber tape, cold-shrink-rubber sleeve, or heat-shrink plastic-sleeve moisture seal for end of insulation whether or not supplied with kits.

(6) Class 3 Terminations: Kit with stress cone and compression-type connector.

C. Non-shielded Cable Terminations: Kit with compression-type connector. Include silicone-rubber tape, cold-shrink-rubber sleeve, or heat-shrink plastic-sleeve moisture seal for end of insulation whether or not supplied with kits.

D. Cable Terminations:

(1) Product of one manufacturer and furnished in kit form compatible with insulation and conductor material for cable terminated.

E. Connecting Lugs:

(1) Connectors and terminals: Copper with uniform compression over entire contact surface.

(2) Terminals on conductors: Solderless terminal lugs.

2.05 SEPARABLE INSULATED CONNECTORS

A. Description: Modular system, complying with IEEE 386, with disconnecting, single-pole, cable terminators and with matching, stationary, plug-in, dead-front terminals designed for cable voltage and for sealing against moisture.

B. Terminations at Distribution Points: Modular type, consisting of terminators installed on cables and modular, dead-front, terminal junctions for interconnecting cables.

C. Load-Break Cable Terminators: Elbow-type units with 200A, 15 KV class, 95 KV BIL load make/break and continuous-current rating; coordinated with insulation diameter, conductor size, and material of cable being terminated, with steel-reinforced hook-stick eye, grounding eye, and arc-quenching material. Include capacitance coupled test point on terminator body. Include cold shrinkable metallic shield adapter kit to ground metallic shielded cable. Include connection bus with parking stand for wall mounting.

D. Dead-Break Cable Terminators: Elbow-type unit with 600A continuous-current rating; designed for de-energized disconnecting and connecting; coordinated with insulation diameter, conductor size, and material of cable being terminated. Include test point on terminator body that is capacitance coupled.

E. Dead-Front Terminal Junctions: 200A, 15 KV class, modular bracket-mounted groups of dead-front stationary terminals that mate and match with above cable terminators. Two-, three-, or four-terminal units as indicated, with fully rated, insulated, watertight conductor connection between terminals and complete with grounding lug, manufacturer's standard accessory stands, stainless-steel mounting brackets, and attaching hardware.

(1) Protective Cap: Insulating, electrostatic-shielding, water-sealing cap with drain wire.

(2) Portable Feed-Through Accessory: Two-terminal, dead-front junction arranged for removable mounting on accessory stand of stationary terminal junction.

(3) Grounding Kit: Jumpered elbows, portable feed-through accessory units, protective caps, test rods suitable for concurrently grounding three phases of feeders, and carrying case.

(4) Standoff Insulator: Portable, single dead-front terminal for removable mounting on accessory stand of stationary terminal junction. Insulators suitable for fully insulated isolation of energized cable-elbow terminator.

F. Test-Pont Fault Indicators: Applicable current-trip ratings and arranged for installation in test points of load-break separable connectors, and complete with self-resetting indicators capable of being installed with shotgun hot stick and tested with test tool.

G. Tool Set: Shotgun hot stick with energized terminal indicator, fault-indicator test tool, and carrying case.

2.06 SOURCE QUALITY CONTROL

A. Test and inspect cables according to Section 26 08 12 - Power Distribution Acceptance Tests and Section 26 08 13 - Power Distribution Acceptance Test Tables.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install cables according to IEEE 576.

B. Pull Conductors: Do not exceed manufacturer's recommended minimum installation temperature, maximum pulling tensions, and sidewall pressure values.

(1) Where necessary, use manufacturer-approved pulling compound or lubricant that will not deteriorate conductor or insulation.

(2) Use pulling means, including fish tape, cable, rope, and basket-weave cable grips that will not damage cables and raceways. Do not use rope hitches for pulling attachment to cable.

(3) Cut off cable damaged by cable grips or pulling make-ups so as to provide clean, undamaged cable for termination. Continuously record pulling tension during installation.

C. Install exposed cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours where possible.

(1) Support cables and conductors in vertical raceways per requirements in Section 26 05 29 - Hangers and Supports for Electrical Systems.

D. Support cables in handholes and manholes from walls on heavy-duty, non-metallic cable rack arms, at least 3” (80 mm) above the floor. Support cables with reinforced nylon cradles. Anchor to wall with stainless steel anchor bolts.

(1) Install compression connectors with hydraulic compression tool on 600V neutral/ground conductor.

E. Install direct-buried cables on leveled and tamped bed of 3” (80 mm) thick, clean sand. Separate cables crossing other cables or piping by a minimum of 4" (100 mm) of tamped earth. Install permanent markers at ends of cable runs, changes in direction, and buried splices.

F. Install “buried-cable” warning tape per requirements in Section 26 05 53 - Identification for Electrical Systems.

G. In manholes, handholes, pull boxes, junction boxes, and cable vaults, train cables around walls by longest route from entry to exit and support cables at intervals adequate to prevent sag. Fill lowest ducts first, avoid covering or blocking duct entrances and allow space for future cable installation.

H. Cut cable in clean, dry environment. Seal cut ends with waterproof seal immediately after cutting. Maintain a seal during and after pulling.

I. Install cable splices at pull points (accessible locations) and elsewhere as indicated; use standard kits.

J. Install terminations at ends of conductors and seal multi-conductor cable ends with standard kits. Do not install exterior terminations during inclement weather or damp atmospheric conditions.

K. Install stress cones at cable splices and terminations, grounded per cable and connector manufacturer recommendations.

L. Check phase rotation before connections are made to existing circuits. Clearly letter cable terminations. Identify phases with phase designations lettered on terminal boxes and other terminations throughout the system.

M. Install separable insulated-connector components as follows:

(1) Protective Cap: At each terminal junction, with one on each terminal to which no feeder is indicated to be connected

(2) Portable Feed-Through Accessory: Three

(3) Standoff Insulator: Three

N. Seal around cables passing through fire-rated elements according to Section 26 05 93 - Electrical Systems Firestopping.

O. Ground shields of shielded cable at terminations, splices, and separable insulated connectors. Shields shall be grounded at both ends of cable run. Single point grounding will not be accepted. Ground metal bodies of terminators, splices, cable and separable insulated-connector fittings, and hardware. For grounding requirements, refer to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

P. Identify cables according to Section 26 05 53 - Electrical Systems Identification.

3.02 FIELD QUALITY CONTROL

A. Perform cable acceptance tests on cable circuits after installing cables and before electrical circuitry has been energized. Splices and terminations required as part of this project are to be completed and acceptance tested as part of cable tests. For cables not spliced or terminated as part of project, ends should be clean, dry and long enough to eliminate leakage from conductor to ground along outer surface of cable.

B. Perform acceptance tests and damage investigations under constant supervision of Owner’s representative. Contractor shall coordinate and provide labor, material, equipment, and services necessary to test each completed cable circuit.

C. Remove and replace defective cables and retest as required.

D. Refer to Section 26 08 12 - Power Distribution Acceptance Tests and Section 26 08 13 - Power Distribution Acceptance Test Tables for visual and mechanical inspection and electrical tests. Certify compliance with test parameters.

END OF SECTION 26 05 13.16

SECTION 26 05 19 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 29 - Hangers and Supports for Electrical Systems

B. Section 26 05 33 - Raceway and Boxes for Electrical Systems

C. Section 26 05 43.16 - Cable In Duct System

D. Section 26 05 53 - Electrical Systems Identification

E. Section 26 05 93 - Electrical Systems Firestopping

F. Section 26 08 12 - Power Distribution Acceptance Tests

G. Section 26 08 13 - Power Distribution Acceptance Test Tables

1.02 DESCRIPTION

A. Section includes conductors and cables rated 600 V and less, connectors, splices, and terminations rated 600 V and less, sleeves and sleeve seals for cables.

B. Conductor and conduit sizes in these contract documents are based on copper wire, and only copper wire shall be used.

1.03 REFERENCE STANDARDS

A. ASTM B1 – Standard Specification for Hand-Drawn Copper Wire.

B. ASTM B8 – Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

C. NEMA WC 70 – Non-Shielded Power Cable 2000 V or less for the Distribution of Electrical Energy (ICEA S-95-658).

D. NFPA 70 – National Electrical Code.

E. UL 44 – Thermoset-Insulated Wires and Cables.

F. UL 83 – Thermoplastic-Insulated Wires and Cables.

G. UL 486A-486B – Wire Connectors.

H. UL 486C – Splicing Wire Connectors.

I. UL 486D – Standard for Insulated Wire Connector Systems for Underground Use or in Damp or Wet Locations.

J. UL 486E – Standard for Equipment Wiring Terminals for Use with Aluminum and/or Copper Conductors.

K. UL 486G - Standard for Sealed Twist-On Connecting Devices.

L. UL 1569 – Standard for Metal-Clad Cables.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Manufacturer’s Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation.

C. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

D. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations of components and circuits.

(2) Operation and Maintenance Data:

(a) Include manufacturer’s recommended operating instructions, maintenance procedures and intervals, test reports, and preventive maintenance instructions.

1.05 QUALITY ASSURANCE

A. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

B. Wire and cable boxes and reels shall bear the date of manufacture.

(1) Date of manufacture shall not precede contract date by more than one year.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Protect from dirt, fumes, water, corrosive substances, and construction debris.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. General Cable Corporation

B. Cerrowire

C. Southwire Company

D. Encore Wire Corporation

2.02 DESCRIPTION

A. NEMA WC 70; single copper conductor insulated wire; 600 V rated insulation; 90°C maximum operating temperature for dry and wet or damp locations.

(1) Thermoplastic-insulated wires and cables: NEMA WC 70, UL 83; Type THHN, THWN, THHW, THW-2, and THWN-2.

(2) Thermoset-insulated wires and cables: NEMA WC 70, UL 44; Type XHHW, XHHW-2, USE, and SO.

B. Multi-conductor Cable: NEMA WC 70; for armored cable, Type AC, metal-clad cable, Type MC, Type SO, and Type USE with ground wire.

C. Metal-clad cable, Type MC; UL 1569:

(1) Impervious, corrugated, continuous, seam welded metal sheath.

(2) No grounding conductor.

(3) Single grounding conductor.

(4) Three grounding conductors for use as VFD to motor feeder.

(5) Overall PVC jacket for water resistance.

(6) Listed for cable tray use when cable trays are used for electrical conductor support

2.03 REMOTE CONTROL AND SIGNAL CIRCUITS

A. Class 1

(1) Copper conductor, single insulated wire.

(2) Insulation type THHN rated 90°C, 600 V insulation class.

(3) Type XHHW for ambient temperature less than 32°F (0°C).

(4) UL 83 listed, ASTM B1 for solid conductors; ASTM B 8 for stranded conductors.

B. Classes 2 and 3

(1) Copper conductor, multiple twisted conductors covered with an overall non-metallic jacket unless otherwise noted.

(2) Insulation type XLPE, rated 105°C, 300 V insulation class.

(3) UL listed for use in space in which circuits will be installed.

2.04 CONNECTORS, SPLICES, AND TERMINALS

A. Manufacturers:

(1) AFC Cable Systems, Inc.

(2) Hubbell Power Systems, Inc.

(3) O-Z/Gedney; EGS Electrical Group LLC.

(4) 3M; Electrical Products Division

(5) Tyco Electronics Corp.

(6) King Innovation

(7) Ideal Industries

(8) NSi Industries

(9) DryConn

(10) Approved equal

B. Description: UL 486A-486B, UL 486C, UL 486D, UL 486E, UL 486G; factory-fabricated connectors, splices, and terminals of size, ampacity rating, material, type, and class for application and service indicated.

2.05 TERMINATIONS

A. Compression set, bolted or screw type lug, or direct to bolted or screw type terminal.

B. Waterproof.

(1) Connectors shall be UL 486G listed for use in wet, damp, direct burial, and above-grade applications.

(2) Connectors shall incorporate internal sealing materials, such as dielectric grease or silicone sealant, and be factory-sealed.

(3) Rated for 600 volts minimum, 1000 volts for fixtures or Class 2 circuits, suitable for lighting systems, irrigation, or branch circuit wiring.

(4) Connector body: UV-resistant, high-impact thermoplastic or equivalent.

(5) Sealant: pre-filled, non-hardening dielectric compond.Spring or twist-on design to mechanically secure wires.

(6) Temperature rating: -40° F to 105° F continuous.

(7) Wire compatibility: #22 AWG to #6 AWG, solid or stranded copper conductors.

(8) Moisture ingress protection: rated for direct burial and submersion in water when installed per manufacturer instructions.

(9) Clearly labeled with wire range, voltage rating, and UL listing.

(10) Marked with installation torque or twist-on guidelines as required.

2.06 PLASTIC CABLE TIES

A. Nylon or approved; locking type; metallic ties not permitted.

PART 3 - EXECUTION

3.01 INSTALLATION OF CONDUCTORS AND CABLES

A. Install conductors in a raceway system, unless otherwise specified or indicated.

B. Install conductors only after:

(1) Building interior is enclosed and weather tight

(2) Mechanical work likely to damage conductors has been completed

(3) Raceway installation is complete and supported

C. Pull conductors into raceway at same time.

D. Neatly train and lace conductors inside boxes, equipment, and panelboards.

E. Conceal cables in finished walls, ceilings, and floors, unless otherwise indicated.

F. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

G. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

H. Install exposed cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours where possible. Protect exposed cables from damage.

I. Support cables above accessible ceiling using plastic cable ties to support cables from structure . Do not rest cable on ceiling panels.

J. Support cables and conductors in vertical raceways per requirements in Section 26 05 29 - Hangers and Supports for Electrical Systems.

K. Identify and color-code conductors and cables according to Section 26 05 53 - Electrical Systems Identification.

L. Wiring at Outlets: Install conductor at each outlet, with minimum 6" (150 mm) of slack.

M. Limit conduit fill to a maximum of 9 current-carrying conductors.

N. Install stranded conductors where conductors terminate in crimp type lugs. Do not place bare stranded conductors directly under screws.

O. Install VFD input wiring, output wiring and control wiring in their own separate conduit systems.

P. Provide dedicated neutrals for branch circuits unless otherwise noted on drawings.

3.02 CONDUCTOR MATERIAL APPLICATIONS

A. Feeders: Copper. Solid or stranded for #10 AWG and smaller; stranded for #8 AWG and larger.

B. Branch Circuits: Copper. Solid or stranded for #10 AWG and smaller; stranded for #8 AWG and larger.

C. Minimum conductor sizes shall be as follows:

(1) #12 AWG – Branch circuits of any kind.

(2) #14 AWG – Fire alarm system.

(3) #16 AWG – Remote control and signal systems.

D. Branch wiring length limitations:

(1) Where wire sizes are shown on project drawings and do not indicate they have been adjusted for voltage drop based on circuit length, they shall be increased as noted below depending on Contractor routing.

(a) 208Y/120 V circuits over 75 ft (23 m) in length: Increase wire size one size for each 75 ft (23 m) in length. Increase conduit size as required.

(b) 480Y/277 V circuits over 150 ft (45 m) in length: Increase wire size one size for each150 ft (45 m) of length. Increase conduit size as required.

3.03 CONDUCTOR INSULATIONS AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

A. Service Entrance: Type THHN/THWN-2, rated 90°C for wet locations, single conductors in raceway, Type XHHW-2, rated 90°C for wet locations, single conductors in raceway, Mineral-insulated, metal-sheathed cable, Type MI, or Type SE or USE multi-conductor cable.

B. Exposed Feeders: Type THHN/THWN-2, rated 90°C for wet locations, single conductors in raceway or Type XHHW-2, rated 90°C for wet locations, single conductors in raceway.

C. Feeders Concealed in Ceilings, Walls, Partitions, and Crawlspaces: Type THHN/THWN-2, rated 90°C for wet locations, single conductors in raceway or Type XHHW-2, rated 90°C for wet locations, single conductors in raceway.

D. Feeders Concealed in Concrete, below Slabs-on-Grade, and Underground: Type XHHW-2, rated 90°C for wet locations, single conductors in raceway.

E. Feeders Installed below Raised Flooring: Type THHN/THWN-2, rated 90°C for wet locations, single conductors in raceway, Type XHHW-2, rated 90°C for wet locations, single conductors in raceway, or Metal-clad cable, Type MC.

F. Exposed Branch Circuits, Including in Crawl Spaces: Type THHN, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type THW-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type THWN-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, or Type XHHW-2. rated 90°C for dry and wet or damp locations, single conductors in raceway.

G. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type THW-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type THWN-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, or Type XHHW-2 rated 90°C for dry and wet or damp locations, single conductors in raceway.

H. Branch Circuits Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THW-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type THWN-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, or Type XHHW-2 rated 90°C for dry and wet or damp locations, single conductors in raceway.

I. Branch Circuits Installed below Raised Flooring: Type THHN, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type THW-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type THWN-2, rated 90°C for dry and wet or damp locations, single conductors in raceway, Type XHHW-2 rated 90°C for dry and wet or damp locations, single conductors in raceway, or Metal-clad cable, Type MC.

J. Motor Circuit Branch Wiring and Associated Control Wiring: Type THHN, rated 90°C for dry and wet or damp locations, single conductors in raceway, stranded.

K. Wiring in Light Fixture Channels: Type THHN/THWN-2, rated 90°C for dry and damp locations, single conductors.

L. Branch Circuits Single Conductors in Raceway: 90°C rated conductors sized at 75°C rating for connection to equipment and devices.

M. Circuits 100A and less, utilize 60C for ampacity (unless both sides of the circuit are listed for 75C). Circuits 100A and over use 75C for ampacity. If the wire insulation ratings are higher, they may be utilized for de-rating purposes only and wire size shall be increased if the de-rated insulation rating is less than the required load current.

N. Metal-clad cable, Type MC, use for the following:

(1) Interior use limited to recessed and semi-recessed lighting fixtures final connections from homerun junction box

O. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.

3.04 REMOTE CONTROL AND SIGNAL CIRCUITS

A. Sizing – #16 AWG minimum.

B. Installation:

(1) Install cables in cable tray and cable rings.

(2) Provide protection for exposed cables where subject to damage.

(3) Support cables above accessible ceilings; do not rest on ceiling tiles.

(4) Use suitable cable fittings and connectors.

3.05 CONNECTORS, SPLICES, AND TERMINALS

A. Connectors:

(1) Except where equipment is furnished with bolted or screw type lug, use compression set pressure connectors with insulating covers. Use compression tools and die compatible with connectors being installed.

(2) Use bolt or compression-set type with application of insulating tape, pre-stretched or heat-shrinkable insulating tubing for splices and taps of #8 AWG conductors and larger. Install with hydraulic compression tool.

(3) Use pre-insulated “twist-on” connectors with integral spring for splices and taps of #10 AWG conductors and smaller and in quantities not to exceed manufacturer's recommendations.

(4) Tighten electrical connectors and terminals according to manufacturer’s published torque-tightening values. If manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

B. Waterproof Connectors:

(1) Install sealed waterproof connectors in accordance with UL 486G, NEC, and manufacturer's instructions.

(2) Ensure conductors are clean and stripped to correct length. Do not pre-twist conductors unless specifically directed by the manufacturer.

(3) Insert conductors fully into connector and twist to engage spring and internal sealant.

(4) Verify sealant visibly encapsulates conductor ends.

(5) For underground or wet environments, confirm proper sealing and apply additional waterproofing (e.g., gel wrap or heat shrink) only if required.

C. Splices:

(1) Splice wires and cable only in accessible locations such as within junction boxes.

(2) Make splices to carry full capacity of conductors with no perceptible temperature rise.

(3) Make below-grade splices in manholes and handholes watertight with pre-stretched or heat-shrinkable insulating tubing, or resin-filled insulator.

(4) Use electrical tape to build up insulation level equivalent to cable insulation and cover with not less than two half-lapped layers of plastic electrical tape, for joints, taps, and splices of #1 AWG conductors and larger.

(5) Plastic snap-on splice insulators are not allowed.

(6) Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.

(7) Use oxide inhibitor in each splice and tap conductor for aluminum conductors.

D. Terminals:

(1) Insulate ends of spare conductors with electrical tape and identify spare circuit number where appropriate.

(2) Eye type crimped terminal for removable screw type terminal. Forked torque terminal when screw terminal cannot be removed.

(3) Train wires to eliminate fanning of stands, crimp with proper tool and die.

(4) Torque screw termination per manufacturer’s recommended values.

(5) Field installed lug terminals:

(a) Install mechanical lugs per manufacturer's instructions and UL 486A requirements.

(b) Clean conductor surfaces and apply antioxidant compound as required.

(c) Ensure proper conductor insertion depth before tightening.

(d) Use a calibrated torque wrench to achieve manufacturer-specified torque values.

(e) Protect connections exposed to moisture or corrosive environments with approved insulating or sealing materials.

3.06 CABLE TIES

A. Neatly bundle conductors and cables together for support. Size cable ties sufficiently to accommodate the multiple cables being supported.

3.07 FIELD QUALITY CONTROL

A. Test 600 volt conductors and cables per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

B. Interpret test results in writing and submit to Engineer.

C. Replace conductors and cables that are found defective, at no expense to Owner.

1.02 DESCRIPTION

A. Section includes methods and materials for grounding systems and equipment, as required by State Codes, NFPA 70, applicable portions of other NFPA codes, as indicated herein, plus the following special applications:
   (1) Overhead-lines grounding.
   (2) Underground distribution grounding.
   (3) Common ground bonding with lightning protection system.
B. Maximum resistance to ground shall be less than _____ ohms.
C. Refer to Grounding Riser Diagram.

1.03 REFERENCE STANDARDS

A. TIA-607 -_____ – Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

B. ASTM B3 – Specification for Soft or Annealed Copper Wire
C. ASTM B8 – Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard or Soft
D. ASTM B33 – Specification for Tinned Soft or Annealed Copper Wire for Electrical Purposes
E. IACS - International Annealed Copper Standard
F. IEEE C2 – National Electrical Safety Code (ANSI)
G. IEEE 142 - Recommended Practice for Grounding of Industrial and Commercial Power Systems
H. IEEE 837 - Standard for Qualifying Permanent Connections used on Substation Grounding
I. IEEE 857 – Standard for Qualifying Permanent Connections Used in Substation Grounding
J. NETA MTS – Maintenance Testing Specifications
K. NFPA 70 – National Electrical Code
L. NFPA 70B – Recommended Practice for Electrical Equipment Maintenance
M. NFPA 780 – Lightning Protection Systems
N. UL 96 – Lightning Protection Components
O. UL 467 – Grounding and Bonding Equipment

1.04 TELECOMMUNICATIONS GROUNDING SYSTEM DEFINITIONS

A. Grounding Equalizer (GE): Conductor that interconnects elements of telecommunications grounding infrastructure.
B. Telecommunications Bonding Backbone (TBB): Conductor that interconnects telecommunications main grounding busbar (TMGB) to telecommunications grounding busbar (TGB).
C. Telecommunications Bonding Conductor: Conductor that interconnects telecommunications bonding infrastructure to building's service equipment (power) ground.
D. Telecommunications Grounding Busbar (TGB): Interface to building telecommunications grounding system, common point of connection for telecommunications system and equipment to ground, and located in telecommunications room or equipment room.
E. Telecommunications Main Grounding Busbar (TMGB): Busbar placed in convenient and accessible location and bonded by means of bonding conductor for telecommunications to building service equipment (power) ground.

1.05 SUBMITTALS

A. Product Data: For each type of product indicated.
B. Other Informational Submittals:
    (1) Plans showing dimensioned as-built locations of grounding features, including the following:
        (a) Test wells
        (b) Ground rods
        (c) Ground rings
        (d) Grounding arrangements and connections for separately derived systems
        (e) Grounding for sensitive electronic equipment
    (2) Photos of underground grounding and bonding
C. Field Quality-Control Test Reports:
    (1) Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.
    (2) Test reports of resistance to earth. Each test report shall include:
        (a) Date of test, soil moisture content, and soil temperature
        (b) Test operator
        (c) Instrument or other test equipment used
        (d) Electrode designation or location
        (e) Ground impedance in ohms
        (f) Assumptions made - if required
D. Closeout Submittals:
    (1) Operation and Maintenance Manuals: Include the following:
        (a) Instructions for periodic testing and inspection of grounding features at _____ based on _____.
            1) Instructions to perform tests to determine if ground resistance or impedance values remain within specified maximums.

1.06 QUALITY ASSURANCE

A. Regulatory Requirements:

(1) Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70.

(2) Comply with UL 467 for grounding and bonding materials and equipment.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Store products in clean, dry space. Protect from dirt, fumes, water, corrosive substances, and construction debris.

1.08 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 CONDUCTORS

A. Insulated Conductors: _____ wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction, insulation color: green.

(1) Grounding Conductor: Solid #12 & #10, stranded #8 and larger

(2) Bonding Cable: 28 kcmil, 14 strands of #17 AWG conductor, 1/4” (6 mm) in diameter.

(3) Bonding Conductor: #4 AWG or #6 AWG, stranded conductor.

B. Bare Copper Conductors:

(1) Solid Conductors: ASTM B3.

(2) Stranded Conductors: ASTM B8.

(3) Tinned Conductors: ASTM B33.

(4) Bonding Jumper: Copper tape, braided conductors, terminated with copper ferrules; 1-5/8” (41 mm) wide and 1/16" (2 mm) thick.

(5) Tinned Bonding Jumper: Tinned-copper tape, braided conductors, terminated with copper ferrules; 1-5/8” (41 mm) wide and 1/16" (2 mm) thick.

C. Bare Grounding Conductor and Conductor Protector for Wood Poles:

(1) #4 AWG minimum, soft drawn copper.

(2) Conductor Protector: Half-round PVC or wood molding. If wood, use pressure-treated fir or cypress or cedar.

2.02 WALL MOUNTED GROUND BUS

A. Grounding Bus: Horizontal rectangular bars of annealed copper, _____.

2.03 CONNECTORS

A. Listed and labeled by a nationally recognized testing laboratory acceptable to authorities having jurisdiction for applications in which used, and for specific types, sizes, and combinations of conductors and other items connected.

B. Bolted Connectors for Conductors and Pipes: Electro-tin-plated copper or copper alloy, bolted pressure-type, with at least two bolts.

(1) Pipe connectors: Clamp type, sized for pipe.

C. Welded Connectors: Exothermic welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

D. Compression Connectors: Irreversible type.

2.04 GROUNDING ELECTRODES

A. Ground Rods: _____ steel_____; _____.

B. Chemical-Enhanced Grounding Electrodes: 300 series stainless steel tube, straight or L-shaped, charged with _____.

(1) Termination: Factory-attached #4/0 AWG bare conductor at least 48” (1219 mm) long.

(2) Backfill Material: Electrode manufacturer’s recommended material.

2.05 TELECOMMUNICATIONS BUSBARS

A. Material: Copper

(1) 1/4” (6 mm) thick

B. Pre-drilled

(1) 7/16” (11 mm) diameter

(2) Hole spacing per ANSI Joint Standard _____

(3) Hole pattern shall accommodate two-hole lugs

C. Insulators and stand-off brackets shall electrically isolate busbar from wall or other mounting surface.

D. Provide busbars listed by nationally recognized testing laboratory.

E. Size:

(1) Telecommunications Main Ground Busbar (TMGB) – 20” x 4” (500 mm x 100 mm) (minimum)

(2) Telecommunications Grounding Busbar (TGB) – 12” x 2” (300 mm x 50 mm) (minimum)

F. Size:

(1) Telecommunications Primary Bonding Busbar (PBB) – _____

(2) Telecommunications Secondary Bonding Busbar (SBB) – _____

2.06 TELECOMMUNICATIONS GROUNDING CONDUCTORS

A. Material: Stranded copper

B. Provide insulated bonding conductors.

(1) Green Jacket or Black Jacket marked with Green Tape or Green adhesive labels per NEC.

C. Size:

(1) Bonding Conductor for Telecommunications (BCT; TMGB to Grounding Electrode), Telecommunications Bonding Backbone (TBB; TMGB to TGB), Grounding Equalizer (GE; TBB to TBB): _____

(2) Telecommunications Bonding Backbone (TBB; TMGB to TGB) _____

D. Size:

(1) Telecommunications Bonding Conductor (TBC; PBB to Electrical Service Entrance main ground bar), Backbone Bonding Conductor (BBC; PBB to local steel structure): _____

(2) Telecommunications Bonding Backbone (TBB; PBB to SBB), Backbone Bonding Conductor (BBC; SBB to local steel structure): _____

2.07 TELECOMMUNICATIONS GROUNDING CONNECTIONS

A. Mechanical Connectors:

(1) Connector Body:

(a) High-strength, high-conductivity cast copper alloy

(b) 2-bolt type

(2) Bolts, nuts, washers, and lock-washers: 300 series stainless steel

(a) Supplied as part of connector body

(b) Split-bolt connector types are not allowed.

(3) Connector:

(a) Meet or exceed UL 467

(b) Clearly marked with catalog number, conductor size, and manufacturer

B. Irreversible Compression Connectors:

(1) Connector Body: Pure wrought copper.

(2) Conductivity shall be no less than 99%.

(3) Connector:

(a) Meet or exceed requirements of IEEE 837, latest revision.

(b) Filled with an oxide-inhibiting compound. _____

(c) Clearly marked with manufacturer, catalog number, conductor size, and required compression tool settings.

PART 3 - EXECUTION

3.01 APPLICATIONS

A. Conductors: Install solid conductor for. ____ and smaller, and stranded conductors for ____ and larger, unless otherwise indicated.

(1) Size conductors and jumpers as indicated on drawings, unless specifically noted otherwise.

B. Underground Grounding Conductors: Install bare _____ conductor. _____

(1) Bury at least 24” (600 mm) below grade.

(2) Ductbank Grounding Conductor: Bury 12” (300 mm) above ductbank when indicated as part of ductbank installation.

C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.

D. Wall Mounted Grounding Bus: Install in electrical and communications rooms, in rooms housing service equipment.
   (1) _____
   (2) Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down to specified height above floor, and connect to horizontal bus.

E. Conductor Terminations and Connections:
   (1) Pipe Terminations: Mechanical lugs
   (2) Equipment Grounding Conductor Terminations: Mechanical lugs
   (3) Underground Connections: Welded connectors
   (4) Connections to Ground Rods at Test Wells: Mechanical connectors
   (5) Connections to Structural Steel: _____

3.02 GROUNDING OVERHEAD LINES

A. Install _____ parallel ground rods if resistance to ground by a single, ground-rod electrode exceeds 25 ohms.

B. Drive ground rods until tops are 12” (300 mm) below finished grade in undisturbed earth.

C. Ground-Rod Connections: Install bolted connectors for underground connections and connections to rods only where located within test well.

D. Secondary Neutral and Transformer Enclosure: Interconnect and connect to grounding conductor.

3.03 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

A. Grounding Manholes and Handholes: Install a driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4” (100 mm) will extend above finished floor. If necessary, install ground rod before manhole is placed and provide #1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof PVC sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2" (50 mm) above to 6" (150 mm) below concrete. Seal floor opening with waterproof, non-shrink grout.

B. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, catch basins, metallic cover frame and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with #4 AWG minimum, stranded, copper bonding conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields as recommended by manufacturer of splicing and termination kits.

C. Pad-Mounted Transformers, Unit Substations, and Switches: Install two ground rods and ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with transformer and switches by connecting them to underground cable and grounding electrodes. Install _____ conductor not less than #2 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 24” from the foundation. Install as indicated on drawings.

3.04 EQUIPMENT GROUNDING

A. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:
   (1) Feeders and branch circuits
      (a) Install a single insulated equipment ground conductor for each branch circuit conduit originating from panelboards.
      (b) Install a single insulated equipment ground conductor for each branch circuit neutral originating from panelboards, including lighting circuits.
   (2) Flexible raceway runs
   (3) Armored and metal-clad cable runs

B. Air-Duct Equipment Circuits: Install a separate insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping. Ground ductwork of fans serving flammable liquid storage rooms or fume hoods. Install continuous ground around any flexible connections in this ductwork system. Bond lower end of exhaust ducts, vent stacks, etc., which pass through roof.

C. Raised Access Floor: _____.

D. Water Heater, Heat-Tracing, and Anti-frost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

E. Wiring devices, receptacles and light switches of any amperage: Install separate jumper between grounding terminal on device and metallic box.

F. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

G. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

H. Size of equipment grounding conductors for branch circuits: As indicated in NEC-70, except minimum size shall be #12 AWG.

I. Size of branch panel feeder originating at switchboards/switchgear: As indicated in NEC-70, except in no instance smaller than #8 AWG.

J. Signal and Communication Equipment: For alarm and other communication equipment (see Telecommunications Grounding System Installation section below for voice and data systems), install _____ from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.

(1) Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor _____.

(2) Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.

K. Install grounding conductor from each standby-emergency generator to grounding electrode system. Provide flexible jumper between base and isolated generator.

L. Install grounding electrode conductor from secondary side of each transformer to grounding electrode system as required for separately derived system.

M. Install supply side bonding jumper from secondary side of each transformer to downstream distribution equipment, as required for separately derived system.

N. Install grounding conductor to luminaires hanging from conduit swivel hangers.

O. Install grounding conductor across all flexible or isolated support systems to maintain effective ground fault path.

P. _____ Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors to pole base. Grounding Conductor: Same size as phase conductors, but not smaller than #10 AWG.

(1) Install at each pole or standard a concealed driven 1/2” x 8’-0” (13 mm x 2.44 m) ground rod, ground clamp and No. 3 stranded copper conductor concealed and attached to pole and base.

3.05 GROUNDING ELECTRODE SYSTEM

A. Install grounding for service entrance equipment room consisting of ground bus, ground conductors, and grounding rods arranged as indicated on drawings.

(1) Ground bus shall be horizontal _____, copper bar. Bolt to wall at 3 ft (1 m) intervals with 1 " (25 mm) stand-offs at each bus support.

(2) Install ground bus per details on drawings.

B. Install No. _____ copper grounding conductor from ground bus to each ground rod.

C. Install No. _____ copper grounding conductor from ground bus to buried ground loop.

D. Install No. _____ copper grounding conductor from ground bus to structural steel.

E. Install No. _____ copper grounding conductor from ground bus to cold water pipe where pipe enters the building.

F. Install No. _____ copper grounding conductor from ground bus to concrete encased electrode.

3.06 SEQUENCING, SCHEDULING

A. Permanently attach grounding conductors before permanent building service is energized.

B. Permanently attach equipment grounds prior to energizing equipment.

3.07 INSTALLATION

A. Contractor shall take photographs of all underground grounding and bonding connections prior to covering. Furthermore, Contractor shall coordinate with the Authority Having Jurisdiction to confirm approval of installation prior to covering.

B. Connections: Exposed and visible for inspection at all times. Do not install insulation over ground connections.

C. Identify all grounding conductors by system and room number of termination at building grounding electrode point.

D. Grounding Conductors: Route along shortest and straightest paths possible, unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

E. Ground Rods: _____.

(1) Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating, if any.

(2) For grounding electrode system, install at least _____ rods spaced at least one rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.

F. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes shall be at least 12” (300 mm) deep, with cover.

(1) Test Wells: Install at least one test well for each service, unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.

G. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance, except where routed through short lengths of conduit.

(1) Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.

(2) Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install so vibration is not transmitted to rigidly mounted equipment.

(3) Use exothermic-welded connectors for outdoor locations, but if a disconnect-type connection is required, use a bolted clamp.

H. Grounding and Bonding for Piping:

(1) Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building’s main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes, using a bolted clamp connector or by bolting a lug-type connector to a pipe flange, using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Water pipe, by itself, is not an adequate grounding electrode and must be supplemented by another electrode system. Bond system together.

(2) Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.

(3) Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

(a) Confirm application with local gas and electric utility ordinances and notify the engineer if restrictions do not allow bonding as required by the project documents.

I. Grounding Electrode Conductor installed in metal conduit or sleeves, shall be bonded at each end using grounding hubs. The bonding conductor shall be the same size as the grounding electrode conductor. Conduits terminated to grounding enclosures, shall be secured to enclosure using grounding locknuts.

J. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install tinned copper bonding jumper to bond across flexible duct connections to achieve continuity.

K. Grounding for Steel Building Structure: _____

L. Bond steel columns at bases using copper conductor to column footing rebar.

M. Make grounding connections on surface that has been cleaned of paint, dirt, oil, etc., so that connections are bare metal to bare metal contact.

N. Make grounding connections tight with UL listed grounding devices, fittings, bushings, etc.

O. Ground Ring: Install a grounding conductor, electrically connected to each building structure ground rod and to each _____, extending around the perimeter of _____.

(1) Install _____ conductor _____.

(2) Bury ground ring not less than _____ below grade.

P. Concrete-Encased Grounding Electrode: Fabricate according to NFPA 70, using a minimum of _____ of bare copper conductor not smaller than _____.

(1) If concrete foundation is less than _____ long, coil excess conductor within base of foundation.

(2) Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building grounding grid or to grounding electrode external to concrete.

Q. Equipment Grounding Conductor: Terminate in panelboard at equipment ground bus.

R. Multiple Conductors on Single Lug: Not permitted. Terminate each grounding and grounded conductor on its own terminal lug.

S. Flexible Metallic Conduit, Non-Metallic Rigid Conduit, or Liquid Tight Flexible Conduit: Install equipment grounding conductor with phase conductors in conduit.

3.08 TELECOMMUNICATIONS BONDING AND GROUNDING SYSTEM INSTALLATION

A. Provide required elements and miscellaneous hardware necessary to establish Telecommunication Bonding and Grounding infrastructure as specified.

B. Install products in accordance with manufacturer's instructions. Install Compression Connectors with compression, tool-and-die system, as recommended by manufacturer of connectors.

C. Telecommunications Bonding Conductor, Telecommunications Bonding Backbone (TBB), and Grounding Equalizer (GE): Compression or Exothermic type connections.

D. Locate TGBs and TMGB per drawings.

E. Telecommunications Bonding Backbone (TBB) shall be continuous and not interrupted by Telecommunications Grounding Busbars (TGB).

(1) TGBs shall be bonded to TBB via tap off of TBB. Exception: "last" TGB on TBB (e.g., furthest from TMGB).

(2) Grounding Equalizer(s) (GE) shall connect to TGBs to be interconnected.

F. Insulate busbars from their support.

G. Coordinate with Sections 27 10 00 - Structured Cabling, 27 11 00 - Communications Equipment Room Fittings, 27 13 00 - Communications Backbone Cabling and 27 15 00 - Communications Horizontal Cabling.

3.09 FIELD QUALITY CONTROL

A. After installing grounding system but before permanent electrical circuits have been energized, test grounding system.

(1) Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal _____.

(2) Test grounding systems per requirements in Section 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

B. Interpret test results in writing and submit to Engineer.

1.02 DESCRIPTION

A. Section includes the following:
   (1) Manufactured hangers and supports for individual raceways and cables, slotted channel and angle systems for multiple conduit runs, and most electrical equipment that is not floor mounted.
   (2) Construction requirements for concrete housekeeping pads for floor-mounted electrical equipment.

1.03 REFERENCE STANDARDS

A. AWS D1.1/D1.1M – Structural Welding Code-Steel.
B. ASTM A36/A36M – Carbon Structural Steel.
C. ASTM F3125/F3125M – Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, Inch Dimensions 120 ksi and 150 ksi Minimum Tensile Strength, and Metric Dimensions 830 MPa and 1040 MPa Minimum Tensile Strength.
D. ASTM A780/A780M – Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
E. MSS SP-58 – Pipe Hangers and Supports - Materials, Design and Manufacture.
F. MSS SP-69 – Pipe Hangers and Supports - Selection and Application.
G. MFMA-4 – Metal Framing Standards Publication.
H. NECA 1 – Standard Practices for Good Workmanship in Electrical Construction.
I. NECA 101 – Standard for Installing Steel Conduits (Rigid, IMC, EMT).
J. NFPA 70 – National Electrical Code.
K. SSPC-PA 1 – Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel.
L. ETL PVC-001 – PVC Coated Conduit

1.04 SUBMITTALS

A. Product Data: For the following:
   (1) Steel slotted support systems.
   (2) Nonmetallic slotted support systems.
   (3) Raceway and cable supports.
   (4) Support for conductors in vertical raceway.
   (5) Structural steel for fabricated supports and restraints.
   (6) Mounting, anchoring, and attachment components:
      (a) Powder-actuated fasteners.
      (b) Mechanical-expansion anchors.
      (c) Concrete inserts.
      (d) Clamps for attachment to structural steel.
      (e) Through bolts.
      (f) Toggle bolts.
      (g) Hanger rods.

B. Shop Drawings: _____. Include concrete anchors application, size, and placement. Include concrete inserts application, size, loading, and placement. Show fabrications and installation details and include calculations for the following:
   (1) Trapeze hangers. Include product data for components.
   (2) Steel slotted channel systems. Include product data for components.
   (3) Nonmetallic slotted channel systems. Include product data for components.
   (4) Fabricated metal equipment support assemblies.

C. Drawings showing specific locations of any suspended loads which exceed 100 lbs (45 kg) within joist chord panel, to be attached to open web steel joist structural members. Include weight supported by such attachments. (Panel is length of chord between two adjacent diagonal web members at points of connection to chord.)

D. Welding certificates and drawings showing specific locations of any weld attachments to structure including weight supported by such attachments.
   (1) Any proposed weld attachments to building structure shall be reviewed by Structural Engineer prior to execution of work. This review may result in use of other welding codes or standards, which may apply to “structural work”. Execution of this work may be assigned to General Trades responsible for building structural steel. Cost of this work, however, will remain the responsibility of this Contractor.

E. Schedule of hangers and support devices with support spacing.

1.05 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, “Structural Welding Code – Steel.”

B. Comply with NFPA 70.

C. Certification:
   (1) Installer of PVC-coated hangers and supports shall be certified by a PVC conduit manufacturer.

PART 2 - PRODUCTS

2.01 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of _____ times the applied force.

B. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
   (1) Finishes
      (a) Metallic Coatings:
         1) Factory standard primed, galvanized or electroplated finish and applied according to MFMA-4, for indoor applications.
         2) Hot-dip galvanized after fabrication and applied according to MFMA-4, for outdoor applications.
      (b) Nonmetallic Coatings: Manufacturer’s standard PVC, polyurethane, or polyester coating applied according to MFMA-4, for corrosive environments.
      (c) Painted Coatings: Manufacturer’s standard painted coating applied according to MFMA-4.
   (2) Channel Dimensions: Selected for applicable load criteria.
   (3) Manufacturers:
      (a) Allied Support Systems; Power-Strut Unit.

(b) Cooper B-Line, Inc.; A division of Cooper Industries.
(c) ERICO International Corporation.
(d) GS Metals Corporation.
(e) Thomas & Betts Corporation.
(f) Unistrut; Tyco International, Ltd.
(g) Wesanco, Inc.
(h) National Pipe Hanger Corporation.
(i) Michigan Hanger Co., Inc.; O-Strut Division.
(j) Approved equal.

C. Nonmetallic Slotted Support Systems: Structural-grade, factory-formed, glass-fiber-resin channels and angles with 9/16” (14 mm) diameter holes at a maximum of 8" (200 mm) o.c., in at least one surface.
(1) Fittings and Accessories: Products of channel and angle manufacturer and designed for use with those items.
(2) Fitting and Accessory Materials: Same as channels and angles, except metal items may be stainless steel.
(3) Rated Strength: Selected to suit applicable load criteria.
(4) Manufacturers:
(a) Allied Support Systems; Power-Strut Unit
(b) Cooper B-Line, Inc.; A division of Cooper Industries
(c) Fabco Plastics Wholesale Limited
(d) Seasafe, Inc.
(e) Approved equal

D. Raceway and Cable Supports: As described in NECA 1 and NECA 101.

E. Raceway and Cable Support Devices: _____ hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

F. PVC Raceway Support Devices: ANSI C80.1, UL 6, ETL PVC-001.

G. Support for 600V and under Conductors in Vertical Raceway: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.
(1) Manufacturers:
(a) O-Z/Gedney
(b) Approved equal

H. Support for Conductors 601V and greater in Vertical Raceway: Heavy duty strain relief grip consisting of solder protector, galvanized steel mesh, endless multi-weave style.
(1) Manufacturers:
(a) Hubbell-Kellems
(b) Approved equal

I. Structural Steel for Fabricated Supports and Restraints: ASTM A36/A36M, steel plates, shapes, and bars; black and galvanized.

J. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
(1) Concrete Anchors
(a) Anchors shall be selected, sized, and detailed by Contractor’s structural engineer registered in project’s jurisdiction, based on project conditions and in accordance with project building code. Calculations and drawings shall be submitted.
(b) Anchors shall meet ICC Acceptance Criteria, and ICC-ES Evaluation Reports (ESRs) shall specifically list the current applicable codes.
(c) Anchors installed in hardened concrete for purpose of transmitting structural loads from one connected element to another, or for safety related elements such as sprinkler pipes, heavy suspended pipes, and barrier rails shall have ICC-ES report demonstrating anchors have met requirements of AC 193 for mechanical anchors in concrete elements.
(d) Post-installed expansion anchors and undercut anchors installed in hardened concrete shall be qualified for strength design and tested according to ACI 355.2. Designs shall be per the requirements of ACI 318, Appendix D.

(e) Anchors for seismic load application shall be approved by ICC-ES Evaluation Reports to resist seismic loads and selected to meet project seismic design requirements. Refer to Section 22 05 48 - Vibration and Seismic Controls for Plumbing Piping and Equipment and Structural drawings.

(f) Anchors shall be zinc plated in accordance with ASTM B633.

(g) Select anchors with load ratings based on cracked concrete conditions.

(h) Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.

1) Manufacturers:

1. Hilti Inc.
2. ITW Ramset/Red Head; A division of Illinois Tool Works, Inc.
3. MKT Fastening, LLC.
4. Simpson Strong-Tie Co., Inc.; Masterset Fastening Systems Unit
5. Approved equal

(i) Mechanical-Expansion Anchors: Insert-wedge-type, _____ steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.

1) Manufacturers:

1. Cooper B-Line, Inc.; A division of Cooper Industries
2. Empire Tool and Manufacturing Co., Inc.
3. Hilti Inc.
4. ITW Ramset/Red Head; A division of Illinois Tool Works, Inc.
5. MKT Fastening, LLC.
6. Approved equal

(2) Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.

(3) Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.

K. Beam Clamps: C-clamps are allowed 3/8” (9 mm) or smaller and only for static loading such conduits. Provide locknut for hanging rod at clamp. C-clamps are not allowed for open web steel joist applications nor seismic applications.

L. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.

M. Toggle Bolts: All-steel springhead type.

N. Hanger Rods:

(1) MSS SP-58; threaded steel, with adjusting and lock nuts; _____ finish.

(2) MSS SP-58; nonmetallic, with adjusting and lock nuts.

2.02 FABRICATED METAL FRAMING EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted, structural steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Division 05 Section “Metal Fabrications” for steel shapes and plates; not be lighter than 12 ga (2.758 mm).

C. Finish: _____.

D. Manufacturers: Same as in paragraph 2.1.B.3 above.

2.03 CONTINUOUS INSERT CHANNELS

A. Length and support capabilities to be suitable for application.

B. Brackets, inserts and accessories suitable for channel insert selected.

C. Manufacturers:

(1) Unistrut; Tyco International, Ltd.

(2) Cooper B-Line, Inc.; A division of Cooper Industries

(3) Michigan Hanger Co., O-Strut Division

(4) Anvil International, Inc.

(5) Approved equal

PART 3 - EXECUTION

3.01 APPLICATION

A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.

B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as _____ NFPA 70.

(1) Size steel hanger rods for individual hangers and trapeze supports as indicated in the following schedule. Total weight of equipment shall not exceed limits indicated.

Maximum Loads	Rod Diameter	Maximum Pipe Size with Single Rod
730lbs (331kg)	3/8" (9mm)	2" (50 mm)
1130lbs (513kg)	1/2" (13mm)	3" (80mm)
1818lbs (825kg)	5/8" (16mm)	5" (130mm)

(2) Size nonmetallic rods for individual hangers and trapeze supports as indicated in the following schedule. Total weight of equipment shall not exceed limits indicated.

Maximum Loads	Rod Diameter	Maximum Pipe Size with Single Rod
____lbs (____kg)	_____" (_____mm)	_____" (_____mm)

C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted or other support system, sized so capacity can be increased by at least _____ in future without exceeding specified design load limits.

(1) Secure raceways and cables to these supports with _____.

D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 3/4” (21 mm) and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

E. Install PVC-coated hangers and supports in areas with corrosive atmosphere as noted on plans.

3.02 SUPPORT INSTALLATION

A. Comply with NECA 1 and NECA 101 for installation requirements, except as specified in paragraphs below.

B. Raceway Support Methods: In addition to methods described in NECA 1, _____ may be supported by openings through structure members, as permitted in NFPA 70.

C. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb (91 kg).

D. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor application size and placement shall be reviewed and approved by Structural Engineer prior to installation. Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:

(1) To Wood: Fasten with lag screws or through bolts.

(2) To New Concrete: Bolt to concrete inserts.

(3) To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.

(4) To Existing Concrete: Expansion anchor fasteners.

(5) Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4” (100 mm) thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4” (100 mm) thick.

(6) To Steel: _____.

(7) To Light Steel: Sheet metal screws.

(8) Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that meet seismic-restraint strength and anchorage requirements.

E. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

F. Do not support raceway by other raceway.

G. Do not support equipment or raceway from metal roof decking or floor decking.

H. Do not impose weight of electrical equipment, raceways, or lighting fixtures on support provided for other trades or systems.

I. Top or bottom chords of open web steel joists may be used to support loads provided total load within panel does not exceed 100 lbs (45 kg) and load is placed concentric to joist (panel is length of chord between two adjacent diagonal web members at point of connection to chord).

(1) C-clamps are not permitted for use in open web steel joist applications.

J. Suspend hangers by means of hanger rods. Perforated band iron and flat wire (strap iron) are not allowed.

K. Use conduit-mounting pedestals for piping on roof. Install bottom of pedestal flat on roof deck and insulate exterior of pedestal, flashing and counter flashing.

L. Minimize use of concrete anchors and inserts after concrete pour.

M. Punching, drilling, welding of building structural steel or welding attachment to building structural steel is not allowed, unless approved by structural engineer.

N. Use tools approved for use with PVC-coated conduits and fittings.

3.03 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Division 05 Section “Metal Fabrications” for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.04 CONCRETE HOUSEKEEPING PADS

A. Construct concrete housekeeping pads for all floor-mounted electrical equipment.

B. Dimensions: _____ high and not less than _____ larger in both directions than supported equipment, so anchors will be a minimum of 10 bolt diameters from edge of the base.

C. Use _____, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 Section “Cast-in-Place Concrete.”

D. Anchor equipment to concrete housekeeping pad.

(1) Place and secure anchorage devices. Use supported equipment manufacturer’s setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

(2) Install anchor bolts to elevations required for proper attachment to supported equipment.

(3) Install anchor bolts according to anchor-bolt manufacturer’s written instructions.

E. Coordinate with Architect installation of housekeeping pads on roof.

3.05 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

(1) Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils (0.05 mm).

B. Touchup: Comply with requirements in Division 09 _____ for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780/A780M.

END OF SECTION 26 05 29

SECTION 26 05 33 - RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems
D. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems
E. Section 26 05 53 - Electrical Systems Identification
F. Section 26 05 93 - Electrical Systems Firestopping
G. Section 26 27 26 - Wiring Devices
H. Section 27 05 53 - Communications Systems Identification
I. Section 27 11 00 - Communications Equipment Room Fittings
J. Section 27 13 00 - Communications Backbone Cabling
K. Section 27 15 00 - Communications Horizontal Cabling

1.02 DESCRIPTION

A. Section includes raceways, fittings, wireways, wall ducts, indoor service poles, outlet boxes, pull and junction boxes, floor boxes, tap boxes and raceway seals.

1.03 REFERENCE STANDARDS

A. ANSI/NECA 1 – Standard Practices for Good Workmanship in Electrical Contracting
B. ANSI C80.1 – Rigid Steel Conduit-Zinc Coated (GRS)
C. ANSI C80.3 – Electrical Metallic Tubing-Zinc Coated (EMT)
D. ANSI C80.5 – Aluminum Rigid Conduit-Zinc Coated (ARC)
E. ANSI C80.6 – Intermediate Metal Conduit-Zinc Coated (IMC)
F. ASTM A53/A53M – Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless
G. BICSI TDMM – Telecommunications Distribution Methods Manual, Latest Edition
H. NEMA EN 10250 – Enclosures for Electrical Equipment (1000 V Maximum)
I. NEMA FB 1 – Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit, Electrical Metallic Tubing and Cable
J. NEMA OS 1 – Sheet-Steel Outlet Boxes, Device Boxes, Covers, and Box Supports
K. NEMA OS 2 – Nonmetallic Outlet Boxes, Device Boxes, Covers, and Box Supports
L. NEMA RN 1 – Polyvinyl Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit
M. NEMA TC 2 – Electrical Polyvinyl Chloride (PVC) Conduit
N. NEMA TC 3 – PVC Fittings for Use with Rigid PVC Conduit and Tubing
O. NEMA BI 50058– Electrical Nonmetallic Tubing (ENT)
P. NFPA 70 – National Electrical Code
Q. TIA-569-B – Commercial Building Standard for Telecommunications Pathways and Spaces
R. UL 1 – Flexible Metal Conduit
S. UL 6 – Electrical Rigid Metallic Conduit-Steel
T. UL 6A – Electrical Rigid Metallic Conduit-Aluminum and Stainless Steel
U. UL 360 – Liquid-Tight Flexible Steel Conduit
V. UL 514A – Metallic Outlet Boxes
W. UL 514B – Conduit, Tubing, and Cable Fittings
X. UL 514C – Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers
Y. UL 651 – Schedule 40 and 80 Rigid PVC Conduit and Fittings
Z. UL 797 – Electrical Metallic Tubing-Steel
AA. UL 870 – Wireways, Auxiliary Gutters, and Associated Fittings
BB. UL 1242 – Electrical Intermediate Metal Conduit-Steel

CC. UL 1660– Liquid-Tight Flexible Nonmetallic Conduit

DD. UL 2024– Optical Fiber and Communication Cable Raceway

1.04 SUBMITTALS

A. Product Data:

(1) Raceways

(2) Fittings

(3) Wireways

(4) Outlet boxes

(5) Pull and junction boxes

(6) Floor boxes

(7) Tap boxes

(8) Raceway seals

B. Manufacturer's Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation and installation of product.

C. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual routing of raceways larger than 2" (53 mm).

(b) Record actual location and mounting heights of wireways, wall ducts, indoor service poles, floor boxes, tap boxes, outlet, pull and junction boxes.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.05 QUALITY ASSURANCE

A. Regulatory Requirements:

(1) Comply with NFPA 70.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Protect PVC conduit from sunlight.

C. Comply with manufacturer's written instructions.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

PART 2 - PRODUCTS

2.01 RIGID METAL CONDUIT (RMC)

A. Rigid Steel Conduit (RSC): ANSI C80.1, UL 6; heavy wall galvanized steel

B. Intermediate Metal Conduit (IMC): ANSI C80.6, UL 1242; thinner wall, galvanized steel

C. Rigid Aluminum Conduit (RAC): ANSI C80.5; heavy wall aluminum

D. Fittings (couplings, connectors and bushings): NEMA FB 1, UL 514B B; _____ (concrete-tight where applicable); threaded; connectors with double locknuts and steel insulating bushings.

E. Fittings (conduit bodies): NEMA FB 1, UL 514B; ____; cover: ____, ____ with stainless steel screws and neoprene gaskets _____.

F. Fittings Manufacturers: Cooper Crouse-Hinds; Carlon Electric Products/Prime Conduit Inc.; O-Z/Gedney; Appleton; Hubbell; Approved equal

2.02 ELECTRICAL METALLIC TUBING (EMT)

A. ANSI C80.3, UL 797; galvanized steel tubing

B. Fittings (couplings and connectors): NEMA FB 1, UL 514B; steel, ____ gland compression type ____ connectors with double locknuts and insulated throat. Indentor, drive-on, zinc die-cast or pressure cast not permitted.

C. Fittings (conduit bodies): NEMA FB 1, UL 514B: ____; cover: ____, with stainless steel screws and neoprene gaskets.

D. Fittings Manufacturers: Same as manufacturers listed in 2.1

2.03 FLEXIBLE METAL CONDUIT (FMC)

A. UL 1; interlocked steel ____

B. Fittings: NEMA FB 1, UL 514B; steel, die-cast fittings not permitted

2.04 LIQUIDTIGHT FLEXIBLE METAL CONDUIT (LFMC)

A. UL 360; interlocked _____, with PVC jacket

B. Fittings: NEMA FB 1, UL 514B; steel

2.05 RIGID NONMETALLIC CONDUIT (RNC)

A. NEMA TC 2, UL 651; Schedule _____ PVC

B. Fittings: NEMA TC 3, UL 651

2.06 ELECTRICAL NONMETALLIC TUBING (ENT)

A. NEMA BI 50058; hand-bendable, corrugated PVC conduit

B. Fittings: NEMA TC 3

2.07 LIQUIDTIGHT FLEXIBLE NONMETALLIC CONDUIT (LFNC)

A. UL 1660; flexible conduit with a plastic sheath

B. Fittings: UL 514B

2.08 METAL WIREWAYS

A. NEMA EN 10250, UL 870; sheet metal troughs with hinged or removable cover, Type ____, unless otherwise indicated.

B. Size: ____.

C. Fittings and Accessories: Couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mated with wireways as required for complete system.

D. Wireways Covers: ____

E. Knockouts: ____

F. Finish: Manufacturer’s standard

G. Manufacturers: Hoffman; Square D Co.; Approved equal

2.09 NONMETALLIC WIREWAYS

A. NEMA EN 10250, UL 870; flame-retardant, nonmetallic troughs with removable cover

B. Fittings and Accessories: Couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mated with wireways as required for complete system.

C. Manufacturers: Hoffman Engineering Co.; Lamson & Sessions; Carlon Electrical Products; Square D Co.; Approved equal

2.10 OUTLET BOXES

A. Sheet Metal Outlet Boxes: NEMA OS 1, UL 514A galvanized steel with stamped knockouts.

(1) Luminaire and Equipment Supporting Boxes: Interior of box shall be marked by the manufacturer to indicate the maximum weight the box is permitted to support. Box shall be supported independently of the luminaire or equipment, if these exceed 50lbs.

(2) Where recessed in Concrete: Concrete Type, two-piece welded construction supplied with two rows of stamped knockouts.

B. Cast-Metal Outlet Boxes: NEMA FB 1, ____, Type FD, with gasketed cover and threaded hubs

(1) For applications requiring more than 2 gang boxes, provide stainless steel custom fabricated welded boxes with threaded hubs and coverplate. For applications including terminations and splicing of power conductors, a standard UL Listed box shall be used inside of the custom fabricated box.

C. Nonmetallic Outlet Boxes: NEMA OS 2

D. Gangable type boxes are not allowed.

E. Manufacturers: O-Z/Gedney; Raco; Cooper Crouse-Hinds; Approved equal

2.11 PULL AND JUNCTION BOXES

A. Sheet Metal Pull and Junction Boxes: NEMA OS 1; galvanized steel

B. Cast-Metal, Pull, and Junction Boxes: NEMA FB 1; ____ with ground flange, gasketed cover and stainless-steel cover screws

C. Minimum size: 4” (100 mm) square by 2-1/8" (54 mm) deep ____ for use with 1" (27 mm) conduit and smaller; 4-11/16” (118 mm) square by 2-1/8" (54 mm) deep ____ for use with 1-1/4” (35 mm) conduit and larger

D. Sheet Metal Boxes Larger Than 12” (300 mm) in any direction: Hinged cover or a chain installed between box and cover

E. Field-fabricated boxes not allowed without prior approval of local authority having jurisdiction.

F. Manufacturers: O-Z/Gedney; Raco; Cooper Crouse-Hinds; ; Approved equal

2.12 POKE-THROUGH FITTINGS

A. Poke-Through Fittings: Assembly comprising service fitting, poke-through component, fire stops and smoke barriers, and junction box for conduit termination.

(1) Fire Rating: ____ h

(2) Service Fitting Type: ____

(3) Housing: ____

(4) Configuration: ____

(5) Manufacturers: Hubbell, Legrand/Wiremold, FSR; Approved equal

2.13 FLOOR BOXES

A. Metal Floor Boxes: NEMA OS 1; ____; ____; ____; Moisture-proof, with forged brass blank cover with each box and close up covers and/or carpet flanges as required for finished floor.

B. Nonmetallic Floor Boxes: nonadjustable, round

2.14 MULTISERVICE FLOOR BOXES

A. Above Grade: Stamped steel, watertight design approved for use on above-grade concrete floor applications, with four independent wiring compartments and capacity for up to four duplex receptacles and/or communication services. The box: fully adjustable providing pre-pour and after-pour adjustment, tunnel compartment, and two receptacle brackets. Conduit knockouts per drawing requirements. Comply with UL 514A and UL 514C scrub water exclusion test for tile, terrazzo, carpet and wood floors.

B. On Grade: Cast iron or steel pour box, watertight design approved for use in on-grade and above-grade concrete floor applications, with four independent wiring compartments and capacity for up to four duplex receptacles and/or communication devices. The box: fully adjustable providing pre-pour and after-pour adjustment, tunnel compartment, and two receptacle brackets. Conduit knockouts per drawing requirements. Comply with UL 514A and UL 514C scrub water exclusion test for tile, terrazzo, carpet and wood floors.

C. Covers: Activation Covers – Die-cast aluminum with textured aluminum finish, and black or brass powder-coated paint finishes as selected by the Architect. Cover: flanged or flangeless, as required, with options for tile or carpet inserts, blank covers, or covers with one or two 1” (27 mm) liquid tight conduit openings for furniture feed applications.

D. Communication Modules Mounting Accessories: Complete line of faceplates and bezels provided by floor box manufacturer to facilitate mounting of fiber optic, coaxial, high-performance twisted-pair cabling, and communication devices. Cabling type and faceplate configurations per requirements in Section 27 15 00 - Communications Horizontal Cabling. The box shall accommodate workstation connectivity outlets and modular inserts and other system devices.

E. Manufacturers:

(1) Hubbell - HBLCFB Series

(2) Spider - AFB/CFB Series

(3) Legrand/Wiremold - Evolution Series

2.15 TAP BOXES

A. Multi-tap connectors as indicated on drawings.

B. Manufacturers: Ilsco; ____

2.16 EXPANSION FITTINGS

A. Malleable iron, hot dip galvanized allowing ____ raceway movement.

B. Manufacturers: OZ/Gedney AX Series; or equivalent by manufacturer listed in 2.1.

2.17 RACEWAY PENETRATION SEALS

A. Thruwall and Floor Seals.

B. Manufacturers: New construction – OZ/Gedney FSK Series; existing construction – OZ/Gedney CSM Series; or equivalent by manufacturer listed in 2.1.

2.18 RACEWAY SEALING FITTINGS

A. For one through four conductors: Manufacturers: OZ/Gedney CSB Series; ____

B. For greater than four conductors: Manufacturers: OZ/Gedney EYA Series with sealing compound; ____

C. Low-temperature or hazardous locations: Manufacturers: OZ/Gedney EYA Series with sealing compound; ____

2.19 CABLE SUPPORTS

A. Manufacturers: OZ/Gedney Type S; or equivalent by manufacturer listed in 2.1.

2.20 SLEEVES FOR RACEWAYS

A. Steel Pipe Sleeves: ASTM A53/A53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends, with integral water stop.

B. Sleeves for Rectangular Openings: Galvanized sheet steel with minimum 0.052” (1.321 mm) or 0.138" (3.505 mm) thickness and of length to suit application.

C. Integral Water Stop: Manufacturer: Thunderline Corporation; ____

(1) High density polyethylene (HDPE). Type Century-Line engineered sleeve with end caps.

(2) Steel. Type WS engineered sleeve.

2.21 SLEEVE SEALS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and cable.

(1) Sealing Elements: ____ interlocking links shaped to fit surface of cable or conduit. Include type and number required for material and size of raceway or cable.

(2) Pressure Plates: ____. Include two for each sealing element.

(3) Connecting Bolts and Nuts: ____ of length required to secure pressure plates to sealing elements. Include one for each sealing element.

PART 3 - EXECUTION

3.01 COORDINATION

A. Coordinate with Architect/Engineer size and location of required built-in openings in building structure, including those sleeved, formed or core drilled.

B. Coordinate with Architect/Engineer cutting, removing, or piercing general or mechanical insulation, fire-rated walls, ceilings or steelwork.

C. Verify with Architect/Engineer all surface raceway installations except in mechanical, electrical, and communications rooms.

D. Coordinate with Architect/Engineer exact locations of floor boxes, where shown on drawings, prior to rough-in.

E. Coordinate routing of through-roof conduits.

F. Coordinate sleeve selection and application with selection and application of firestopping specified in Section 26 05 93 - Electrical Systems Firestopping.

G. Verify that exterior wall or wet location boxes are gasketed type cast boxes with matching cover.

H. Verify with manufacturer that “touch-up” paint kit and PVC-coating kit are available for use.

3.02 EXAMINATION

A. Examine surfaces to receive raceways and boxes for compliance with installation tolerances and other conditions affecting performance of raceway’s installation. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.03 INSTALLATION

A. Raceways:

(1) Comply with ANSI/NECA 1 and NFPA 70 for installation requirements applicable to products specified in Part 2 except where requirements on drawings or in this Section are stricter.

(2) Arrange raceways to maintain headroom and present neat appearance.

(3) Raceway routing is shown in approximate locations, unless dimensioned. Route to complete raceway installation before starting conductor installation.

(4) Keep raceways at least ____ away from parallel runs of flues, steam, hot-water pipes or ductwork. Install horizontal raceway runs above water and steam piping. Install raceways level and square and at proper elevations: 6’-6” (2 m) minimum headroom, except in exit pathways 7'0" (2.1 m) minimum headroom. Do not block access to junction boxes, mechanical equipment or prevent removal of ceiling panels, etc.

(5) Run raceways concealed in construction to avoid adverse conditions such as heat and moisture, to permit drainage, and to avoid materials and equipment of other trades, except where noted otherwise.

(6) Avoid exposed raceway runs. Run raceways exposed where impractical or impossible to conceal or where specific approval is obtained. Run exposed raceways grouped and parallel or perpendicular to construction. Do not route exposed raceways over boilers or other high-temperature machinery or in contact with such equipment. Offset exposed raceways at boxes.

(7) Route raceways installed above accessible ceilings parallel or perpendicular to construction.

(8) Do not install raceways in structural or topping floor slabs, except where noted on the plans. Install raceway in structural or topping floor slabs, where noted on plans, as follows:

- (a) Center raceways in structural slabs clear of reinforcing steel, except where crossing same, and spaced on centers equal or exceeding 3 times the raceway diameter. Secure raceways to reinforcing rods to prevent sagging or shifting during concrete placement. Space raceways laterally to prevent voids in concrete.
- (b) Outside diameter of raceway shall not exceed 1/3 the structural slab thickness.
- (c) Obtain approval from Engineer for each run of raceway 1” (27 mm) or larger.
- (d) Do not install raceways in topping slabs of 2” (50 mm) or less.
- (e) Locate raceways to avoid conflict with equipment, door bucks, partitions and other equipment bolted to floor.
- (f) Arrange stub-ups so curved portions of bends are not visible above finished slab. Install with an adjustable top or coupling threaded inside for plugs set flush with finished floor. Extend conductors to equipment with rigid steel conduit; use flexible metal conduit 6” above the floor. Install threaded plugs flush with floor for future equipment connections.
- (g) Change from nonmetallic raceway to RMC or IMC before rising above floor.

(9) Cut raceways square using saw or pipe cutter.

(10) Use hydraulic one-shot raceway bender or factory elbows for bends in raceway larger than 2” (53 mm), unless sweep elbows required. Bend raceways according to manufacturer’s recommendations. Do not use torches or open flame to aid in bend of PVC conduit.

(11) Use raceway fittings compatible with raceways and suitable for use and environment.

(12) Provide bushings on ____.

(13) Raceways minimum sizes:

- (a) Minimum raceway size ____, except as noted on drawings.
- (b) Minimum home run size: ____, except as noted on drawings.
- (c) Minimum size for flexible metal conduit is 1/2” (16 mm) except 3/8" (12 mm) for luminaires.
- (d) Minimum size for liquidtight flexible metal conduit is 1/2” (16 mm)

(14) Install empty raceways 2-1/2” (63 mm) and larger with 10 ga (2.5 mm) galvanized fish wire; install 200 lb (90.7 kg) nylon pull cord in raceways smaller than 2-1/2" (63 mm); leave at least 12" (300 mm) of slack at each end of pull wire. Cap raceways at both ends.

(15) Feed devices on same wall vertically from above or junction box in suspended ceiling.

- (a) Do not install horizontal bends in conduit around corners.
- (b) Feed devices in exterior or load-bearing walls by horizontal conduit runs.

(16) Raceways Supports:

- (a) Independently support or attach raceway system to structural parts of construction. Suspended ceiling systems shall not be considered as structural parts of construction for raceway support. Do not attach raceways to piping system.
- (b) Raceway supports for horizontal or vertical single runs:
  - 1) Hot dipped galvanized heavy-duty sheet steel straps, mineralac clamps or steel slotted support channel system with appropriate components.
  - 2) Spring steel type pressure clamps for raceways 3/4” (21 mm) and smaller.
- (c) Raceway supports for horizontal and vertical multiple runs:
  - 1) Trapeze-type supports fabricated with steel slotted channel systems with appropriate components.
  - 2) Support horizontal runs with appropriately sized rods.
  - 3) Anchor vertical runs to structure.
  - 4) Spring-steel type pressure clamps for raceways 3/4” (21 mm) and smaller.
- (d) Vertical raceway runs 1-1/4” (35 mm) and larger passing through floors: Support at each floor with pipe riser clamps.
- (e) Do not support raceways with wire, perforated pipe straps or plastic tie-wrap. Remove wires used for temporary support.
- (f) Secure raceways in metal stud walls to prevent rattling.
- (g) Arrange raceway supports to prevent misalignment during wiring installation.

(h) Do not fasten raceways to corrugated metal roof deck.

(i) For fasteners and supports, including steel slotted support systems, support devices, support spacing, support of conductors in vertical raceways, and hanger rod size, refer to Section 26 05 29 - Hangers and Supports for Electrical Systems and NFPA 70.

(17) Raceways Seismic Restraints:

(a) Avoid raceway runs crossing building seismic joints. Use flexible connections where crossings cannot be avoided.

(b) Install rigid bracing and lateral restraints for suspended raceway runs per requirements in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems.

(18) Identify raceways per requirements in Section 26 05 53 - Electrical Systems Identification.

(19) Ground raceways per requirements in Section 26 05 26 - Grounding and Bonding for Electrical Systems.

(20) Flexible Conduit Connections: Use maximum of 72” (1800 mm) of flexible conduit for recessed and semi-recessed lighting fixtures, equipment subject to vibration, noise transmission, or movement; and for motors.

(a) Use LFMC or LFNC in damp or wet locations not subject to severe physical damage.

B. Wireways and Wall Ducts:

(1) Install in accordance with manufacturer’s instructions.

(2) Use screws, clips and straps to fasten raceway channel to surfaces.

(3) Mount plumb and level.

(4) Use suitable insulating bushings and inserts at connections to outlets and corner fittings.

(5) Supports: Per manufacturer’s recommendations.

(6) Close ends of raceway channel and unused conduit openings.

C. Boxes:

(1) Install boxes to accommodate device indicated by symbol, in conformance with code requirements, number and size of conductors and splices and consistent with type of construction.

(2) Install the appropriate cover on surface-mounted boxes:

(a) Raised device covers on 4” (100 mm) square and 4-11/16" (118 mm) boxes and handy box covers on handy boxes, etc.

(b) Device covers that are square drawn or square cut on boxes in block.

(c) Tile covers on boxes in tile.

(d) Round drawn device covers on boxes in lath and plaster walls or drywall only.

(e) Set front edge of device boxes flush with finished wall surfaces except on walls of non-combustible materials where boxes may have maximum set back of 1/4” (6 mm). Secure flush-mounted box to interior wall and partition studs. Accurately position to allow for surface finish thickness.

(3) Set outlet boxes parallel to construction and independently attached to same.

(4) Do not install back-to-back and through-the-wall boxes. Install with minimum 6” (150 mm) horizontal separation between closest edges of the boxes. Install with minimum 24" (600 mm) separation in acoustic-rated walls and fire-rated walls.

(5) Install multi-ganged boxes where 2 or more devices are in same location, unless otherwise noted.

(6) Box Support:

(a) Mount boxes straight.

(b) Install horizontal bracing at top or bottom of box for 3 or more gang device boxes in stud walls.

(c) Install stud support one side, with short piece of stud, for up to 2 gang device boxes.

(d) Do not support boxes with tie-wire.

(e) For one and two gang box support, manufactured bracket supports shall be accepted alternate.

(f) Support boxes independently of raceways.

(g) Install adjustable steel channel fasteners for hung ceiling outlet box.

(h) Install stamped steel bridges to fasten flush-mounted outlet box between studs.

(i) Do not install boxes to ceiling support wires or piping systems.

(7) Install partitions in multi-ganged boxes where different types of devices are installed, or devices installed operate at different voltages.

(8) Mount boxes in block walls at block joint nearest to indicated height.

(9) Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block and install box flush with surface of wall.

(10) When boxes are installed in fire-resistive walls and partitions, provide 24” (600 mm) horizontal separation between boxes on opposite sides of a wall. In addition, limit penetrations to 16 sq in (650 sq mm) per penetration and not to exceed a total of 100 sq in per 100 sq ft (64500 sq mm per 9 sq m) of wall area. Apply fire stop putty pads acceptable to the fire marshal.

(11) Pull and junction boxes: Install as shown, or as necessary to facilitate pulling of wire and to limit number of bends within code requirements. Install above accessible ceilings and in unfinished areas.

(12) Install boxes to be permanently accessible.

(13) Do not intermix conductors from more than one system in same junction box or pull box, unless shown or specifically authorized otherwise.

(14) Adjust box location up to ____ prior to rough-in to accommodate intended purpose.

(15) Orient boxes to accommodate wiring devices oriented as specified in Section 26 27 26 - Wiring Devices.

(16) Inaccessible Ceiling Areas: Install outlet and junction boxes no more than 6” (150 mm) from ceiling access panel or from removable recessed luminaire.

(17) The drawings do not necessarily show every outlet, pull or junction box required. Add all required boxes as necessary.

D. Floor Boxes:

(1) Set metal floor boxes level and flush with finished floor surface.

(2) Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

(3) Use cast floor boxes for installations in slab on grade.

(4) Install floor boxes and fittings to preserve fire-resistant rating of slabs and other elements, using materials and methods specified in Section 26 05 93 - Electrical Systems Firestopping.

(5) Identify communication outlets per requirements in Section 27 05 53 - Communications Systems Identification.

(6) Power and IT or AV conduits require a minimum 12” separation where routed parallel including entry into floor boxes.

E. Expansion Fittings:

(1) Install raceway expansion and deflection fittings in all raceway runs embedded in or penetrating concrete where movement perpendicular to axis of the raceway may be encountered.

(2) Install raceway expansion fittings complete with bonding jumpers in raceway runs that cross expansion joints in structure and raceway runs mechanically attached to 2 separate structures.

(3) Use couplings and flexible connection made up of 24” (600 mm) length of flexible metal conduit, where EMT runs across expansion joints in ceiling spaces.

(4) Install fitting(s) that provide expansion and contraction for at least 0.0004” per ft (0.01 mm per m) of length of straight run per ____°F (____°C) of temperature change.

(5) Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer’s written instructions for conditions at specific location at time of installation.

F. Raceway Penetration Seals:

(1) Seal space outside of sleeves with grout for penetrations of concrete and masonry and with approved joint compound for gypsum board assemblies.

(2) Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway, using joint sealant appropriate for size, depth, and location of joint. Refer to Division 07 Section “Maintenance of Joint Protection” for materials and installation.

(3) Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway penetrations. Install sleeves and seal with firestop materials. Comply with Section 26 05 93 - Electrical Systems Firestopping.

(4) Roof-Penetration Sleeves: Seal penetration of individual raceways with flexible, boot-type flashing units applied in coordination with roofing work.

(5) Aboveground, Exterior-Wall Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1” (25 mm) annual clear space between pipe and sleeve for installing mechanical sleeve seals.

(6) Underground, Exterior-Wall Penetrations: Install cast-iron “wall pipes” for sleeves. Size sleeves to allow for 1” (25 mm) annual clear space between raceway and sleeve for installing mechanical sleeve seals.

(7) Sleeve-Seal Installation: Use type and number of sealing elements recommended by manufacturer for raceway material and size. Position raceway in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

(8) Remove temporary sleeves, if used for form wall openings, prior to installation of permanent materials.

G. Raceway Sealing Fittings:

(1) Install listed watertight seals to prevent the passage of moisture and water vapor through raceway, where raceway passes from interior to exterior of the building, where raceway passes between areas of different temperatures such as into or out of cold rooms or freezers, where raceway enters room which at any time is subject to low or high temperatures and where raceway enters a room which at any time is subject to internal air pressures above or below normal.

(2) Install watertight seals in interior of all raceways passing through building roof, ground floor slab (when the raceway does not extend beyond building footprint), or through outside walls of building above or below grade. Seal on the end inside building, using raceway sealing fittings manufactured for the purpose. Locate fittings at suitable accessible locations. For concealed raceways install each fitting in flush steel box with blank coverplate to match finish of adjacent plates or surfaces.

(3) Seal raceways entering or passing through “hazardous (classified) areas” as defined in NFPA 70.

H. Sleeve Installation for Electrical Penetrations:

(1) Coordinate sleeve selection and application with selection and application of firestopping specified in Section 26 05 93 - Electrical Systems Firestopping.

(2) Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.

(3) Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

(4) Rectangular Sleeve Minimum Metal Thickness:

(a) For sleeve cross-section rectangle perimeter less than 50” (1270 mm) and no side greater than 16" (400 mm), thickness shall be 0.052" (1.321 mm).

(b) For sleeve cross-section rectangle perimeter equal to, or greater than, 50” (1250 mm) and 1 or more sides equal to, or greater than, 16" (400 mm), thickness shall be 0.138" (3.5 mm).

(5) Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies, unless openings compatible with firestop system used are fabricated during construction of floor or wall.

(6) Cut sleeves to length for mounting flush with both surfaces of walls.

(7) Extend sleeves installed in floors 2” (50 mm) above finished floor level.

(8) Size pipe sleeves to provide ____ annular clear space between sleeve and raceway, unless sleeve seal is to be installed or unless seismic criteria require different clearance.

3.04 APPLICATION

A. Provide raceways and boxes in accordance with the following table:

Application	Approved Raceways	Approved Boxes	Application Notes
Underground More than____ outside Foundation Walls	____, ____.	Cast Metal Boxes or Nonmetallic Handholes	
Underground More than ____ from Foundation Walls	____, ____.	Cast Metal Boxes or Nonmetallic Handholes	
In or Under Slab on Grade	____, ____	Cast or Nonmetallic Boxes	Use steel elbows with RNC when encased in concrete
Outdoor Locations, Above Grade	____	Cast Metal or Nonmetallic	
In Slab Above Grade	____, ____	____	
Wet and Damp Locations	____, ____	Cast Metal or Nonmetallic. Install flush mounting outlet boxes in finished areas.	
Concealed Dry Locations	____, ____	Sheet Metal Boxes; Install flush mounting outlet boxes in finished areas. Install hinged enclosure for large pull boxes.	
Exposed Dry Locations	____, Schedule 80 PVC	____ boxes; Install flush mounting outlet boxes in finished areas; Install hinged enclosure for large pull boxes.	
Exposed Subject to Damage	____	Cast Metal	
Hazardous Locations	____	Cast Metal	
Locations requiring Mechanical Protection	____		
Corrosive Atmospheres	____		Use PVC Coated Elbows with PVC Conduits
Vibrating equipment (including transformers &	Flexible Metal Conduits		Lengths for FMC & LFMC may range between 2 ft (0.6

Application	Approved Raceways	Approved Boxes	Application Notes
hydraulic, pneumatic, electric solenoid or motor-driven equipment)	(FMC) – Dry Locations Only Liquid Tight Flexible Metal Conduits (LFMC) – Wet Locations		m) to 4 ft (1.2 m)
Kitchen Equipment	Liquid Tight Flexible Metal Conduits		Lengths for LFMC may range between 2 ft (0.6 m) to 4 ft (1.2 m)
Instruments & control devices	Liquid Tight Flexible Metal Conduits		Lengths for LFMC may range between 2 ft (0.6 m) to 4 ft (1.2 m)

B. Special Conditions

(1) 1/2" raceway permitted:

(a) Between controller and its control or pilot device

(b) Between lighting switch and nearest outlet for luminaire

(c) Control wiring where mounted on equipment where conduit must follow contour of equipment

(d) Protective and signal systems where noted

(e) Where shown on plans

3.05 FIELD QUALITY CONTROL

A. Inspect raceway, boxes, indoor service poles, and wireways for physical damage, proper alignment, supports and seismic restraints, where applicable.

B. Replace any damaged component of the raceway system or install new raceway system.

C. Inspect components, wiring, connections and grounding.

3.06 REPAINTING

A. Repair damage to galvanized finishes with manufacturer-supplied zinc-rich paint kit. Leave remaining paint with Owner.

B. Repair damage to PVC or paint finishes with manufacturer-supplied touch-up coating. Leave remaining coating with Owner.

C. Wireways, indoor service poles: Remove paint splatters and other marks from surface; touch-up chips, scratches, or marred finished to match original finish using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.07 ADJUSTING

A. Adjust flush-mounted boxes pre-pour and after-pour to be flush with finished materials.

B. Install knockout closures in unused openings in boxes.

C. Align adjacent wall-mounted outlet boxes for switches and similar devices.

D. Adjust outlet boxes to allow luminaires to be positioned as indicated on ____.

3.08 CLEANING

A. Clean interior and exterior of boxes, wireways, and indoor poles to remove dust, debris and other material.

END OF SECTION 26 05 33

SECTION 26 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 03 30 00 - Cast-In-Place Concrete

B. Section 26 05 26 - Grounding and Bonding for Electrical Systems

C. Section 26 05 33 - Raceway and Boxes for Electrical Systems

D. Section 26 05 43.13 - Excavation and Backfill

E. Section 26 05 43.19 - Manholes and Hardware

F. Section 26 05 53 - Electrical Systems Identification

1.02 DESCRIPTION

A. Section includes conduits, ducts, and duct accessories for ____ for underground distribution for electrical power and communications.

B. The terms duct and ductbank, as used in this Section, are defined as follows:

(1) Duct: A single underground conduit, encased in concrete or direct buried.

(2) Duct Bank: Two or more ducts run together.

1.03 REFERENCE STANDARDS

A. ANSI C2 – National Electrical Safety Code

B. ANSI C80.1 – Rigid Steel Conduit-Zinc Coated (GRC)

C. ASTM F512 – Specification for Smooth-Wall Poly (Vinyl Chloride) (PVC) Conduits and Fittings for Underground Installation

D. NEMA TC 2 – Electrical Polyvinylchloride (PVC) Conduit

E. NEMA TC 3 – PVC Fittings for Use with Rigid PVC Conduit and Tubing

F. NEMA BI 50063 – PVC Plastic Utilities Duct for Underground Installation

G. NEMA TC 9 – Fittings for PVC Plastic Utility Duct for Underground Installation

H. NFPA 70 – National Electrical Code

I. UL 651 – Schedule 40 and 80 Rigid PVC Conduit

J. UL 651A – Type EB and A Rigid PVC Conduit and HDPE Conduit

K. UL E53373 – Underground Fiber Reinforced Epoxy Conduit (FRE)

L. UL 6 – Electrical Rigid Metallic Conduit-Steel

1.04 SUBMITTALS

A. Product data for the following:

(1) Duct bank materials, including spacers and miscellaneous components

(2) Ducts and conduits and their accessories, including elbows, end bells, bushings, seals, bends, fittings, plugs, pull tape, and solvent cement

(3) Warning tape

(4) Warning plank

B. Manufacturer’s Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

C. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual routing of conduits and ductbanks.

(2) Operation and Maintenance Data:

(a) Include manufacturer’s recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.05 QUALITY ASSURANCE

A. Regulatory Requirements:

(1) Comply with NFPA 70

(2) Comply with ANSI C2

(3) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Deliver ducts to project site with end capped. Store nonmetallic ducts with supports to prevent bending, warping, and deforming.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 CONDUITS

A. Rigid Steel Conduit (RSC):_____ ANSI C80.1, UL 6, heavy wall, hot dipped, galvanized steel _____.

B. Rigid Nonmetallic Conduit (RNC): NEMA TC 2 _____, UL 651, with matching fittings by same manufacturer, complying with NEMA TC 3 and UL 651, listed for underground use, _____.

C. Size:

(1) 4” (103 mm) nominal for voltages below 600 V and communications

(2) 5” (129 mm) nominal for voltages above 600 V

2.02 NONMETALLIC DUCTS

A. Underground Plastic Utilities Duct: NEMA BI 50063, Type EB-20-PVC, ASTM F512, UL 651A, with matching fittings by the same manufacturer, complying with NEMA TC 9.

B. Underground Plastic Utilities Duct: NEMA BI 50063, _____, ASTM F512, with matching fittings by the same manufacturer, complying with NEMA TC 9.

C. Underground Fiber Reinforced Epoxy Conduit (FRE): UL E53373

2.03 DUCT ACCESSORIES

A. Duct Spacers:

(1) Rigid PVC interlocking spacers.

(2) Factory-fabricated, sized for type and sizes of ducts with which used, and selected to provide minimum duct spacings indicated while supporting ducts during concreting or backfilling. Horizontal and vertical locking separation of _____ between ducts _____.

B. Elbows: Material to match conduit; minimum bend radius of _____.

C. Bell Ends: Manufactured bell ends of appropriate sizes at each end of conduit; pre-manufactured system for PVC with conduit seals, provisions for roughing into the concrete pour and waste stops, when entering a new building or a new manhole.

D. Bushings: Groundable steel bushings of appropriate sizes on all metal conduits where bell ends are not used; pre-manufactured system for PVC with conduit seals, provisions for roughing into concrete pour and water stops, when entering a new or existing building or a new or existing _____.

E. Seals: Mechanical interlocking assembly seal of modular synthetic rubber links properly sized to fit the pipe and tightened in place, in accordance with manufacturer’s instructions, when entering an existing building or _____ below grade and concrete shall be core drilled for the appropriate size conduit and seal.

F. Plugs: Closure plugs or caps of same material as conduit at ends of unused sections.

G. Pull Tape: Nylon pull tape with measurement markings in uniform lengths in each empty duct.

H. Grounding:

(1) Steel grounding bushings, where bell ends are not used.

(2) Bonding fitting with bonding strap on steel conduit with end bells.

I. Warning Tape: Underground line warning tape specified in Section 26 05 53 - Electrical Systems Identification.

J. Concrete Dye Color: Red dye for electrical ductbank and orange dye for communications ductbank added to _____.

K. Solvent Cement: Recommended by conduit manufacturer.

L. Multicell Raceway Systems: An outer shell with pre-lubricated inner ducts preinstalled. A typical assembly: 4” (100 mm) shell with 4 cells of 1-1/2" (41 mm) inner ducts. The outer shell: Available in bullet-resistant fiberglass, galvanized steel, and electrical metallic tubing; manufactured for direct burial and concrete encasement installation methods.

M. PVC and High-Density Polyethylene (HDPE) Bundles: For installation in large-bore steel casings. The bundles: Assembled with bore spacers to keep conduits aligned within the casing.

N. Preassembled Multiduct Kits: Communication ducts, assembled with duct spacers, ready to lay in trenches for direct burial or encasement. A typical preassembled kit: Four 1-1/2” (41 mm) ducts in 20 ft (6.1 m) lengths.

PART 3 - EXECUTION

3.01 COORDINATION

A. Coordinate layout and installation of ducts with final arrangement of other utilities, site grading, and surface features as determined in the field.

B. Coordinate elevations of ducts and ductbank entrances into _____ with final locations and profiles of ducts and ductbanks as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations from those indicated as required to suit field conditions and to ensure that duct runs drain to manholes and handholes, and as approved by Architect. For manholes and handholes construction, refer to Section 26 05 43.19 - Manholes and Hardware.

C. Adjust the depth of electrical utilities to avoid existing utilities with no change to contract price.

D. Utility Coordination: When duct lines are being constructed for use by a utility serving the project, consult with them for duct size and quantity, minimum bending radii, maximum distance between pulling points, grounding details, termination arrangement, and other criteria.

E. Duct Bank Coordination Drawings: Show duct profiles and coordination with other utilities and underground structures.

(1) Include plans and sections, drawn to scale, and show bends and locations of expansion fittings.

(2) Drawings shall be signed and sealed by a qualified professional engineer.

3.02 EXISTING UTILITIES

A. The existing utilities shown on contract drawings have been plotted from available records. No guarantee is made as to accuracy of locations indicated and is shown for the benefit of Contractor.

B. Contact all serving utility companies and have them locate their lines prior to commencing work. Telephone “Call Before You Dig” _____, 48 hours prior to commencing work. Coordinate with Owner all existing utility lines prior to commencing work.

C. Protect shown, visible and located utilities from damage. Promptly repair all active shown, visible and located utilities damaged by construction. This repair shall be made solely at the expense of the Contractor.

D. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies to shut off services if lines are active.

3.03 PROJECT CONDITIONS

A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:

(1) Notify _____ no fewer than _____ days in advance of proposed interruption of electrical service.

(2) Do not proceed with interruption of electrical service without written permission from the _____.

3.04 DUCT INSTALLATION

A. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes to drain in both directions.

B. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends, both horizontally and vertically, at other locations, unless otherwise indicated. All 90-degree sweeps with radius 10 ft (3 m) or less shall be rigid steel conduit.

C. Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer’s written instructions. Stagger couplings so those of adjacent ducts do not lie in same plane. Do not use conduit that requires the use of couplings for straight runs. Use acceptable PVC terminal adapters when joining PVC conduit to metallic fittings or rigid metal conduit.

D. Duct Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 10” (250 mm) o.c. for 5" (129 mm) ducts, and vary proportionately for other duct sizes.

(1) Begin change from regular spacing to end-bell spacing 10 ft (3 m) from the end bell without reducing duct line slope and without forming a trap in the line.

(2) Direct Buried Duct Banks: Install an expansion and deflection fitting in each conduit in area of disturbed earth adjacent to manhole or handhole.

(3) Concrete Enclosed Duct Banks: Install watertight expansion fitting in each conduit, with internal bonding jumper to allow for 3/4” (19 mm) movement in any direction.

(4) Grout end bells into structure walls from both sides to provide watertight entrances.

E. Building Wall Penetrations: Make a transition from underground duct to rigid steel conduit at least _____ outside the building wall without reducing duct line slope away from the building, and without forming a trap in the line. Use fittings manufactured for duct-to-conduit transition. Install conduit penetrations of building walls as specified in Section 26 05 33 - Raceway and Boxes for Electrical Systems.

F. Sealing: Provide temporary closure at termination of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand minimum of 15 psig (103.4 kPa) hydrostatic pressure. Provide watertight entrance sealing device where an underground conduit enters a structure through a concrete roof or membrane waterproofed wall or floor.

G. Fire Stops: Provide fire stop openings around electrical penetrations to maintain fire-resistance rating, where underground raceways penetrate fire-rated walls or floors.

H. Pulling Cord: Install 100 lb (45 kg) test nylon cord in ducts, including spares. Identify with tags at each end and at any intermediate pull point the origin and destination of each spare duct. _____ Provide a removable permanent cap over each end of each spare duct.

I. Concrete Encased Ducts: Support ducts on duct spacers.

(1) Spacer Installation:

(a) Provide spacers close enough to prevent sagging and deforming of ducts, with not less than _____ spacers per 20 ft (6.1 m) of duct. Secure spacers to earth and to ducts to prevent floating during concreting. Stagger spacers approximately 6" (150 mm) between tiers. Tie entire assembly together using tie wires and reinforcing steel. Install base and intermediate spacers at every coupling point of each duct line for a separation horizontally and vertically per NEC.

(2) Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.

(a) Start at one end and finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to manufacturer’s written recommendations or use other specific measures to prevent expansion-contraction damage.

(b) Terminate each pour in a vertical plane if more than one pour is necessary and install 3/4” (19 mm) reinforcing rod dowels extending 18" (450 mm) into concrete on both sides of joint near corners of envelope. Obtain Architect’s approval for the number and location of dowels.

(3) Pouring Concrete: Space concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Use a plank to direct concrete down sides of bank assembly to trench bottom. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for ductbank application.

(4) Reinforcement: Reinforce concrete-encased ductbanks where they cross disturbed earth and where indicated. Arrange reinforcing bars and ties without forming conductive or magnetic loops around ducts or duct groups. Size reinforcing bars and wire ties as indicated on drawings. Provide rebars with minimum of 2” (50 mm) of concrete on sides, top and bottom. Reinforcing bars shown in sections are required throughout.

(5) Forms: Use walls of trench to form side walls of ductbank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms of materials and in a manner acceptable to Architect.

(6) Minimum Space between Ducts: 3” (80 mm) between ducts and exterior envelope wall, 2" (50 mm) between ducts for like services, and 4" (100 mm) between power and signal ducts.

(7) Depth: Install top of ductbank at least _____ below finished grade in areas not subject to deliberate traffic, and at least _____ below finished grade in deliberate traffic paths for vehicles, unless otherwise indicated.

(8) Maintain a grade of at least 4” (100 mm) per 100 ft (30.5 m), either from one manhole or pull box to the next, or from a high point between them, depending on surface contour.

(9) Warning Tape: Refer to requirements in 26 05 53 - Electrical Systems Identification.

(10) Place ductbanks on an undisturbed soil base if possible. Where concrete encased ductbank is installed over an extensive area of disturbed earth such that within the periphery of a building, provide a separate concrete base under the ductbank to ensure stability of raceways during installation. Allow this base to set before ductbank is installed.

J. Direct Buried Duct Banks:

(1) Support ducts on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.

(2) Space spacers close enough to prevent sagging and deforming of ducts, with not less than _____ spacers per 20 ft (6.1 m) of duct. Secure spacers to earth and to ducts to prevent displacement during backfill and yet permit linear duct movement due to expansion and contraction as temperature changes. Stagger spacers approximately 6" (150 mm) between tiers.

(3) Excavate trench bottom to provide firm and uniform support for ductbank. Prepare trench bottoms as specified in Section 26 05 43.13 - Excavation and Backfill.

(4) Install backfill as specified in Section 26 05 43.13 - Excavation and Backfill.

(5) After installing first tier of ducts, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand place backfill to 4” (100 mm) over ducts and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction as specified in Section 26 05 43.13 - Excavation and Backfill.

(6) Install ducts with a minimum of 3” (80 mm) between ducts for like services and 6" (150 mm) between power and signal ducts.

(7) Depth: Install top of ductbank at least 36” (914 mm) below finished grade, unless otherwise indicated.

(8) Set elevation of bottom of ductbank below the frost line.

K. Stub-Ups:

(1) Use manufactured PVC duct elbows for stub-ups at poles and equipment and at building entrances through floor, unless otherwise indicated. Extend concrete encasement throughout length of the elbow. Concrete encasement applies to concreted encased ducts.

(2) Use manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through floor.

(a) Couple steel conduits to ducts with adapters designed for this purpose and encase couplings with 3” (80 mm) of concrete. Concrete encasement applies to concrete encased ducts.

(b) Stub-Ups to Equipment: For equipment mounted on outdoor concrete pads, extend steel conduit horizontally a minimum of _____ from edge of equipment pad or foundation. Encase in concrete for concrete encased ducts. Install insulated grounding bushings on terminations at equipment.

L. Arrangement and Routing:

(1) Arrange multiple duct runs substantially in accordance with details shown on drawings. Locate underground ducts where indicated on drawings and grade to the elevations shown on civil drawings.

(2) Make minor changes in location or cross-section as necessary to avoid obstructions or conflicts. Where duct runs cannot be installed substantially as shown because of conditions not discoverable prior to digging of trenches, refer the condition to the _____ for written instructions before further work is done.

(3) Maintain a 12” (300 mm) minimum vertical separation between ducts and other systems at crossings where other utility piping systems are encountered or being installed along a raceway route. Maintain a 12" (300 mm) minimum separation between ducts and other systems in parallel runs. Do not place ducts over valves or couplings in other piping systems. Refer conflicts with these requirements to the _____ for written instructions before further work is done.

(4) Provide markers at grade to indicate direction of underground conduits provided under this contract. Provide markers consisting of double-ended arrows, straight for straight runs and bent at locations where runs change direction. Provide markers at all bends and at intervals not exceeding 100 ft (30.5 m) in straight runs. Use markers made of sheet bronze not less than 1/4" (6 mm) thick embedded in and secured to the top of concrete posts. User markers not less than 10" (250 mm) long and 3/4" (19 mm) wide and marked ELECTRIC CABLES in letters 1/4" (6 mm) high incised into the bronze to a depth of 3/32" (2 mm).

(5) Enter manholes and structures with ducts at right angles.

3.05 UNDERGROUND DUCT APPLICATION

A. Ducts for Electrical Cables Over 600V: RNC, NEMA Type _____-PVC, in concrete encased ductbank, unless otherwise indicated.

B. Ducts for Electrical Feeders 600V and Less: RNC, NEMA Type _____-PVC, in concrete encased ductbank, unless otherwise indicated.

C. Ducts for Electrical Feeders 600V and Less: RNC, NEMA Type _____-PVC, in direct buried ductbank, unless otherwise indicated.

D. Ducts for Electrical Branch Circuits: RNC, NEMA Type _____-PVC, in direct buried ductbank, unless otherwise indicated.

E. Underground Ducts for Telephone, Communications, or Data Utility Service Cables: RNC, NEMA Type _____-PVC, in concrete encased ductbank, unless otherwise indicated.

F. Underground Ducts for Telephone, Communications, or Data Utility Service Cables: _____ installed in _____ ductbank, unless otherwise indicated.

G. Underground Ducts for Telephone, Communications, or Data Circuits: RNC, NEMA Type _____-PVC, in direct buried ductbank, unless otherwise indicated.

H. Underground Ducts for Telephone, Communications, or Data Circuits: RNC, NEMA Type EB-2--PVC, in concrete encased ductbank, unless otherwise indicated.

I. Underground Ducts Crossing _____: RNC, NEMA Type EPC-40-PVC, encased in reinforced concrete.

3.06 EARTHWORK

A. Excavation and Backfill: Comply with Section 26 05 43.13 - Excavation and Backfill, do not use heavy-duty, hydraulic-operated compaction equipment.

3.07 CONCRETE

A. Concrete: 3000 psi (211 kg/cm²), 28-day strength, complying with Division 03 – Concrete, where concrete encased.

3.08 GROUNDING

A. Ground underground ducts according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

3.09 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

(1) Demonstrate capability and compliance with requirements on completion of installation of underground ducts.

(2) Pull aluminum or wood test mandrel through duct to prove joint integrity and test for out-of-round duct. Provide mandrel equal to 80% fill of duct. If obstructions are indicated, remove obstructions and retest.

B. Preparation for pulling in conductors:

(1) Do not install crushed or deformed raceways. Avoid traps in raceways where possible. Take care to prevent the lodging of plaster, concrete, dirt, or trash in raceways, boxes, fittings, and equipment during the course of construction. Make raceways entirely free of obstructions or replace them. Ream all raceways, remove burrs, and clean raceway interior before introducing conductors or pull wires.

(2) Immediately after installation, plug or cap all raceway ends with watertight and dust-tight seals until the time for pulling in conductors.

C. Do not backfill underground direct buried and concrete encased ducts until the Architect has inspected them. Notify Architect 24 h in advance of duct concrete pour or backfill of direct buried ducts.

3.10 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.

END OF SECTION 26 05 43

SECTION 26 05 43.13 - EXCAVATION AND BACKFILL

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 31 2000 - Earth Moving

B. Section 26 05 43 - Underground Ducts And Raceways For Electrical Systems

1.02 DESCRIPTION

A. Section lists methods and materials for trench excavation and backfill for electrical and communications conduits in ductbanks. Refer to Section 26 05 43 - Underground Ducts And Raceways For Electrical Systems.

1.03 DEFINITIONS

A. Backfill: Soil material or controlled low-strength material used to fill an excavation.

B. Excavation: Removal of material encountered above sub-grade elevations and to lines and dimensions indicated.

C. Duct: A single underground conduit encased in concrete or direct buried.

D. Duct Bank: Two or more ducts run together.

E. Fill: Soil materials used to raise existing grades.

F. Sub-grade: Surface or elevation remaining after completing excavation, or top surface of fill or backfill immediately below subbase, drainage fill, or topsoil materials.

G. Utilities: On-site underground ducts and ductbanks as well as underground services within buildings.

1.04 SUBMITTALS

A. Submit list of materials to be used for backfill.

1.05 QUALITY ASSURANCE

A. Pre-excavation Conference: Conduct conference at project site to comply with requirements in Division 01 Section “Project Coordination.”

PART 2 - PRODUCTS

2.01 FILL MATERIAL

A. Type 1 Fill:

(1) Material from excavation separated from materials, which do not compact by tamping and rolling. No stones larger than 3” (80 mm) and no building, organic, or corrosive or frozen materials and no lumps larger than 6" (150 mm).

B. Type 2 Fill:

(1) Sand or gravel materials with none larger than 2” (50 mm) and of that portion passing the #4 (4.75 mm) sieve less the 5% to pass #200 sieve.

C. Type 3 Fill:

(1) Gravel of rounded to sub-angular shape, screened, which will pass 3/4” (19 mm) sieve and retained on #4 (4.75 mm) sieve.

D. Type 4 Fill:

(1) Pit run rock or gravel with maximum stone size of 1” (25 mm).

E. Type 5 Fill:

(1) Pea gravel, screened, which will pass 3/8” (9.5 mm) sieve and retained on #4 (4.75 mm) sieve.

2.02 CRUSHED ROCK

A. Crushed Rock: 1-1/4” (32 mm) minus, unless smaller is required for bedding material.

2.03 SAND

A. Sand: Clean and washed building sand.

2.04 TOPSOIL

A. Topsoil: Equal in quality to that removed.

2.05 SOD

A. New Sod: Mature, densely rooted grass free of weeds and objectionable grasses.

2.06 PLANTS

A. Plants: Obtained from a commercial nursery and be similar to those replaced.

PART 3 - EXECUTION

3.01 PREPARATION

A. Establish grade lines and locations of roadways and sidewalks, grade beams, and pill caps. Provide necessary stakes and batter boards.

B. Verify elevations of existing utilities prior to excavation for new ducts.

C. Verify locations of _____ with civil drawings.

D. Coordinate excavation and backfill with Section 31 2000 – Earth Moving.

E. Verify footings and foundations with structural drawings.

F. Verify underground sanitary and sewer with plumbing and civil drawings.

3.02 EXCAVATION

A. Provide excavation for underground work, including ducts, vaults, manholes, handholes, pull boxes____, unless otherwise shown or specified. Lay duct in open trench, except when Architect gives written permission for tunneling.

B. Excavate trench _____ to 24” (600 mm) wider than duct or ductbank dimensions and minimum of 3" (80 mm) below bottom of duct.

C. Include clearing, tree removal, grubbing, pavement removal, substructure removal such as walls, footings, and piers, and all incidental work such as tunneling, sheet piling, shoring, underpinning, pumping, bailing, and transportation. Coordinate excavation extending beyond construction limits with Construction Manager and Owner.

D. Do not provide blasting on this project without written permission of Architect and Owner.

E. _____

F. Over excavate 3” (80 mm) and fill with 3" (80 mm) of sand, where trench bottom is rock, or rocky, or contains debris larger than 1" (25 mm), or material with sharp edges.

G. Perform all crossings of concrete or asphalt after surface material has been saw cut to required width and removed.

H. Conform to utility company requirements for excavation and vault installation in addition to contract document requirements where excavations are for installing utility company’s ducts and vaults.

3.03 ROCK EXCAVATION

A. Use mechanical methods to remove rock in trenches for underground ducts.

B. Refer to Geotechnical Report available from Architect/Engineer for data on rock.

C. Include rock excavation in the Bid, unless otherwise indicated.

3.04 INSTALLATION

A. Keep underground ducts to proper line and grade and sealed to prevent entrance of animals or foreign matter.

B. Provide bracing and sheet piling as necessary to support trenches. Comply with Local Regulations, applicable provisions of OSHA Regulations on trenching, or with provisions of “Manual of Accident Prevention in Construction” published by Associated General Contractors of America.

C. Do not lay duct in water.

D. Review project drawings for underground ductbank details.

E. Keep trench free from water until duct joint material has hardened and concrete encasement is in place.

F. Do not increase the contract cost due to presence of ground water in soil or necessity of sheet piling or bracing trenches. Adjust contract cost when sheet piling is left in place, on written order of Owner.

G. Do not remove sheet piling until trench is substantially backfilled. Cut off sheet piling left in place not less than 2 ft (0.6 m) below new, finished grade.

H. Place underground ducts on _____ compacted bedding of sand. Shape bedding for clearance for joints and fittings, tamped in place and graded evenly to ensure uniform bearing for the full length of duct. Do not support duct by blocking, planking or mounding of bedding material.

I. Install lines passing under foundations with minimum of _____ clearance to concrete and ensure there is no disturbance of bearing soil.

3.05 BACKFILL

A. Backfill around ducts by hand to depth of 12” (300 mm) above top of duct with _____ fill in 6" (150 mm) layers. Compact backfill thoroughly with compactor of suitable weight or with approved mechanical tamper. Do not use flooding or jetting with water.

B. Place backfill from 12” (300 mm) above duct to elevation of subgrade in layers not exceeding 8" (200 mm) in depth with _____ fill.

C. Backfill from 12” (300 mm) above duct to sub-grade with _____ fill, when excavating through areas which are to become walks, roads, driveways or parking areas of concrete, bituminous or exposed gravel surfacing or such areas are existing to remain. Backfill in 12" (300 mm) layers and compact with mechanical means to density 95% modified proctor.

D. Conform excavation, duct laying, backfilling, grading and surfacing, as herein specified, when excavation occurs on public property or areas beyond the property line. Comply with additional requirements for public utility or other authorities. Check with each utility and incorporate cost of any additional requirements in base bid.

E. Backfill around vaults and handholes to be free of debris larger than 1-3/4” (44 mm) in all directions to 1 ft (0.3 m) from vault.

F. Provide 6” (150 mm) of pea gravel or sand bedding for vaults and handholes larger than 3x3 FT (0.9x0.9 M). For handholes smaller than 3x3 ft (0.9x0.9 m), provide 3" (80 mm) pea gravel or sand.

G. Other backfill shall be free of debris larger than 6” (150 mm) in diameter.

H. Place backfill material so as to obtain a minimum degree of compaction of 95% of maximum density at optimum moisture content. Moisten backfill material as required to obtain proper compaction.

I. Broken pavement, concrete, sod, roots, and debris shall not be used for backfill.

3.06 DEWATERING

A. Provide, operate, and maintain all pumps or other dewatering equipment required for control of water in trenches and excavations for electrical and communications site work during the entire construction period.

3.07 SHORING

A. Provide as required by trenching and excavating to secure site work. Comply with applicable safety regulations.

3.08 FINISHING

A. On completion of trenching and backfilling operations, restore grades to original elevation or to new sub-grade elevation.

B. Replace surfaces to existing conditions when trenching is through existing areas or beyond construction limits.

C. Use 6” (150 mm) of topsoil and sod to match existing elevations in landscaped areas or as otherwise approved by Landscape Architect.

3.09 SURFACE FINISHING

A. Refinish every disturbed surface to its original condition.

B. Replace planted materials not surviving 90 days after contract acceptance at Contractor’s own expense.

C. Return after 1 year and re-fill, compact and refinish settled areas to grade.

3.10 CARE OF PLANTS AND TREES

A. Remove and safely store plants and trees with trunks smaller than 6” (150 mm) diameter prior to commencing site work. Avoid trees larger than 6" (150 mm) diameter when so indicated on drawings. Replace plants and trees upon completion of site work.

END OF SECTION 26 05 43.13

SECTION 26 05 43.19 - MANHOLES AND HARDWARE

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 03 30 00 - Cast-in-Place Concrete

B. Section 26 05 26 - Grounding and Bonding for Electrical Systems

C. Section 26 05 43 - Underground Ducts And Raceways For Electrical Systems

D. Section 26 05 43.13 - Excavation and Backfill

1.02 DESCRIPTION

A. Section includes underground utility structures: _____ for power and communication cable systems.

1.03 REFERENCED STANDARDS

A. AASHTO HB 17 – Standard Specifications for Highway Bridges

B. ANSI C2 – National Electrical Safety Code

C. ASTM A48/A48M – Specification for Gray Iron Castings

D. ASTM C270 – Specification for Mortar for Unit Masonry

E. ASTM C387/C387M – Specification for Packaged, Dry, Combined Materials for Mortar and Concrete

F. ASTM C858 – Specification for Underground Precast Concrete Utility Structures

G. ASTM C891 – Standard Practice for Installation of Underground Precast Concrete Utility Structures

H. ASTM C1037 – Practice for Inspection of Underground Precast Concrete Utility Structures

I. ASTM E329 – Standard Specification for Agencies Engaged in Construction Inspection and/or Testing

J. ISO 9000 – Quality Management

K. ISO 10012 – Measurement Management Systems

L. NFPA 70 – National Electrical Code

M. SCTE 77 – Specification for Underground Enclosure Integrity

1.04 SUBMITTALS

A. Product Data:

(1) Accessories for underground utility structures.

B. Shop Drawings for Precast or Factory-Fabricated Underground Utility Structures: Include plans, elevations, sections, details, attachments to other work, and accessories, including the following:

(1) Duct entry provisions, including locations and duct sizes

(2) Reinforcement details

(3) Frame and cover design and _____ frame support rings

(4) _____ details

(5) Grounding details

(6) Dimensioned locations of cable rack inserts, pulling-in and lifting irons, and sumps

(7) Joint details

C. Shop Drawings for Factory-Fabricated Handholes and Pull Boxes Other Than Precast Concrete: Include dimensioned plans, sections, and elevations, and fabrication and installation details, including the following:

(1) Duct entry provisions, including locations and duct sizes

(2) Cover design

(3) Grounding details

(4) Dimensioned locations of cable rack inserts, and pulling-in and lifting irons

D. Product Certificates: For concrete and steel used in precast concrete _____, as required by ASTM C858.

E. Qualification Data: For professional engineer and testing agency.

F. Source quality-control test reports.

G. Field quality-control test reports.

(1) Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

H. Manufacturer’s Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

I. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual location of underground utility structures.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.05 QUALITY ASSURANCE

A. Testing Agency Qualifications: Qualified according to ASTM E329 for testing indicated

B. Comply with ANSI C2

C. Comply with NFPA 70

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store _____ underground utility structures at project site as recommended by manufacturer to prevent physical damage. Arrange so identification markings are visible.

B. Lift and support precast concrete units only at designated lifting or supporting points.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials:

(1) Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

(2) Furnish cable-support stanchions, arms, _____ and associated fasteners in quantities equal to _____ of quantity of each item installed.

PART 2 - PRODUCTS

2.01 PRECAST CONCRETE _____

A. Description: Factory-fabricated, reinforced-concrete, monolithically poured walls and bottom. Frame and cover shall form top of enclosure and shall have load rating consistent with that of _____.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(1) Carder Concrete Products

(2) Christy Concrete Products

(3) Elmhurst-Chicago Stone Co.

(4) Oldcastle Precast Group

(5) Riverton Concrete Products; a division of Cretex Companies, Inc.

(6) Utility Concrete Products, LLC.

(7) Utility Vault Co.

(8) Wausau Tile, Inc.

(9) Jensen Precast

C. Comply with ASTM C858 _____ and with interlocking mating sections, complete with accessories, hardware, and features.

(1) Windows: Precast openings in walls, arranged to match dimensions and elevations of approaching ducts and ductbanks plus an additional 12" (300 mm) vertically and horizontally to accommodate alignment variations.

(a) Windows: Located not less than 6" (150 mm) from interior surfaces of walls, floors, or roofs of _____, but close enough to corners to facilitate racking of cables on walls.

(b) Window opening: Cast-in-place, welded wire fabric reinforcement for field cutting and bending to tie into concrete envelopes of ductbanks.

(c) Window openings: Framed with at least two additional No. 4 steel reinforcing bars in concrete around each opening.

(2) Duct Entrances in _____ Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.

(a) Type and size: Fittings matched to duct or conduit to be terminated.

(b) Fittings: Aligned with elevations of approaching ducts and located near interior corners of _____ to facilitate racking of cable.

D. Concrete Knockout Panels: 1-1/2” (40 mm) to 2" (50 mm) thick, for future conduit entrance and sleeve for ground rod.

E. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the groundwater level at grade.

2.02 CAST-IN-PLACE _____

A. Description: Underground utility structures, constructed in place, complete with accessories, hardware, and features, with concrete knockout panels for conduit entrance and sleeve for ground rod.

B. Materials: Comply with ASTM C858 and with Section 03 30 00 - Cast-in-Place Concrete.

C. Structural Design Loading: As specified in Part 3 “Underground Enclosure Application” Article.

2.03 PRECAST CONCRETE HANDHOLES AND PULL BOXES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(1) Carder Concrete Products
(2) Christy Concrete Products
(3) Elmhurst-Chicago Stone Co.
(4) Oldcastle Precast Group
(5) Riverton Concrete Products; a division of Cretex Companies, Inc.
(6) Utility Concrete Products, LLC.
(7) Utility Vault Co.
(8) Wausau Tile, Inc.
(9) Jensen Precast

B. Comply with ASTM C858 for design and manufacturing processes.

C. Structural Load Ratings: As specified in Part 3 “Underground Enclosure Application.”

D. Description: Factory-fabricated, reinforced-concrete, monolithically poured walls and bottom unless open-bottom enclosures are indicated. Frame and cover shall form top of enclosure and shall have load rating consistent with that of handhole or pull box.

(1) Frame and Cover: Weatherproof cast-iron frame, with cast-iron cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
(2) Frame and Cover: Weatherproof steel frame, with steel cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
(3) Frame and Cover: Weatherproof steel frame, with hinged steel access door assembly with tamper-resistant, captive, cover-securing bolts.
(a) Cover Hinges: Concealed, with hold-open ratchet assembly
(b) Cover Handle: Recessed
(4) Frame and Cover: Weatherproof aluminum frame with hinged aluminum access door assembly with tamper-resistant, captive, cover-securing bolts.
(a) Cover Hinges: Concealed, with hold-open ratchet assembly
(b) Cover Handle: Recessed
(5) Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
(6) Cover Legend: Molded lettering, _____
(7) Configuration: Units shall be designed for flush burial and have _____ bottom, unless otherwise indicated.
(8) Extensions and Slabs: Designed to mate with bottom of enclosure. Same material as enclosure.
(a) Extension shall provide increased depth of _____.
(b) Slab: Same dimensions as bottom of enclosure and arranged to provide closure.
(9) Windows: Precast openings in walls, arranged to match dimensions and elevations of approaching ducts and ductbanks plus an additional 12” (300 mm) vertically and horizontally to accommodate alignment variations.
(a) Windows: Located no less than 6” (150 mm) from interior surfaces of walls, floors, or frames and covers of handholes, but close enough to corners to facilitate racking of cables on walls.
(b) Window opening: Cast-in-place, welded wire fabric reinforcement for field cutting and bending to tie-in to concrete envelopes of ductbanks.
(c) Window openings: Framed with at least two additional NO. 4 steel reinforcing bars in concrete around each opening.
(10) Duct Entrances in Handhole Walls:

(a) Type and size: Fittings matched to duct or conduit to be terminated.

(b) Fittings: Aligned with elevations of approaching ducts and located near interior corners of handholes to facilitate racking of cable.

(11) Handholes _____ and larger: Inserts for cable racks and pulling-in irons installed before concrete is poured.

2.04 HANDHOLES AND PULL BOXES OTHER THAN PRECAST CONCRETE

A. Description: Comply with SCTE 77.

(1) Color: _____.

(2) Configuration: Designed for flush burial and have _____ bottom, unless otherwise indicated.

(3) Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.

(4) Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

(5) Cover Legend: Molded lettering, _____

(6) Direct Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.

(7) Duct Entrance Provisions: Duct-terminating fittings mated with entering ducts for secure, fixed installations in enclosure wall.

(8) Handholes _____ and larger: Factory-installed inserts for cable racks and pulling-in irons.

B. Polymer Concrete Handholes and Pull Boxes with Polymer Concrete Cover: Molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two.

(1) Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(a) Armorcast Products Company

(b) Carson Industries LLC.

(c) CDR Systems Corporation

(d) NewBasis

C. Fiberglass Handholes and Pull Boxes with Polymer Concrete Frame and Cover: Sheet-molded, fiberglass-reinforced, polyester resin enclosure jointed to polymer concrete top ring or frame.

(1) Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(a) Armorcast Products Company

(b) Carson Industries LLC.

(c) Christy Concrete Products

(d) Synertech Moulded Products, Inc.; a division of Oldcastle Precast

D. Fiberglass Handholes and Pull Boxes: Molded of fiberglass-reinforced polyester resin, with covers of _____.

(1) Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(a) Carson Industries LLC.

(b) Christy Concrete Products

(c) Nordic Fiberglass, Inc.

E. High-Density Plastic Boxes: Injection molded of high-density polyethylene or copolymer-polypropylene. Cover: _____.

(1) Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(a) Carson Industries LLC.

(b) Nordic Fiberglass, Inc.

(c) PenCell Plastics

2.05 UTILITY STRUCTURE ACCESSORIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(1) Bilco Company (The)

(2) Campbell Foundry Company

(3) Carder Concrete Products

(4) Christy Concrete Products

(5) East Jordan Iron Works, Inc.

(6) Elmhurst-Chicago Stone Co.

(7) Jensen Precast

(8) McKinley Irion Works, Inc.

(9) Neenah Foundry Company

(10) NewBasis
(11) Oldcastle Precast Group
(12) Osburn Associates, Inc.
(13) Pennsylvania Insert Corporation
(14) Riverton Concrete Products; a division of Cretex Companies, Inc.
(15) Strongwell Corporation; Lenoir City Division
(16) Underground Devices, Inc.
(17) Utility Concrete Products, LLC.
(18) Utility Vault Co.
(19) Wausau Tile, Inc.

B. _____ Frames, Covers, and Chimney Components: Comply with structural design loading specified for _____.
   (1) Frame and Cover: Weatherproof, _____ with milled cover-to-frame bearing surface; diameter _____.
      (a) Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
   (2) Cover Legend: Cast in. Selected to suit system.
      (a) Legend: “ELECTRIC-LV” for duct system with power wires and cables for systems operating at 600 V and less.
      (b) Legend: “ELECTRIC-HV” for duct systems with medium-voltage cables.
      (c) Legend: “SIGNAL” for communications, data, and telephone duct systems.
   (3) _____ Chimney Components: Precast concrete rings with dimensions matched to those of roof opening.
      (a) Mortar for Chimney Ring and Frame and Cover Joints: Comply with ASTM C270, Type M, except for quantities less than 2.0 ft³ (0.06 m³) where packaged mix complying with ASTM C387/C387M, Type M, may be used.

C. _____ Sump Frame and Grate: ASTM A48/A48M, Class 30B, gray cast iron.

D. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2” (50 mm) diameter eye, and 1x4" (25x100 mm) bolt.
   (1) Working Load Embedded in 6” (150 mm), 4000 psi (281 kg/cm²) Concrete: 13000 lbf (5897 kgf) minimum tension.

E. Pulling Eyes in Nonconcrete Walls: Eyebolt with reinforced fastening, 1-1/4” (32 mm) diameter eye, rated _____ minimum tension.

F. Pulling-in and Lifting Irons in Concrete Floors: 7/8” (22 mm) diameter, hot-dip galvanized, bent steel rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.
   (1) Ultimate Yield Strength: 40,000 lbf (18,144 kgf) shear and 60000 lbf (27216 kgf) tension.

G. Bolting Inserts for Concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts for noncorrosive, chemical-resistant, nonconductive thermoplastic material; 1/2” (13 mm) ID by 2-3/4" (70 mm) deep, flared to 1-1/4" (32 mm) minimum at base.
   (1) Tested Ultimate Pullout Strength: 12,000 lbf (5443 kgf) minimum.

H. Expansion Anchors for Installation after Concrete Is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip with 1/2” (13 mm) bolt, 5300 lbf (2404 kgf) rated pullout strength, and minimum 6800 lbf (3084 kgf) rated shear strength.

I. Cable Rack Assembly: Steel, _____ galvanized, except insulators.
   (1) Stanchions: T-section or channel; 2-1/4” (58 mm) nominal size; punched with 14 holes on 1-1/2" (40 mm) centers for cable-arm attachment.
   (2) Arms: 1-1/2” (40 mm) wide, lengths ranging from 3" (75 mm) with 450 lb (204 kg) minimum capacity to 18" (450 mm) with 250 lb (113 kg) minimum capacity. Arms shall have slots along full length for cable ties and be arranged for secure mounting in horizontal position at any vertical location on stanchions.
   (3) Insulators: High-glaze, wet-process porcelain arranged for mounting on cable arms.

J. Cable Rack Assembly: Nonmetallic. Components fabricated from nonconductive, fiberglass-reinforced polymer.
   (1) Stanchions: Nominal 36” (920 mm) high by 4" (100 mm) wide, with minimum of 9 holes for arm attachment.
   (2) Arms: Arranged for secure, drop-in attachment in horizontal position at any location on cable stanchions, and capable of being locked in position. Arms shall be available in lengths ranging from 3” (75 mm) with 450 lb (204 kg) minimum capacity to 20" (500 mm) with 250 lb (113 kg) minimum capacity. Top of arm shall be nominally 4" (100 mm) wide, and arm shall have slots along full length for cable ties.

K. Duct-Sealing Compound: Non-hardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 35°F (1.7°C). Capable of withstanding temperature of 300 °F (149 °C) without slump and adhering to clean surfaces of plastic ducts, metallic conduits, conduit coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals.

L. Fixed _____ Ladders: Arranged for attachment to _____ of _____. Ladder, mounting brackets and braces: Fabricated from _____.

M. Portable _____ Ladders: UL-listed, heavy-duty _____ specifically designed for portable use for access to electrical _____. Minimum length equal to distance from deepest _____ floor to grade plus 36” (920 mm). _____ required.

N. Cover Hooks: _____ required.

2.06 SOURCE QUALITY CONTROL

A. Test and inspect precast concrete utility structures according to ASTM C1037.

B. Nonconcrete Handhole and Pull Box Prototype Test: Test prototypes of _____ and pull boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.

(1) Tests of materials shall be performed by an independent testing agency.

(2) Strength of tests of complete pull boxes and covers shall be by either an independent testing agency or the manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.

(3) Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 - EXECUTION

3.01 UNDERGROUND ENCLOSURE APPLICATION

A. _____: _____ concrete:

(1) _____ Located in Roadways and Other Deliberate Traffic Paths by Heavy or Medium Vehicles: H-20 structural load rating according to AASHTO HB 17.

(2) _____ Not Located in Deliberate Traffic Paths by Heavy or Medium Vehicles: H-10 load rating according to AASHTO HB 17.

B. Handholes and Pull Boxes for 600 V and Less, Including Telephone, Communications, and Data Wiring:

(1) Handholes and Pull Boxes in Roadways and Other Deliberate Traffic Paths: Precast concrete AASHTO HB 17, _____ structural load rating.

(2) Handholes and Pull Boxes in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: _____ structural load rating.

(3) Handholes and Pull Boxes in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: _____ structural load rating.

(4) Handholes and Pull Boxes Subject to Light-Duty Pedestrian Traffic Only: _____, structurally tested according to SCTE 77 with 3000 lbf (360.1 kgf) vertical loading.

3.02 INSTALLATION OF CONCRETE _____, HANDHOLES, AND PULL BOXES

A. Cast-in-Place _____ Installation:

(1) Finish interior surfaces with a smooth-troweled finish.

(2) Windows for Future Duct Connections: Form and pour concrete knockout panels 1-1/2” (40 mm) to 20" (50 mm) thick, arranged as indicated.

(3) Cast-in-place concrete, formwork, and reinforcement are specified in Section 03 30 00 - Cast-in-Place Concrete.

B. Precast Concrete _____ and Handhole Installation

(1) Comply with ASTM C891, unless otherwise indicated.

(2) Install units level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances.

(3) Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1” (25 mm) sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

(4) Concrete: 5000 psi (352 kg/sq cm) 28-day strength, complying with Division 03 – Concrete.

C. Elevations:

(1) _____ Roof: Install with rooftop at least 15” (380 mm) below finished grade.

(2) _____ Frame: In paved areas and traffic-ways, set frames flush with finished grade. Set other _____ frames 1” (25 mm) above finished grade.

(3) Install handholes with bottom below the frost line, _____ below grade.

(4) Handhole Covers: In paved areas and traffic-ways set surface flush with finished grade. Set covers of other handholes 1” (25 mm) above finished grade.

(5) Where indicated, cast handhole cover frame integrally with handhole structure.

D. Drainage: Install drains in bottom of _____ via drain lines where indicated. Coordinate with drainage provisions indicated.

E. _____ Access: Circular opening in manhole roof; sized to match cover size.

(1) _____ with Fixed Ladders: Offset access opening from _____ centerlines to align with ladder.

(2) Install chimney, constructed of precast concrete collars and rings, to support frame and cover and to connect cover with _____ roof opening. Provide moisture-tight masonry joints and waterproof grouting for cast-iron frame to chimney.

F. Waterproofing: Apply waterproofing to exterior surfaces of _____ after concrete has cured at least 3 days. Waterproofing materials and installation are specified in Division 07 Section _____." After ducts have been connected and grouted, and before backfilling, waterproof joints and connections and touch up abrasions and scars. Waterproof exterior of _____ chimneys after mortar has cured at least 3 days.

G. Dampproofing: Apply dampproofing to exterior surfaces of _____ after concrete has cured at least 3 days. Dampproofing materials and installation are specified in Division 07 Section "Bituminous Dampproofing." After ducts have been connected and grouted, and before backfilling, dampproof joints and connections and touch up abrasions and scars. Dampproof exterior of _____ chimneys after mortar has cured at least 3 days.

H. Hardware: Install removable hardware, including pulling eyes, cable stanchions, _____ cable arms, _____ as required for installation and support of cables and conductors and as indicated.

I. Fixed _____ Ladders: Arrange to provide for safe entry with maximum clearance from cables and other items in _____.

J. Field-Installed Bolting Anchors in _____ and Concrete Handholes: Do not drill deeper than 3-7/8" (98 mm) for _____ and 2" (50 mm) for handholes, for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.

K. Warning Sign: Install "Confined Space Hazard" warning sign on the inside surface of each _____ cover.

L. Pack and smooth non-shrink grout at all rough edges around duct entrances at each _____.

3.03 INSTALLATION OF HANDHOLES AND PULL BOXES OTHER THAN PRECAST CONCRETE

A. Install handholes and pull boxes level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances. Use pull box extension if required to match depths of ducts, and seal joint between box and extension as recommended by the manufacturer.

B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2" (13 mm) sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevation: In paved areas and traffic-ways, set so cover surface will be flush with finished grade. Set covers of other handholes 1" (25 mm) above finished grade.

D. Install handholes and pull boxes with bottom below the frost line. Insert depth of frost line below grade at project site below grade.

E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in the enclosure.

F. Field-cut openings for ducts and conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetration after fittings are sealed.

G. For enclosures installed in _____ and subject to occasional, non-deliberate, heavy-vehicle loading, form and pour a concrete ring encircling, and in contact with, enclosure and with top surface screeded to top of box cover frame. Bottom of ring shall rest on _____.

(1) Concrete: 3000 psi (211 kg/sq cm), 28-day strength, complying with Section 03 30 00 - Cast-in-Place Concrete, with a troweled finish.

(2) Dimensions: 10" (250 mm)wide by 12" (300 mm) deep.

H. Install drainage through the _____ of each handhole and pull box via drain lines where indicated.

3.04 GROUNDING

A. Ground utility structures according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

3.05 FIELD QUALITY CONTROL

A. Perform the following tests and inspections and prepare test reports:

(1) Demonstrate capability and compliance with requirements on completion of installation of underground utility structures.

(2) Test ____ grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Correct deficiencies and retest as specified above to demonstrate compliance.

C. Interpret test results in writing and submit to Engineer.

3.06 CLEANING

A. Clean internal surfaces of _____, including sump and remove foreign material, after completing the installation of all devices, equipment, cables and terminations.

B. Remove water from _____. If _____ continue to fill up with water, Contractor shall pump them regularly until the source of water has been detected and corrected.

END OF SECTION 26 05 43.19

SECTION 26 05 43.23 - UNDERGROUND ELECTRICAL SERVICE

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements

B. Section 26 05 26 - Grounding and Bonding for Electrical Systems

C. Section 26 05 43 - Underground Ducts And Raceways For Electrical Systems

D. Section 26 05 43.19 - Manholes and Hardware

1.02 DESCRIPTION

A. Utility Company is _____.

B. Primary Service Characteristics

(1) Primary service from terminal pole to building will be _____-1 V, 3-wire, 3-phase.

(2) Primary service from terminal pole to building will be _____-1 V, 4-wire, 3-phase.

C. Secondary Service Characteristics

(1) Secondary service will be _____-1 V, 3-wire, single-phase for lighting, _____-2 V, 3-wire, 3-phase for power.

(2) Secondary service will be _____-1 V, 4-wire, 3-phase for lighting, _____-2 V, 3-wire, 3-phase for power.

(3) Secondary service will be _____-1 V, 4-wire, 3-phase for combined lighting and power.

(4) Secondary service will be _____-1 V, 4-wire, 3-phase for incandescent lighting and receptacles, _____-2 V, _____-3 wire, 3-phase for fluorescent lighting and power.

D. Provide electrical service system except for the following which will be provided by Utility Company:

(1) Duct from terminal pole to building

(2) Conduit from terminal pole to building

(3) Duct from transformer to building

(4) Protective device at terminal pole

(5) Protective device at transformer

(6) Transformer

(7) Metering at terminal pole

(8) Metering at transformer

(9) Cable from terminal pole to transformer

(10) Cable from terminal pole to building

(11) Cable from transformer to building

(12) Primary cable as shown

(13) Secondary cable as shown

1.03 SEQUENCING, SCHEDULING

A. Coordinate electrical service with Utility.

B. Utility costs shall be included in Base Bid.

PART 2 - PRODUCTS

2.01 NOT APPLICABLE

PART 3 - EXECUTION

3.01 INSTALLATION

A. Provide ductbanks as specified in Specification Section 26 05 43 - Underground Ducts And Raceways For Electrical Systems.

B. Provide manhole as specified in Specification Section 26 05 43.19 - Manholes and Hardware.

END OF SECTION 26 05 43.23

1.02 DESCRIPTION

A. Section includes the following:
   (1) Identification for raceway and metal-clad cable
   (2) Identification for conductors and communication and control cable
   (3) Underground-line warning tape
   (4) Warning labels and signs
   (5) Instruction signs and posted drawings
   (6) Equipment identification nameplates
   (7) Wiring devices identification
   (8) Miscellaneous identification products

B. Refer to the respective Division 26 Sections, and Sections in other Divisions that specify electrical components, for additional electrical identification requirements.

1.03 REFERENCE STANDARDS

A. ANSI C2 – National Electrical Safety Code

B. ANSI Z535.4 – National Standards for Product Safety Signs and Labels

C. 29 CFR 1910 – Labor, Part 1910 – Occupational Safety and Health Standards, Section 1910.145 – Specifications for Accident Prevention Signs and Tags

D. NFPA 70 – National Electrical Code

1.04 SUBMITTALS

A. Product Data: For each electrical identification product indicated.

B. Torque log for all terminations 100A and over. Log shall identify target torque values, as they are found via manufacturer documentation and individual locations.

C. Nameplate Schedule: Prior to making nameplates, submit a complete schedule to Architect for approval indicating nameplate size, lettering size, color and actual nameplate information.

D. Samples: For each type of label and sign to illustrate size, colors, lettering style, mounting provisions, and graphic features of identification products.

1.05 QUALITY ASSURANCE

A. Comply with ANSI A13.1 and ANSI C2.

B. Comply with NFPA 70.

C. Comply with 29 CFR 1910.145.

1.06 COORDINATION

A. Coordinate identification names, abbreviations, colors, and other features with requirements in Contract Documents, Shop Drawings, manufacturer's wiring diagrams, and Operation and Maintenance Manual, and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout project.

B. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

C. Coordinate installation of identifying devices with location of access panels and doors.

D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.01 RACEWAY AND METAL-CLAD CABLE IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.

B. Manufacturers: Brady USA, Ideal, Marking Services, Inc. (MSI), Seton, or approved equal.

C. Color for Printed Legend:

(1) Power Circuits: Black letters on an orange field.

(2) Legend: Indicate system or service and voltage, if applicable.

D. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

E. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeves, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action when placed in position.

F. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeves, 2" (50 mm) long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action when placed in position.

G. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; 2" (50 mm) wide; compounded for outdoor use.

2.02 CONDUCTOR AND COMMUNICATION- AND CONTROL-CABLE IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend.

B. Manufacturers: Brady USA, Ideal, Marking Services, Inc. (MRI), Seton, or approved equal.

C. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils (0.076 mm) thick by 1 to 2" (25 to 50 mm) wide.

D. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.

E. Aluminum Wraparound Marker Labels: Cut from 0.014” (0.36 mm) thick aluminum sheet, with stamped, embossed, or scribed legend, and fitted with tabs and matching slots for permanently securing around wire or cable jacket or around groups of conductors.

F. Metal Tags: Brass or aluminum, 2” x 2” x 0.05” (50 mm x 50 mm x 1.27 mm), with stamped legend, punched for use with self-locking nylon tie fastener.

G. Write-On Tags: Polyester tag, ____ thick, with corrosion-resistant grommet and polyester or nylon tie for attachment to conductor or cable.

(1) Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.

H. Plasticized Card-Stock Tags: Vinyl cloth with preprinted and field-printed legends. Orange background, unless otherwise indicated, with eyelet for fastener.

2.03 UNDERGROUND-LINE WARNING TAPE

A. Manufacturers: Ideal, Marking Services, Inc. (MRI), Seton, or approved equal.

B. Description: Permanent, bright-colored, continuous-printed, polyethylene tape.

(1) Not less than 6” (150 mm) wide by 4 mils (0.102 mm) thick.

(2) Compounded for permanent direct-burial service.

(3) Embedded continuous metallic strip.

(4) Printed legend shall indicate type of underground line.

(5) Red tape for electrical and orange tape for communications / controls installations.

2.04 WARNING LABELS AND SIGNS

A. Comply with NFPA 70 and 29 CFR 1910.145.

B. Self-Adhesive Warning Labels: Factory printed, multicolor, pressure-sensitive adhesive labels, configured for display on front cover, door, or other access to equipment, unless otherwise indicated.

C. Self-Adhesive Arc Flash Warning Labels: Industrial grade, made of durable polyester with over-laminate to withstand harsh environments (UV rays, scratches and most chemicals).

(1) Manufacturer: Seton or approved equal

D. Engraved Plastic Signs: Engraving stock, melamine plastic laminate, minimum 1/16” (1.6 mm) thick for signs up to 20 sq inch (2000 sq mm) and 1/8" (3.2 mm) thick for larger sizes.

(1) Engraved legend with black letters on white face.

(2) Punched or drilled for mechanical fasteners.

E. Baked-Enamel Warning Signs for Interior Use: Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application. 1/4” (6 mm) grommets in corners for mounting. Nominal size, 7x10" (178x250 mm).

F. Metal-Backed, Butyrate Warning Signs for Exterior Use: Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with 0.0396” (1.01 mm) galvanized-steel backing; and with colors, legend, and size required for application. 1/4" (6 mm) grommets in corners for mounting. Nominal size, 10x14" (250x350 mm).

G. Warning label and sign shall include, but are not limited to, the following legends:

(1) Multiple Power Source Warning: “DANGER – ELECTRICAL SHOCK HAZARD – EQUIPMENT HAS MULTIPLE POWER SOURCES.”

(2) Workspace Clearance Warning: “WARNING – OSHA REGULATION – AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36" (914 mm).”

(3) Arc Flash Labels: Per ANSI Z535.4, the signal word WARNING appearing in black letters on an orange background, with second line below (Arc Flash and Shock Hazard) in black letters on white background and third line below (Appropriate PPE Required) in black letters on white background. Include the following information on the label:

(a) Equipment name

(b) Available bolted current

(c) Flash protection boundary distance

(d) Incident energy level at 18” (450 mm) expressed in cal/cm2

(e) Personnel protective equipment (PPE) class

(f) Voltage shock hazard

(g) Limited shock approach boundary

(h) Restricted shock approach boundary

2.05 TORQUE MARKING

A. Contractor shall keep a log of torque values used for project. This record shall incorporate name of installer for each specific location with date/time.

B. Torque marks shall be made on nut side and extend to a non-rotating surface. Torque marks shall be made at time of torquing – placing torque marks after the fact is not permitted but instead must be re-torqued and marked.

C. Torque seal: (Blue) Cross-Check or similar manufacturer shall be used for terminations 100A and over. Use of permanent black marker is not acceptable.

2.06 INSTRUCTION SIGNS AND POSTED DRAWINGS

A. Instruction Signs: Engraved, laminated acrylic or melamine plastic, minimum 1/16” (1.6 mm) thick for signs up to 20 sq inch (2000 sq mm) and 1/8" (3.2 mm) thick for larger sizes.

(1) Engraved legend with _____.

(2) Punched or drilled for mechanical fasteners.

(3) Mounting Frames: Extruded aluminum, 4-point screw mount with 1/8” (3.2 mm) clear plexiglass cover.

B. Posted Drawings: Print electrical riser diagrams on 20 lb (9.1 kg) bond paper. (Blueprint paper is not acceptable.) Reduce drawings to approximately 1/2 size using Xerox reduction process. Contact Engineer to obtain updated original plans for printing.

2.07 EQUIPMENT IDENTIFICATION NAMEPLATES

A. Engraved, Three-layer, Laminated Acrylic or Melamine Nameplate: Punched or drilled for screw mounting. White letters on a black background, except emergency power equipment nameplates are to have white letters on a red background. Minimum letter height shall be 3/8” (9.5 mm) unless otherwise noted.

B. Stenciled Legend: In non-fading, waterproof, _____ ink or oil-based, alkyd enamel paint. Minimum letter height shall be _____.

2.08 WIRING DEVICES IDENTIFICATION

A. Refer to Section 26 27 26 - Wiring Devices for requirements.

2.09 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Cable Ties: Fungus-inert, self-extinguishing, 1-piece, self-locking, type 6/6 nylon cable ties.

(1) Minimum Width: 3/16” (4.8 mm)

(2) Tensile Strength: 50 lb (22.7 kg) minimum

(3) Temperature Range: -40°F to 185°F (-40°C to 85°C)

(4) Color: Black, except where used for color-coding

B. Paint: Paint materials and application requirements are specified in Division 09 – Finishes painting Sections.

C. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.01 APPLICATION

A. Raceway and Ductbanks More Than 600 V Concealed within Buildings: 4” (100 mm) wide black stripes on 10" (250 mm) centers over orange background that extends full length of raceway or duct and is 12" (300 mm) wide. Stencil legend “DANGER CONCEALED HIGH-VOLTAGE WIRING” with 3" (80 mm) high black letters on 20" (500 mm) centers. Stop stripes at legends. Apply to the following finished surfaces:

(1) Floor surface directly above conduits running beneath and within 12” (300 mm) of a floor that is in contact with earth or is framed above unexcavated space.

(2) Wall surfaces directly external to raceways concealed within wall.

(3) Accessible surfaces of concrete envelope around raceways in vertical shafts, exposed in the building, or concealed above suspended ceilings.

B. Accessible Raceways and Metal-Clad Cables More Than 600 V: _____

(1) Identify covers of exposed junction and pull boxes with red paint. Stencil the legend “DANGER – HIGH VOLTAGE _____ VOLTS” in black letters 1/2” (13 mm) high.

C. Accessible Raceways and Metal-Clad Cables, 600 V or Less, for Service, Feeder, and Branch Circuits More Than _____: Identify with orange _____.

(1) Identify 4” (100 mm) round, 4" (100 mm) square and 4-11/16" (119 mm) junction boxes concealed above ceiling or exposed with neat lettering on cover with permanent black marking pen. Identify source, circuit number, phase, and control circuit number.

D. Accessible Raceways and Cables of Auxiliary Electrical Systems: Identify the following systems with color-coded, _____:

(1) Fire Alarm System (including covers of pull and junction boxes): Red
(2) Fire-Suppression Supervisory and Control System: Red and yellow
(3) Combined Fire Alarm and Security System: Red and blue
(4) Security System: Blue and yellow
(5) Mechanical and Electrical Supervisory System: Green and blue
(6) Telecommunication System: Green and yellow

E. Power-Circuit Conductor Identification: For _____ conductors No. _____ AWG and larger in vaults, pull and junction boxes, manholes, and handholes use _____. Identify source and circuit number of each set of conductors or other appropriate number or letter to expedite future tracing and troubleshooting. For single conductor cables, identify phase in addition to the above. Phase identification shall be consistent throughout the system.

F. Branch-Circuit Conductor Identification: Where there are conductors for more than three branch circuits in same junction or pull box, use _____. Identify each ungrounded conductor according to source and circuit number.

G. Conductors to Be Extended in the Future and Spare Conductors: Attach _____ to conductors and list source and circuit number.

H. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, signal, sound, intercommunications, voice, and data connections.

(1) Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
(2) Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
(3) Coordinate identification with project drawings, manufacturer's wiring diagrams, and Operation and Maintenance Manual.

I. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable. _____

J. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Comply with 29 CFR 1910.145 and apply _____. Identify system voltage with black letters on an orange background. Apply to exterior of door, cover, or other access to equipment.

(1) Equipment with Multiple Power or Control Sources: Apply to door or cover of equipment including, the following:
(a) Power transfer switches
(b) Controls with external control power connections
(2) Equipment Requiring Workspace Clearance According to NFPA 70: Unless otherwise indicated, apply to door or cover of equipment but not on flush panelboards and similar equipment in finished spaces.
(3) Arc Flash Warning Labels: install per NFPA 70 for each switchgear, switchboard, panelboard, motor control center, industrial control panel (every enclosure that may contain energized conductors or components). Locate labels so they are visible to the personnel before examination, adjustment, servicing, or maintenance of the equipment.
(4) Available Fault Current Labels: install per NFPA 70 for each piece of service entrance equipment. Locate labels so they are visible to the personnel before examination, adjustment, servicing or maintenance of the equipment.

K. Instruction Signs and Posted Drawings:

(1) Operating Instructions: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend printed in all capital letters of 12 pt size minimum where instructions are needed for system or equipment operation.
(2) Emergency Operating Instructions: Install instruction signs with white legend on a red background with minimum 3/8" (9.5 mm) high letters for emergency instructions at equipment used for _____.

L. Essential Electrical System in Hospitals:

(1) Identify raceways and covers of pull and junction boxes as follows:
(a) Life Safety Branch: Yellow
(b) Critical Branch: Orange
(c) Equipment System: Green

M. Emergency Electrical System Junction and Pull Boxes:

(1) Identify with spray-painted covers as follows:
(a) 480/277 V circuits: _____
(b) 120/208 V circuits: _____

N. Equipment Identification Nameplates: On each unit of equipment, install unique designation nameplate that is consistent with wiring diagrams, schedules, and Operation and Maintenance Manual. Apply nameplates to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.

(1) Nameplate Instructions:

(a) Indoor Equipment: Engraved, laminated acrylic or melamine nameplate. Unless otherwise indicated, provide a single line of text with 3/8” (9.5 mm) minimum high letters 1/4" (6 mm)on 1-1/2" (40 mm) high nameplate; where 2 lines of text are required, use nameplates sized 2" (50 mm) high.

(b) Outdoor Equipment: _____

(c) Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.

(2) Install nameplates for equipment including, the following:

(a) Panelboards, electrical cabinets, and enclosures

(b) Access doors and panels for concealed electrical items

(c) Electrical switchgear, switchboards, and distribution panelboards including each feeder device within the equipment enclosures.

(d) Transformers

(e) Electrical substations

(f) Emergency system boxes and enclosures

(g) Motor-control centers, including each device

(h) Disconnect switches

(i) Enclosed circuit breakers

(j) Motor controllers

(k) Pushbutton stations

(l) Power transfer equipment

(m) Contactors

(n) Remote-controlled switches, dimmer modules, and control devices

(o) Battery inverter units

(p) Battery racks

(q) Power-generating units

(r) Voice and data cable terminal equipment

(s) Master clock and program equipment

(t) Intercommunication and call system master and staff stations

(u) Television/audio components, racks, and controls

(v) Fire alarm control panel and annunciators

(w) Security and intrusion-detection control stations, control panels, terminal cabinets, and racks

(x) Monitoring and control equipment

(y) Uninterruptible power supply equipment

(z) Terminals, racks, and patch panels for voice and data communication and for signal and control functions

(aa) Non-concealed junction box covers of auxiliary electrical systems

(3) Provide the following information on each nameplate:

(a) Equipment name/tag:

1) Matching the designation from the contract documents, or identifying the load controlled or function of the equipment where no specific tag is shown on the contract documents.

2) For disconnect switches, use the prefix “SW-” followed by the name of the equipment served, example: “SW-PMP-201.”

(b) Equipment operating voltage, phase, wiring configuration, and ampacity:

1) Example: “208V/3PH/4W/225A”

(c) Source of power supply, including circuit number:

1) Example: “FED FROM LP-2/45”

O. For service entrance equipment, provide a nameplate identifying the maximum available fault current and “as of” effective date.

(1) Example: “MAXIMUM AVAILABLE FAULT CURRENT 33,500A AS OF 2017/06/15.”

P. Access Panel Identification: Furnish typewritten charts with identification and location of access panels serving equipment and incorporate in O&M Manuals.

3.02 INSTALLATION

A. Verify identity of each item before installing identification products.

B. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.

C. Apply identification devices to surfaces that require finish after completing finish work.

D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.

E. Install non-adhesive signs and plastic nameplates parallel to equipment lines; attach with screws and auxiliary hardware appropriate to the location and substrate. Secure to inside surface of door or panelboard that is recessed in finished locations.

F. Posted Drawings and Operating Instructions: Mount drawings and operating procedures on the wall immediately adjacent to the piece of equipment for which the instructions apply. If sufficient wall space is available, mount directly to one of the sheet metal panels of the equipment.

G. Warning Signs: Install warning signs where there is hazardous exposure or danger associated with access to or operation of electrical facilities. Provide text of sufficient clarity and lettering of sufficient size to convey adequate information at each location; mount permanently in an appropriate and effective location. Comply with ANSI A13.1 standard color and design.

   (1) Operational Tags: Where needed for proper and adequate information on operation and maintenance of electrical systems, provide tags of plasticized card stock, either preprinted or hand printed to convey the message; example: “DO NOT OPEN THIS SWITCH WHEN BREAKER IS CLOSED.”

H. System Identification Color Banding for Raceways and Cables: Each color band shall completely encircle cable or conduit. Place adjacent bands of two-color markings in contact, side by side. Locate bands at changes in direction, at penetrations of walls and floors, at 50 ft (15.2 m) maximum intervals in straight runs, and at 25 ft (7.6 m) maximum intervals in congested areas.

I. Color-Coding for Phase _____Identification, 600 V or Less: Use colors listed below for ungrounded _____ conductors.

   (1) Color shall be _____.

   (2) Colors for 208/120 V Circuits:

      (a) Phase A (left bus in panelboard): Black

      (b) Phase B (center bus in panelboard): Red

      (c) Phase C (right bus in panelboard): Blue

      (d) Neutral: White

      (e) Equipment Ground: Green

   (3) Colors for 480/277 V Circuits:

      (a) Phase A (left bus in panelboard): Brown

      (b) Phase B (center bus in panelboard): Orange

      (c) Phase C (right bus in panelboard): Yellow

      (d) Neutral: Gray

      (e) Equipment Ground: Green

   (4) Field-applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6” (150 mm) from terminal points and in boxes where splices or taps are made. Apply last two runs of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings.

J. Aluminum Wraparound Marker Nameplates and Metal Tags: Secure tight to surface of conductor or cable at a location with high visibility and accessibility.

K. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6” to 8” (150 mm to 200 mm) below finished grade. Use multiple tapes where width of multiple lines installed in a common trench _____ exceeds 16" (400 mm) overall.

L. Painted Identification: Prepare surface and apply paint according to Division 09 – Finishes painting Sections.

1.02 DESCRIPTION

A. Section includes computer based, fault current, arc flash, and overcurrent protective device coordination studies for an electrical distribution system, based on actual equipment supplied. Set protective devices based on results of the protective device coordination study.
   (1) Coordination of series-rated devices is permitted only where indicated on drawings.
B. Furnish field information and data needed for the studies.
C. Available fault current and electrical equipment interrupting capacity indicated on drawings are based on the short circuit study performed during design as part of the construction documents.

1.03 REFERENCE STANDARDS

A. IEEE C57.12.10 – American National Standard for Transformers-230 kV and Below 833/958-8333/10 417 kVA, Single-Phase, and 750/862-60 000/80 000/100 000 kVA, Three-Phase, w/o Load Tap Changing; and 3750/4687-60 000/80 000 kVA with Load Tap Changing-Safety Requirements
B. ANSI C57.12.22 – American National Standard for Transformers-Pad-Mounted, Compartmental-Type, Self-Cooled, Three-Phase Distribution Transformers with High-Voltage Bushings, 2500 kVA & Smaller: High-Voltage, 34 500 GrdY/19 920 V & Below; Low Voltage, 480 V & Below-Requirements
C. ANSI C57.12.40 – American National Standard for Secondary Network Transformers-Subway and Vault Types (Liquid Immersed)-Requirements
D. ANSI C57.12.90 – General Requirements for Liquid-Immersed Distribution Power and Regulating Transformers
E. IEEE C57.96 – Distribution and Power Transformers, Guide for Loading Dry-Type (Appendix to ANSI C57.12 Standards)
F. IEEE Std 3001 Standards: Power Systems Design
G. IEEE Std 3004 Standards: Protection & Coordination
H. IEEE Std 3002 Standards: Power Systems Analysis

W. NFPA 70E – Standard for Electrical Safety in Workplace

1.04 SUBMITTALS

A. Product Data: Computer software program to be used for studies. Include specific software version for owner record.
B. Product Certificates:
   (1) Coordination-study and fault-current-study computer software programs, certifying compliance with IEEE 3002.3.
   (2) Arc flash calculations computer software programs, certifying compliance with IEEE 1584.
C. Qualification Data: For coordination study specialist.
   (1) Submit qualifications of the organization proposed for performing the study. Include description of the equipment and computer-based computation methods or programs used and the names and experience histories of the personnel who will perform the study.
D. Other Action Submittals: Subsequent to having approval for system protective devices submit the following in digital format:
   (1) Electrical one-line drawing drafted in computer software program with component names.
      (a) Component names shall be easily traceable to the names used in the Construction Documents.
      (b) Drawing minimum text height of 3/32”. Maximum paper size 30”x42”. Provide multiple drawing sheets as required.
   (2) Fault current study report
   (3) Equipment evaluation report
   (4) Coordination study input data, including completed computer program input data sheets
   (5) Coordination Study Report
   (6) Arc Flash Study and Report
   (7) Arc Flash labels
   (8) Serving utility information with utility letterhead, including:
      (a) Protective device part numbers/settings
      (b) Maximum available 1P and 3P fault
      (c) Line conductor sizes/lengths
      (d) Transformer impedance
      (e) Serving voltage
   (9) Provide copy of Owner’s electrical safety program if site specific standards vary from instructions noted in this project specification. All software files, including report documents and system study native files (including relevant library files), to allow review and future use of files
   (10) Sample energized work permit form

1.05 QUALITY ASSURANCE

A. Perform studies using computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are not acceptable.
B. Coordination Study Specialist Qualifications: An organization experienced in the application of computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.
   (1) Perform study under the direct supervision and control of a Registered Professional Electrical Engineer licensed in the _____ of _____, with a minimum of 5 yrs recent experience in performing protective device coordination studies, arc flash calculations, and electrical system analysis. Final report shall be signed and sealed by said engineer.

C. Comply with IEEE 3002.3 for general study procedures.

D. Comply with IEEE 1584 for arc flash calculations.

PART 2 - PRODUCTS

2.01 COMPUTER SOFTWARE DEVELOPERS

A. Computer Software Developers: Subject to compliance with requirements, provide products by one of the following:

B. Basis of Design Product:

(1) CYME International, Inc.

(2) EDSA Micro Corporation

(3) SKM Systems Analysis, Inc.

(4) ETAP

2.02 COMPUTER SOFTWARE PROGRAM REQUIREMENTS

A. Comply with IEEE 3002.3 and IEEE 1584.

B. Computer software program shall be capable of plotting and diagramming time-current characteristic curves as part of its output. Computer software program reports device settings and ratings of all overcurrent protective devices and demonstrates selective coordination by computer-generated, time-current coordination plots.

C. Arc Flash Calculations: Software program capable of calculating Arc Flash Incident Energy (AFIE) levels and flash protection boundary distances.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices for coordination are indicated on drawings.

B. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

C. Provide the study based on the actual electrical equipment supplied for the project.

3.02 POWER SYSTEM DATA

A. Gather and tabulate the following input data to support coordination study:

(1) Product Data for overcurrent protective devices specified in other Division 26 Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with power riser diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.

(2) Impedance of utility service entrance(s).

(3) Power Riser Diagrams: In hard copy and electronic copy formats, showing the following:

(a) Circuit breaker and fuse-current ratings and types

(b) Relays and associated power and current transformer ratings and ratios

(c) Transformer kilovolt amperes, primary and secondary voltages, connection type, impedance, and X/R ratios

(d) Generator kilovolt amperes, size, voltage, and source impedance

(e) Cables: Indicate conduit material, sizes of conductors, conductor material, insulation, and length

1) Prior to equipment purchase, utilize conservative lengths (up/down included) based on planned conduit routing to validate equipment ratings. Final study to utilize contractor provided as-built lengths to confirm equipment ratings.

(f) Busway ampacity and impedance

(g) Motor horsepower and code letter designation according to NEMA MG 00001

(h) Load current that is the basis for sizing continuous ratings of circuits for cables and equipment

(4) Data sheets to supplement power riser diagrams, cross-referenced with tag numbers on diagrams, showing the following:

(a) Special load considerations, including starting inrush currents and frequent starting and stopping

(b) Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability

(c) Motor full-load current, locked-rotor current, service factor, starting time, type of start, and thermal-damage curve

(d) Generator thermal-damage curve

(e) Ratings, types, and settings of utility company’s overcurrent protective devices

(f) Special overcurrent protective device settings or types stipulated by utility company

(g) Time-current characteristic curves of devices indicated to be coordinated

(h) Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers

(i) Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays

(j) Panelboards, switchboards, automatic transfer switch, ampacity, and interrupting rating in amperes rms symmetrical

1) Automatic transfer switch withstand rating to comply with UL 1008. Equivalent trip curves are not accepted for specific breaker rated equipment – exact breaker and associated trip unit must be listed on UL certification.

3.03 FAULT CURRENT STUDY

A. Calculate maximum available short circuit current in amperes rms symmetrical at circuit breaker positions of electrical power distribution system. Provide calculation for a current immediately after initiation and for a three-phase bolted short circuit at the following:

(1) _____ bus

(2) Distribution panelboard

(3) Branch circuit panelboard

(4) Disconnect switches

(5) Automatic transfer switch

(6) Manual transfer switch

(7) Equipment fed by Variable Frequency Drive (VFD)

(8) Industrial control panels including air handling equipment, elevator controllers, etc.

B. For standard non-bypass Pulse Width Modulation VFDs, a line short circuit condition may be ignored.

C. Verify mechanical equipment served meets or exceeds maximum short circuit available.

D. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for project. Include studies of system switching configurations and alternate operations that could result in maximum fault conditions.

(1) Model the entire electrical distribution system from utility company point of connection to circuit breakers in 208 V distribution panels at secondary side of distribution transformers. Include mechanical HVAC equipment, motor driven equipment feeder circuits, and elevator feeder circuits.

(2) Model shall include components of the distribution system which would be exposed to fault current levels of 10,000 A symmetrical on a calculated basis.

(3) Study shall include closed transition operation of automatic transfer switches _____ and worst-case short circuit rating shall be included in analysis for each piece of equipment as defined above. The closed transition and normal operation short circuit ratings shall both be used to explore the worst-case arc fault rating for each piece of electrical equipment as defined above.

E. Calculate momentary and interrupting duties on basis of maximum available fault current.

F. Perform calculations to verify interrupting ratings of overcurrent protective devices in compliance with _____ and IEEE 242.

(1) Transformers:

(a) IEEE C57.12.10

(b) ANSI C57.12.22

(c) ANSI C57.12.40

(d) IEEE C57.12.00

(e) IEEE C57.96

(2) Medium-Voltage Circuit Breakers: IEEE C37.010

(3) Low-Voltage Circuit Breakers: IEEE 1015 and IEEE C37.20.1

(4) Low-Voltage Fuses: ANSI C37.46

G. Study Report:

(1) Show calculated X/R ratios and equipment interrupting rating (5-cycle) fault currents on power riser diagrams in report. List other output values from computer analyses, including momentary (1/2-cycle), interrupting (5-cycle), and 30-cycle fault current values for 3-phase, 2-phase, and phase-to-ground faults.

(2) Show interrupting (5-cycle) and time-delayed currents (6 cycles and above) on medium- and high voltage circuit breakers to set relays and assess the sensitivity of overcurrent relays.

H. Equipment Evaluation Report:

(1) Prepare report on adequacy of overcurrent protective devices and conductors by comparing fault current ratings of devices with calculated fault current momentary and interrupting duties.

(2) For 600V overcurrent protective devices, ensure interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

(3) For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in standards to 1/2-cycle symmetrical fault current.

(4) Verify adequacy of phase conductors at maximum 3-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure short circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

(5) Notify Owner/Engineer promptly of discrepancies, problem areas, or inadequacies and provide recommendations for problem resolution.

3.04 COORDINATION STUDY

A. Perform coordination study using approved computer software program. Prepare a written report using results of fault current study. Comply with IEEE 3002.3.

(1) Calculate maximum and minimum 1/2-cycle short circuit currents.

(2) Calculate maximum and minimum interrupting duty (5 cycles to 2 seconds) short circuit currents.

(3) Calculate maximum and minimum ground-fault currents.

B. Comply with NFPA 70 for overcurrent protection of circuit elements and devices.

C. Comply with _____ recommendations for fault currents and time intervals.

D. Transformer Primary Overcurrent Protective Devices:

(1) Devices non-operational in response to the following:

(a) Inrush current when first energized

(b) Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.

(c) Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.

(2) Protect transformers according to IEEE C57.12.00, for fault currents by device settings.

E. Protect motors served by voltages more than 600 V according to IEEE 620.

F. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Demonstrate equipment withstands the maximum short circuit current for a time equivalent to tripping time of primary relay protection or total clearing time of fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short circuit current. Verify adequacy of phase conductors at maximum three-phase bolted fault currents, equipment grounding conductors, and grounding electrode conductors at maximum ground-fault currents.

G. Include voltage classes of equipment from utility's incoming line protective device down to and including each panelboard. The phase and ground overcurrent protection shall be included as well as settings for other adjustable protective devices.

H. Selective Coordination: Overcurrent devices installed upstream and downstream of automatic transfer switches and/or associated with NEC Article 700 Emergency and 701 Legally Required loads shall be selectively coordinated from source of supply (both normal and emergency sources) through final device. Change specific circuit breakers (type, frame, trip-unit, etc.) and equipment bus rating as necessary to meet this requirement. Selective coordination of the system indicated on the one-line diagram is based on (list manufacturer) equipment.

(1) Additionally, provide selective coordination for ground fault through-out.

I. Coordination Study Report: Prepare a written report indicating results of coordination study:

(1) Tabular Format of Settings Selected for Overcurrent Protective Devices:

(a) Device tag

(b) Relay-current transformer ratios; and tap, time-dial, and instantaneous-pickup values

(c) Circuit breaker sensor rating; and long-time, short-time, and instantaneous settings

(d) Fuse-current rating and type

(e) Ground-fault relay-pickup and time-delay settings

(f) Manufacturer and type of device

(g) Range of adjustments and recommended settings

(2) Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate adequate time separation exists between devices installed in series, drawn to show the boundaries of device operation on log-log scale graphs, including power utility company's upstream devices. Where time current curves do not explicitly illustrate selective coordination but breakers have been tested and documented as being selectively coordinated, submit manufacturer's literature to substantiate device coordination. Include on curve sheet a title and legend identifying portion of the system covered. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:

(a) Device tag
(b) Voltage and current ratio for curves
(c) Three-phase and single-phase damage points for each transformer
(d) No damage, melting, and clearing curves for fuses
(e) Cable damage curves
(f) Transformer inrush points, full-load amps, and damage curves
(g) Maximum fault current cutoff point
(h) Generator decrement curve and full-load amps

(3) Plot characteristics where applicable:

(a) _____voltage fuses including minimum melt, total clearing and damage bands
(b) Low-voltage circuit breaker trip devices
(c) Transformer full-load current, magnetizing inrush current, and ANSI transformer withstand parameters
(d) Ground-fault protective devices
(e) Motor starting characteristics and motor damage points
(f) Generator short circuit decrement curve and generator damage point
(g) Conductor damage curves
(h) Electric utility's protective devices
(i) Medium-voltage equipment relays

(4) Notify Owner/Engineer promptly of discrepancies, problem areas, or inadequacies and provide recommendations for problem resolution. Propose approaches to effectively protect the underrated equipment. Present technical evaluation with discussion of logical compromises for best coordination.

J. Completed data sheets for setting of overcurrent protective devices.

3.05 ARC FLASH STUDY

A. Perform arc flash calculations for Arc Flash Incident Energy (AFIE) levels and flash protection boundary distances. Utilize short circuit rating of equipment identified in fault current study – note infinite bus fault current alone is not acceptable.

B. Model worst-case arc flash conditions_____.

(1) Equipment with PPE rating greater than 2 shall be investigated. Investigation shall include adjustment of upstream overcurrent device settings to determine if PPE rating can be reduced with minimal compromise to coordination with other overcurrent devices.

C. Arc Flash Study Report: Provide study results in tabular form and include:

(1) Device or bus name
(2) Bolted fault and arcing fault current levels
(3) Arc Flash Incident Energy (AFIE) level at 455 mm expressed in cal/cm2
(4) Flash protection boundary distances including:

(a) Limited shock approach boundary
(b) Restricted shock approach boundary

(5) Trip/Delay time
(6) Breaker opening time
(7) Working distance
(8) Equipment class and bus gap
(9) Personal protective equipment class (PPE)

D. Provide recommendation for reducing AFIE levels and enhancing worker safety.

3.06 FIELD QUALITY CONTROL

A. Inspect, set, test, and calibrate the protective relays, circuit breakers, fuses, and other applicable devices per requirements in Section 26 08 12 - Power Distribution Acceptance Tests and Section 26 08 13 - Power Distribution Acceptance Test Tables.

B. Upon final approval of study, provide weatherproof vinyl or polyester arc flash label for all electrical equipment defined above. Label shall include calculated flash protection boundary, incident energy in cal/cm2 at working distance (mm working distance based on equipment class, per IEEE 1584), required PPE level, limited approach, restricted approach, equipment name, company name/logo who performed the study, available fault current, _____ and date label was produced.

(1) Label to comply with ANSI Z535. Use “WARNING” (ANSI safety orange background with an orange exclamation point safety symbol) for all arc flash levels.

(2) Per NFPA 70E 130.5(C), due to use of incident energy analysis method, PPE categories shall not be provided on labels unless site specific standard PPE categories differ from incident energy levels noted in NFPA 70E Table 130.7(C)(16).

(3) Include verbiage on label noting study should be re-examined once every (5) years or upon modifications to electrical system.

3.07 ADJUSTING

A. Make modifications to equipment, as required, to accomplish conformance with equipment evaluation study.

B. Adjust relay and overcurrent protective device settings according to recommended settings table provided by overcurrent protective device coordination study.

C. Notify Owner/Engineer in writing of any required major modifications.

3.08 INSTALLATION

A. Install arc labels on each piece of equipment prior to energizing equipment.

B. Arc flash labels shall be protected by clear plastic cover, weatherproof type material, or laminated and mounted on front of equipment. Taping of PPE label to front of equipment is unacceptable.

C. Arc flash label shall be clearly visible upon approach to equipment.

D. For large pieces of equipment, label shall be placed near main overcurrent device or incoming feeder to equipment. For equipment such as switchboards, UPS, or switchgear, with multiple vertical sections, provide (1) label per vertical section.

E. Contractor to provide one-line diagrams (meet IEEE/ANSI standard 141), mounted on 24”x36” (minimum) Styrofoam backboard. These one-line diagrams shall be mounted in each electrical room.

F. Label shall be mounted at a minimum of 42” (1070 mm) to bottom and maximum 66" (1680 mm) to top above finished floor.

END OF SECTION 26 05 73

SECTION 26 05 93 - ELECTRICAL SYSTEMS FIRESTOPPING

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 07 84 00 - Firestopping

B. Section 26 05 33 - Raceway and Boxes for Electrical Systems

C. Section 26 05 36 - Cable Trays for Electrical Systems

D. Section 26 25 00 - Enclosed Bus Assemblies

1.02 DESCRIPTION

A. Section includes through-penetration firestop systems for penetrations through fire-resistance-rated constructions (walls, partitions, floors, and ceilings) including both empty openings and openings containing electrical penetrating items, including raceways, cables, cable trays, busways, and wireways.

1.03 REFERENCE STANDARDS

A. ASTM E814 – Standard Test Method for Fire Tests of Through-Penetration Firestops

B. UL 1479 - Fire Tests of Through-Penetration Firestops

1.04 PERFORMANCE REQUIREMENTS

A. Provide firestop system to resist spread of fire, resist passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated.

B. Firestop systems shall be UL Classified for the application and correspond to those indicated by reference to designations listed by UL Fire Resistance Directory.

C. Conform to applicable Code requirements of Authority Having Jurisdiction.

1.05 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For each through-penetration firestop system, show each type of construction condition penetrated, relationships to adjoining construction, and type of penetrating item. Include firestop design designation of qualified testing and inspecting agency that evidences compliance with requirements for each condition indicated.

(1) Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each through-penetration firestop system configuration for construction and penetration items, including documentation of UL certification for firestop systems.

C. Manufacturer’s Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

D. Material Safety Data Sheets provided with product delivered to job site.

E. Certification of compliance with Building Codes of the _____ of _____.

F. Inspection reports

G. Onsite Training Letter: Firestop manufacturer to provide and contractor to submit letter stating the names(s) of the companies, person(s) in attendance and date of onsite training as required in section 1.7.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: A firm experienced in installing through-penetration firestop systems similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful performance.

B. Firestopping tests shall be performed by a qualified testing and inspecting agency, or another agency performing testing and follow-up inspection services for firestop systems acceptable to Authorities Having Jurisdiction.

C. Manufacturer’s representative shall be on-site during initial installation of firestop systems to train appropriate Contractor personnel in proper selection and installation procedures.

1.07 DELIVERY, STORAGE AND HANDLING

A. Deliver through-penetration firestop system products to Project site in original, unopened containers or packages with intact and legible manufacturers’ labels identifying product, type and manufacturer, and UL Label where applicable.

B. Store and handle materials for through-penetration firestop systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

C. Handle in accordance with recommended procedures, precautions, or remedies described in material safety data sheets as applicable.

1.08 PROJECT CONDITIONS

A. Do not install through-penetration firestop systems when ambient or substrate temperatures are outside limits permitted by through-penetration firestop systems' manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.

B. Ventilate through-penetration firestop systems per manufacturers' written instructions by natural means or, where this is inadequate, forced-air circulation.

1.09 COORDINATION

A. Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.

B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.

C. Notify Owner's inspecting agency at least 7 days in advance of through-penetration firestop system installations; confirm dates and times on days preceding each series of installations.

D. Do not cover up through-penetration firestop system installations that will become concealed behind other construction until each installation has been examined by Owner's inspecting agency and building inspector, if required by Authorities Having Jurisdiction.

1.10 SEQUENCING

A. Sequence work to avoid interferences with building finishes and installation of other products.

1.11 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. 3M (Fire Protection Products Division), Hilti Inc, Tremco (Sealant/Weatherproofing Division), Nelson Firestop Products, Specified Technologies Inc, RectorSeal Corporation, _____.

2.02 MATERIALS

A. Firestop Products: UL 1479, ASTM E814 tested for specific fire-rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements and fire-rating involved for each separate instance; materials shall not contain flammable solvents.

B. Firestop Systems: Produced by the same manufacturer.

C. VOC Content: Penetration firestopping sealants and sealant primers shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

(1) Sealants: 250 g/L

(2) Sealant Primers for Nonporous Substrates: 250 g/L

(3) Sealant Primers for Porous Substrates: 775 g/L

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas and conditions for compliance with requirements for opening configurations, penetrating items and other conditions affecting performance of firestopping.

B. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Clean out openings immediately prior to installing through-penetration firestop system to comply with firestop system manufacturer's written instructions.

B. Provide masking and temporary covering to prevent soiling of adjacent surfaces by firestopping materials.

C. Comply with manufacturer's recommendations for temperature and humidity conditions before, during and after installation of firestopping.

3.03 INSTALLATION

A. Comply with "System Performance Requirements" Article in Part 1 and with firestop system manufacturer's written installation instructions and drawings for products and applications indicated.

B. Install forming/damming/backing materials and other accessories of types required to support fill materials during application as required. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.

C. Each conduit penetration through a fire rated assembly is to be dedicated to a single conduit. Multiple conduits penetrating a single opening is not acceptable unless a UL listed, multi-conduit assembly is used.

3.04 IDENTIFICATION

A. Identify through-penetration firestop systems with pressure-sensitive, self-adhesive, preprinted vinyl labels. Attach labels permanently to surfaces of penetrated construction on both sides of each firestop system installation where labels will be visible to anyone seeking to remove penetrating items or firestop systems. Include label(s) complying with 1 or 2 below.

(1) Custom label with the following information:

(a) The words: “Warning—Through-Penetration Firestop System—Do Not Disturb. Notify Building Management of Any Damage.”

(b) Contractor’s name, address, and phone number

(c) Through-penetration firestop system designation of applicable testing and inspecting agency

(d) Date of installation

(e) Through-penetration firestop system manufacturer’s name

(f) Installer’s name

(2) Manufacturer’s preprinted labels with similar information per 1 above.

3.05 FIELD QUALITY CONTROL

A. Inspecting Agency: Owner will engage a qualified independent inspecting agency to inspect through-penetration firestop systems and to prepare test reports.

(1) Inspecting agency will state in each report whether inspected through-penetration firestop systems comply with or deviate from requirements.

B. Provide certification by Installer that all through-penetration firestop systems have been firestopped in accordance with applicable Building Codes of the _____ of _____.

C. Proceed with enclosing through-penetration firestop systems with other construction only after inspection reports are issued and firestop installations comply with requirements.

D. Where deficiencies are found, repair or replace through-penetration firestop systems so they comply with specifications.

3.06 CLEANING

A. Clean surfaces adjacent to sealed holes and joints to be free of excess firestop materials and soiling as work progresses.

END OF SECTION 26 05 93

SECTION 26 08 00 - COMMISSIONING OF ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

A. Commissioning of Electrical Systems is the process of ensuring that the Electrical System is installed and performs interactively according to the basis of design criteria and meets the building's operational performance expectations as defined in the sequences of operations. The process also provides adequate documentation of installation, start-up, and functional testing and ensures that the Owner's maintenance personnel are adequately trained. It provides for the discovery of system operational performance deficiencies prior to substantial completion while the responsible contractors can provide a timely response. It establishes testing and communication protocols in an effort to advance the Electrical System from installation to complete dynamic operation and optimization.

B. The commissioning process involves all the parties involved in the design and construction process as well as the Owner and the Commissioning Agent (CxA). Primary elements of Commissioning during the construction, acceptance, and warranty phases of the project include:

(1) Verify applicable equipment and systems are installed in accordance with manufacturers' instructions and contract documents and receive adequate operational start-up checkout by installing contractors.

(2) Demonstrate functional operational performance of equipment and systems in the commissioning program.

(3) Verify Operations and Maintenance (O&M) documentation submitted is complete. Provide required documentation and information to the General Contractor to allow compilation of Building Systems Manuals in accordance with Section 01 78 23 - Building System Manuals (O&M).

(4) Verify Owner's maintenance personnel are adequately trained in accordance with specified training plan requirements.

(5) Verify systems are interacting and performing optimally in accordance with the system sequence of operations.

(6) Furnish labor and material to accomplish electrical system commissioning and systems testing as specified herein and other related sections.

1.02 RELATED SECTIONS

A. Section 01 79 13 - Demonstration and Training

B. Section 01 78 23 - Building System Manuals (O&M)

C. Section 01 91 13 - General Commissioning Requirements

D. Section 01 91 14 - Functional Testing Requirements

1.03 SUBMITTALS

A. Refer to Section 01 91 13 - General Commissioning Requirementsfor commissioning submittal requirements. Provide copies of commissioning submittal requirements to the CxA, in addition to the copies required by the Owner and Design Professional.

1.04 COORDINATION

A. The installation schedule for the components, equipment & systems included in the commissioning program shall be such that the commissioning requirements can be met without impacting the construction schedule. Commissioning Functional Performance Testing is a requirement for Substantial Completion.

B. All maintenance points for components installed by the contractor for building systems servicing shall be flagged utilizing construction marker ribbons if the maintenance point is located where multiple trades will be installing systems, unobstructed access from floor level shall be maintained. Refer to Section 01 91 13 - General Commissioning Requirementsfor additional information on maintenance/service point access.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Trade contractors shall provide all specialized tools, test equipment, and instruments required to execute startup, checkout, field calibration and functional performance testing of equipment under their contract.

B. Test equipment shall be of sufficient quality and accuracy (great accuracy than specified for component) to test and/or measure system performance according to specified tolerances. Test equipment is to have calibrated within the previous 12 months. Calibration shall be NIST traceable. Equipment shall be re-calibrated when dropped or damaged. Calibration tags shall be affixed or certificates be readily available.

C. Datalogging equipment or software required to test equipment will be provided by the CxA, but shall not become the property of the Owner.

PART 3 - EXECUTION

3.01 COMMISSIONING

A. General Requirements. For additional information regarding general commissioning requirements refer to Section 01 91 13 - General Commissioning Requirements.

B. Installation contractors shall be responsible for executing and documenting equipment installation, start-up and check out for systems and equipment. Contractors shall also be responsible for executing and documenting Contractor Pre-Testing. Both of these documents are required prior to the CxA scheduling the Functional Performance Testing. Contractors shall also be responsible for providing training for the Owner's maintenance personnel in accordance with project requirements.

C. Construction Checklists for each type of equipment and system shall be provided to the installation contractors by the CxA via the web-based commissioning application for use by the contractors in documenting the installation and start-up of equipment in the commissioning program.

D. For equipment and system components requiring a manufacturer's representative for Construction Checklists and start-up, manufacturer documentation of these activities shall be attached to the checklists provided by the CxA.

E. Functional Testing Procedures for each type of equipment and system shall be provided to the installation contractors by the CxA for use by the contractor in documenting the performance of the Contractor Pre-Testing. Refer to Section 01 91 14 - Functional Testing Requirementsfor further information.

F. Completed Start-up checklists and Construction Checklists for all pieces of equipment shall be submitted by contractors to the CxA through the General Contractor prior to the scheduling of the final Functional Performance Testing that is witnessed by the CxA.

3.02 TRAINING

A. Contractor responsible for the installation of the system shall coordinate the participation of other subcontractors and manufacturer's representatives in the training program in accordance with requirements of 01 79 13 - Demonstration and Training 01 79 13A - Demonstration and Training Sample Agenda.

3.03 OPERATIONS AND MAINTENANCE DATA

A. Contractor responsible for the installation of the system shall provide operations and maintenance manuals in accordance with requirements of other sections of the project specifications

3.04 GENERAL SYSTEM TESTING CRITERIA

A. Functional Performance Testing

(1) Refer to Sections 01 91 13 - General Commissioning Requirementsand 01 91 14 - Functional Testing Requirements. Installation contractor shall be responsible for providing authorized manufacturer's representatives to demonstrate the operational capabilities of the equipment systems.

END OF SECTION 26 08 00

SECTION 26 08 12 - POWER DISTRIBUTION ACCEPTANCE TESTS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 13.16 - Medium-Voltage, Single- and Multi-Conductor Cables
B. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
C. Section 26 05 26 - Grounding and Bonding for Electrical Systems
D. Section 26 05 73 - Power System Studies
E. Section 26 08 13 - Power Distribution Acceptance Test Tables
F. Section 26 12 19 - Pad-Mounted, Liquid-Filled, Medium-Voltage Transformers
G. Section 26 13 23 - Medium-Voltage Pad-Mounted Switchgear
H. Section 26 22 00 - Low-Voltage Transformers
I. Section 26 23 00 - Low-Voltage Switchgear
J. Section 26 24 13 - Switchboards
K. Section 26 27 13 - Electrical Metering
L. Section 26 28 16 - Enclosed Switches and Circuit Breakers
M. Section 26 29 13 - Enclosed Controllers
N. Section 26 32 13 - Engine Generators
O. Section 26 36 23 - Automatic Transfer Switches

1.02 DESCRIPTION

A. Section includes acceptance testing requirements for assessing the suitability for service and reliability of the power distribution system.
B. Contractor to ensure all tested electrical equipment, both Contractor and Owner supplied, is operational and within industry and manufacturer’s tolerances and is installed in accordance with design specifications.
C. Tests and inspections shall be performed after installation.
D. Tests and inspections shall determine suitability for energization.
E. Electrical systems shall pass tests prior to substantial completion or Owner occupancy.
F. This specification requires Contractor to engage services of testing agency.
G. All test tables referenced in this specification provided in Section 26 08 13 - Power Distribution Acceptance Test Tables.
H. Items to be tested and inspected as follows:
   (1) 600-volt conductors and cables
   (2) Medium-voltage cables
   (3) Electrical metering
   (4) Engine generator
   (5) Dry type transformers (small)
   (6) Dry type transformers (large)
   (7) Liquid filled transformers
   (8) Low-voltage switchgear
   (9) Switchboard
   (10) Medium-voltage metal-enclosed air switches
   (11) Medium-voltage oil switches
   (12) Medium-voltage air circuit breakers
   (13) Medium-voltage vacuum circuit breakers
   (14) Low-voltage power circuit breakers
   (15) Low-voltage insulated-case/molded-case circuit breakers
   (16) Low-voltage disconnect switches
   (17) Medium-voltage SF6 circuit breakers
   (18) Medium-voltage SF6 switches
   (19) Medium-voltage surge arresters

(20) Network protectors (600 V class)
(21) Automatic transfer switches
(22) Motor control and motor control center
(23) Ground fault protection systems
(24) Grounding systems
(25) Protective relays (as applicable)
(26) Instrument transformers
(27) Thermographic survey

1.04 SUBMITTALS

A. Test Reports: Include the following:

(1) Summary of project

(2) Description of equipment tested

(3) Equipment used to conduct the test

(4) Description of test

(5) Test results, as compared to manufacturers' or industry accepted standards and tolerances

(6) Conclusions and recommendations

(7) Signature of responsible test organization authority

B. List of equipment used to perform tests. Identify the following:

(1) Type

(2) Manufacturer

(3) Model number

(4) Serial number

(5) Date of last calibration

(6) Documentation of calibration leading to NIST standards

1.05 QUALITY ASSURANCE

A. Qualifications of Testing Agency:

(1) Testing firm shall be a corporately and financially independent testing organization that can function as an unbiased testing authority, professionally independent of the manufacturer, supplier, and installers of equipment or system evaluated by the testing firm.

(2) Testing firm shall be regularly engaged in testing of electrical equipment, devices, installations and systems.

(3) Testing firm shall meet Federal Occupational Safety and Health Administration (OSHA) requirements for accreditation of independent testing laboratories.

(4) On-site technical person shall be currently certified by the International Electrical Testing Association in electrical power distribution system testing.

(5) Testing firm shall use technicians who are regularly employed by the firm for testing services.

(6) Testing firm shall submit proof of above qualifications with bid documents when requested.

PART 2 - PRODUCTS

2.01 NOT APPLICABLE TO THIS SECTION.

PART 3 - EXECUTION

3.01 PREPARATION

A. Documentation: Deliver the following to testing firm, minimum two weeks prior to commencement of testing:

(1) Complete set of electrical plans and specifications, with available short circuit indicated on power riser diagrams.

(2) Approved submittals and shop drawings of equipment being tested.

(3) Pertinent change orders.

(4) Evaluation, overcurrent protective device coordination and arc flash studies, per requirements in Section 26 05 73 - Power System Studies.

B. Schedule: Notify Owner and Engineer 10 working days prior to performance of any tests.

C. Coordination: Coordinate with Construction Manager/Owner/Engineer the testing schedule and availability of equipment ready for testing.

D. Test Power: Provide test power (including specialized) for equipment testing before and after service energizing.

3.02 FIELD QUALITY CONTROL

A. Inspection and Test Procedures: Comply with NETA.

(1) 600 V Conductors and Cables:

(a) Visual and Mechanical Inspection:

1) Compare cable data with drawing and specifications.

2) Inspect exposed sections of cables for physical damage.

3) Verify tightness of accessible bolted electrical connections by calibrated torque wrench in accordance with manufacturer's published data or Table 12.

4) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."

5) Inspect compression-applied connectors for correct cable match and indentation.

6) Verify visible cable bends meet or exceed ICEA and manufacturer's minimum allowable bending radius.

7) For cables are terminated through window-type current transformers, provide an inspection to verify neutral and ground conductors are correctly placed for operation of protective devices.

8) Inspect for correct identification and arrangements.

9) Inspect jacket and insulation condition.

(b) Electrical Tests:

1) Perform insulation-resistance test using megohm meter. Applied potential to be 1000 VDC. Individually test each conductor with other conductors grounded. Test duration shall be one minute.

2) Perform continuity tests to ensure correct cable connection.

(c) Test Values:

1) Insulation-resistance values should not be less than 100 megohms.

(2) Medium-Voltage Cables:

(a) Visual and Mechanical Inspection:

1) Compare cable data with drawings and specifications.

2) Inspect exposed sections of cables for physical damage.

3) Verify tightness of accessible bolted connections by calibrated torque wrench in accordance with manufacturer's published data or Table 12.

4) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."

5) Inspect compression-applied connectors for correct cable match and indentation.

6) Inspection for shield grounding, cable support, and termination.

7) Verify visible cable bends meet or exceed ICEA and manufacturer's minimum allowable bending radius.

8) Inspect for adequate fireproofing in common cable areas, if specified.

9) For cables that are terminated through window-type current transformers, provide an inspection to verify neutral and ground conductors are correctly placed and shields are correctly terminated for operation of protective devices.

10) Inspect jacket and insulation condition.

11) Inspect for correct identification and arrangements.

(b) Electrical Tests:

1) Perform shield-continuity test on each power cable by ohmmeter method and record value.

2) Perform insulation-resistance test using megohm meter with voltage output of at least 2500 V. Individually test each conductor with other conductors and shields grounded. Test duration shall be 1 minute.

3) Perform DC high-potential test on cables, including terminations and joints after cable system installation and before placing cable in service. Adhere to precautions and limits as specified in applicable NEMA/ICEA Standards for the specific cable. Perform tests in accordance with ANSI/IEEE 400. Test voltages shall not exceed 80% of cable manufacturer's factory test value or maximum test voltage in Table 6.
    1. Ensure input voltage to test set is regulated.
    2. Current-sensing circuits in test equipment shall measure only leakage current associated with cable under test and shall not include internal leakage of test equipment.
    3. Record wet- and dry-bulb temperatures or relative humidity and temperature.
    4. Test each section of cable individually.
    5. Individually test each conductor with other conductors grounded. Ground all cable shields.
    6. Terminations shall be adequately corona-suppressed by guard ring, field reduction sphere, or other suitable method as necessary.
    7. Ensure maximum test voltage does not exceed limits for terminators specified in ANSI/IEEE 48 or manufacturer's specifications.
    8. Apply DC high-potential test in at least 5 equal increments until maximum test voltage is reached. No increment shall exceed voltage rating of the cable. Record DC leakage current at each step after constant stabilization time consistent with system charging current.
    9. Raise conductor to specified maximum test voltage and hold for 15 minutes on shielded cable and 5 minutes on non-shielded cable. Record readings of leakage current at 30 seconds and one minute and at one-minute intervals thereafter.
    10. Reduce conductor test potential to zero and measure residual voltage at discrete intervals.
    11. Apply grounds for time period adequate to drain insulation stored charge.
    12. When new cables are spliced into existing cables, DC high-potential test shall be performed on new cable prior to splicing in accordance with this section. After test results are approved for new cable and splice is complete, perform insulation-resistance test and shield-continuity test on the length of new and existing cable including the splice. After satisfactory insulation-resistance test, DC high-potential test shall be performed on cable using test voltage acceptable to Owner and not exceeding 60% of factory test value.

(c) Test Values:
1) Shielding must exhibit continuity. Investigate resistance values in excess of 10 ohms per 1000 ft (300 m) of cable.
2) Graphic plots may be made of leakage current versus step voltage at each increment and leakage current versus time at final test voltages.
    1. Step voltage slope should be reasonably linear.
    2. Capacitive and absorption current should decrease continually until steady state leakage is approached.

(3) Electrical Metering:
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Verify tightness of electrical connections.
4) Inspect cover gasket, cover glass, condition of spiral spring, disc clearance, contacts, and case-shorting contacts, as applicable.
5) Verify freedom of movement, correct travel and alignment, and tightness of mounting hardware.
(b) Electrical Tests:
1) Check calibration of meters at cardinal points.
2) Calibrate watt-hour meters according to manufacturer's published data.
3) Verify instrument multipliers.
4) Electrically confirm current transformer and voltage transformer secondary circuits are intact.

(4) Engine Generator:
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect correct anchorage and grounding.
4) Inspect air baffles, filter media, and cooling fans.
5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.

6) Confirm correct application of manufacturer's recommended lubricants.

(b) Electrical and Mechanical Tests:

1) Perform insulation-resistance test on generator winding with respect to ground in accordance with ANSI/IEEE 43. Calculate polarization index.
2) Test protective relay devices in accordance with paragraph "Protective Relays."
3) Perform phase-rotation test to determine compatibility with load requirements.
4) Functionally test engine shutdown for low oil pressure, overtemperature, overspeed, and other protection features as applicable.
5) Perform vibration baseline test. Plot amplitude versus frequency for each main bearing cap.
6) Conduct performance test in accordance with NFPA 110, Section 7-13 (Installation Acceptance).
7) Verify correct functioning of governor and regulator.
8) Verify function and temperature regulation for battery and engine heaters.

(c) Test Values:

1) Polarization index values shall be in accordance with ANSI/IIEEE 43.
2) Vibration levels shall be in accordance with manufacturer's published data.
3) Performance tests shall conform to manufacturer's published data and NFPA 110.
4) Vibration amplitudes shall not exceed values shown in Table 10.
5) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.

(5) Dry Type Transformers (Small):

(a) Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment, and grounding.
4) Verify that resilient mounts are free and that any shipping brackets have been removed.
5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
6) Verify that as-lift tap connections are as specified.

(b) Electrical Tests:

1) Perform insulation-resistance tests winding-to-winding and each winding-to-ground with test voltage in accordance with Table 5. Calculate dielectric absorption ratio or polarization index.

(c) Test Values:

1) Bolt-torque levels should be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Insulation-resistance test values at one minute should be in accordance with Table 5.
3) The dielectric absorption or polarization index shall be greater than 1.0 and shall be recorded for future reference.

(6) Dry Type Transformers (Large):

(a) Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Verify control and alarm settings on temperature indicators are as specified.
4) Verify cooling fans operate correctly and fan motors have correct overcurrent protection.
5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
6) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."
7) Perform specific inspections and mechanical tests as recommended by manufacturer.
8) Make a close examination of shipping brackets or fixtures that may not have been removed during installation. Ensure resilient mounts are free.
9) Verify seismic bracing is correct.
10) Verify winding core, frame, and enclosure grounding are correct.
11) Verify as-lift tap connections are as specified.

(b) Electrical Tests:

1) Perform insulation-resistance tests winding-to-winding and each winding-to-ground with test voltage in accordance with Table 5.

2) Calculate polarization index.
3) Perform power-factor or dissipation-factor tests in accordance with test equipment manufacturer's instructions.
4) Perform turns-ratio test on tap connections. Verify winding polarities are in accordance with nameplate.
5) Perform an excitation-current test on each phase.
6) Measure resistance of each winding at each tap connection.
7) Verify core is solidly grounded. If core is insulated and removable core ground strap is available, perform core insulation-resistance test at 500 VDC.
8) Verify correct secondary voltage phase-to-phase and phase-to-neutral after energization and prior to loading.

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Insulation-resistance test values at one minute should not be less than values recommended in Table 5. Results shall be temperature corrected in accordance with Table 14.
3) Polarization index should be compared to manufacturer's factory test results. If manufacturer's data is not available, acceptance test results will serve as baseline data.
4) Turns-ratio test results should not deviate more than 0.5% from either adjacent coils or calculated ratio.
5) CH and CL dissipation-factor/power-factor values will vary due to support insulators and bus work used on dry transformers. The following should be expected on CHL power factors:
    1. Power Transformers: 2% or less
    2. Distribution Transformers: 5% or less
6) Consult transformer manufacturer's or test equipment manufacturer's data for additional information.
7) If winding-resistance test results vary more than 1% from adjacent windings, consult manufacturer.
8) Typical excitation current test data pattern for three-legged core transformer is two similar current readings and one lower current reading.
9) If core insulation resistance is less than one megohm at 500 VDC, consult manufacturer.

(7) Liquid Filled Transformers:

(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition for physical damage, cracked insulators, and tightness of connection.
3) Verify removal of shipping bracing after final placement.
4) Inspect impact recorder prior to unloading, if applicable.
5) Verify alarm, control, and trip settings on temperature and level indicators are as specified.
6) Verify cooling fans and pumps operate correctly and fans and pump motors have correct overcurrent protection.
7) Verify operation of alarm, control, and trip circuits from temperature and level indicators, pressure relief device, and fault pressure relay.
8) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
9) Perform thermographic survey in accordance with paragraph "Thermographic Survey."
10) Verify correct liquid level in tanks and bushings.
11) Perform specific inspections and mechanical tests as recommended by manufacturer.
12) Verify correct equipment grounding.
13) Verify seismic bracing is correct.

(b) Electrical Tests:
1) Perform insulation-resistance tests, winding-to-winding and each winding-to-grounding with test voltage in accordance with Table 5. Test duration shall be for 10 minutes with resistance tabulated at 30 seconds, 1 minute, and 10 minutes.
2) Calculate polarization index.
3) Perform a turns-ratio test on no-load tap-changer positions and load tap-changer positions. Verify tap setting is as specified. Verify winding polarities are in accordance with nameplate.
4) Perform insulation power-factor/dissipation-factor tests on windings and correct to 68°F (20°C) in accordance with test equipment manufacturer's instructions.

5) Perform power-factor/dissipation-factor tests (or hot collar watts-loss tests) on bushings and correct to 68°F (20°C) in accordance with test equipment manufacturer's instructions.
6) Perform excitation-current tests in accordance with test equipment manufacturer's instructions.
7) Measure resistance of each high-voltage winding in each no-load tap-changer position. Measure resistance of each low-voltage winding in each load tap-changer position, if applicable.
8) If core ground strap is accessible, measure core insulation resistance at 500 VDC.
9) Measure percentage of oxygen in nitrogen blanket.
10) Remove sample of insulating liquid in accordance with ASTM D923. Sample shall be tested for the following:
    1. Dielectric breakdown voltage: ASTM D877/D877M and/or ASTM D1816.
    2. Acid neutralization number: ASTM D974.
    3. Specific gravity: ASTM D1298.
    4. Interfacial tension: ASTM D971 or ASTM D2285.
    5. Color: ASTM D1500.
    6. Visual condition: ASTM D1524.
    7. Measure dissipation factor or power factor in accordance with ASTM D924.
11) Remove sample of insulating liquid in accordance with ASTM D3613 and perform dissolved gas analysis (DGA) in accordance with ANSI/IEEE c57.104 or ASTM D3612.
12) Test instrument transformers in accordance with paragraph "Instrument Transformers."
13) Test surge arresters in accordance with paragraph "Surge Arresters."

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Insulation-resistance test values at one minute should not be less than values recommended in Table 5. Resistance values to be temperature corrected in accordance with Table 14.
3) Polarization index should be compared to manufacturer's factory test results. If manufacturer's data is not available, acceptance test results will serve as baseline data.
4) Turns-ratio test results shall not deviate more than 0.5% from either the adjacent coils or the calculated ratio.
5) Maximum power factor of liquid-filled transformers corrected to 68°F (20°C) shall be in accordance with transformer manufacturer's published data. Representative values are shown in Table 3. Compare with test equipment manufacturer's published data.
6) Investigate bushing power factors and capacitances that vary from nameplate values by more than 10%. Investigate any bushing hot collar watts-loss results that exceed test equipment manufacturer's published data.
7) Typical excitation-current test data pattern for three-legged core transformer is two similar current readings and one lower current reading.
8) Consult manufacturer if winding-resistance measurements vary more than 1% from adjacent windings.
9) Consult manufacturer if core insulation is less than one megohm at 500 VDC.
10) Insulating liquid shall comply with Table 4.
11) Evaluate results of dissolved-gas analysis in accordance with IEEE c57.104. Use results as baseline for future tests.

(8) Low-Voltage Switchgear and Switchboard Assemblies:
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Confirm correct application of manufacturer's recommended lubricants.
4) Verify appropriate anchorage, required area clearances, grounding and correct alignment.
5) Inspect doors, panels, and sections for paint, dents, scratches, fit, and missing hardware.
6) Verify fuse and/or circuit breaker sizes and types correspond to drawings and coordination study as well as to circuit breaker's address for microprocessor-communication packages.
7) Verify that current and potential transformer ratios correspond to drawings.
8) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench. Refer to manufacturer's published data or Table 12 for proper torque values.
9) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."
10) Confirm correct operation and sequencing of electrical and mechanical interlock systems.

1. Attempt closure on locked-open devices. Attempt to open locked-closed devices.
2. Make key exchange with devices operated in off-normal positions.

11) Inspect insulators for evidence of physical damage or contaminated surfaces.

12) Verify correct barrier and shutter installation and operation.

13) Exercise active components.

14) Inspect mechanical indicating devices for correct operation.

15) Verify filters are in place and/or vents are clear.

16) Perform visual and mechanical inspection of instrument transformers, in accordance with paragraph “Instrument Transformers.”

17) Inspect control power transformers.

1. Inspect physical damage, cracked insulation, broken leads, tightness of connections, defective wiring, and overall general condition.
2. Verify that primary and secondary fuse ratings or circuit breakers match drawings.
3. Verify correct functioning of draw-out disconnecting and grounding contacts and interlocks.

(b) Electrical Tests:

1) Perform tests on all instrument transformers in accordance with paragraph “Instrument Transformers.”

2) Perform resistance tests through bus joints with low-resistance ohmmeter. Joints that cannot be directly measured due to permanently installed insulation wrap shall be indirectly measured from closest accessible connection.

3) Perform insulation-resistance tests in each bus section, phase-to-phase and phase-to-ground for one minute in accordance with Table 1.

4) Perform over-potential test on each bus section, each phase-to-ground with phases not under test grounded, in accordance with manufacturer’s published data. In the absence of any published data, Table 2 shall apply. Test voltage shall be applied for one minute.

5) Perform insulation-resistance tests at 1000 VDC on control wiring. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state components. Follow manufacturer’s recommendation.

6) Perform current injection tests on the entire current circuit in each section of switchgear.

1. Perform current tests by primary injection, where possible, with magnitudes such that minimum of 1.0 amp flows in secondary circuit.
2. Where primary injection is impractical, utilize secondary injection with minimum current of 1.0 amp.
3. Test current at each device.

7) Determine accuracy of meters and calibrate watt-hour meters in accordance with paragraph “Electrical Metering.” Verify multipliers.

8) Perform phasing check on double-ended switchboard/switchgear to ensure correct bus phasing from each source.

9) Perform the following tests on control power transformers:

1. Perform insulation-resistance tests. Perform measurements from winding-to-winding and each winding-to-ground. Test voltages shall be in accordance with Table 1 unless otherwise specified by manufacturer.
2. Perform secondary wiring integrity test. Disconnect transformer at secondary terminals and connect secondary wiring to correct secondary voltage. Confirm potential at all devices.
3. Verify correct secondary voltage by energizing primary winding with system voltage. Measure secondary voltage with secondary wiring disconnected.
4. Verify correct function of control transfer relays located in switchboard/switchgear with multiple control power sources.

10) Potential Transformer Circuits:

1. Perform insulation-resistance tests. Perform measurements from winding-to-winding and each winding-to-ground. Test voltages shall be in accordance with Table 1, unless otherwise specified by manufacturer.
2. Perform secondary wiring integrity test. Disconnect transformer at secondary terminals and connect secondary wiring to correct secondary voltage.
3. Verify secondary voltage by energizing primary winding with system voltage. Measure secondary voltage with secondary wiring disconnected.

11) Verify operation of switchgear/switchboard space heaters.

(c) Test Values:

1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare bus connection resistances to values of similar connections.
3) Insulation-resistance values for bus, control wiring, and control power transformers shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation resistance less than this table or manufacturer's minimum should be investigated. Over-potential tests should not proceed until insulation-resistance levels are raised above minimum values.
4) Bus insulation shall withstand the over-potential test voltage applied.
5) Contact resistance values shall not exceed high limit of normal range as indicated in manufacturer's published data. If manufacturer's data is not available, investigate values that deviate from similar bus by more than 50% of lowest value.

(9) Medium-Voltage Metal-Enclosed Air Switches:

(a) Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Confirm correct application of manufacturer's recommended lubricants.
4) Verify appropriate anchorage, alignment and required area clearances.
5) Verify appropriate equipment grounding.
6) Verify correct blade alignment, blade penetration, travel stops, and mechanical operation.
7) Verify fuse sizes and types are in accordance with drawing and short-circuit and coordination studies.
8) Verify expulsion-limiting devices are in place on holders having expulsion-type elements.
9) Verify each fuse holder has adequate mechanical support.
10) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
11) Test interlocking systems for correct operating and sequencing.
12) Verify correct phase-barrier materials and installation.
13) Compare switchblade clearances with industry standards.
14) Inspect indicating and control devices for correct operation.
15) Record as-found and as-left operation-counter readings.

(b) Electrical Tests:

1) Perform insulation-resistance tests on each pole, phase-to-phase and phase-to-ground with switch closed and across each open pole for one minute. Test voltage shall be in accordance with manufacturer's published data or Table 1.
2) Perform an over-potential test on each pole with switch closed. Test each pole-to-ground with other poles grounded. Test voltage shall be in accordance with manufacturer's published data or Table 11.
3) Measure contact resistance across each switchblade and fuse holder.
4) Measure fuse resistance.
5) Verify space heater operation.
6) Perform insulation-resistance test on control wiring at 1000 VDC. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state relays. Follow manufacturer's recommendations.

(c) Test Values:

1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Insulation shall withstand over-potential test voltage applied.
3) Minimum insulation-resistance shall be in accordance with manufacturer's published data or Table 1.
4) Investigate any contact resistance values that deviate from adjacent poles or similar switches by more than 50% of lowest value.
5) Investigate fuse resistance values that deviate from each other by more than 15%.
6) Control wiring insulation-resistance shall comply with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation resistance less than this table or manufacturer's minimum shall be investigated.

(10) Medium-Voltage Oil Switches:

(a) Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment, grounding and required clearances.

4) Perform mechanical operation and contact alignment tests on both the switch and its operating mechanism.
5) Check each fuse holder for adequate support and contact.
6) Verify fuse sizes and types correspond to drawings.
7) Test electrical and mechanical interlock systems for correct operation and sequencing.
8) Verify tightness of accessible bolted electrical connections and/or cable connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
9) Perform thermographic survey of accessible bolted electrical connections in accordance with paragraph "Thermographic Survey."
10) Verify insulating oil level is correct.
11) Confirm correct application of manufacturer's recommended lubricants.
12) Record as-found and as-left operation-counter readings.

(b) Electrical Tests:
1) Measure contact resistance.
2) Remove a sample of insulating liquid in accordance with ASTM D923. Sample shall be tested for the following:
1. Dielectric breakdown voltage: ASTM D877/D877M.
2. Color: AASTM D1500.
3. Visual condition: ASTM D1524.
3) Perform insulation-resistance tests pole-to-pole, pole-to-ground, and across open poles. Test duration shall be one minute. Use a test voltage in accordance with Table 1 or manufacturer's published data.
4) Perform insulation-resistance test on control wiring at 1000 VDC. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state relays. Follow manufacturer's recommendation.
5) Perform and over-potential test on each pole with switch closed. Test each pole-to-ground with other poles grounded. Test voltage shall be in accordance with manufacturer's published data or Table 11.

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Contact resistance values shall not exceed high limit of normal range as indicated in manufacturer's published data. If manufacturer's data is not available, investigate values that deviate from adjacent poles or similar switches by more than 50% of lowest value.
3) Insulating liquid shall comply with Table 4.
4) Control wiring insulation resistance shall comply with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation resistance less than this table or manufacturer's minimum shall be investigated.

(11) Low-Voltage Power Circuit Breakers:

(a) Visual and Mechanical Inspection:
1) Compare nameplate data with drawings and specifications.
2) Inspect physical and mechanical conditions.
3) Confirm correct application of manufacturer's recommended lubricants.
4) Inspect anchorage, alignment, and grounding.
5) Inspect arc chutes.
6) Inspect moving and stationary contacts for condition, wear, and alignment.
7) Verify maintenance devices are available for servicing and operating breaker.
8) Verify primary and secondary contact wipe and other dimensions vital to satisfactory operation of breaker are correct.
9) Perform mechanical operator and contact alignment tests on breaker and its operating mechanism.
10) Verify tightness of accessible bolted bus connections by calibrated torque-wrench method. Refer to manufacturer's instructions or Table 12 for correct torque levels.
11) Perform thermographic survey of accessible bolted bus connections in accordance with paragraph "Thermographic Survey."
12) Check cell fit and element alignment.
13) Check racking mechanism.
14) Record as-found and as-left operation-counter readings.

(b) Electrical Tests:
1) Perform contact-resistance test.

2) Perform insulation-resistance test at 1000 VDC from pole-to-pole and from each pole-to-ground with breaker closed and across open contacts of each phase. Test duration shall be one minute. Use a minimum test voltage in accordance with Table 1 or manufacturer's published data.
3) Perform insulation-resistance test at 1000 VDC on control wiring. Test duration shall be one minute. Do not perform test on wiring connected to solid-state components. Follow manufacturer's recommendation.
4) Make adjustments for final trip settings in accordance with overcurrent protective device coordination study.
5) Determine minimum pickup current by primary current injection.
6) Determine long-time delay by primary current injection.
7) Determine short-time pickup and delay by primary current injection.
8) Determine ground-fault pickup and delay by primary current injection.
9) Determine instantaneous pickup value by primary current injection.
10) Verify trip unit calibrations by secondary injection.
11) Activate auxiliary protective devices, such as ground-fault or undervoltage relays, to ensure operation of shunt trip devices. Check operation of electrically operated breakers in their cubicles. Perform minimum operation voltage on shunt trip and close coils in accordance with Table 20.
12) Verify correct operation of auxiliary features such as trip and pickup indicators, zone interlocking, electrically close and trip operations, trip-free, anti-pump function, and trip unit battery condition. Reset all trip logs and indicators.
13) Check charging mechanism.
14) Determine minimum operation voltage on shunt trip and close coils in accordance with Table 20.

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare microhm or millivolt drop values to adjacent poles or similar breakers. Investigate deviations of more than 50% of the lowest value. Investigate any value exceeding manufacturer's recommendations.
3) Circuit breaker insulation resistance shall be in accordance with Table 1.
4) Control wiring insulation-resistance shall comply with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation-resistance less than this table or manufacturer's minimum shall be investigated.
5) Trip characteristics of breakers shall fall within manufacturer's published time-current tolerance bands.
6) Minimum operation voltages on shunt trip and close coils shall be in accordance with manufacturer's published data. In the absence of manufacturer's data, refer to Table 20.

(12) Low-Voltage Insulated-Case/Molded-Case Circuit Breakers, 225A and Larger:
(a) Visual and Mechanical Inspection:
1) Compare nameplate date with drawings and specifications.
2) Inspect circuit breaker for correct mounting.
3) Check cell fit, element alignment and racking mechanism for draw-out breakers.
4) Operate circuit breaker to ensure smooth operation.
5) Inspect case for cracks or other defects.
6) Verify tightness of accessible bolted electrical connections and/or cable connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
7) Inspect mechanism contacts and arc chutes in unsealed units.

(b) Electrical Tests:
1) Perform a contact-resistance test.
2) Perform insulation-resistance test at 1000 VDC from pole-to-pole and from each pole-to-ground with breaker closed and across open contacts of each phase. Test duration shall be one minute. Use a minimum test voltage in accordance with Table 1 or manufacturer's published data.
3) Perform insulation-resistance test at 1000 VDC on all control wiring. Test duration shall be one minute. Do not perform the test on wiring connected to solid-state components. Follow manufacturer's recommendation.
4) Perform adjustments for final trip settings in accordance with overcurrent protective device coordination study.
5) Perform long-time delay time-current characteristic tests by passing 300% rated current through each pole separately, unless series testing is required to defeat ground fault functions.
6) Determine short-time pickup and delay by primary current injection.

7) Determine ground-fault pickup and time delay by primary current injection.
8) Determine instantaneous pickup current by primary injection using run-up or pulse method.
9) Verify correct operation of auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and anti-pump function.
10) Verify trip unit calibrations by secondary injection.
11) Determine minimum operation voltage on shunt trip and close coils in accordance with Table 20.
12) Check charging mechanism.

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare microhm or millivolt drop values to adjacent poles or similar breakers. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.
3) Circuit breaker insulation-resistance shall be in accordance with Table 1.
4) Control wiring insulation-resistance shall comply with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation resistance less than this table or manufacturer's minimum shall be investigated.
5) Trip characteristic of breakers shall fall within manufacturer's published time-current characteristic tolerance band, including adjustment factors. If manufacturer's curves are not available, trip times shall not exceed the value shown in Table 7. Circuit breakers exceeding specified trip time at 300% of pickup shall be tagged defective.
6) For molded-case circuit breakers, instantaneous pickup values shall be within manufacturer's published data or tolerances shown in Table 8.
7) Minimum operation voltages on shunt trip and close coils shall be in accordance with manufacturer's published data. In the absence of manufacturer's data, refer to Table 20.

(13) Low-Voltage Disconnect Switches:
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment, grounding, and required clearances.
4) Verify correct blade alignment, blade penetration, travel stops, and mechanical operation.
5) Verify that fuse sizes and types are in accordance with drawings, short-circuit and overcurrent protective device coordination studies.
6) Verify that each fuse has adequate mechanical support and contact integrity.
7) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
8) Perform thermographic survey of accessible bolted electrical connection in accordance with paragraph "Thermographic Survey."
9) Verify operation and sequencing of interlocking systems.
10) Verify correct phase barrier installation.
11) Verify correct operation of all indicating and control devices.
12) Confirm correct application of manufacturer's recommended lubricants.

(b) Electrical Tests:
1) Measure contact resistance across each switchblade and fuseholder.
2) Perform insulation-resistance test at 1000 VDC from pole-to-pole and from each pole-to-ground. Test duration shall be one minute. Use a minimum test voltage in accordance with Table 1 or manufacturer's published data.
3) Measure fuse resistance.
4) Perform ground fault test, if applicable.

(c) Test Values:
1) Compare bolted connection resistances to values of similar connections.
2) Bolt-torque levels should be in accordance with Table 12, unless otherwise specified by the manufacturer.
3) Compare microhm or millivolt drop values to adjacent poles or similar switches. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.
4) Minimum insulation-resistance shall be in accordance with manufacturer's published data or Table 1.
5) Investigate fuse-resistance values that deviate from each other by more than 15%.

(14) Medium-Voltage SF6 Circuit Breakers:
(a) Visual and Mechanical Inspection:

1) Compare equipment nameplate date with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment and grounding.
4) Verify that all maintenance devices such as special tools and gauges specified by the manufacturer are available for servicing and operating the breaker.
5) Remove a sample of SF6 gas if provisions are made for sampling and test in accordance with Table 13.
6) Inspect operating mechanism and SF6 gas-insulated system in accordance with manufacturer's published data.
7) Test for SF6 gas leaks if temperature-corrected pressure/density alarms or metering indicate a need.
8) Verify correct operation of alarms and pressure-limit switches for pneumatic, hydraulic, and SF6 gas pressure as recommended by manufacturer.
9) If recommended by manufacturer, slow close/open breaker and check for binding, friction, contact alignment, and penetration. Verify that contact sequence is in accordance with manufacturer's published data. In the absence of manufacturer's published data, refer to ANSI/IEEE C37.04.
10) Perform time-travel analysis.
11) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
12) Confirm correct application of manufacturer's recommended lubricants.
13) Record as-found and as-left operation-counter readings.

(b) Electrical Tests:

1) Measure contact resistance.
2) Perform insulation-resistance tests pole-to-pole, pole-to-ground, and across open poles. Test duration shall be one minute. Use a test voltage in accordance with Table 1 or manufacturer's published data.
3) Perform insulation-resistance test on control wiring at 1000 VDC. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state relays. Follow manufacturer's recommendation.
4) Verify trip, close, trip-free, and anti-pump function.
5) Perform power-factor or dissipation-factor tests on breaker and bushings. Use hot collar procedures if bushings are not equipped with power-factor tap.
6) Perform over-potential test in accordance with manufacturer's published data.
7) Perform minimum pickup voltage tests on trip and close coils in accordance with Table 20.
8) Trip circuit breaker by operation of each protective device.
9) Test instrument transformers in accordance with paragraph "Instrument Transformers."

(c) Test Values:

1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare microhm or millivolt values to adjacent poles or similar breakers or manufacturer's published data. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.
3) Compare circuit breaker travel and velocity values with manufacturer's published data.
4) Circuit breaker insulation resistance should be in accordance with Table 1. Refer to Table 14 for temperature correction factors.
5) Dissipation-factor/power-factor test results shall be compared to previous tests of similar breakers or manufacturer's published data.
6) SF6 gas should have values in accordance with Table 13.
7) Insulation shall withstand over-potential test voltage applied.
8) Minimum pickup for trip and close coils shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, refer to Table 20.

(15) Medium-Voltage SF6 Switches:

(a) Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment and grounding.
4) Inspect and service mechanical operator and SF6 gas-insulated system in accordance with the manufacturer's published data.
5) Inspect operating mechanism and SF6 gas-insulated system in accordance with manufacturer's published data.

6) Verify correct operation of SF6 gas pressure alarms and limit switches, if applicable, as recommended by the manufacturer.
7) Measure critical distances as recommended by the manufacturer.
8) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
9) Verify each fuse has adequate mechanical support and contact integrity.
10) Verify fuse sizes and types correspond to drawings.
11) Verify operation and sequencing of interlocking systems.
12) Confirm correct application of manufacturer's recommended lubricants.
13) Test for SF6 gas leaks in accordance with manufacturer's published data.
14) Record as-found and as-left operation-counter readings.

(b) Electrical Tests:
1) Measure contact resistance.
2) Perform insulation-resistance tests pole-to-pole, pole-to-ground, and across open poles. Test duration shall be one minute. Use a test voltage in accordance with Table 1 or manufacturer's published data.
3) Perform insulation-resistance test on control wiring at 1000 VDC. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state relays. Follow manufacturer's recommendations.
4) Remove a sample of SF6 gas if provisions are made for sampling and test in accordance with Table 13.
5) Perform over-potential test across each gas bottle with the switch in the open position in accordance with the manufacturer's published data.
6) Verify open and close operation from control devices, if applicable.

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12 unless otherwise specified by manufacturer.
2) Compare microhm or millivolt drop values to adjacent poles or similar switches. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.
3) Insulation-resistance should be in accordance with manufacturer's published data or Table 1.
4) Critical distances of operating mechanism should be in accordance with manufacturer's published data.
5) The gas interrupters shall withstand the over-potential voltage applied.
6) Insulation shall withstand over-potential test voltage applied.
7) SF6 gas should have values in accordance with Table 13.

(16) Medium-Voltage Surge Arresters:
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment and grounding.
4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
5) Verify that the ground lead on each device is individually attached to a ground bus or ground electrode.
6) Verify the stroke counter is correctly mounted and electrically connected, if applicable.
7) Record stroke counter reading.

(b) Electrical Tests:
1) Perform resistance measurements through bolted connections.
2) Perform insulation-resistance test in accordance with Table 1.
3) Test grounding connection with a point-to-point resistance test.
4) Perform a watts-loss test.

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare microhm or millivolt drop values to manufacturer's published data. In the absence of manufacturer's data, compare similar units. Investigate deviations of more than 50% from lowest value.
3) Insulation resistance should be in accordance with manufacturer's published data or Table 1.
4) Resistance between the arrester ground terminal and ground shall be less than 0.5 ohm.

5) Compare watts-loss to similar units.

(17) Network Protectors – 600V Class:

(a) Visual and Mechanical Inspection:

1) Open protector and rack it out of enclosure. Note network bus and transformer generally will be energized. Exercise extreme caution. Observe clearance and check for smoothness of operation when racking.
2) Compare equipment nameplate data with drawings and specifications.
3) Inspect physical and mechanical condition.
4) Inspect anchorage, alignment and grounding.
5) Confirm correct application of manufacturer's recommended lubricants.
6) Inspect enclosure door gasket and sight glass for damage.
7) Inspect interior of enclosure for debris or damaged components. Inspect insulating components, current-carrying parts, and secondary disconnecting devices. Exercise extreme caution when working around network bus conductors.
8) Check for missing parts on protector. Check tightness of electrical and mechanical connections. Tighten as necessary according to manufacturer's published data.
9) Inspect insulating barriers for damage and correct mounting.
10) Inspect network protector fuse covers, fuses, and blown fuse indicators for damage. Inspect closing motor brushes and commutator surface for damage. Inspect motor brake mechanism, if applicable.
11) Remove and inspect arc chutes for damage.
12) Verify sequence of main and arcing contacts by slow-closing protector. Adjust as necessary according to manufacturer's published data.
13) Manually open and close protector and verify mechanism latches correctly in each position. Verify correct operation of position indicator.
14) Verify electrical connections to network and auxiliary relays. Inspect electromechanical relays for freedom of movement of internal parts.
15) Verify electrical connections to auxiliary switches, secondary disconnects, current transformers, voltage transformers, control power transformers, closing motors, contactors, trip coils, loading resistors, and other auxiliary devices.
16) Record the as-found and as-left operations-counter reading.
17) Perform leak test on submersible enclosure in accordance with manufacturer's published data.

(b) Electrical Tests:

1) Perform insulation-resistance tests on each pole, phase-to-phase and phase-to-ground with protector closed and across each open pole. Test duration shall be one minute. Test voltage shall be in accordance with Table 1 or manufacturer's published data.
2) Perform insulation-resistance tests at 1000 VDC for one minute on control wiring and electromechanical components. For units with solid-state components, follow manufacturer's recommendations.
3) Verify current transformer ratios in accordance with paragraph "Instrument Transformers."
4) Measure contact resistance.
5) Measure resistance of each protector power fuse.
6) Measure minimum pickup voltage of motor control relay.
7) Verify motor can charge closing mechanism at minimum voltage specified by manufacturer.
8) Measure minimum pickup voltage of trip actuator. Verify actuator resets correctly.
9) Calibrate network protector relays in accordance with paragraph "Protective Relays."
10) Verify phase rotation, phasing and synchronized operation as required by the application.
11) Perform operational tests:
    1. Verify correct operation of mechanical and electrical interlocks.
    2. Verify trip-free operation.
    3. Verify correct operation of auto-open-close control handle.
    4. Verify protector will close with voltage on transformer side only.
    5. Verify protector will open when source feeder breaker is opened.

(c) Test Values:

1) Insulation-resistance of protector components shall be in accordance with Table 1.
2) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by the manufacturer.

3) Control wiring insulation shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation-resistance less than this table or manufacturer's minimum should be investigated.
4) Contact resistance shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, compare contact resistance to adjacent poles or similar protectors. Investigate deviations of more than 50% of the lowest value.
5) Fuse resistance values shall not deviate by more than 15% of the lowest reading.
6) Minimum voltage to operate trip actuator shall not exceed 7.5% of rated control circuit voltage.
7) Minimum acceptable motor-closing voltage shall not exceed 75% of rated control circuit voltage.
8) Network protector should automatically close upon closing feeder breaker with normal load demand and automatically trip when source feeder breaker is opened.

(18) Automatic Transfer Switches:
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Confirm correct application of manufacturer's recommended lubricants.
4) Verify manual transfer warnings are attached and visible.
5) Verify tightness of control connections.
6) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
7) Perform thermographic survey of accessible bolted electrical connections in accordance with paragraph "Thermographic Survey."
8) Perform manual transfer operation.
9) Verify positive mechanical interlocking between normal and alternative sources.
10) Inspect anchorage, alignment, grounding and required clearances.
(b) Electrical Tests:
1) Measure contact resistance.
2) Perform insulation-resistance tests, phase-to-phase and phase-to-ground, with switch in both source positions. Test duration shall be one minute. Use a test voltage in accordance with Table 1 or manufacturer's published data. For control devices that cannot tolerate test voltage, follow manufacturer's recommendation.
3) Verify settings and operation of control devices.
4) Calibrate and set relays and timers in accordance with paragraph "Protective Relays."
5) Verify phase rotation, phasing and synchronized operation as required by the application.
6) Perform automatic transfer tests:
1. Simulate loss of normal power.
2. Return to normal power.
3. Simulate loss of emergency power.
4. Simulate all forms of single-phase conditions.
7) Verify correct operation and timing of following functions:
1. Normal source voltage-sensing relays.
2. Engine start sequence.
3. Time delay upon transfer.
4. Alternate source voltage-sensing relays.
5. Automatic transfer operation.
6. Interlocks and limit switch function.
7. Time delay and retransfer upon normal power restoration.
8. Engine cool down and shutdown feature.
(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Insulation-resistance test voltage and minimum values shall be in accordance with Table 1.
3) Compare microhm values to adjacent poles or similar switches. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.

(19) Motor Control and Motor Control Center:
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.

2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment and grounding.
4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
5) Verify controller mechanical operations. Inspect gap, wipe, alignment, and pressure are in accordance with manufacturer's published data.
6) Verify motor running protection installed and properly sized.
7) Confirm correct application of manufacturer's recommended lubricants.

(b) Electrical Tests:
1) Perform resistance tests through all bus joints with low-resistance ohmmeter. Any joints that cannot be directly measured due to permanently installed insulation wrap shall be indirectly measured from closest accessible connection.
2) Perform insulation-resistance tests on each bus section, phase-to-phase and phase-to-ground with controller closed and across each open pole. Test duration shall be one minute. Use a test voltage in accordance with Table 1 or manufacturer's published data. For control devices that cannot tolerate test voltage, follow manufacturer's recommendations.
3) Perform insulation-resistance tests at 1000 VDC on control wiring. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state components. Follow manufacturer's recommendations.
4) Test motor protection devices in accordance with manufacturer's published data. In the absence of manufacturer's data, use paragraph "Protective Relays."
5) Test circuit breakers in accordance with paragraph "Low-Voltage Insulated-Case/Molded-Case Circuit Breakers."
6) Perform operational tests by initiating control devices.

(c) Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare bus connection resistances to values of similar connections.
3) Insulation-resistance values for bus, control wiring, and control power transformers shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation-resistance less than this table or manufacturer's minimum should be investigated.
4) Motor protection parameters shall be in accordance with manufacturer's published data.

(20) Ground Fault Protection Systems:

(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Visually inspect components for damage and errors in polarity or conductor routing:
1. Verify ground connection is made ahead of neutral disconnect link and on line side of any ground fault sensor.
2. Verify neutral sensors are connected with correct polarity on both primary and secondary.
3. Verify all phase conductors and neutral pass through sensor in same direction for zero sequence systems.
4. Verify grounding conductors do not pass through zero sequence sensors.
5. Verify grounded conductor is solidly grounded.
3) Verify tightness of accessible bolted electrical connections, including control circuits, by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
4) Verify correct operation of self-test panel.
5) Set pickup and time-delay settings in accordance with settings provided on drawings and in specifications. Record operation and test sequences as required by NFPA 70.
6) Verify the control power transformer has adequate capacity for the system.

(b) Electrical Tests:
1) Measure system neutral-to-ground insulation resistance with neutral disconnect link temporarily removed. Replace neutral disconnect link after testing.
2) Perform insulation-resistance test of control wiring at 1000 VDC for one minute. Do not perform this test on wiring connected to solid-state components. Follow manufacturer's recommendations.
3) Perform the following pickup tests using primary injection:
1. Verify relay does not operate at 90% of pickup setting.
2. Verify pickup is less than 125% of setting or 1200 amp, whichever is smaller.

4) For summation type systems using phase-neutral current transformers, verify correct polarities by applying current to each phase-neutral current transformer pair. This test also applies to molded-case breakers using external neutral current transformer.
    1. Relay should operate when current direction is the same relative to polarity marks in the two current transformers.
    2. Relay should not operate when current direction is opposite relative to polarity marks in the two current transformers.
5) Measure time delay of the relay at 150% or greater of pickup.
6) Verify reduced voltage tripping capability: 55% for AC systems and 80% for DC systems.

(c) Test Values:
1) System neutral-to-ground insulation shall be minimum of one megohm.
2) Insulation resistance values shall be in accordance with Table 1.
3) Relay timing shall be in accordance with manufacturer's specifications but must also be no longer than one second at 3000 amp.
4) Bus bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.

(21) Grounding Systems:
(a) Visual and Mechanical Inspection:
1) Verify ground system is in compliance with drawings, specifications, and NFPA 70.
2) Inspect physical and mechanical condition.
3) Inspect anchorage.

(b) Electrical Tests:
1) Perform fall-of-potential or alternative test in accordance with ANSI/IEEE 81 on the main grounding electrode or system.
2) Perform point-to-point tests to determine the resistance between the main grounding system and all major electrical equipment frames, system neutral, and/or derived neutral points.
3) Make resistance measurements in dry weather not earlier than 48 hours after rainfall.

(c) Test Values:
1) The resistance between the main grounding electrode and ground should be no greater than five ohms. (Reference ANSI/IEEE 142.) Investigate any values above five ohms and notify Engineer immediately for further instructions.
2) Investigate point-to-point resistance values that exceed 0.5 ohm.

(22) Protective Relays (as applicable):
(a) Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect relays and cases for physical damage. Remove shipping restraint material.
3) Tighten case connectors. Inspect cover for correct gasket seal. Clean cover glass. Inspect shorting hardware, connection paddles, and knife switches. Remove foreign material from case. Verify target reset.
4) Inspect relay for foreign material, particularly in disc slots of damping and electromagnets. Verify disk clearance. Verify contact clearance and spring bias. Inspect spiral spring convolutions. Inspect disk and contacts for freedom of movement and correct travel. Verify tightness of mounting hardware and connections. Burnish contacts. Inspect bearings and pivots.
5) Set relays in accordance with coordination study supplied.

(b) Electrical Tests:
1) Perform insulation-resistance test on each circuit-to-frame. Determine from manufacturer's instructions allowable procedures for this test for solid-state and microprocessor-based relays.
2) Inspect targets and indicators. Determine pickup and dropouts of electromechanical targets. Verify operation of light-emitting diode indicators. Set contrast for liquid-crystal display readouts.
3) Functional Operation:
    1. IEEE 2/62 Timing Relay
        a. Determine time delay.
        b. Verify operation of instantaneous contacts.
    2. IEEE 21 Distance Relay
        a. Determine maximum reach.
        b. Determine maximum torque angle.
        c. Determine offset.

d. Plot impedance circle.

3. IEEE 24 V/Hz Relay
   a. Determine pickup frequency at rated voltage.
   b. Determine pickup frequency at second voltage level.
   c. Determine time delay.
4. IEEE 25 Sync Check Relay
   a. Determine closing zone at rated voltage.
   b. Determine maximum voltage differential that permits closing at zero degrees.
   c. Determine live line, live bus, dead line, and dead bus set points.
   d. Determine time delay.
   e. Verify dead bus/live line, dead line/live bus and dead bus/dead line control functions.
5. IEEE 27 Undervoltage Relay
   a. Determine dropout voltage.
   b. Determine time delay.
   c. Determine time delay at second point on timing curve for inverse time relays.
6. IEEE 32 Directional Power Relay
   a. Determine minimum pickup at maximum torque angle.
   b. Determine closing zone.
   c. Determine maximum torque angle.
   d. Determine time delay
   e. Verify time delay at second point on timing curve for inverse time relays.
   f. Plot operating characteristic.
7. IEEE 40 Loss of Field (Impedance) Relay
   a. Determine maximum reach.
   b. Determine maximum torque angle.
   c. Determine offset.
   d. Plot impedance circle.
8. IEEE 46 Current Balance Relay
   a. Determine pickup of each unit.
   b. Determine percent slope.
   c. Determine time delay.
9. IEEE 46N Negative Sequence Current Relay
   a. Determine negative sequence alarm level.
   b. Determine negative sequence minimum trip level.
   c. Determine maximum time delay.
   d. Verify two points on (I2)2t curve.
10. IEEE 47 Phase Sequence or Phase Balance Voltage Relay
    a. Determine positive sequence voltage to close normally open contact.
    b. Determine positive sequence voltage to open normally closed contact (undervoltage trip).
    c. Verify negative sequence trip.
    d. Determine time delay to close normally open contact with sudden application of 120% of pickup.
    e. Determine time delay to close normally closed contact upon removal of voltage when previously set to rated system voltage.
11. IEEE 49R Thermal Replica Relay
    a. Determine time delay at 300% of setting.
    b. Determine second point on operating curve.
    c. Determine pickup.
12. IEEE 49T Temperature (RTD) Relay
    a. Determine trip resistance.
    b. Determine reset resistance.
13. IEEE 50 Instantaneous Overcurrent Relay
    a. Determine pickup.

b. Determine dropout.
c. Determine time delay.

14. IEEE 51 Time Overcurrent
    a. Determine minimum pickup.
    b. Determine time delays at 2 points on time current curve.
15. IEEE 55 Power Factor Relay
    a. Determine tripping angle.
    b. Determine time delay.
16. IEEE 59 Overvoltage Relay
    a. Determine overvoltage pickup.
    b. Determine time delay to close contact with sudden application of 120% of pickup.
17. IEEE 60 Voltage Balance Relay
    a. Determine voltage difference to close contacts with one source at rated voltage.
    b. Plot operating curve for relay.
18. IEEE 63 Transformer Sudden Pressure Relay
    a. Determine rate-of-rise or pickup level of suddenly applied pressure in accordance with manufacturer's specifications.
    b. Verify operation of 63 FPX seal-in circuit.
    c. Verify trip circuit to remote breaker.
19. IEEE 64 Ground Detector Relay
    a. Determine maximum impedance to ground causing relay pickup.
20. IEEE 67 Directional Overcurrent Relay
    a. Determine directional unit minimum pickup at maximum torque angle.
    b. Determine closing zone.
    c. Determine maximum torque angle.
    d. Plot operating characteristics.
    e. Determine overcurrent unit pickup.
    f. Determine overcurrent unit time delay at 2 points on time current curve.
21. IEEE 79 Reclosing Relay
    a. Determine time delay for each programmed reclosing interval.
    b. Verify lockout for unsuccessful reclosing.
    c. Determine reset time.
    d. Determine close pulse duration.
    e. Verify instantaneous overcurrent lockout.
22. IEEE 81 Frequency Relay
    a. Verify frequency set points.
    b. Determine time delay.
    c. Determine undervoltage cutoff.
23. IEEE 85 Pilot Wire Monitor
    a. Determine overcurrent pickup.
    b. Determine undercurrent pickup.
    c. Determine pilot wire ground pickup level.
24. IEEE 87 Differential
    a. Determine operating unit pickup.
    b. Determine operation of each restraint unit.
    c. Determine slope.
    d. Determine harmonic restraint.
    e. Determine instantaneous pickup.
    f. Plot operating characteristics for each restraint.

(c) Control Verification:

1) Verify each relay contact performs its intended function in control scheme including breaker trip tests, close inhibit tests, 86 lockout tests, and alarm functions.
2) For microprocessor-based relays, verify all inputs, outputs, internal logic, and timing elements used in protection, metering, and control functions.

(d) Systems Tests:

1) After the equipment is energized, measure magnitude and phase angle of inputs and compare to expected values.

(e) Test Values:

1) When not otherwise specified, use manufacturer's recommended tolerances.

2) When critical test points are specified, relay should be calibrated to those points even though other test points may be out of tolerance.

(23) Instrument Transformers:

(a) Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.

2) Inspect physical and mechanical condition.

3) Verify correct connection of transformers with system requirements.

4) Verify adequate clearance between primary and secondary circuit wiring.

5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.

6) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."

7) Verify required grounding and shorting connections provide contact.

8) Verify correct operation of transformer withdrawal mechanism and grounding operation.

9) Verify correct primary and secondary fuse sizes for potential transformers.

10) Confirm correct application of manufacturer's recommended lubricants.

(b) Electrical Tests – Current Transformers:

1) Perform insulation-resistance test of current transformer and wiring-to-ground at 1000 VDC. Do not perform this test on wiring connected to units with solid-state components. Follow manufacturer's recommendations.

2) Perform polarity test of each current transformer.

3) Perform ratio-verification test using voltage or current method in accordance with ANSI/IEEE C57.13.1.

4) Perform excitation test on transformers used for relaying applications in accordance with ANSI/IEEE C57.13.1.

5) Measure current circuit burdens at transformer terminal and determine total burden.

6) When applicable, perform insulation-resistance and dielectric withstand tests on primary winding with secondary grounded. Test voltages shall be in accordance with Tables 5 and 9 respectively.

7) Verify that current circuits are grounded and have only one grounding point in accordance with ANSI/IEEE C57.13.3.

(c) Electrical Tests – Voltage Transformers:

1) Perform insulation-resistance tests winding-to-winding and each winding-to-ground. Test voltages shall be applied for one minute in accordance with Table 5. For units with solid-state components, follow manufacturer's recommendation.

2) Perform polarity test on each transformer to verify polarity marks or H1-X1 relationship as applicable.

3) Perform turns ratio test on all tap positions, if applicable.

4) Measure potential circuit burdens at transformer terminals and determine total burden.

5) Perform dielectric withstand test on primary windings with secondary windings connected to ground. Dielectric voltage shall be in accordance with Table 9. Test voltage shall be applied for one minute.

(d) Test Values:

1) Insulation-resistance measurement on instrument transformer shall not be less than that shown in Table 5.

2) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by the manufacturer.

3) Polarity results shall agree with system drawings.

4) Compare measured burdens to calculated burdens supplied by Owner.

5) Ratio accuracies shall be within 0.5% of nameplate or manufacturer's published data.

6) Insulation shall withstand over-potential test voltage applied.

(24) Thermographic Survey:

(a) Visual and Mechanical Inspection:

1) Inspect physical, electrical, and mechanical conditions.

2) Remove all necessary covers prior to thermographic inspection.

3) Equipment to be inspected shall include all current-carrying devices. Provide report including the following:
    1. Discrepancies.
    2. Temperature difference between area of concern and reference area.
    3. Cause of temperature difference.
    4. Areas inspected. Identify inaccessible and unobservable areas and equipment.
    5. Identify load conditions at time of inspection.
    6. Provide photographs and thermogram of deficient area.

(b) Test Parameters:
1) Inspect distribution systems with imaging equipment capable of detecting minimum temperature difference of 2°F at 86°F (1°C at 30°C).
2) Equipment shall detect emitted radiation and convert detected radiation to visual signal.
3) Thermographic surveys should be performed during periods of maximum possible loading but not less than 40% of rated load of the electrical equipment being inspected. Refer to NFPA 70B, Section 20.17 (Infrared Inspection).

(c) Test Results:
1) Temperature differences of 2°F to 5°F (1°C to 3°C) indicate possible deficiency and warrant investigation.
2) Temperature differences of 7°F to 27°F (4°C to 15°C) indicate deficiency, repair as time permits.
3) Temperature differences of 29°F (16°C) and above indicate major deficiency, repair immediately.
4) Suggested actions based on temperature rise can be found in Table 18.

B. Test Reports:
(1) Testing firm shall do the following:
(a) Prepare test report, including description of equipment tested, description of test, test results, conclusions and recommendations, retesting results, list of test equipment used and calibration date.
(b) Show test results in comparison to industry and manufacturer's values and tolerances.
(c) Interpret test results in writing and give recommendations for acceptance or rejection upon consultation with Engineer and prior to energizing equipment.
(d) Assure electrical equipment is operational and within industry and manufacturer's tolerances, and is installed in accordance with contract documents.
(e) Assure suitability of energization.
(f) Report to the Owner and Engineer any system, material, or workmanship that is found defective on the basis of acceptance tests.
(g) Retest equipment when required.
(h) Maintain written record of tests.
(i) Utilize safety practices during the tests in accordance with:
1) Acceptable state and local safety operating procedures
2) Owner's safety practices
3) OSHA
4) NFPA 70E
(j) Perform tests with apparatus de-energized and grounded, except where otherwise specifically required ungrounded by test procedures.
(k) Assemble and certify final test report.
(l) Provide 4 copies of complete test report.
(m) Attach label to all tested equipment with indication of date tested and testing firm name.
(2) Contractor shall do the following:
(a) Investigate, replace, or repair any fault in material or in any part of the installation revealed by the tests.
(b) Deliver one copy of each test report directly to Engineer within 30 days after completion of testing, unless directed otherwise. Insert a copy of each test report in the equipment operation and maintenance manuals.

C. Test Equipment:
(1) Test Instrument Calibration:
(a) Testing firm shall have calibration program that assures test instruments are maintained with rated accuracy.
(b) Instruments shall be calibrated in accordance with the following frequency schedule:
1) Field instruments: Analog, 6 months maximum; Digital, 12 months maximum
2) Laboratory instruments: 12 months

3) Leased specialty equipment: 12 months where accuracy is guaranteed by lessor

(c) Dated calibration labels shall be visible on test equipment.

(d) Records, which show date and results of instruments calibrated or tested, must be kept up-to-date.

(e) Up-to-date instrument calibration instructions and procedures shall be maintained for test instrument.

(f) Equipment used for field testing shall be more accurate than instrument being tested.

(g) Calibrating standard applied to testing equipment shall be of higher accuracy than instrument tested.

END OF SECTION 26 08 12

SECTION 26 08 13 - POWER DISTRIBUTION ACCEPTANCE TEST TABLES

TABLE 1
INSULATION RESISTANCE TEST VALUES
ELECTRICAL APPARATUS AND SYSTEMS

Voltage Rating	Minimum DC Test Voltage	Recommended Minimum Insulation Resistance In Megohms
250	500	25
600	1,000	100
1,000	1,000	100
2,500	1,000	500
5,000	2,500	1,000
8,000	2,500	2,000
15,000	2,500	5,000
25,000	5,000	20,000
34,500 and above	15,000	100,000

See Table 14 for temperature correction factors.

TABLE 2

SWITCHGEAR LOW-FREQUENCY WITHSTAND TEST VOLTAGES

Type of Switchgear	Rated kV	Maximum Test Voltage kV	
		AC	DC
Low-Voltage Power Circuit Breaker Switchgear	.254	1.6	2.3
	.508	1.6	2.3
	.635	1.6	2.3
MC (Metal-Clad Switchgear)	4.76	14.0	20.0
	8.25	27.0	37.0
	15.0	27.0	37.0
	27.0	45.0	+
	38.0	60.0	+
SC (Station-Type Cubicle Switchgear)	15.5	37.0	+
	38.0	60.0	+
	72.5	120.0	+
MEI (Metal-Enclosed Interrupter Switchgear)	4.76	14.0	20.0
	8.25	19.0	27.0
	15.0	27.0	37.0
	15.5	37.0	52.0
	25.8	45.0	+
	38.0	60.0	+

Derived from ANSI/IEEE C37.20.2-1993, Paragraph 5.5, Metal-Clad and Station-Type Cubicle Switchgear and C37.20.3-1993, Paragraph 5.5, Metal-Enclosed Interrupter Switchgear, and includes 0.75 multiplier with fraction rounded down.

The column headed “DC, Maximum Test Voltage kV” is given as a reference only for those using DC tests to verify the integrity of connected cable installations without disconnecting the cables from the switchgear. It represents values believed to be appropriate and approximately equivalent to the corresponding power frequency withstand test values specified for voltage rating of switchgear. The presence of this column in no way implies any requirement for a DC withstand test on AC equipment or that a DC withstand test represents an acceptable alternative to the low-frequency withstand tests specified in this specification, either for design tests, production tests, conformance tests, or field tests. When making DC tests, the voltage should be raised to the test value in discrete steps and held for a period of one minute.

Because of the variable voltage distribution encountered when making DC withstand tests, the manufacturer should be contacted for recommendations before applying DC withstand tests to the switchgear. Voltage transformers above 34.5kV should be disconnected when testing with DC. Refer to ANSI/IEEE C57.13-1993 (IEEE Standard Requirements for Instrument Transformers) paragraph 8.8.2.

ANSI/IEEE C57.121-1998, IEEE Guide for Acceptance and Maintenance of Less-Flammable Hydrocarbon Fluid in Transformers, Table 3.

The test limits shown in this table apply to less-flammable hydrocarbon fluids as a class. Specific typical values for each brand of fluid should be obtained from each fluid manufacturer.

If the purpose of the HMWH installation is to comply with the NFPA 70 National Electrical Code, this value is the minimum for compliance with NEC Article 450.23.

TABLE 5

TRANSFORMER INSULATION-RESISTANCE

ACCEPTANCE TEST VOLTAGE AND MINIMUM RESULTS

Transformer Coil Rating Type in Volts	Minimum DC Test Voltage	Recommended Minimum Insulation Resistance in Megohms	
		Liquid Filled	Dry
0 - 600	1000	100	500
601 - 5000	2500	1000	5000
5001 - 15000	5000	5000	25000

See Table 14 for Temperature Correction Factors.

NOTE: Since insulation resistance depends on insulation rating (kV) and winding capacity (kVA), values obtained should be compared to manufacturer's test data.

TABLE 6

MEDIUM-VOLTAGE CABLES

ACCEPTANCE TEST VALUES

Table 6.1 DC Test Voltages

Rated Voltage Phase-to-Phase kV	Conductor Sizes AWG or kcmil (mm)	Nominal Insulation Thickness mils (mm)		Maximum DC Field Test Voltages, kV During/After Installation	
		100% Insulation Level	133% Insulation Level	100% Insulation Level	133% Insulation Level

2501-5000	----------	900

Reproduction of Table 5-3 from NEMA AB 4-1996.

[1] For integrally-fused circuit breakers, trip times may be substantially longer if tested with the fuses replaced by solid links (shorting bars).

TABLE 8

INSTANTANEOUS TRIP SETTING TOLERANCES FOR FIELD TESTING

OF MARKED ADJUSTABLE TRIP CIRCUIT BREAKERS

	Tolerances of High and Low Settings	
Ampere Rating	High	Low
Adjustable	+40%	-30%
Non-adjustable	+25%	-25%

For circuit breakers with nonadjustable instantaneous trips, tolerances apply to the manufacturer's published trip range, i.e., +40% on high side, -30% on low side.

TABLE 9

INSTRUMENT TRANSFORMER DIELECTRIC TESTS

FIELD ACCEPTANCE

Nominal System (kV)	BIL(kV)	Applied Potential Tests Field Test Voltage (kV)	
		AC	DC[1]
0.6	10	3	4
1.2	30	7.5	10
2.4	45	11.25	15
5.0	60	14.25	19
8.7	75	19.5	26
15	95	25.5	34
15	110	25.5	34
25	125	30	40
25	150	37.5	50
34.5	150	37.5	50
34.5	200	52.5	70

Derived from Paragraph 8.8.2 and Tables 2 and 7 of ANSI/IEEE C57.13-1993 (Standard Requirements for Instrument Transformers).

[1] DC potential tests are not recommended for transformers rated higher than 200 kV BIL. DC tests may prove beneficial as a reference for future testing. In such cases the test direct voltage should not exceed the original factory test RMS alternating voltages.

TABLE 10

MAXIMUM ALLOWABLE VIBRATION AMPLITUDE

RPM @60 Hz	Velocity in/s peak	Velocity mm/s	RPM @60 Hz	Velocity in/s peak	Velocity mm/s
3600	0.15	3.8	3000	0.15	3.8
1800	0.15	3.8	1500	0.15	3.8
1200	0.15	3.8	1000	0.13	3.3
900	0.12	3.0	750	0.10	2.5
720	0.09	2.3	600	0.08	2.0
600	0.08	2.0	500	0.07	1.7

Derived from NEMA publication MG 1-1998, Section 7.8.1, Table 7-1. Table is unfiltered vibration limits for resiliently mounted machines. For machines with rigid mounting, multiply the limiting values by 0.8.

TABLE 11

OVERPOTENTIAL TEST VOLTAGES FOR ELECTRICAL APPARATUS OTHER THAN INDUCTIVE EQUIPMENT

Nominal System (Line) Voltage[1] (kV)	Insulation Class	AC Factory Test (kV)	Maximum Field Applied AC Test (kV)	Maximum Field Applied DC Test (kV)

TABLE 16 (NOT USED)

HIGH-POTENTIAL TEST VOLTAGE

FOR ACCEPTANCE TEST OF LINE SECTIONALIZERS

Nominal Voltage Class, kV	Maximum Voltage, kV	Rated Impulse Withstand Voltage, kV	Maximum Field Test Voltage, kV, AC	DC 15 Minute Withstand (kV)
14.4 (1 Ø)	15.0	95	35	53
14.4 (1 Ø)	15.0	125	42	53
14.4 (3 Ø)	15.5	110	50	53
24.9 (1 Ø)	27.0	125	60	78
34.5 (3 Ø)	38.0	150	70	103

Derived from ANSI/IEEE C37.63-1984(R1990) Table 2 (Standard Requirements for Overhead, Pad-Mounted, Dry-Vault, and Submersible Automatic Line Sectionalizers of AC Systems).

NOTE: Values of AC voltage given are dry test one-minute factory test values.

TABLE 17
DIELECTRIC WITHSTAND TEST VOLTAGES
METAL-ENCLOSED BUS

Type of Bus	Rated kV	Maximum Test Voltage, kV	
		AC	DC
Isolated Phase for Generator Leads	24.5	37.0	52.0
	29.5	45.0	--
	34.5	60.0	--
Isolated Phase for Other than Generator Leads	15.5	37.0	52.0
	25.8	45.0	--
	38.0	60.0	--
Nonsegregated Phase	0.635	1.6	2.3
	4.76	14.2	20.0
	15.0	27.0	37.0
	25.8	45.0	63.0
	38.0	60.0	--
Segregated Phase	15.5	37.0	52.0
	25.8	45.0	63.0
	38.0	60.0	--
DC Bus Duct	0.3	1.6	2.3
	0.8	2.7	3.9
	1.2	3.4	4.8
	1.6	4.0	5.7
	3.2	6.6	9.3

Derived from ANSI/IIEEE C37.23-1987, Tables 3A, 3B, 3C, 3D, and paragraph 6.4.2. The table includes a 0.75 multiplier with fractions rounded down.

NOTE:

The presence of the column headed “DC” does not imply any requirement for a DC withstand test on AC equipment. This column is given as a reference only for those using DC tests and represents values believed to be appropriate and approximately equivalent to the corresponding power frequency withstand test values specified for each class of bus.

Direct current withstand tests are recommended for flexible bus to avoid the loss of insulation life that may result from the dielectric heating that occurs with rated frequency withstand testing.

Because of the variable voltage distribution encountered when making DC withstand tests and variances in leakage currents associated with various insulation systems, the manufacturer should be consulted for recommendations before applying DC withstand tests to this equipment.

TABLE 18

THERMOGRAPHIC SURVEY

SUGGESTED ACTIONS BASED ON TEMPERATURE RISE

Temperature difference (TD) based on comparisons between similar components under similar loading	Temperature difference (TD) based upon comparisons between component and ambient air temperatures	Recommended action
1°C to 3°C	1°C to 10°C	Possible deficiency; warrants investigation
4°C to 15°C	11°C to 20°C	Indicates probably deficiency; repair as time permits
-- -- --	21°C to 40°C	Monitor until corrective measures can be accomplished
>15°C	>40°C	Major discrepancy; repair immediately

Temperature specifications vary depending on the exact type of equipment. Even in the same class of equipment (i.e., cables) there are various temperature ratings. Heating is generally related to the square of the current; therefore, the load current will have a major impact on □T. In the absence of consensus standards for TD, the values in this table will provide reasonable guidelines.

An alternative method of evaluation is the standards-based temperature rating system as discussed in Chapter 8.9.2, Conducting an IR Thermographic Inspection, Electrical Power Systems Maintenance and Testing, by Paul Gill, PE, 1998.

It is a necessary and valid requirement that the person performing the electrical inspection be thoroughly trained and experienced concerning the apparatus and systems being evaluated as well as knowledgeable of thermographic methodology.

RATED CONTROL VOLTAGES AND THEIR RANGES

FOR CIRCUIT BREAKERS

The maximum voltage is measured at the point of user connection to the circuit breaker (see Notes (9) (10)) with no operating current flowing, and the minimum voltage is measured with maximum operating current flowing.

Rated Control Voltages and their Ranges for Circuit Breakers					
Rated Control Voltage (8)	**Direct Current Voltage Ranges (1)(2) Volts, DC**		**Opening Functions All Types**	**Rated Control Voltage (60 Hz)**	**Alternating Current (1)(2)(3)(5) Closing, Tripping, and Auxiliary Functions**
	Closing and Auxiliary Functions				
	Indoor Circuit Breakers	**Outdoor Circuit Breakers**		**Single Phase**	**SINGLE PHASE**
24	---	---	14-28	120	104-127 (4)
48	38-56	36-56	28-56	240	208-254 (4)
				Polyphase	Polyphase
125	100-140	90-140	70-140		
250	200-280	180-280	140-280	208Y/120	180Y/104-220Y/127
---	---	---	---		
---	---	---	---	240	208-254

Derived from Table 8, ANSI C37.06-2000, AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis – Preferred Ratings and Related Required Capabilities.

Rated Control Voltages and their Ranges for Circuit BreakersSolenoid-Operated Devices	
Rated Voltage	**Closing Voltage Ranges for Power Supply**
125 dc	90 – 115 or 105 – 130
250 dc	180 – 230 or 210 – 260
230 ac	190 – 230 or 210 - 260

Notes:

(1) Electrically operated motors, contactors, solenoids, valves, and the like need not carry a nameplate voltage rating that corresponds to the control voltage rating shown in the table as long as these components perform the intended duty cycle (usually intermittent) in the voltage range specified.

(2) Relays, motors, or other auxiliary equipment that function as a part of the control for a device shall be subject to the voltage limits imposed by this standard, whether mounted at the device or at a remote location.

(3) Includes supply for pump or compressor motors. Note that rated voltages for motors and their operating ranges are covered by ANSI/NEA MG-1-1978.

(4) Includes heater circuits.

(5) Voltage ranges apply to all closing and auxiliary devices when cold. Breakers using standard auxiliary relays for control functions may not comply at lower extremes of voltage ranges when relay coils are hot, as after repeated or continuous operation.

(6) Direct current control voltage sources, such as those derived from rectified alternating current, may contain sufficient inherent ripple to modify the operation of control devices to the extent that they may not function over the entire specified voltage ranges.

(7) This table also applies for circuit breakers in gas-insulation substation installations.

(8) For an outdoor circuit breaker, the point of user connection to the circuit breaker is the secondary terminal block point at which the wires from the circuit breaker operating mechanism components are connected to the user’s control circuit wiring.

(9) In cases where other operational ratings are a function of the specific control voltage applied, tests in C37.09 may refer to the “Rated Control Voltage.” In these cases, tests shall be performed at the levels in this column.

(10) For an indoor circuit breaker, the point of user connection to the circuit breaker is either the secondary disconnecting contact (where the control power is connected from the stationary housing to the removable circuit breaker), or the terminal block point in the housing nearest to the secondary disconnecting contact.

(11) Some solenoid operating mechanisms are not capable of satisfactory performance over the range of voltage specified in the standard; moreover, two ranges of voltage may be required for such mechanisms to achieve an acceptable standard of performance.

(12) The preferred method of obtaining the double range of closing voltage is by use of tapped coils. Otherwise, it will be necessary to designate one of the two closing voltage ranges listed above as representing the condition existing at the device location due to battery or lead voltage drop or control power transformer regulation. Also, caution should be exercised to ensure that the maximum voltage of the range used is not exceeded.

END OF SECTION 26 08 13

SECTION 26 09 23 - LIGHTING CONTROL DEVICES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements

B. Section 26 50 00 - Lighting

1.02 DESCRIPTION OF SYSTEM

A. Provide devices such as wall box dimmers, wall and ceiling-mounted occupancy sensors, ambient light sensors, sensor power packs, etc., as shown on drawings.

B. Openings shall be covered with devices and matching plates.

C. Devices of same type shall be from same manufacturer.

1.03 REFERENCE STANDARDS

A. UL 20 - General Use Snap Switches.

B. UL 773A - Non-Industrial Photoelectric Switches for Lighting Control.

C. UL 924 - Emergency Lighting and Power Equipment

D. NEMA WD 7 - Occupancy Motion Sensors.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings shall include:

(1) Bill of material

(2) Schematic diagrams

(3) Suggested manufacturer layouts of all devices including overlays of product range.

C. Samples: One for each type of device and wall plate specified, in each color specified upon request.

D. Manufacturer's Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

E. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

F. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations and type of devices.

(2) Operation and Maintenance Data:

(a) Include in manufacturers' packing label warnings and instruction manuals with labeling conditions.

(b) Include source and current prices of replacement parts and supplies.

1.05 QUALITY ASSURANCE

A. Obtain devices from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory unopened packaging until ready for installation.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers:

(1) Wall Box Dimmers: Acuity Brands Controls, Cooper Controls, Hubbell, Leviton, Lutron, Philips (Sunrise Series), Wattstopper

(2) Low Voltage Switches: Acuity Brands Controls, Cooper Controls, Hubbell, Leviton, Lutron, Philips, Wattstopper

(3) Sensors and Power Packs: Acuity Brands Controls, Cooper Controls, Hubbell, Leviton, Lutron, Philips, Wattstopper

(4) UL 924 Emergency Bypass/Control Device: Acuity Brands Controls, Hubbell, Leviton, Wattstopper, LVS

(5) Exterior Photocells: Cooper Controls, Hubbell, Intermatic, Leviton, Paragon, Tork

(6) Timeclocks: Intermatic, Paragon, Tork

(7) Self-Contained Automatic Timer Switches: Acuity Brands Controls, Cooper Controls, Hubbell, Leviton, Philips, Wattstopper

B. It is the responsibility of Electrical Contractor to ensure devices submitted meet or exceed functional intent and design quality standards.

2.02 FABRICATION AND MANUFACTURE

A. Devices shall be UL listed for loads and voltages as indicated in contract drawings and specifications.

2.03 WALL BOX DIMMERS

A. Dimmers shall:

(1) Operate in ambient temperature range of 32°F to 104°F (0°C to 40°C).

(2) Be linear slide or pushbutton preset or programmable dimmers with power-failure memory.

(3) Incorporate separate control of intensity and ON/OFF.

(4) Include voltage compensation circuitry that adjusts firing angle of dimmer to compensate light output for variations in AC line voltage. Dimmers in which firing angle is held constant with varying AC line voltage shall not be acceptable.

(5) Provide smooth and continuous IESNA Square Law Dimming Curve throughout entire dimming range.

(6) Incorporate filter network to minimize interference (RFI) with radio, audio, and video equipment.

(7) Incorporate air-gap switch to meet requirements of UL 20 for air-gap switches in incandescent dimmers.

B. Fluorescent dimmers shall:

(1) Be rated to control 430 mA rapid start, 800 mA high output or 265 mA lamps.

(2) Be approved by ballast manufacturer for control of ballasts provided.

(3) Contain relay to automatically remove power to circuit feeding dimming ballast when dimmer is OFF.

(4) Incorporate circuitry to prevent lights from momentarily “flashing” when dimmer is turned on or OFF.

(5) Different lamp lengths or one and two lamp ballasts on same circuit shall track evenly with no perceptible difference in light levels for same type of lamps.

(6) Dimmers and lamps shall have a dimming range from 100% down to _____% light output.

(7) Refer to Section 26 50 00 - Lighting for solid state dimming ballast specification.

C. LED dimmers shall:

(1) Be approved for use with luminaire and driver.

(2) Provide smooth non-flicker dimming of controlled luminaires.

(3) Be 0-10V type, unless otherwise noted on drawings.

(4) Provide at least 10 steps for continuously dimmed luminaires.

(5) Refer to Section 26 50 00 - Lighting for solid state dimming ballast/driver specification.

2.04 LOW-VOLTAGE SWITCHES

A. Low voltage switches shall:

(1) Mount in a single or double gang box.

(2) Be capable of multi-way switching.

2.05 OCCUPANCY AND VACANCY SENSORS

A. Sensors shall:

(1) Operate with all lamp and ballast combinations; including magnetic, hybrid, and solid-state ballasts/drivers.

(2) Operate with ultrasonic, microphonic, passive infrared or presence technologies as indicated on drawings.

(3) Have visible LED to indicate occupant detection.

(4) Have adjustable time delay or remote relay with a maximum setting of 30 minutes and adjustable sensitivity.

(5) Contain isolated relay with normally open, normally closed, and common outputs for use with HVAC system, data logging, controlled receptacles or other system control options where indicated in contract documents.

(6) Be provided with ceiling, wall or wall switch style mounting as indicated on drawings.

(7) Have daylight filter to ensure PIR sensor is insensitive to short-wavelength waves emitted by the sun.

(8) Incorporate by-pass switch to enable lighting to be turned on if sensor fails.

B. Occupancy Sensor shall:

(1) Provide automatic ON, automatic OFF operation where indicated on drawings.

C. Vacancy Sensor shall:

(1) Provide manual ON, automatic OFF operation where indicated on drawings.

2.06 AMBIENT LIGHT SENSORS

A. Ambient light sensors shall:

(1) Incorporate photoconductive cell to measure light levels between 1 and 1,000 footcandles.

(2) Be adjustable with deadband feature to prevent cycling of lighting from minor changes in cloud cover.

(3) Have adjustable time delay range from 3 to 5 minutes.

(4) Not permit lighting systems to be turned on if enough daylight is present.

(5) Incorporate by-pass switch to enable lighting to be turned on if sensor fails.

2.07 POWER PACKS

A. Sensor power packs shall:

(1) Be self-contained transformer relay modules.

(2) Have universal rated voltage inputs 120-277 VAC, 60 Hz.

(3) Have normally closed dry contacts rated for switching 120-277 volts, 60 Hz. 20 amp loads. Provide 24VDC output capable of controlling low-voltage occupancy sensors.

2.08 EXTERIOR OCCUPANCY SENSORS

A. Exterior occupancy sensors shall:

(1) Be a completely self-contained device capable of detecting presence in the controlled range by detecting changes between infrared energy in motion and the background space.

(2) Utilize passive infrared detection technology and a three level Fresnel lens to increase detection density and accuracy of motion detection.

(3) Be capable of mounting vertically or horizontally onto a standard outdoor junction box or integral to exterior luminaires.

(4) Cover up to 35 ft (10m) with a field of view of 180 degrees or 52.5 ft (16 m) with a field of view of 270 degrees.

(5) Have an operating temperature range of -40°F to 130°F (-40° C to 54°C).

(6) Be IP66 rated for outdoor applications.

(7) Include a built-in light level sensor, adjustable by the user that will keep lights from turning on during daylight hours.

(8) Have user-adjustable time delay settings, including an override ON option that enables controlled lights to be turned on remotely for the length of the time delay.

(9) Be compatible with all electronic ballasts and LED drivers with no minimum load requirements.

(10) Provide _____ control to reduce electric light levels from a minimum of 40% to a maximum of 80% based on area occupancy.

2.09 UL 924 EMERGENCY BYPASS/CONTROL DEVICES

A. UL 924 listed bypass relays shall:

(1) Be UL 924 listed and labeled for connection to both normal and emergency lighting power sources.

(2) Have universal rated voltage inputs 120-277 VAC, 60 Hz.

(3) Have normally closed dry contacts rated for switching 120-277 volts, 60 Hz. 20 amp loads.

(4) Have integral manual test switch.

(5) Have auxiliary isolated normally closed contact for connection to remote test switch, fire alarm system, or other external system capable of providing a normally closed dry contact closure.

(6) Have status indication for presence of normal and emergency power sources and current operational mode (normal or emergency).

(7) Utilize zero crossing circuitry to protect relay contacts from the damaging effects of inrush current generated by switching electronic ballast loads.

(8) Be forced into the emergency mode upon loss of normal power sense and turn ON the emergency lighting.

(9) Automatically switch emergency lighting ON/OFF as normal lighting is switched. When normal power is not available, the unit shall force and hold emergency lighting ON regardless of the state of any external control device until normal power is restored.

B. Operational temperature range shall be -40°F to 140°F (-40°C to 60°C).

C. Device shall have universal mounting; surface, above suspended ceiling or recessed.

2.10 EXTERIOR PHOTOCELLS

A. Photocells shall:

(1) Have universal rated voltage inputs 120-277 VAC, 60 Hz.

(2) Be rated for up to 2,000 watts.

(3) Have cadmium sulfide, 1” (25 mm) diameter cell.

(4) Have SPST normally closed contacts.

(5) Have a minimum delay of 3 minutes to prevent false switching.

B. ON/OFF adjustment shall be done by moving light selector with range from 2 to 50 footcandles.

C. Operational temperature range shall be -40°F to 140°F (-40°C to 60°C).

D. Enclosure shall be die cast zinc, gasketed for maximum weatherproofing.

E. Enclosure shall include positioning lug on top.

F. Mounting shall be for 1/2” (16 mm) conduit nipple.

2.11 TIMECLOCKS

A. Timeclocks shall:

(1) Be multi-purpose, 7-day, 365-day advance single and skip a day, combination 2-channel electronic astronomical time clock with SPDT switching configuration.

(2) Have universal rated voltage inputs 120-277 VAC, 60 Hz.

(3) Be capable of programming in AM/PM or 24-hour format by jumper selection or digital setting, in one-minute resolution, using 2 buttons for basic settings.

(4) Have 365-day and/or holiday selection capabilities, with 16 single date and 5 holiday selection options and user selectable daylight savings/standard time functions.

(5) Have 72-hour memory backup with rechargeable battery and charger.

(6) Have manual override, ON/OFF to the next scheduled event, using one button for each channel.

(7) Have operational temperature range of -40°F to 150°F (-40°C to 66°C).

(8) Have a maximum allowed over-ride period no greater than 2 hours.

B. Contacts shall be rated 10 amp resistive at 120/250 VAC, 7.5 amps inductive at 120/250 VAC, 5 amps inductive at 30 VDC and up to 1/2 hp (0.4 kW) at 250 VAC.

C. Display shall be LCD type.

D. Enclosure shall be rated for installation location.

2.12 SELF-CONTAINED AUTOMATIC TIMER SWITCHES

A. Timer switches shall:

(1) Have universal rated voltage inputs 120-277 VAC, 60 Hz.

(2) Be programmable to turn lights OFF after a preset time.

(3) Have a ground wire and ground strap for safety with a latching air gap relay switching mechanism.

(4) Use Zero Crossing Circuitry to increase the relay life, protect from the effects of inrush current.

(5) Be compatible with all electronic ballasts, motor loads, LEDs and LED drivers, compact fluorescent and inductive loads. Triac and other harmonic generating devices shall not be allowed.

(6) Have no minimum load requirement and shall be capable of controlling 0 to 800 watt incandescent, fluorescent @ 100/120 VAC, 50/60 Hz; 0 to 1200 watts fluorescent @ 230/277 VAC, 50/60 Hz; 1/6 hp @ 125 VAC. LED with internal or external driver@ 100/120VAC.

(7) Have the option for light flash warning at five minutes before the timer runs out and again when the countdown reaches one minute.

(8) Have the option for a beep warning that shall sound every five seconds once the time switch countdown reaches one minute.

(9) Have manual feature for timer reset where pressing the ON/OFF switch for more than 2 seconds resets the timer to the programmed time-out period.

(10) Have a feature that shows the timer’s countdown.

(11) Have the calibration switch for setting time-out, time scroll, one second light flash, and beep warning shall be concealed to prevent tampering of adjustments and hardware.

(12) Have a maximum allowed over-ride period no greater than 2 hours.

(13) Be capable of operating as an ON/OFF switch.

(14) Utilize terminal style wiring.

(15) Have a 100% OFF override switch with no leakage current to the load.

2.13 FINISHES

A. Color:

(1) Wall box dimmers, low-voltage switches, occupancy sensors, ambient light sensors and device cover plates: _____.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install devices at heights scheduled, and as indicated on drawings.

B. Install wall devices vertically on latch side of door within 6” (150 mm) of frame edge, unless otherwise noted.

C. Install ceiling devices as shown on drawings and as recommended by device manufacturer.

D. Ceiling mounted occupancy sensors shall be located minimum of 6 ft (1.8 m) from supply air diffusers.

E. Install devices plumb, level with finished surfaces and free from blemishes.

F. Verify device locations prior to rough in.

G. Control wiring shall be low voltage, Class II wiring, electrically isolated from power wiring by a Class II transformer.

H. Provide separate neutral conductor for each dimmer.

I. Wiring shall be in conduit.

J. Electrical Contractor shall be responsible for final adjustment and testing of all devices.

3.02 TESTING

A. Verify proper location and operation of all devices.

B. Verify dimmers function without:

(1) Producing lamp flicker or audible noise.

(2) Interference of audio and visual equipment.

C. Adjust occupancy sensors for a _____ minute time delay.

D. Adjust occupancy sensor sensitivity such that movement outside range of coverage shall not trigger sensor.

E. Adjust ambient light sensor to maintain illuminance level equal to light level from controlled lighting in the space when no daylight is present or as indicated per drawings. Demonstrate ambient light sensor(s) control lighting as specified.

END OF SECTION 26 09 23

SECTION 26 09 43 - NETWORK LIGHTING CONTROLS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements

B. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables

C. Section 26 05 33 - Raceway and Boxes for Electrical Systems

D. Section 26 09 23 - Lighting Control Devices

E. Section 26 27 26 - Wiring Devices

F. Section 26 50 00 - Lighting

1.02 DESCRIPTION OF WORK

A. Network Lighting Control System shall be a complete system for control, configuration, monitoring, and reporting via a computer software interface of lighting systems which meets characteristics and performance requirements as described within this specification.

(1) System shall include system backbone infrastructure, an intelligently distributed digital network of devices that may or may not be integral to luminaires, sensors, switches, relays, and other ancillary devices required for a complete and operable system.

(2) System shall include software interface.

(3) Lighting control system equipment shall be capable of being networked together, enabling communication between devices to provide a fully engineered solution.

(4) System shall be configured using control zones defined by common area and function. Sensing and control devices within zones shall provide lighting control as a stand-alone system if network connectivity or communication between control zones is lost, or where a network system is not required such as back of house spaces.

1.03 REFERENCE STANDARDS

A. NFPA 70 – National Electrical Code; National Fire Protection Association

B. NEMA – National Electrical Manufacturers Association

C. UL 20 – General Use Switches, plug load controls

D. UL 916 – Energy Management Equipment

E. UL 924 –Emergency Lighting Equipment

F. FCC - Federal Communications Commission Standards

G. Local Building and Energy Codes

1.04 SUBMITTALS

A. Bill of Materials: Complete list of parts needed to fully install selected system components.

B. Product Data (for each type of product indicated):

(1) Specification sheets with product descriptions.

(2) Manufacturer’s installation instructions.

(3) Operation and maintenance information for normal and emergency operation.

(4) Manufacturer shall provide rate sheet for onsite support.

C. Shop and Wiring Drawings:

(1) Detailed shop drawings of complete control system to be supplied:

(a) Manufacturer layouts of devices indicating placement of system components and required connections between each, wire counts, and coverage patterns.

(b) One-line diagram(s)

(c) Interconnection diagrams showing field-installed wiring and physical dimensions of each item.

(d) Diagrams showing interconnecting signal and control wiring and interfacing devices that prove compatibility of inputs and outputs. For networked controls, list network protocols and provide statements from manufacturers that input and output devices meet interoperability requirements of network protocol.

D. Schedules:

(1) Submit low voltage switch schedule for multi zone switches and controllers showing zones/scenes controlled.

E. Information Technology (IT):

(1) Connection information pertaining to interconnection with facility IT networking equipment and third-party systems shall be submitted.

F. Service Specification Sheets: Documentation indicating general service descriptions, including startup, training, post-startup support, and service contract terms.

G. Warranty: Copy of applicable warranty

1.05 QUALITY ASSURANCE

A. Installer Qualifications: Installer shall be NALCTP Certified and experienced in performing the work of this section, and who has specialized in installation of work similar to that required for this project.

B. Manufacturer Requirements:

(1) Manufacturer shall provide 24/7 telephone support by qualified technicians.

(a) Phone Support: Toll free technical support shall be available.

(b) Remote Support: Manufacturer shall offer remote support capability.

(c) Service Contract: Manufacturer shall offer a Service Contract that packages phone, remote, and onsite support calls for project. Response times for each type of support call shall be indicated in terms of service contract included in bid package.

C. Contractor shall ensure that lighting system control devices and assemblies are compatible and can be integrated into a system that operates as described in lighting control notes on drawings and as described within this specification. Any incompatibilities between devices, assemblies, and controllers shall be resolved between Contractor and system provider, as required to ensure proper system operation and maintainability.

D. Performance Requirements: provide system components that have been manufactured, assembled, and installed to maintain performance criteria stated by manufacturer without defects, damage, or failure.

E. Code Requirements

(1) System components shall be UL listed and certified.

(2) System components shall be FCC /IC compliant.

(3) System components shall be installed in compliance with National Electrical Codes.

(4) Building Codes: Units shall be installed in compliance with applicable, local building codes.

(5) ISO Certification: System components shall be manufactured at ISO 9000 certified plants.

(6) Components and manufacturing facility where product was manufactured must be RoHS compliant.

F. Coordination

(1) Coordinate lighting control components to form an integrated interconnection of compatible components.

(a) Match components and interconnections for optimum performance of lighting control functions.

(2) Coordinate Sequence of Operations, Controls Matrix and Task Tuning Table with Architect/Engineer/Lighting Designer. Provide all programming requirements on lighting plans to be evaluated in system submittal

1.06 SUBSTITUTION REQUESTS

A. Shall be made not less than 10 days prior to bid date and will be evaluated prior to bid.

B. Shall include the following information indicating that proposed substitution is of similar construction quality and assembly and performance

(1) Specified and proposed manufacturer's product data sheet, noting options and features.

(2) Compliance statement consisting of line-by-line comparison that describes differences between specification requirements and equipment being proposed. Comparison shall include complete listing of how proposed equipment differs from that specified with regard to size, quantity, quality, method of control, features and functions, control software functions and installation requirements.

C. Equipment delivery lead time shall not be held as a valid reason for requesting controls system substitution unless lead time from specified manufacturer is in excess of 14 weeks. It shall be sole responsibility of Contractor to determine necessary equipment lead times, deliver submittals for review in a timely fashion, and place orders accordingly to ensure timely delivery.

D. When requesting a substitution, Contractor shall provide pricing for specified system and for proposed alternate, and delta savings to Owner to be realized by accepting proposed alternate. If requested, provide unit pricing for each component type specified to provide a baseline comparison for substitution request.

1.07 DELIVERY, STORAGE & HANDLING

A. Comply with manufacturer’s ordering instructions and lead-time requirements to avoid construction delays.

B. Deliver materials in manufacturer’s original, unopened, undamaged packaging with intact identification labels.

C. Store materials away from exposure to harmful weather conditions and at temperature and humidity conditions recommended by manufacturer.

1.08 WARRANTY

A. Provide manufacturer's warranty for a period of not less than five years from date of substantial completion. Warranty shall include all system hardware and software components. Manufacturer shall make available to Owner new parts, upgrades, and/or replacements for the entirety of warranty period following installation.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS (ALPHABETICAL)

A. Athena by Lutron

B. nLight by Acuity Brands

C. NX Distributed Intelligence by Current

D. Wattstopper DLM by Legrand

E. Zum by Crestron

2.02 SYSTEM PERFORMANCE REQUIREMENTS

A. Occupancy Sensing:

(1) System shall provide 2 states of occupancy status; occupied or vacant. Based on this status system will adjust lights on or off or to configurable (dimmed) light level as indicated in Sequence of Operations shown on plans.

B. Daylight Control:

(1) Photosensor shall trigger changes to light levels with an adjustable delay time when ambient (natural) light is available and shall maintain a steady light level when subjected to fluctuating ambient conditions by dimming ballasts and/or drivers.

(2) System shall utilize light level inputs from common and/or remote sensor locations to minimize the number of photosensors required.

(3) System shall react gradually and without flicker upon manual override inputs.

C. Time Clock Scheduling:

(1) System shall be programmable for time scheduling lights on or off via control software interface.

(2) Manual adjustments via wall stations or control software shall temporarily override off status imposed by time clock schedule.

(3) Prior to a scheduled lights-off event or expiry of a temporary override, system shall provide short light level drops or flashes as a warning to affected occupants. Warning time shall be programmable via software between 1 and 5 minutes.

(4) System shall automatically adjust for leap year and daylight savings time and shall provide weekly routine and annual holiday scheduling.

(5) System shall allow for scheduling via astronomic timeclock in addition to time of day inputs.

D. Emergency Mode:

(1) Upon loss of utility power, system shall immediately adjust emergency lights to full light output and retain that level until the mode is deactivated. This setting shall override all other inputs.

(2) System shall interface with building emergency monitoring system fire alarm via a single convenient point and not require multiple connections.

E. Firewall Security:

(1) Firewall technology shall be used to separate tenants from lighting control network.

(2) Network lighting control system shall include software technologies (firewall or other acceptable method) and built in policies for digital security that assure vendor and manufacturer maintenance access is separated from tenant's lighting control network and corporate LAN(s). Coordinate technologies and policies with client IT and facility network requirements.

(3) Network lighting control system shall include firewall security technologies to assure integrity of network lighting control system from digital intrusion. Standards for network security shall be manufactured to ISO/IEC 27000 standards.

2.03 LIGHTING CONTROL SOFTWARE

A. Shall provide start-up, configuration, management of the following system features:

(1) Occupancy/Vacancy control including time delays and sensitivity parameters

(2) Daylight control, including light level sensor parameters

(3) Time scheduling

(4) Lighting system zones

B. Shall provide reporting feature capable of reporting the following parameters for each device and zone individually without requiring any third party hardware and software:

(1) Occupancy data by zone as well as by individual sensor

(2) Building wide occupancy status

(3) Energy Analysis data shall be exportable in CSV.

(4) Energy performance reports shall be printable in a printer friendly format and downloadable for use in spreadsheet applications, etc.

C. Shall be used for energy reporting status and complete programming without the need for third party hardware or software.

(1) Software shall provide information on general system settings

(2) System software interface shall notify communication failures to system users.

(3) Software to be cloud based.

D. Shall provide tools that can be accessed via cloud. Tools shall show listed rooms or floor plan and associated control components.

E. Software settings and properties shall be selectable per individual device, room based, floor based or global building based.

F. Programming, assignments of lighting loads to control strategies, lighting status and lighting energy reporting shall be native to software and executed from the included program. Editing shall be available without need for any third party software. Systems that utilize or require third party linked graphics are unacceptable. Program shall indicate status of connected devices on system and a warning indicator if a device goes offline.

2.04 EQUIPMENT

A. System Backbone Equipment

(1) Host PC/Server shall be provided to host controls software and communicate with IP networked devices.

(2) Connections to devices within a wired networked lighting control zone and to backbone components shall be with a single type of low voltage network cable, which shall be compliant with CAT5e specifications or higher.

(3) If a wireless system is selected, _____

(4) Where necessary, system shall provide option of having pre-terminated plenum rated low voltage network cabling supplied with hardware so as to reduce opportunity for improper wiring and communication errors during system installation.

(5) Following proper installation and provision of power, networked devices connected together with low voltage network cable shall automatically form a functional lighting control zone without requiring any type of programming, regardless of programming mechanism (e.g., software application, handheld remote, pushbutton). The “out of box” default sequence of operations is intended to provide typical sequence of operations so as to minimize system startup and programming requirements and to also have functional lighting control operation prior to system startup and programming.

(6) Once software is installed, system shall be able to automatically discover connected devices without requiring any provisioning of system or zone addresses.

(7) Networked devices shall have ability to detect improper communication wiring and blink its LED in a specific cadence as to alert installation/startup personnel.

(8) System shall have ability to control (dim/switch) a group of luminaires with loads up to 16A.

B. Control Devices

(1) Control stations, occupancy sensors, and photosensors shall be low voltage that carry 0-10V control signals for communication.

(a) Wall stations shall:

1) Provide individual button for each zone. There shall be no buttons that are not associated to a zone. If there are 3 zones but a 3-button control station is not available by selected manufacturer, provide (1) 2-button and (1) 1-button controls station.

2) Button/Switch plate shall be capable of labeling/engraving and be white unless otherwise indicated on plans.

3) Have pre-set scene control.

4) Have ability to adjust dimming level for each zone where indicated on plans.

5) Mount in standard size wall box (suitable for multi gang installation) or on mounting brackets for low voltage devices.

6) With the exception of areas with stand-alone controls, system shall connect with wall stations.

(b) Occupancy sensors shall:

1) Use passive-infrared (PIR), or dual technology (DT) with a combination of PIR and microphonic or ultrasonic

2) Have adjustable time delay with a maximum setting of 20 minutes and adjustable sensitivity.

3) Contain isolated or remote relay with normally open, normally closed, and common outputs for use with HVAC system, data logging, controlled receptacles or other system control options where indicated in the contract documents.

4) Be provided with ceiling, wall or wall switch style mounting as indicated on drawings.
5) Have daylight filter to ensure PIR sensor is insensitive to short-wavelength waves emitted by the sun (where applicable).
6) Incorporate by-pass switch to enable lighting to be turned on if sensor fails.
7) Provide automatic on/automatic off or manual on/automatic off as indicated on the Network Controls Sequence of Operations with adjustability through network controls software.

(c) Photosensors shall:
1) Incorporate photoconductive cell to measure light levels between 1 and 1,000 footcandles.
2) Be adjustable with deadband feature to prevent cycling of lighting from minor changes in cloud cover.
3) Have adjustable time delay range from 3 to 5 minutes.
4) System programming shall not permit lighting systems to be turned on if enough daylight is present.
5) Incorporate by-pass switch to enable lighting to be turned on if sensor fails.

(d) Auxiliary Devices
1) Sensor power packs shall:
1. Be self-contained transformer relay modules.
2. Have universal rated voltage inputs 120-277 VAC, 60 Hz.
3. Have dry contact closures rated for switching 120-277 volts, 60 Hz. 20 amp loads.
2) Emergency Bypass/Control Devices shall:
1. UL924 listed and labeled for connection to both normal and emergency lighting power sources.
2. Have universal rated voltage inputs 120-277 VAC, 60 Hz.
3. Have normally closed dry contacts rated for switching 120-277 volts, 60 Hz. 20 amp loads.
4. Have integral manual test switch.
5. Have auxiliary isolated normally closed contact for connection to remote test switch, fire alarm system, or other external system capable of providing a normally closed dry contact closure.
6. Have status indication for presence of normal and emergency power sources and current operational mode (normal or emergency).
7. Utilize zero crossing circuitry to protect relay contacts from the damaging effects of inrush current generated by switching electronic ballast loads.
8. Be forced into the emergency mode upon loss of normal power sense and turn ON the emergency lighting at full output.
9. Automatically switch emergency lighting ON/OFF as normal lighting is switched. When normal power is not available, the unit shall force and hold emergency lighting ON regardless of the state of any external control device until normal power is restored.
10. Operational temperature range shall be -40°F to 140°F.
11. Device shall have universal mounting; surface, above suspended ceiling or recessed.

(e) Exterior Photocells
1) Photocells shall:
1. Have universal rated voltage inputs 120-277 VAC, 60 Hz.
2. Be rated for up to 2,000 watts.
3. Have cadmium sulfide, 1” diameter cell.
4. Have SPST normally closed contacts.
5. Have a minimum delay of 3 minutes to prevent false switching.
6. Operational temperature range shall be -40°F to 140°F.
7. Enclosure shall be die cast zinc, gasketed for maximum weatherproofing.
8. Enclosure shall include positioning lug on top.
9. Mounting shall be for 1/2” conduit nipple.

PART 3 - EXECUTION

3.01 PREPARATION

A. Pre-Construction Meeting: Contractor shall meet with lighting equipment supplier, lighting control equipment supplier, and _____ to establish compatibility requirements prior to submitting shop drawings for review.

(1) Verify luminaire-controller compatibility, review exceptions and alternate compliance associated with Specification Conformance Document, and review installation and wiring methodology for optimal function of the control systems.

(2) Confirm cover plate labeling and button engraving prior to submitting info to the factory.

(3) Confirm matched components and interconnections for optimum performance of lighting control functions and as described in design documents.

B. Site Examination: Verify that wiring conditions, which have been previously installed under other sections or at a previous time, are acceptable for product installation in accordance with manufacturer's instructions.

C. Product Inspection: Inspect all material included in this contract prior to installation. Manufacturer shall be notified of unacceptable material prior to installation.

3.02 INSTALLATION

A. General

(1) Contractor shall coordinate, receive, mount, connect, and place into operation all equipment. Contractor shall furnish conduit, wire, connectors, hardware, control interfaces, devices, _____ and other incidental items necessary for properly functioning lighting control as described herein and shown on drawings (including control devices, 0-10V dimming ballasts, fixed output ballasts, 0-10V LED drivers and communication wire), as well as interconnect wiring between lighting and BMS devices (if required). Contractor shall maintain performance criteria stated by manufacturer without defects, damage, or failure.

(2) Contractor shall test that branch load circuits are operational before connecting loads to sensor system load terminals, and then de-energize circuits before installation.

(3) Wiring Methods:

(a) Comply with Division 26 Section "Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size shall be 3/4".

(b) Wiring within Enclosures: Comply with NEC & CEC. Separate power-limited and non- power-limited conductors according to conductor manufacturer's written instructions.

(c) Size conductors according to lighting control device manufacturer's written instructions, unless otherwise indicated.

(d) Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

B. Control Station Installation

(1) Install devices at heights scheduled, and as indicated on drawings. Verify discrepancies prior to rough in.

(2) Install wall devices vertically located as follows:

(a) Where located at single-leaf entry doors, locate within 6" of latch side of frame.

(b) Where located at double-leaf entry doors or entry doors without sufficient space at latch side, locate in nearest wall within 6" of edge of door swing. Door shall not block access to device.

(c) For unusual entry door configurations or devices not at entry doors, locate per plans.

(3) Where multiple wall stations are collocated, gang and provide single faceplate whenever possible.

(4) Install devices plumb, level with finished surfaces and free from blemishes.

C. Sensor Installation

(1) Adjust sensitivity to cover area installed as appropriate for mounting location.

(2) Set time delay on occupancy sensors that are connected to lighting control system as detailed in Sequence of Operations as shown on plans. Time delays shall be controlled via control software.

(3) Install interior photosensor as appropriate for detection type and daylight aperture.

(4) Adjust photosensors to maintained illuminance levels specified in the Sequence of Operations.

(5) Install sensors a minimum of 6' from HVAC diffusers and chilled beams where possible.

3.03 SYSTEM START-UP AND CONFIGURATION

A. Testing

(1) Requests for start-up or technical services shall be at least fifteen (15) business days prior to date desired for service.

(2) System Start-up: Manufacturer shall supply factory trained representatives to start-up lighting control system.

(3) Upon completion of all line, load and interconnection wiring, and after luminaires are installed and lamped, a qualified factory representative shall completely configure and test system.

(4) Test dimming quality:

(a) Check dimmer preset control for proper operation.

(b) Verify dimmers function without producing flicker or audible noise.

(c) Verify dimmers function without interference of audio and visual equipment.

(5) Perform the following field tests and inspections with assistance of a factory-authorized service representative:

(a) Operational Test: After installing wall stations and sensors, and after electrical circuitry has been energized, start units to confirm proper unit operation.

(b) Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

1) Set preset light levels for all areas
2) Set time of day Time Clock events
3) Set Astronomic Time Clock events
4) Set all other items required for full system functionality per design intent

(6) Lighting control devices will be considered defective if they do not pass tests and inspections.

(7) Prepare test and inspection reports.

(8) Extended Service Coverage: Maintenance agreements shall be available from manufacturer to provide service for system both during and after warranty period.

(9) Provide Owner's representatives with system operating manuals.

B. Programming

(1) Scene and Level Tuning:

(a) Configure wall stations, sensor functionality, and set system lighting levels to IES recommended target illuminance levels using a light meter calibrated within last 12 months.

(2) Arrange walk-through visits with Owner to fine-tune and develop appropriate additional scenes for system presets.

(a) User interface devices shall have button configuration and programming complete in accordance with contract documents with revisions per shop drawing review process for initial review by users.

(b) Incorporate revisions following user walk-through and provide final engraved buttons.

(3) Performance Verification:

(a) Walk through systems with commissioning agent to demonstrate control system meets design intent.

(b) Review system settings with Owner and adjust as necessary to optimize system performance.

(c) Provide documentation that systems were thoroughly tested.

C. Operation and Maintenance Manuals:

(1) Contractor shall provide Owner with _____ complete copies of Operations and Maintenance manuals. Each manual shall contain at a minimum:

(a) Detailed as-built shop drawings for system installed

(b) Panel schedules for system installed (if applicable)

(c) Any controls station schedules for system installed

(d) Manufacturers cut sheets for equipment installed

(e) Manufacturers complete installation instructions

(f) Programming manuals

(g) System maintenance requirements and maintenance schedules

(h) Manufacturers contact information

(i) Manufacturer's warranty

3.04 TRAINING:

A. Provider of the service shall train facility staff, or end users, responsible for changing lighting characteristics in building in operation of system and to adjust, operate, utilize, troubleshoot, conduct software installation, and maintain lighting controls and software training.

B. Provide minimum of three 4-hour sessions at times stipulated by Owner

C. Training and programming shall be completed prior to job closeout

D. Provide a follow-up visit _____ months after occupancy

END OF SECTION 26 09 43

SECTION 26 12 19 - PAD-MOUNTED, LIQUID-FILLED, MEDIUM-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements

B. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems

C. Section 26 05 53 - Electrical Systems Identification

D. Section 26 08 12 - Power Distribution Acceptance Tests

E. Section 26 08 13 - Power Distribution Acceptance Test Tables

1.02 DESCRIPTION OF SYSTEM

A. Specification covers 3-phase, liquid-filled, compartmental type, pad-mounted transformers, including tap changers, fuses, and terminations.

1.03 REFERENCE STANDARDS

A. ANSI C57.12.22 - Standard for Transformers - Pad-Mounted, Compartmental-Type, Self-Cooled, 3-Phase Distribution Transformers with High-Voltage Bushings, 2500 kVA and Smaller: High Voltage, 34,500Grd/19,920 V and Below; Low-Voltage, 480 V and Below - Requirements.

B. ANSI C57.12.26 - Standard for Transformers - Pad-Mounted, Compartmental-Type, Self-Cooled, 3-Phase Distribution Transformers for Use with Separable Insulated High-Voltage Connectors, H-V, 34,500 Grd/19,920 V and below; 2500 kVA and Smaller.

C. ANSI C57.12.28 - Pad-Mounted Equipment - Enclosure Integrity.

D. IEEE C57.12.00 - Standard General; Requirements for Liquid - Immersed Distribution, Power, and Regulating Transformers.

E. UL 340 - Tests for Comparative Flammability of Liquids.

F. 10 CFR 431.196 (b) (2) – Energy Conservation Standards and Their Effective Dates

1.04 SUBMITTALS

A. Submit shop drawings for equipment provided under this Section.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Acceptable Manufacturers: ABB, Eaton Cooper, ABB-GE Industrial Solutions, RTE, Schneider Square D

B. Rating of transformer(s) shall be _____:

(1) kVA: _____

(2) Primary Voltage: _____ kV _____

(3) BIL: _____ kV

(4) Secondary Voltage: _____ _____

(5) Impedance: _____

(6) Temperature Rise: _____ (over 86°F (30°C) average ambient temperature)

ANSI Standard Insulation Levels kV-BIL					
	5kV	**8kV**	**15kV**	**27kV**	**38kV**

3500	3500	4200	4690	5250	64	67

2.02 CONSTRUCTION

A. Transformer(s) shall:
   (1) Be compartmental type, self-cooled, tamper-resistant and weatherproof.
   (2) Include sealed tank construction to withstand pressure of 15 psi (105 kPa).
   (3) Include welded cover.
B. Transformer tank and high and low voltage compartments shall be assembled as integral unit.
C. High and low voltage compartments shall be located side by side, separated by a steel barrier.
D. Cooling panels will be provided on back of tank.
E. High voltage compartment shall not be accessible until low voltage door has been opened.
F. Low voltage door shall have 3-point latching mechanism with vault type handle having provisions for single padlock.
G. Provide lifting eyes and jacking pads.
H. Include tank grounding provisions in each compartment.

2.03 FINISH

A. In accordance with ANSI C57.12.28 – Standard for Pad-mounted Enclosure Integrity.

2.04 INSULATING FLUID

2.05 CORE AND COIL CONSTRUCTION

A. Coils shall be wound with _____ windings.
B. Core shall be high grade, grain oriented silicon steel laminations.
C. Core and coil assemblies shall be _____.
D. Internal leads shall be insulated.
E. Manual Tap Changer:
   (1) Provide tap changer, externally operated.
   (2) Tap changer handle shall have provisions for padlocking.
   (3) Tap changer shall be 4-position with four 2-1/2% full capacity taps, _____.

2.06 HIGH VOLTAGE COMPARTMENT

A. Terminations:
   (1) Terminations shall be dead front construction.
   (2) Provide _____ universal load break type bushing wells and parking stands, for _____ feed and mounting accessory equipment.
   (3) Bushing wells shall be externally clamped and externally removable.
   (4) Provide 1 set of load break bushings and 1 load break feed-thru insert for each phase.
   (5) Mount lightning arrestors to one side and phase conductor elbows to other side.
B. High Voltage Switch:
   (1) Provide load break, gang operated, oil immersed switch, with eye for hot stick operation.
   (2) Switch shall be _____.
   (3) Switch shall be stacked deck, spring loaded cam, rotary operated.
C. High Voltage Fusing:
   (1) Provide internal oil immersed cartridge fuses.
   (2) Provide _____ Bay-O-Net type oil immersed fuses.
   (3) Provide _____ Bay-O-Net type oil immersed fuses in series with oil immersed current limiters.
   (4) Provide Bay-O-Net type current limiting fuses.
   (5) Fuses shall have continuous current ratings sized per manufacturer's recommendations for indicated kVA, impedance, and primary voltage.
D. Surge Arrestors:
   (1) Provide 3 distribution class metal oxide varistor type surge arrestors, installed in high voltage compartment and grounded to structure. Connect to incoming load break bushings.

2.07 LOW VOLTAGE TERMINATIONS AND EQUIPMENT

A. Bushings shall be molded epoxy.

B. Externally clamped, blade type spade terminals with 6 hole NEMA spacing.

C. High voltage neutral on Wye-Wye units shall be connected internally to low voltage neutral with provisions for opening this connection for testing.

D. Low voltage neutral bushing shall be fully insulated.

(1) Connect to adjacent ground pad on tank with detachable strap.

E. Accessories:

(1) Each transformer shall be equipped with the following:

(a) Dial type thermometer for indicating top liquid temperature.

(b) Globe valve to serve as drain valve, bottom filler plug connection, and liquid sampling valve.

(c) Globe valve for top filter plug connection and vacuum pump connection.

(d) Pressure vacuum gauge.

(e) Magnetic liquid-level indicator.

(f) Spare fuse pocket with 1 complete set of fuses.

(2) Pressure relief device.

(3) Stainless steel nameplate mounted in low-voltage compartment with the following information:

(a) Serial number and style number.

(b) Graphic representation of high-voltage and low-voltage connections.

(c) kVA ratings at all cooling class ratings and temperature rises.

(d) Transformer impedance at 131°F (55°C) base kVA rating.

(e) Tap changer positions, voltages and full load currents at each tap setting.

(f) Low voltage rating and full load current.

(g) Gallons of liquid in tank and radiators.

(h) Maximum allowable pressure on tank.

(i) Transformer weight with and without oil.

(j) Listing as non-PCB transformer.

F. Labeling:

(1) Provide warning label on outside high voltage compartment door and danger label on inside low voltage compartment door.

2.08 HARDWARE

A. Provide hardware, including bolts, fasteners, caps, plugs, etc. of corrosion resistant materials or plated with corrosion resistant materials.

2.09 TESTING

A. Report of transformer tests shall be submitted for each transformer:

(1) Standard ANSI tests.

(2) Resistance measurements of windings on rated voltage tap of each transformer and at tap extremes of 1 transformer only of given rating on order.

(3) Ratio tests on rated voltage connections and on tap connections.

(4) Phase-relation and polarity tests on rated voltage connections.

(5) No load losses and excitation current at rated voltage on rated voltage connections.

(6) Impedance and load losses at rated current on rated voltage connections of each transformer and on extremes of 1 unit only of given rating on order.

(7) Applied and induced potential tests.

(8) Regulation and efficiency at rated load and voltage.

(9) Insulation resistance tests (high voltage to ground, low voltage to ground, high voltage to low voltage).

B. Temperature test or tests shall be made on 1 unit only of transformers covered by these specifications of given rating, provided that test data is not available from records of temperature tests on duplicate or essentially duplicate transformer.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install components as indicated and in accordance with manufacturer's instructions and recommendations.

B. Install transformer level and plumb.

C. Provide means for lifting complete transformer.

D. Bearing surfaces of lifting means shall be free from sharp edges.

E. Provide facilities for guying transformer.

F. Provide lifting means for untanking transformer.

G. Base shall permit rolling (or sliding) in directions of both center lines of transformer and provision shall be made for pulling transformer in these directions.

H. Locate jacking facilities near extreme ends of junction of base segments.

I. Jack ports or lugs shall be so designed that lifting members of jack can be inserted.

J. If liquid filling of any part of transformer is required at job site, supplier shall furnish liquid and job site supervision, and shall furnish or make available suitable filter press and vacuum pump.

3.02 ACCEPTANCE TESTING

A. Acceptance testing to be performed in accordance with Section 26 08 12 - Power Distribution Acceptance Tests and Section 26 08 13 - Power Distribution Acceptance Test Tables.

END OF SECTION 26 12 19

SECTION 26 13 23 - MEDIUM-VOLTAGE PAD-MOUNTED SWITCHGEAR

PART 1 - GENERAL

1.01 DESCRIPTION

A. Provide freestanding, self-supporting, pad-mounted switchgear, complete with switches, fuses, bushings, and bus terminals.

1.02 REFERENCE STANDARDS

A. IEEE C37.20.3 - Standard for Metal-Enclosed Interrupter Switchgear

B. IEEE C37.20.4 - Standard for Indoor AC Switches (1KV-38KV) for use in Metal-Enclosed Switchgear

C. IEEE C57.12.28 – Standard for Pad-Mounted Equipment Enclosure Integrity

1.03 SUBMITTALS

A. Submit shop drawings for equipment provided under this Section.

PART 2 - PRODUCTS

2.01 MANUFACTURER

A. Manufacturers: Eaton Cooper, G & W, S & C Electric, Model PMH, PME or Vista Series

B. Provide pad-mounted gear in accordance with the one-line diagram.

C. Pad-mounted gear (PMH):

(1) Single self-supporting enclosure, containing interrupter switches and power fuses with accessory components, completely factory-assembled.

(2) Enclose interrupter switches and fuses within inner grounded steel compartment.

(3) Equip fuse terminals and bus terminals with compression terminals rated 400 A continuous.

(4) Provide termination compartments as follows:

(a) One for each 3-phase switch

(b) One for each 3-phase set of fuses

(c) One for each 3-phase set of bus terminals

D. Pad-mounted gear (PME):

(1) Single self-supporting enclosure, containing interrupter switches and power fuses with accessory components, completely factory-assembled.

(2) Enclose interrupter switches and fuses within inner grounded steel compartment.

(3) Equip switch terminals with bushings rated 600 A continuous.

(4) Equip fuse terminals and bus terminals with bushing wells rated 200 A continuous for elbow connection.

(5) Mount bushings and bushing wells on walls of inner compartment and extend into termination compartments.

(6) Provide termination compartments as follows:

(a) One for each 3-phase switch

(b) One for each 3-phase set of fuses

(c) One for each 3-phase set of bus terminals

E. Pad-mounted gear (Vista):

(1) Switchgear shall consist of gas-tight tank containing SF6 gas, load-interrupter switches and re-settable fault interrupters with visible open gaps and integral visible grounds, and microprocessor-based overcurrent control.

(2) Equip load-interrupter switch terminals with bushings rated 600 or 900 A continuous, and fault-interrupter terminals with bushing wells rated 200 A continuous or bushings rated 600 or 900 A continuous to provide for elbow connection.

(3) Locate manual operating mechanism and viewing windows on opposite side of tank from bushings and bushing wells so operating personnel shall not be required to perform any routine operations in close proximity to high-voltage elbows and cables.

F. Ratings (PMH or PME):

(1) Ratings for integrated pad-mounted gear as shown below:

(a) kV, Nominal _____

(b) kV, Maximum _____

(c) kV, BIL _____

(d) Main Bus Continuous, Amperes _____

(e) Three Pole Interrupter Switches

1) Continuous, Amperes _____

2) Load Dropping, Amperes _____
3) Two Time Duty Cycle Fault Closing
4) Amperes Rms Asymmetrical _____

(f) Fuses Maximum, Amperes _____
_____

(g) Short Circuit Ratings
1) Amperes Rms Symmetrical _____
2) Mva Three Phase Symmetrical at rated Nominal Voltage _____

G. Ratings for integrated switchgear as designated below.
(1) Frequency, Hz: _____
(2) Short-Circuit Rating: _____
(3) Amperes, RMS Symmetrical: _____
(4) kV, Maximum: _____
(5) kV, BIL: _____
(6) Main Bus Continuous, Amperes: _____
(7) Three-Pole Load-Interrupter Switches: _____
(8) Continuous, Amperes: _____
(9) Load Dropping, Amperes: _____
(10) Fault-Closing, Duty-Cycle: _____
(11) Three-Time, Amperes RMS Symmetrical: _____
(12) Three-Time, Amperes, Peak: _____
(13) 10-Time, Amperes RMS Symmetrical: _____
(14) 10-Time, Amperes, Peak: _____
(15) Fault Interrupters: _____
(16) Continuous, Amperes: _____
(17) Load Dropping, Amperes: _____
(18) Fault Interrupting, Duty-Cycle: _____
(19) Three-Time, Amperes RMS Symmetrical: _____
(20) Ten-Time, Amperes RMS Symmetrical: _____
(21) Fault-Closing, Duty-Cycle: _____
(22) Three-Time, Amperes RMS Symmetrical: _____
(23) Three-Time, Amperes, Peak: _____
(24) 10-Time, Amperes RMS Symmetrical: _____
(25) 10-Time, Amperes, Peak: _____

H. Momentary and two-time duty-cycle fault-closing ratings of switches, momentary rating of bus and interrupting ratings of fuses shall equal or exceed short circuit ratings of pad-mounted gear.

I. Enclosure:
(1) 11 ga (3.038 mm) steel sheet.
(2) Weld structural joints and butt joints and grind external seams flush and smooth.
(3) Provide base of continuous 90-degree flanges, turned inward and welded at corners for bolting to concrete pad.
(4) Door openings with 90-degree flanges, facing outward.
(5) Provide gasketing between roof and enclosure.
(6) Provide heavy coat of insulating “no-drip” compound to inside surface of roof to minimize moisture condensation.
(7) Provide interrupter switches with dual-purpose front barriers. Barriers, in normal hanging positions, guard against inadvertent contact with live parts. It shall also be possible to lift barriers out and insert them into open gap when switch is open. Barriers shall meet requirements of Section 381G of the National Electrical Safety Code (ANSI Standard C2).
(8) Provide interrupter switches with window panels to allow viewing of switch position without removing dual-purpose front barriers. Window panels shall be removable to facilitate phasing and secured to enclosure with stainless-steel or zinc-nickel-plated hardware.
(9) Provide each fuse with dual-purpose front barrier. Barriers, in normal hanging positions, guard against inadvertent contact with live parts. It shall also be possible to lift barriers out and insert them into open gaps when fuses are in disconnect position. Barriers shall meet requirements of Section 381G of the National Electrical Safety Code (ANSI Standard C2).

(10) Provide internal steel-enclosed compartment to encase interrupter switches and fuses.
  (a) Provide galvanized steel sheet floor compartment.
  (b) Provide screened floor drain vents.
(11) Provide Insulating barriers of fiberglass-reinforced polyester for each interrupter switch where required to achieve BIL ratings. Additional insulating barriers of same material shall isolate tie bus (where furnished).
(12) SF6 - Gas Insulation
  (a) SF6 gas shall conform to ASTM D2472.
  (b) Fill switchgear with SF6 gas to a pressure of 7 psig at 68°F (48.3 kPa at 20°C).
  (c) Evacuate gas-tight tank prior to filling with SF6 gas to minimize moisture in tank.
  (d) Switchgear shall withstand system voltage at gas pressure of 0 psig at 68°F (0 kPa at 20°C).
  (e) Provide gas-fill valve.
  (f) Provide temperature-compensated pressure gauge color coded to show operating range. Mount gauge inside gas-tight tank (visible through large viewing window) to provide consistent pressure readings regardless of temperature or altitude at installation site.
(13) Gas-Tight Tank
  (a) Provide submersible tank able to withstand up to 10 ft (3m) of water over base.
  (b) Provide tank of welded construction and made of 7 ga mild steel or Type 304 stainless steel, as specified in Section IV.
  (c) Provide means of lifting tank.
(14) Provide full-length steel barriers to separate adjoining termination compartments.

J. Doors:
(1) 11 ga (3.038 mm) steel sheet.
(2) Door-edge flanges shall overlap with door-opening flanges.
(3) Minimum of 2 extruded-aluminum hinges with stainless-steel hinge pins and interlocking extruded-aluminum hinge supports for full length of door. Stainless steel or zinc-nickel plated steel mounting hardware.
(4) Doors hinges at sides.
(5) Door (or set of double doors) equipped with automatic 3-point latching mechanism.
(6) Spring-loaded latching mechanism shall latch automatically when door is closed.
(7) Pentahead socket wrench or tool required to actuate mechanism to unlatch door and, in same motion, recharge spring for next closing operation.
  (a) Provision latching mechanism for padlocking.
(8) Provisions to store spare fuse units or refill units in doors.

K. Finish:
(1) Provide hardware (including door fittings, fasteners, etc.), operating-mechanism parts, and parts subject to abrasive action from mechanical motion of either nonferrous materials or galvanized or zinc-nickel plated ferrous materials.
(2) Do not use Cadmium-plated ferrous parts.

L. Insulators:
(1) Provide cycloaliphatic epoxy resin interrupter-switch, fuse-mounting insulators and main-bus support insulators.

M. Bus:
(1) Bus supports, bus, and interconnections shall withstand stresses associated with short circuits up through maximum rating of switchgear.
(2) Provide ground bus of short circuit rating equal to integrated assembly. In each bay, bolt ground bus to copper-clad steel bracket welded to steel enclosure.
(3) Copper-clad steel brackets (at least one per bay) shall have short-time current-carrying capability with short circuit rating assembly.
(4) Provide 2 ground cable connectors accommodating #2 AWG through 500 kc mil conductors for connection of ground bus to station ground.
(5) Include utility required grounding provisions.

N. Bushings and Bushing Wells:
(1) Provide cycloaliphatic epoxy resin bushings and bushing wells with characteristics and restrictions as follows:
  (a) Adequate leakage distance for in-air application.
  (b) Adequate strength for short-circuit stress established by test.
  (c) Homogeneity of cycloaliphatic epoxy resin throughout each bushing or bushing well to provide maximum resistance to power arcs.

(2) Mount bushings and bushing wells so semi-conductive coating is solidly grounded to enclosure.

(3) Provide bushings rated 600 A continuous with removable threaded stud.

O. Termination Compartments:

(1) Provide switches with bushings and termination compartments.

(2) Provide busing wells to permit connection of elbows.

(3) Provide adequate depth for bushings rated 600 A continuous to accommodate two 600 A elbows mounted piggyback, encapsulated surge arresters or grounding elbows mounted on 600 A elbows having 200 A interfaces.

(4) Provide adequate depth for bushing wells rated 200 A continuous to accommodate 200 A elbows mounted on portable feedthru or standoff insulators.

(5) Provide 1 parking stand for each bushing or bushing well. Locate parking stand immediately adjacent to associated bushing or bushing well and accommodate standard feedthru and standoff insulators.

(6) Equip switch with viewing window to allow visual inspection of interrupter switch blades and allow positive verification of switch position.

(7) Equip fuses with viewing windows to allow visual inspection of blown-fuse indicators.

P. Interrupter Switches:

(1) Use quick-make quick-break mechanism.

(2) Provide two-time duty-cycle fault-closing rating equal to or exceeding short circuit rating of switch gear.

(3) Enclose in inner steel compartment and provide with bushings rated 600 A continuous.

(4) Operate switch with externally accessible 3/4” (19 mm) hex switch-operating hub.

(5) Provide folding switch-operating handle.

(6) Provide contacts backed up by stainless-steel springs for constant high contact pressure.

(7) Single blade per phase. Spring-loaded auxiliary blades are not permitted.

(8) Circuit interruption shall take place completely within interrupter, with no external arc or flame. Vent exhaust in controlled manner through deionizing vent.

Q. Fuses:

(1) Solid-Material Power Fuses

(a) Provide disconnect style, solid-material power fuses, and shall utilize refill-unit-and-holder or fuse-unit-and-end-fitting construction. Refill unit or fuse unit shall be readily replaceable and low in cost.

(b) Provide non-aging and non-damageable fusing elements.

(c) Provide helically coiled fusible elements for refill units or fuse units rated 10 A or larger to avoid mechanical damage due to stresses from current surges.

(d) Support fusible elements that carry continuous current in air to help prevent damage from current surges.

(e) Each refill unit or fuse unit shall have a single fusible element to eliminate the possibility of unequal current sharing in parallel current paths.

(f) Fuses shall have melting time-current characteristics that are permanently accurate to within maximum total tolerance of 10% in terms of current. Time-current characteristics shall be available which permit coordination with source-side and load-side protective relays, automatic circuit reclosers, and other fuses.

(g) Provide fuses capable of detecting and interrupting faults whether large, medium, or small (down to minimum melting current), under realistic conditions of circuitry, with line-to-line or line-to-ground voltage across fuse, and capable of handling full range of transient recovery voltage severity associated with these faults.

(h) Contain arcing accompanying operation of solid-material power fuses within fuse. Contain arc products and gases evolved within exhaust control device during fuse operation.

(i) Equip fuses with a blown-fuse indicator that provides visible evidence of fuse operation while installed in fuse mounting.

(2) Electronic Power Fuses

(a) Use electronic power fuses with expendable interrupting module and reusable control module.

(b) Provide interrupting module with main-current section and fault-interrupting section. Arrange sections coaxially and contain within the same housing.

(c) Main-current section shall carry under normal operating conditions.

(d) Fault-interrupting section shall operate only under fault conditions and not carry current continuously and shall not determine minimum operating time-current characteristic curve shape.

(e) Current-limiting-section fusible element shall not be subject to damage due to current surges.

(f) Contain arcing accompanying operation of electronic power fuse within interrupting module; fuse operation shall be silent, without any exhaust.

(3) Fusible elements:

(a) Non-aging and non-damageable

(b) Helically coiled refill units or fuse units to avoid mechanical damage due to stresses from current surges

(c) Support that carries continuous current elements in air

(4) Contain arcing accompanying fuse operation within fuse. Contain arc products and gases within exhaust control device during fuse operation.

(5) Provide access to fuse sections such that replacement of fuses in one compartment shall not require opening of interrupter switch.

(6) Provide fuse handling tool.

(7) Provide spare set of fuses for each switch.

R. Overcurrent Control

(1) Provide microprocessor-based overcurrent control to initiate fault interruption.

(2) Mount control in watertight enclosure. Control removable in field without taking gear out of service.

(3) Provide field-programmable control settings using a personal computer connected via data port to control. Locate data port accessible from exterior of enclosure.

(4) Provide integral current transformers for power and sensing for control.

(5) Minimum total clearing time (from initiation of fault to total clearing) for fault interruption shall be 40 milliseconds (2.4 cycles) at 60 Hz or 44 milliseconds (2.2 cycles) at 50 Hz.

(6) Control shall feature time-current characteristic (TCC) curves including standard E-speed, K-speed, coordinating-speed tap, coordinating-speed main curves, and relay curves per IEEE C37.112-1996. Coordinating-speed tap curves shall optimize coordination with load-side weak-link/backup current-limiting fuse combinations, and coordinating-speed main curves to optimize coordination with tap-interrupter curves.

(7) Provide standard E-speed curve phase-overcurrent settings ranging from 25E through 400E. Standard K-speed curve phase-overcurrent settings ranging from 25K through 200K. Coordinating-speed tap curve phase-overcurrent and independent ground-overcurrent settings ranging from 50 A through 400 A. Coordinating-speed main curve phase-overcurrent and independent ground-overcurrent settings ranging from 100 A through 800 A.

S. Provide steel _____ base spacer to increase elevation of live parts in pad-mounted gear above mounting pad by _____.

2.02 UTILITY METERING

A. Provide separate utility metering _____ with hinged sealable door. Where shown on drawings.

B. Bus work shall include provisions for mounting utility company current transformers and potential transformers, or potential taps as required by utility company.

C. Provide service entrance label and necessary applicable service entrance features.

2.03 OWNERS METERS

A. Provide separate metering compartment with digital meter per requirements in Section 26 27 13 - Electrical Metering.

2.04 LABELING

A. Provide “Caution – High Voltage – Keep Out” signs on external doors and hinged bolted panels providing access to high voltage.

B. Provide “Danger – High Voltage – Qualified Persons Only” signs on internal doors and screen doors providing access to high voltage.

C. Provide warning signs indicating “Switch Blades may be Energized in any Position” on internal doors and screen doors providing access to interrupter switches.

D. Provide nameplate on Integrated switchgear assembly:

(1) Indicating manufacturer's drawing number

(2) Voltage ratings (kV nominal; kV maximum design; kV BIL)

(3) Main bus continuous rating (amperes)

(4) Short-circuit ratings (amperes, rms symmetrical and MVA 3-phase symmetrical at rated nominal voltage)

(5) Momentary and fault-closing ratings (amperes, rms asymmetrical)

E. Provide nameplate in each bay indicating:

(1) Ratings of interrupter switch (amperes continuous and interrupting)

(2) Maximum rating of power fuse in amperes

(3) Catalog number of fuse units or refill units

F. Submit identification to Owner/Engineer for approval.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install equipment per manufacturer's recommendations and as indicated.

B. Coordinate final locations with General Contractor and review final locations with Engineer prior to setting equipment.

C. Protect equipment during installation to prevent twisting or deformations, exposure to damaging environments, and work of other trades. Maintain protection until completion of construction.

D. Prior to energizing, factory representative shall visually inspect switchgear installation to verify switches are operable and bus connections are complete.

E. Test switch operators at least once after energizing.

3.02 ADJUSTMENTS AND CLEANING

A. Immediately prior to final inspection, make final adjustments and thoroughly clean equipment.

B. Refinish damaged enclosures to original quality.

3.03 CONNECTIONS

A. Provide cable terminations at switchgear - Section 26 05 13 - Medium-Voltage Cables.

B. Tighten bus joints, electrical connectors, and terminals according to manufacturer's published torque-tightening values.

C. Provide ground equipment - Section 26 05 26 - Grounding and Bonding for Electrical Systems.

D. Provide connect wiring - Sections 26 05 19 - Low-Voltage Electrical Power Conductors and Cables and Section 26 05 13 - Medium-Voltage Cables.

3.04 ACCEPTANCE TESTING

A. Perform acceptance testing - Section 26 08 12 - Power Distribution Acceptance Tests and Section 26 08 13 - Power Distribution Acceptance Test Tables.

B. Adjust or replace equipment as needed to comply with manufacturer's specifications and submit new test reports.

END OF SECTION 26 13 23

SECTION 26 22 00 - LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems
D. Section 26 05 33 - Raceway and Boxes for Electrical Systems
E. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems
F. Section 26 05 53 - Electrical Systems Identification
G. Section 26 08 12 - Power Distribution Acceptance Tests
H. Section 26 08 13 - Power Distribution Acceptance Test Tables

1.02 DESCRIPTION

A. Section includes dry type distribution and buck-boost transformers rated 600V and less, with capacities up to 300 kVA.

1.03 REFERENCE STANDARDS

A. ANSI/NECA 1 – Standard Practices for Good Workmanship in Electrical Contracting
B. IEEE C57.12.91 – Test Code for Dry Type Distribution and Power Transformers
C. NEMA EN 10250 – Enclosures for Electrical Equipment (1000 Volts Maximum)
D. NEMA ST 1 – Specialty Transformers (except General Purpose Type)
E. NEMA ST 20 – Dry-Type Transformers for General Applications
F. NFPA 70 – National Electrical Code
G. UL 506 – Specialty Transformers
H. UL 1561 – Dry-Type General Purpose and Power Transformers
I. 10 CFR 431, Subpart K (a) (2) – Energy Conservation Standards and Their Effective Dates

1.04 SUBMITTALS

A. Product Data:
   (1) Include rated nameplate data, capacities, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.
B. Shop Drawings:
   (1) For each transformer size and type:
      (a) Physical dimensions, including bolting templates, weight, and center of gravity
      (b) Loads, method of field assembly, components, and location and size of each field connection
      (c) Wiring Diagrams: Power, signal, and control wiring
      (d) kVA rating
      (e) Primary taps
      (f) Insulation class and temperature rise
      (g) Efficiency values measured at 0, 25, 50, 75, and 100% load
      (h) Impedance value – X/R and %Z
      (i) Sound level
      (j) “K” factor listing, where applicable
C. Submit 1/4” (1:50) scale electrical room floor plans with transformer locations.
D. Manufacturer’s Installation Instructions:
   (1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.
E. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.
F. Output Settings Report: Record output voltages and tap settings.
G. Closeout Submittals:
   (1) Project Record Documents:

(a) Record actual locations of transformers.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include manufacturer's Seismic Qualification Certification, Installation Seismic Qualification Certification, manufacturer's Ultra Quiet Transformers Sound Level Certification, where applicable, and Output Settings Report.

1.05 QUALITY ASSURANCE

A. Obtain transformers from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with manufacturer's Seismic Qualification Certification: Submit certification that transformers, accessories, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.

(2) Furnish Engineer with manufacturer's Ultra Quiet Transformers Sound Level Certification, where applicable: Submit certification that ultra quiet transformers have sound level not exceeding 35 dB. Submit for each ultra quiet transformer. Include the following:

(3) Basis for Certification: Indicate whether certification is based on actual test of assembled components or on calculations.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Schneider Square D

B. ABB-GE Industrial Solutions

C. Eaton Cutler-Hammer

D. Siemens

2.02 DISTRIBUTION TRANSFORMERS

A. Fabrication:

(1) NEMA ST 20, UL 1561

(2) Factory assembled and tested

(3) Air-cooled, for 60 Hz service

(4) Two winding dry type

(5) Coils:

(a) Continuous wound construction and impregnated with non-hydroscopic, thermosetting varnish.

(b) Conductors: Continuous windings without splices, except for taps, and encapsulated wire resin compound to seal out moisture and air.

(c) Materials: _____

(d) Separate primary and secondary

(e) Internal Connections: Braised or pressure type

(6) Cores: High-grade silicon steel, non-aging, with high magnetic permeability, low eddy current losses and low hysteresis. Magnetic flux densities below saturation point. Core laminations clamped with steel members, one leg per phase.

(7) Rubber vibration absorbing mounts to isolate base of enclosure from core and coil assembly.

(8) Transformer neutral visibly grounded to enclosures with flexible grounding conductor.

B. Enclosure:

(1) NEMA EN 10250

(2) _____, unless otherwise indicated to comply with environmental conditions at installed location.

(3) Code-gauge steel panel over core and coil.

(4) Ventilated (air-cooled): Louvered openings for convection cooling.

(5) Cooling and terminal chamber access with both sides and rear obstructed.

(6) Manufacturer's lifting eyes or brackets.

(7) Finish: Manufacturer's standard gray enamel over prime coat after being degreased, cleaned, and phosphatized.

C. Ratings:

(1) KVA Rating: 300 kVA maximum

(2) Primary Voltage: _____.

(3) Secondary Voltage: _____.

(4) Insulation Class and Winding Temperature Rise:

(a) Transformers 15kVA and smaller: Class 185°C, with 115°C temperature rise above 40°C ambient temperature, capable of carrying 15% continuous overload without exceeding 150°C rise.

(b) Transformers 25kVA – 112.5kVA: Class 220°C, with 115°C temperature rise above 40°C ambient temperature, capable of carrying 15% continuous overload without exceeding 150°C rise.

(c) Transformers above 112.5kVA: Class 220°C, with 80°C temperature rise above 40°C ambient temperature, capable of carrying 30% continuous overload without exceeding 150°C.

(5) Top of Enclosure Temperature: Maximum 35°C above 40°C ambient temperature at warmest point at full load.

(6) K-Factor Rating: UL 1561, as indicated.

D. Primary Taps:

(1) Transformers rated less than 3kVA: _____.

(2) Transformers rated 3kVA - 15kVA: _____.

(3) Transformers rated 15kVA and larger: Two 2.5% above and two 2.5% below normal full capacity, minimum of four taps.

E. Energy Efficiency:

(1) Transformers rated 15kVA and larger, except K-rated, quiet type and ultra quiet type:

(a) 10 CFR 431, Subpart K .196 (a) (2) compliant

F. Sound Levels:

(1) NEMA ST 20, maximum average sound levels as follows:

(a) 45 dB for general-purpose transformer sizes less than 51kVA.

(b) 50 dB for general-purpose transformer sizes 51-150kVA.

(c) 55 dB for general-purpose transformer sizes 151-300kVA.

(2) Minimum of 3 dB less than NEMA ST 20. Maximum average sound levels when factory tested according to IEEE C57.12.91 as follows:

(a) 42 dB for quiet type transformer sizes less than 51kVA.

(b) 47 dB for quiet type transformer sizes 51-150kVA.

(c) 52 dB for quiet type transformer sizes 151-300kVA.

(3) Maximum average sound levels, when factory tested according to IEEE C57.12.91, as follows:

(a) 35 dB for ultra quiet transformers, for all sizes through 300kVA.

G. Electrostatic Shielding, where indicated: Each winding with an independent, single, full-width copper electrostatic shield arranged to minimize interwinding capacitance.

(1) Coil leads and terminal strips arranged to minimize capacitive coupling between input and output terminals.

(2) Special terminal included for grounding the shield.

(3) Shield Effectiveness:

(a) Capacitance between Primary and Secondary Windings: Not to exceed 33 picofarads over a frequency range of 20 Hz to 1 MHz.

(b) Common-Mode Noise Attenuation: Minimum of minus 120 dBA at 0.5 to 1.5 kHz; minimum of minus 65 dBA at 1.5 to 100 kHz.

(c) Normal-Mode Noise Attenuation: Minimum of minus 52 dBA at 1.5 to 10 kHz.

2.03 BUCK-BOOST TRANSFORMERS

A. Description: NEMA ST 1, UL 506, UL 1561, same as distribution transformers, except rated for continuous duty and with wiring terminals suitable for connection as autotransformer.

B. Enclosure: Ventilated, NEMA EN 10250, Type 2.

(1) Finish Color: _____.

2.04 LUGS

A. Manufacturer's primary and secondary bolted lugs: labeled for 75°C copper and aluminum conductors for ventilated enclosures and labeled for 90°C copper and aluminum conductors for non-ventilated enclosures.

B. Connections at sides near bottom, accessible from front of cabinet.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine conditions for compliance with enclosure and ambient temperature requirements for each transformer.

B. Examine areas and surface to receive transformers for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Verify space indicated for transformers' mounting meets code-required working clearances.

D. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

E. Verify that ground connections are in place and requirements in Section 26 05 26 - Grounding and Bonding for Electrical Systems have been met.

F. Verify with manufacturer that "touch-up" paint kit is available for repainting.

3.02 INSTALLATION

A. Install transformers in accordance with ANSI/NECA 1.

B. Install level and plumb within 1/2 degree, and at least 6" (150 mm) from the adjacent wall or structure to ensure proper ventilation, in accordance with manufacturer's written instruction, and in compliance with recognized industry practices.

C. Transformer mounting, seismic restraints, and vibration control:

(1) Install transformer anchorage devices, seismic restraints and vibration control based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.

(2) Mount transformers _____.

(3) Floor mounting:

(a) Secure to floor via isolation pads between floor brackets (per manufacturer recommendations) and transformer.

(b) Mount on spring isolator.

(4) Wall mounting:

(a) Secure to concrete-and-block wall via isolation pads between wall brackets (fabricated by manufacturer) and transformer.

(b) Secure to gypsum walls with independent steel slotted channel supports, secured to floor via isolation pads between wall brackets (fabricated by manufacturer) and transformer.

(c) Mount on spring isolator.

(5) Suspended mounting:

(a) Suspend transformer enclosures designed for floor mounting, where suspended from structural ceiling, via trapeze constructed of steel slotted channel support system hung via 3/8" (9 mm) minimum steel threaded hanger rods attached to structural members or inserts in structural slab. Each rod to contain spring isolator ceiling hanger. Use locking type nuts in assembly.

(b) Install restraint cables sway bracing sized to resist a horizontal force of 162% of the operating weight acting in any direction for normal power transformers and 212% of the operating weight for emergency/standby power transformers.

(c) Anchor and fasten transformers and their supports to building structural elements by the methods described in Section 26 05 29 - Hangers and Supports for Electrical Systems.

D. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification. Attach nameplate to transformer using small, corrosion-resistant metal screws or rivets. Do not use contact adhesive.

(1) Indicate kVA rating, voltage/phase rating, taps, insulation class and temperature rise, impedance value, sound level, and K-factor listing.

E. Install conduit per requirements in Section 26 05 33 - Raceway and Boxes for Electrical Systems.

F. Install transformer in dedicated electrical space per NFPA 70 and as shown on drawings. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

3.03 CONNECTIONS

A. Ground transformers according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

3.04 FIELD QUALITY CONTROL

A. Inspect transformers for physical damage, proper alignment, anchorage, grounding, connections, and installation.

B. Test transformers per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

C. Interpret test results in writing and submit to Engineer.

D. Output Settings Report: Prepare a written report recording output voltages and tap settings and submit to Engineer.

3.05 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.06 ADJUSTING

A. Record transformer secondary voltage at each unit for at least 48 h of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10% and not being lower than nameplate voltage minus 3% at maximum load conditions.

B. Connect buck-boost transformers to provide nameplate voltage of equipment being served, plus or minus 5%, at secondary terminals.

3.07 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

END OF SECTION 26 22 00

SECTION 26 23 00 - LOW-VOLTAGE SWITCHGEAR

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems

L. Section 26 28 13 - Fuses
M. Section 26 43 00 - Surge Protective Devices

1.02 DESCRIPTION

A. Section includes free-standing, dead-front type, metal-enclosed, low-voltage distribution switchgear.

1.03 REFERENCE STANDARDS

A. ANSI/IEEE C37.13 – Low-Voltage AC Power Circuit Breakers Used in Enclosures
B. IEEE C37.20.1 – Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
C. IEEE C37.90 – Relay and Relay Systems Associated with Electric Power Apparatus
D. IEEE C62.41.1 Guide on the Surges Environment in Low-Voltage (1000 V and Less) AC Power Circuits
E. IEEE C62.41.2 Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits
F. NFPA 70 – National Electrical Code
G. NEMA EN 10250 – Enclosures for Electrical Equipment (1000 Volts Maximum)
H. UL 486A-486B – Wire Connectors
I. UL 869A – Reference Standard for Service Equipment
J. UL 1066 – Low-Voltage AC and DC Power Circuit Breakers Used in Enclosures
K. UL 1558 – Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear

1.04 SUBMITTALS

A. Product Data: For each switchgear, components and accessories indicated:
   (1) Include data on features and components and complete description; submit catalog cut sheets showing voltage, size, rating and size of surge protective devices, switching and overcurrent protective devices.
   (2) Features, characteristics, factory settings and time-current curves of individual protective devices, auxiliary components and ground fault relaying.
B. Shop Drawings:
   (1) For each switchgear specified in this Section:
      (a) General Arrangement:
         1) Indicate front, plan, and side views of switchgear; access requirements; overall dimensions and components list; shipping splits and weights.
         2) Front elevation indicating location of devices and instruments.
         3) Sections through switchgear showing space available for conduits.
      (b) Conduit entrance locations and requirements
      (c) Nameplate legends
      (d) Configuration, size and number of bus bars for each phase and current rating of buses
      (e) Ground bus
      (f) Neutral bus

(g) Short circuit ratings of switchgear and overcurrent protective devices, and bus withstand rating

(h) Instrument details; enclosure types and details

(i) Wiring diagrams: power, signal and control wiring

(j) Utility company's metering provisions with indication of approval by utility company

(2) Submit 1/4" (1:50) scale floor plans with switchgear location(s) and required clearances and service space around equipment.

C. Manufacturer's Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Complete review of this specification noting for each paragraph whether proposed equipment complies with project specifications or deviates. Justification must be given for each deviation.

F. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations, configurations, and ratings of switchgear and major components on single-line diagrams and plan layouts.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.

(c) Include spare parts data listing, source, and current prices of replacement parts and supplies.

(d) Include Manufacturer Seismic Qualification Certification and Installation Seismic Qualification Certification.

(e) Include time-current curves, including selectable ranges for each type of overcurrent protective device.

1.05 QUALITY ASSURANCE

A. Obtain switchgear from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with Manufacturer Seismic Qualification Certification: Submit certification that switchgear, accessories, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchgear as required to prevent condensation.

B. Deliver switchgear in _____, individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes, and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Use factory-installed lifting provisions. Handle carefully to avoid damage to switchgear internal components, enclosure, and finish.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.

(1) Potential Transformer Fuses: Equal to 10% of amount installed for each size and type, but no fewer than 2 of each size and type.

(2) Control-Power Fuses: Equal to 10% of amount installed for each size and type, but no fewer than 2 of each size and type.

(3) Fuses for Fused Switches and for Fused Circuit Breakers: Equal to 10% of amount installed for each size and type, but no fewer than 3 of each size and type.

(4) Indicating Lights: _____

PART 2 - PRODUCTS

2.02 RATINGS

A. Nominal system voltage: _____.

B. Main bus continuous amperes: ____

C. Short circuit current rating: _____.

D. Brace switchgear components to withstand mechanical forces for symmetrical fault current shown.

2.03 CONSTRUCTION

A. IEEE C37.20.1, UL 1558.

B. Free-standing, dead-front type; metal-enclosed; side, front and rear panels of one-piece welded or bolted construction; compartments with ventilation louvers in top and bottom sections of front and rear panels; supporting frame: steel _____ rigidly fastened together, with same outside dimensions as the enclosure.

C. Adequate strength and rigidity necessary to resist conditions of use to which it may be subjected and to support equipment, devices and appurtenances contained therein.

D. Incoming lug locations: _____, as applicable per drawings.

E. Barriers shall be placed such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations

F. _____.

G. Environmental Limitations:

(1) Ambient temperatures: not exceeding 40°C

(2) Altitude: Not exceeding 6600 ft (2 km) _____

(3) Temperature rise: Not to exceed 65°C over a 40°C ambient environment, with no derating required.

H. Device Mounting and Type:

(1) Front and rear accessible switchgear: _____.

(a) Main and tie device and feeder devices: Drawout and _____.

I. Bus:

(1) Material: _____; copper: 98% conductivity.

(2) Connections: Accessible from rear only for maintenance.

(a) Bolted:

1) Not fewer than 4 bolts for each 4” x 4” (100 mm x 100 mm) contact

2) Not fewer than 2 bolts for each 2” x 2” (50 mm x 50 mm) contact

3) Grade 5 bolts and conical spring-type washers

(3) Sizing: Standard size, based on 65°C over 40°C; full capacity of the breaker frame size, not the trip setting; fully rated vertical and horizontal bus sections.

(4) Main Phase Buses: Three phase, _____ wire; uniform capacity for entire length of switchgear; ampacity as indicated on drawings; rated for the main protective device frame size or main incoming conductors.

(5) Bus Arrangement: A-B-C (left to right, top to bottom, front to rear).

J. Ground Bus: Insulated, extend length of switchgear.

(1) _____ amp, hard-drawn copper of 98% conductivity, equipped with pressure connectors for feeder ground conductors.

K. Neutral Bus: _____% of the ampacity of phase buses, as indicated, equipped with pressure connectors for outgoing circuit neutral cables. Bus extensions for busway feeder neutral bus are braced.

L. Hinged Front Doors: Allow access to metering, accessory, and blank compartments, with latch and padlocking provisions.

M. Removable, Hinged Rear Doors and Compartment Covers: Secured by _____, for access to rear interior of switchgear, with latch and padlocking provisions.

N. Circuit breaker compartment: Equipped to house drawout type circuit breakers, fitted with hinged outer doors, and segregated from adjacent compartments by steel barriers; equipped with drawout rails, levering out mechanism, primary and secondary contacts; The following functions may be performed without the need to open the circuit breaker door: lever circuit breaker between positions, operate manual charging system, close and open circuit breaker, examine and adjust trip unit, and read circuit breaker rating nameplate.

O. Section barriers between main and tie circuit breakers compartments: Extended to rear of section; rear compartment barrier between the cable compartment and the main bus; glass polyester barrier between adjacent vertical structures in the cable compartment.

P. Bus isolation barriers: Arranged to isolate line bus from load bus at each main and tie circuit breaker; separate barriered compartment for current and potential transformers; main and riser buses fully isolated from breaker instrument and auxiliary compartments.

Q. Bus bars connect: Between vertical sections and between compartments. Cable connections are not permitted.

R. Safety shutter: To automatically cover line and load stubs to protect against accidental contact.

S. Utility Metering Compartment: Fabricated compartment barriered from the rest of the section, with a hinged lockable front cover and removable bus links, complying with utility company's requirements. If separate vertical section is required for utility metering, match and align with basic switchgear. Metering equipment: Provisions for mounting current transformers and potential transformers; meter base(s), metering conductors and miscellaneous appurtenances required by serving utility.

T. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchgear.

   (1) Pull Section: _____ Arrange _____

U. Pull Box on Top of Switchgear:

   (1) Adequate ventilation to maintain temperature in pull box within same limits as switchgear.

   (2) Removable top, front, and sides, same construction as switchgear.

   (3) Insulating, fire-resistive bottom with separate holes for cable drops into switchgear.

   (4) Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.

   (5) _____

V. Spare circuit breakers and spaces for future circuit breakers: Allowance in vertical section bus size.

W. Future Provisions: Fully equip spaces for future devices with bussing, bus connections, rails, mounting brackets, supports, and appurtenances, insulated and braced for short circuit currents, with continuous current rating _____. Extension of phase, neutral, and ground buses from both ends by means of predrilled bolt-holes and connecting links.

X. Adequate lifting means.

Y. Dimensions: _____ maximum height, excluding floor sills, lifting members and pull boxes. Length and depth indicated _____ on the drawing are maximums allowed.

Z. Line and Load Terminations: _____ type, labeled for 75°C copper and aluminum conductors; suitable for number, sizes and trip ratings; feeder load terminals: silver-plated copper bus extensions equipped with pressure connectors for outgoing circuit conductors.

AA. Bus-Bar Insulation: Individual bus bars wrapped with factory-applied, flame-retardant tape or spray-applied, flame-retardant insulation, or fluidized epoxy coating. No live connections shall be accessible from the rear, except the breaker load side terminals.

   (1) Sprayed Insulation Thickness: 3 mils (0.075 mm), minimum.

   (2) Bolted Bus Joints: Insulate with secure joint covers that can easily be removed and reinstalled.

BB. Relays: IEEE C37.90; types and settings as indicated; with test blocks and plugs.

CC. Enclosure: Steel, NEMA EN 10250, Type _____:

   (1) Outdoor Non-walk-in Enclosure: Lifting plates at base of structure, hinged aisle doors with rubber gaskets and padlocking provision, asphalt base undercoating on exterior bottom, interior lights, space heater per vertical section, outlets, light switch and space heater switch.

      (a) Space Heater: Factory-installed electric space heater of sufficient wattage in each vertical section to maintain enclosure temperature above expected dew point.

      (b) Space-Heater Power Source: _____.

(2) Walk-in Enclosure:

(a) Outdoor sections: Same width as indoor sections except end sections shall be wider to allow for opening of inner door; designed to withstand wind velocities of _____

(b) A minimum of 42" (1070 mm) front aisle depth in front for walk-in structures.

(c) Rear hinged padlockable doors with wind stops for each section.

(d) Aisle doors shall be equipped with provisions for padlocking.

(e) Steel floor in walk-in aisle space and under each vertical section.

(f) Anti-skid floor strip in aisle way.

(g) Panic hardware on aisle doors at each end of line-up.

(h) Exterior padlocking of doors shall not prevent operation of panic hardware from interior of enclosure.

(i) Enclosure: Rear sloping roof.

(j) Overhead circuit breaker lifter.

(k) Ventilating louvers with insect and rodent screen and replaceable fiberglass filters; filters: removable from exterior of enclosure.

(l) Interior aisle vaporproof fluorescent lights with low-temperature ballasts, 3-way switches at each entrance and GFCI protected receptacles, a minimum of two.

(m) Space heaters with thermostatic controls for breaker, bus and cable compartments.

(n) Power for lights, receptacles and space heaters shall be obtained from _____; supply voltage: 120 VAC.

(3) Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.

(4) Enclosure Finish for Outdoor Units: Factory-applied finish in manufacturer's standard color, undersurfaces treated with corrosion-resistant undercoating.

2.04 SERVICE ENTRANCE

A. UL 869A

B. Switchgear labeled as suitable for use as service entrance equipment, where applicable, with incoming line isolation barriers, and a removable neutral bond to switchgear ground for solidly grounded wye systems.

C. Barriers shall be placed such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations.

D. Surge arrestors on all phases per requirements in Section 26 43 00 - Surge Protective Devices (SPD).

2.05 SHORT CIRCUIT CURRENT RATING

A. Each switchgear with minimum short circuit current rating as indicated on drawings.

B. Switchgear: Marked with their maximum short circuit current rating at supply voltage.

C. Switchgear: Fully rated

2.06 SURGE PROTECTIVE DEVICES (SPD)

A. _____

B. IEEE C62.41.1; integrally mounted, plug-in style, solid-state, parallel-connected, sine-wave tracking suppression and filtering modules.

C. Per requirements in Section 26 43 00 - Surge Protective Devices.

2.07 OVERCURRENT PROTECTIVE DEVICES

A. Power Circuit Breaker and Accessories: ANSI/IEEE C37.13; UL 1066; metal frame; field interchangeable electrical accessories, including shunt trip, spring release, electrical operator, auxiliary contacts and trip unit.

(1) Ratings: As indicated for continuous, interrupting, and short-time current ratings for each circuit breaker; voltage and frequency ratings same as switchgear.

(2) Operating Mechanism: Mechanically and electrically trip-free, stored-energy operating mechanism with the following features:

(a) Normal Closing Speed: Independent of both control and operator.

(b) Slow Closing Speed: Optional with operator for inspection and adjustment.

(c) Store-Energy Mechanism: _____.

(d) Means for manual opening and closing.

(e) Operation counter.

(3) Trip Devices: Electronic (solid-state, microprocessor-based), overcurrent trip-device system consisting of one or two current transformers or sensors per phase, a release mechanism, and the following features:

(a) Functions: Long-time pickup and delay, short-time pickup and delay, ground-fault pickup and delay and instantaneous-trip functions, independent of each other in both action and adjustment.

(b) Temperature Compensation: Ensures accuracy and calibration stability from 23°F to 104°F (-5°C to 40°C).

(c) Field-adjustable time-current characteristics.

(d) Current Adjustability: Dial settings and ratings plugs on trip units or sensors on circuit breakers, or a combination of these methods.

(e) Three bands, minimum, for long-time- and short-time-delay functions; marked “minimum,” “intermediate,” and “maximum.”

(f) Pickup Points: Five minimum, for long-time- and short-time-trip functions. Equip short-time-trip function for switchable I2t operation.

(g) Pickup Points: Five minimum, for instantaneous-trip functions.

(h) Trip Indication: Labeled, battery-powered lights or mechanical targets on trip device to indicate type of fault.

(4) Auxiliary Contacts: For interlocking or remote indication of circuit breaker position, with spare auxiliary switches and other auxiliary switches required for normal circuit breaker operation. Each consists of two type “a” and two type “b” contacts wired through secondary disconnect devices to a terminal block in stationary housing; “a” contacts mimic circuit breaker contacts, “b” contacts operate in reverse of circuit breaker contacts.

(5) Drawout Features: Circuit breaker mounting assembly equipped with a racking mechanism to position circuit breaker and hold it rigidly in connected, test, and disconnected positions. Include the following features:

(a) Interlocks: Prevent movement of circuit breaker to or from connected position when it is closed, and prevent closure of circuit breaker unless it is in connected, test, or disconnected position.

(b) Circuit Breaker Positioning: An open circuit breaker may be racked to or from connected, test, and disconnected positions only with the associated compartment door closed unless live parts are covered by a full dead-front shield. An open circuit breaker may be manually withdrawn to a position for removal from the structure with the door open. Status for connection devices for different positions includes the following:

1) Test Position: Primary disconnect devices disengaged, and secondary disconnect devices and ground contact engaged.

2) Disconnected Position: Primary and secondary devices and ground contact disengaged.

(6) Arc Chutes: Readily removable from associated circuit breaker when it is in disconnected position and arranged to permit inspection of contacts without removing circuit breaker from switchgear.

(7) Padlocking Provisions: For installing at least three padlocks on each circuit breaker to secure its enclosure and prevent movement of drawout mechanism.

(8) Operating Handle: One for each circuit breaker capable of manual operation.

(9) Electric Close Button: One for each electrically operated circuit breaker.

(10) Mechanical Interlocking of Circuit Breakers: Uses a mechanical tripping lever or equivalent design and electrical interlocks.

(11) Key Interlocks: Arranged so keys are attached at devices indicated. Mountings and hardware are included where future installation of key interlock devices is indicated.

(12) Shunt-Trip Devices: Where indicated.

(13) Indicating Lights: To indicate circuit breaker is open or closed, for main and bus tie circuit breakers interlocked wither with each other or with exterior devices.

(14) Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 26 09 13 - Electrical Power Monitoring and Control.

(15) Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground fault protection function, and/or short time function.

(16) Control Voltage: _____.

(17) Trip Voltage: _____, close and charge.

(18) Listed for 100% of breaker’s continuous ampere rating.

B. Circuit Breaker Electronic Trip Units general characteristics:

(1) Circuit breakers, with solid-state microprocessor based trip units:

(a) Unit shall consist of current sensors, solid-state trip device, and solid-state adjustable time/current curve shaping elements.

(b) Trip units shall be removable to allow for field upgrades.

(c) Trip units shall incorporate “True RMS Sensing.”

(2) Solid-state elements shall provide functions as indicated above.

(3) Adjustments shall be made using non-removable, discrete steps.

(4) Sealable transparent cover shall be provided over adjustments.

(5) Adjustable long-time pickup (Ir) and delay shall be available in an adjustable rating plug that is UL listed as field-replaceable. Adjustable rating plug shall allow for five minimum long-time pickup settings from 0.4 to 1.0 times the sensor plug (In). Other adjustable rating plugs shall be available for more precise settings to match the application. Long-time delay settings shall be at least three bands.

(6) Short-time pickup shall allow for five minimum settings from 1.5 to 10 times Ir. Short-time delay shall be at least three bands with I2t ON and OFF.

(7) Instantaneous settings on the trip units shall be available in five minimum bands from 2 to 15 times In. The instantaneous settings shall also have an OFF setting when short-time pickup is provided.

(8) Trip units shall have the capability to electronically adjust the settings locally and remotely to fine increments below the switch settings. Fine increments for pickup adjustments are to be one ampere. Fine increments for delay adjustments are to be one second.

(9) Trip unit shall indicate:

(a) Long-time fault

(b) Short-time fault

(c) Instantaneous fault

(d) Ground fault, where provided

(10) Trip unit shall provide local trip indication and capability to indicate local and remote reason for trip, i.e., overload, short circuit or ground fault.

(11) Trip unit shall contain means to conduct circuit breaker tests, or via separate test kit.

(12) Breaker shall be equipped with externally accessible test points to be used for field testing.

(13) Trip units shall be available to provide real time metering. Metering functions include current, voltage, power and frequency.

(14) Trip units shall be provided with the following standard features:

(a) True RMS sensing

(b) LI

(c) LSI

(d) LSIG/Ground-fault trip

(e) Ground Fault Alarm (no trip), with external relay, where required

(f) Adjustable rating plugs

(g) LCD or LED – Long-time pickup

(h) LCD or LED – Trip indication

(i) Digital Ammeter

(j) Communications

(k) LCD dot matrix display

(l) Advanced user interface

(m) Protective relay functions

(n) Neutral protection

(o) Incremental fine tuning of settings

(p) Selectable long-time delay bands

(q) Power measurement

(r) Maximum peak demand (measure of average power over a 15-minute period) continuously recorded over a one-year period

C. Fused Power Circuit Breakers: Circuit breaker and fuse combinations complying with requirements for circuit breakers and trip devices and with the following:

(1) Fuses: NEMA FU 1, Class L current limiting, sized to coordinate with and protect associated circuit breaker, per requirements in Section 26 28 13 - Fuses.

(2) Circuit Breakers with Frame Size 1600 A and Smaller: Fuses on line side of associated circuit breaker, on a common drawout mounting, arranged so fuses are accessible only when circuit breaker is in disconnected position.

(3) Circuit Breakers with Frame Sizes More Than 1600 A: Fuses and circuit breakers may be installed in separate compartments on separate drawout mountings. Fuse drawout element is interlocked with associated power circuit breaker to prevent drawing out fuse element unless circuit breaker is in open position.

(4) Open-Fuse Trip Device: Positive means of tripping and holding circuit breaker in open position when a fuse opens. Open-fuse status is indicated at front of circuit breaker or fuse drawout element.

D. Ground Fault protection equipment on breakers, where indicated: _____ relay and trip unit, push-to-test feature and ground fault indicator:

(1) Ground-fault protection with at least three adjustable short-time-delay settings and three trip-time-delay bands; adjustable current pickup with maximum setting of 1200 A. Arrange to provide protection for the following:

(a) Three-wire circuit or system

(b) Four-wire circuit or system

(c) Four-wire, double-ended substation

(2) Trip units shall be capable of the following types of ground-fault protection: _____. Ground-fault sensing systems shall be changed in the field.

(3) Neutral current transformers shall be provided for 4-wire system.

(4) Ground-fault settings for circuit breaker sensor sizes 1200 A or below shall be in nine bands from 0.2 to 1.0 times In. The ground-fault settings for circuit breakers above 1200 A shall be in minimum three bands up to 1200 A.

(5) Ground-Fault Relay: UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and 3-phase current transformer/sensor.

2.08 CONTROL POWER, COMPONENTS IDENTIFICATION, AND CONTROL WIRING

A. Control Circuits: 120 V, supplied through secondary disconnecting devices from control-power transformer: Dry-type transformers in separate compartments for units larger than 3 KVA, including primary and secondary fuses.

B. Electrically Interlocked Main and Tie Circuit Breakers: Two control-power transformers in separate compartments, with interlocking relays, connected to the primary side of each control-power transformer at the line side of the associated main circuit breaker. 120 V secondaries connected through automatic transfer relays to ensure a fail-safe automatic transfer scheme.

C. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

D. Control components mounted within assembly, such as relays, pushbuttons, switches etc.: Suitably marked for identification, corresponding to appropriate designations on manufacturer's wiring diagrams.

E. Control Wiring: Factory installed, with bundling, lacing, and protection included; flexible conductors for #8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units; insulated locking spade terminals for control connections, except where saddle type terminals, integral to a device; current transformer secondary leads, connected to short circuit terminal blocks; terminal blocks with suitable numbering strips for group of control wires leaving switchgear, with wire markers at each end of control wiring.

2.09 ACCESSORY COMPONENTS AND FEATURES

A. Furnish portable test set to test functions of circuit breakers and solid-state trip devices without removal from switchgear. Include relay and meter test plugs suitable for testing switchgear meters and switchgear class relays.

B. Furnish accessory set including tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

C. Furnish one portable, floor-supported, roller-based, elevating carriage arranged for movement of circuit breakers in and out of compartments for present and future circuit breakers.

D. Furnish overhead circuit-breaker lifting devices, mounted at top front of switchgear, with hoist and lifting yokes matching each drawout circuit breaker.

E. Furnish set of tools for manually charging circuit breaker stored energy device.

F. Furnish racking handle to manually move circuit breaker between connected and disconnected positions.

G. Lockout Devices: Circuit breakers with integral, lockout/tagout devices.

H. Provide energy-reducing maintenance switching with local status indicator for all breakers 1200A and higher per NEC 240.87.

2.10 CUSTOMER METERING

A. Per requirements in Section 26 27 13 - Electrical Metering.

PART 3 - EXECUTION

3.01 COORDINATION

A. Instruct manufacturer about the location of incoming lugs, i.e., top or bottom feed based on incoming feeder entrance location.

B. Coordinate installation of housekeeping concrete pad based on actual equipment supplied:

(1) Concrete: Per requirements in Division 03 – Concrete.

(2) Dimensions: Per requirements in Section 26 05 29 - Hangers and Supports for Electrical Systems.

C. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

D. Coordinate utility company metering equipment requirements.

E. Verify with manufacturer that “touch-up” paint kit is available for repainting.

3.02 EXAMINATION

A. Examine areas and surface to receive switchgear for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for switchgear mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.03 INSTALLATION

A. Install switchgear in accordance with applicable portions of ANSI/NECA 400.

B. Switchgear mounting and seismic restraints:

(1) Install switchgear anchorage devices and seismic restraints based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.

(2) Bolt switchgear to concrete housekeeping pads, using anchor bolts in accordance with Section 26 05 29 - Hangers and Supports for Electrical Systems. Cast anchor bolt inserts into pads.

(3) Install bushing assemblies for anchor bolts for seismic restraints per requirements in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems.

C. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification for switchgear, every instrument, overcurrent protective device and disconnect device. Attach nameplate to exterior of switchgear using small corrosion-resistant metal screws and rivets. Do not use contact adhesive. Indicate switchgear manufacturer’s name and drawing number, name, amperage, voltage, phase, number of wires, short circuit current rating (amp, RMS symmetrical and MVA 3-phase symmetrical) and momentary and fault-closing ratings (amp, RMS asymmetrical). For each overcurrent protective device and disconnect device, include circuit, load and area served, voltage/phase rating, and fuse size and type, when applicable.

D. Provide framed, printed operating instructions for switchgear, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of switchgear.

E. Install switchgear in dedicated electrical space per NFPA 70, and as indicated on drawings.

F. Tighten electrical connectors and terminal according to equipment manufacturer’s published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

G. Install fuses in fusible switch at job site per requirements in Section 26 08 13 - Power Distribution Acceptance Test Tables.

H. Install surge arrestors in cable termination compartments and connect to each phase of circuit, per requirements in Section 26 43 00 - Surge Protective Devices (SPD)

I. Connect surge protective devices to switchgear bus per requirements in Section 26 43 00 - Surge Protective Devices (SPD).

J. Install utility company metering equipment, devices and wiring in conformance with serving utility requirements.

K. Apply temporary heat to maintain temperature according to manufacturer’s written instructions.

3.04 CONNECTIONS

A. Ground switchgear according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Connect power and control wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

3.05 FIELD QUALITY CONTROL

A. Inspect switchgear for physical damage, proper alignment, connections, anchorage, seismic restraints and grounding.

B. Test continuity of each circuit.

C. Test switchgear per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

D. Interpret test results in writing and submit to Engineer.

3.06 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.07 ADJUSTING

A. Set field-adjustable circuit breakers trip settings, to values indicated on drawings or recommended by the overcurrent protective device coordination study per Section 26 05 73 - Power System Studies.

B. Field adjustments of trip setting and adjustment or replacement of equipment to comply with Section 26 05 73 - Power System Studies; no additional cost to Owner.

3.08 CLEANING

A. Clean switchgear during construction phase, prior to initial testing and energization, and prior to final punch list, after other trades have departed. Cleaning procedures shall be as follows:

(1) Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

(2) Rack out circuit breakers and remove arc chutes.

(3) Wipe down surfaces, including arc chutes and circuit breakers with Endust or equivalent.

(4) Use paintbrush to dust small, hard-to-reach crevices.

3.09 DEMONSTRATION

A. Provide training session by manufacturer for one workday at a job location, to train the Owner’s personnel in the operation and maintenance of switchgear.

END OF SECTION 26 23 00

SECTION 26 24 13 - SWITCHBOARDS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems

M. Section 26 43 00 - Surge Protective Devices (SPD)

1.02 DESCRIPTION

A. Section includes free-standing, dead-front type low-voltage distribution switchboards.

1.03 REFERENCE STANDARDS

A. ANSI/IEEE C37.13 – Low-Voltage AC Power Circuit Breakers Used in Enclosures
B. ANSI/NECA 400 – Recommended Practice for Installing and Maintaining Switchboards
C. IEEE C62.41.1 - Guide on the Surges Environment in Low-Voltage (1000 V and Less) AC Power Circuits
D. IEEE C62.41.2 - Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits
E. NFPA 70– National Electrical Code
F. NEMA AB 1 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures
G. NEMA AB 3 – Molded-Case Circuit Breakers and Their Applications
H. NEMA FU 1 – Low-Voltage Cartridge Fuses
I. NEMA BS 31047 – Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)
J. NEMA PB 2 – Dead-Front Distribution Switchboards
K. NEMA PB 2.1 – General Instructions for Proper Handling, Installation and Maintenance of Dead-Front Distribution Switchboards Rated 600 Volts or Less
L. NEMA EN 10250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
M. UL 98– Enclosed and Dead-Front Switches
N. UL 486A-486B – Wire Connectors
O. UL 489 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures
P. UL 869A – Reference Standard for Service Equipment
Q. UL 891 – Dead-Front Switchboards
R. UL 1053 – Ground-Fault Sensing and Relaying Equipment
S. UL 1066 – Low-Voltage AC and DC Power Circuit Breakers Used in Enclosures

1.04 SUBMITTALS

A. Product Data: For each switchboard, components and accessories indicated:
   (1) Include data on features and components and complete description; submit catalog cut sheets showing voltage, size, rating and size of surge protective devices, switching and overcurrent protective devices.
   (2) Features, characteristics, factory settings and time-current curves of individual protective devices, auxiliary components and ground fault relaying.
B. Shop Drawings:
   (1) For each switchboard specified in this Section:

(a) General Arrangement:

1) Indicate front, plan, and side views of switchboards; access requirements (front, side, rear); overall dimensions and components list; shipping splits and weights.

2) Front elevation indicating location of devices and instruments.

3) Sections through switchboard showing space available for conduits.

(b) Conduit entrance locations and requirements.

(c) Nameplate legends.

(d) Configuration, size and number of bus bars for each phase and current rating of buses.

(e) Ground bus.

(f) Neutral bus.

(g) Short circuit ratings of switchboards and overcurrent protective devices, and bus withstand rating.

(h) Instrument details; enclosure types and details.

(i) Wiring diagrams: power, signal and control wiring.

(j) Utility company's metering provisions with indication of approval by utility company.

(k) Descriptive documentation of optional barriers specified for electrical insulation and isolation.

(l) UL listing for series rating of installed devices.

(2) Contractor to submit 1/4" (1:50) scale floor plans with switchboard locations and required clearances and service space around equipment.

C. Manufacturer's Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Complete review of this specification noting for each paragraph whether proposed equipment complies with project specifications or deviates. Justification must be given for each deviation.

F. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations, configurations, and ratings of switchboard and major components on single-line diagrams and plan layouts.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.

(c) Include spare parts data listing, source, and current prices of replacement parts and supplies.

(d) Include Manufacturer Seismic Qualification Certification and Installation Seismic Qualification Certification.

(e) Include time-current curves, including selectable ranges for each type of overcurrent protective device.

1.05 QUALITY ASSURANCE

A. Obtain switchboards from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with Manufacturer Seismic Qualification Certification: Submit certification that switchboards, accessories, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchboards as required to prevent condensation.

B. Deliver switchgear in _____, individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes, and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Handle switchboards in accordance with NEMA PB 2.1 and ANSI/NECA 400. Use factory-installed lifting provisions. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.

(1) Potential Transformer Fuses: Equal to 10% of amount installed for each size and type, but no fewer than 2 of each size and type.

(2) Control-Power Fuses: Equal to 10% of amount installed for each size and type, but no fewer than 2 of each size and type.

(3) Fuses for Fused Switches and for Fused Circuit Breakers: Equal to 10% of amount installed for each size and type, but no fewer than 3 of each size and type.

(4) Indicating Lights: _____

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Schneider Square D

B. ABB

C. Eaton Cutler-Hammer

D. Siemens

2.02 RATINGS

A. Nominal system voltage: _____.

B. Main bus continuous amp: _____.

C. Short circuit current rating: _____.

D. Brace switchboard components to withstand mechanical forces for symmetrical fault current shown.

2.03 CONSTRUCTION

A. NEMA PB 2, UL 891

B. Free-standing, dead-front type; vertical sections bolted together; sides and rear covered with removable bolt-on covers; adequate ventilation within enclosure; supporting frame: steel _____ rigidly fastened together, with same outside dimensions as the enclosure.

C. Adequate strength and rigidity necessary to resist conditions of use to which it may be subjected and to support equipment, devices and appurtenances contained therein.

D. Barriers shall be placed such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations

E. Incoming lug locations: _____, as applicable per drawings.

F. _____

G. Environmental Limitations:

(1) Ambient temperatures: Not exceeding 40°C.

(2) Altitude: Not exceeding _____

(3) Temperature rise: Not to exceed 65°C over a 40°C ambient environment, with no derating required.

H. Device Mounting and Type:

(1) Front accessible switchboard: _____ for placement against the wall:

(a) Main and tie device: _____.

(b) Feeder devices: Panel mounted _____.

(c) Devices: Front removable; load connections: Front accessible.

(2) Front and side accessible switchboard: _____ for placement against the wall:

(a) Main and tie device: _____.

(b) Feeder devices: Panel mounted _____.

(c) Devices: Front removable; load connections: Front accessible.

(3) Front and rear accessible switchboard: _____.

(a) Main and tie device: _____.

(b) Feeder devices: _____.

(c) Devices: Front removable; load connections: Front and rear accessible.

I. Bus:

(1) Material: _____; copper: 98% conductivity. The bus bars shall have sufficient cross-sectional area to meet UL 891 temperature rise requirements through actual tests. The bus bars shall be _____.

(2) Connections:

(a) Bolted:

1) Not fewer than 4 bolts for each 4” x 4” (100 mm x 100 mm) contact.

2) Not fewer than 2 bolts for each 2” x 2” (50 mm x 50 mm) contact.

3) Grade 5 bolts and conical spring-type washers.

4) Clamp joints are not allowed.

(3) Sizing: Standard size, based on 65°C over 40°C.

(4) Main Phase Buses: Three phase, _____ wire; fully rated; uniform capacity for entire length of switchboard; ampacity as indicated on drawings; rated for the main protective device frame size or main incoming conductors.

(5) All feeder device line and load connection straps: Rated to carry current rating of device frame (not trip rating).

(6) Support for Buses: Mounted on high-impact, non-tracking insulated supports; joints in the vertical bus are not permitted.

(7) Bus arrangement: A-B-C (left to right, top to bottom, front to rear).

J. Ground Bus: Insulated, extend length of switchboard.

(1) 1/4” x 2” (6 mm x 50 mm) minimum-size, hard-drawn copper of 98 percent conductivity, equipped with pressure connectors for feeder ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection.

K. Neutral Bus: _____ of the ampacity of phase buses, as indicated on drawings, equipped with pressure connectors for outgoing circuit neutral cables. Bus extensions for busway feeder neutral bus are braced.

L. Main incoming compartment.

M. Hinged Front Doors: Allow access to metering and accessory compartments; concealed hinges; fastened by head bolts.

N. Cable Supports: For each vertical section.

O. Vertical Insulating Barrier: Between the device compartment and bus compartment.

P. Vertical Insulating Barrier: Between the bus compartment and cable compartment.

Q. Barriers: Between adjacent sections.

R. Hinged Front Doors: Over device compartments, with concealed hinges and fastened by hex head bolts.

S. Hinged Rear Doors and Compartment Covers: With concealed hinges and fastened by hex head bolts.

T. Bus Connections: Extend from load side of devices into rear compartment for connections to outgoing cables.

U. All buswork shall have 30 cycles withstand rating.

V. Utility Metering Compartment: Fabricated compartment barriered from rest of the section, with a hinged lockable front cover and removable bus links, complying with utility company’s requirements. If separate vertical section is required for utility metering, match and align with basic switchboard. Metering equipment: Provisions for mounting current transformers and potential transformers; meter base(s), metering conductors and miscellaneous appurtenances required by serving utility.

W. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.

(1) Pull Section: _____ Arrange _____

X. Pull Box on Top of Switchboard:

(1) Adequate ventilation to maintain temperature in pull box within same limits as switchboard.

(2) Removable top, front, and sides, same construction as switchboard.

(3) Insulating, fire-resistive bottom with separate holes for cable drops into switchboard.

(4) Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.

(5) _____.

Y. Future Provisions: Fully equip spaces for future devices with bussing, mounting brackets, supports, and appurtenances, insulated and braced for short circuit currents, with continuous current rating _____. Extension of phase, neutral, and ground buses from both ends.

Z. Adequate lifting means.

AA. Dimensions: _____ maximum height, excluding floor sills, lifting members and pull boxes. Length and depth indicated _____ on the drawing are maximum allowed.

BB. Line and Load Terminations: _____ type accessible from _____ of switchboard, _____; suitable for number, size and trip ratings.

CC. Enclosure: Steel, NEMA EN 10250, Type _____:

(1) Outdoor Non-walk-in Enclosure: Lifting plates at base of structure, hinged aisle doors with rubber gaskets and padlocking provision, asphalt base undercoating on exterior bottom, interior lights, space heater per vertical section, outlets, light switch and space heater switch.

(a) Space Heater: Factory-installed electric space heater of sufficient wattage in each vertical section to maintain enclosure temperature above expected dew point.

1) Space-Heater Control: Thermostats to maintain temperature of each section above expected dew point.

2) Space-Heater Power Source: _____.

(2) Outdoor Walk-in Enclosure:

(a) Outdoor sections: Same width as indoor sections except end sections shall be wider to allow for opening of inner door; designed to withstand wind velocities of _____ .

(b) A minimum of 42” (1070 mm) front aisle depth in front for walk-in structures.

(c) Rear hinged padlockable doors with wind stops for each section.

(d) Aisle doors shall be equipped with provisions for padlocking.

(e) Steel floor in walk-in aisle space and under each vertical section

(f) Anti-skid floor strip in aisle way

(g) Panic hardware on aisle doors at each end of line-up

(h) Exterior padlocking of door shall not prevent operation of panic hardware from interior of enclosure.

(i) Enclosure: Rear sloping roof

(j) Overhead circuit breaker lifter

(k) Ventilating louvers with insect and rodent screen and replaceable fiberglass filters; filters: removable from exterior of enclosure.

(l) Interior aisle vaporproof fluorescent lights with low-temperature ballasts, 3-way switches at each entrance and GFCI protected receptacles, a minimum of two.

(m) Space heaters with thermostatic controls for breaker, bus and cable compartments.

(n) Power for lights, receptacles and space heaters shall be obtained from _____; supply voltage: 120 VAC

(3) Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer’s standard gray finish over a rust-inhibiting primer on treated metal surface.

(4) Enclosure Finish for Outdoor Units: Factory-applied finish in manufacturer’s standard color, undersurfaces treated with corrosion-resistant undercoating.

2.04 SERVICE ENTRANCE

A. UL 869A

B. Switchboards labeled as suitable for use as service entrance equipment, where applicable, with incoming line isolation barriers, and a removable neutral bond to switchboard ground for solidly grounded wye systems.

C. Surge arrestors on all phases: per requirements in Section 26 43 00 - Surge Protective Devices (SPD).

2.05 SHORT CIRCUIT CURRENT RATING

A. Each switchboard with minimum short circuit current rating as indicated on drawings.

B. Switchboards: Marked with their maximum short circuit current rating at supply voltage.

C. Switchboards: _____.

2.06 SURGE PROTECTIVE DEVICES (SPD)

A. _____.

B. IEEE C62.41.1; integrally mounted, plug-in style, solid-state, parallel-connected, suppression and filtering modules

C. Per requirements in Section 26 43 00 - Surge Protective Devices (SPD)

2.07 OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breaker: NEMA AB 1, NEMA AB 3, UL 489; lockable handle; interrupting capacity to meet available fault current.

(1) Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit breaker trip ratings _____ and below.

(2) Electronic (solid-state microprocessor based) trip unit circuit breakers: digital true RMS sensing trip units; interchangeable in the field within the frame size (field-replaceable rating plug to determine the breaker trip rating), field-adjustable settings and the following trip functions for circuit breaker trip ratings ___ - 1200 A:

(a) Instantaneous trip

(b) Long- and short-time pickup levels

(c) Long- and short-time time delay adjustments with I2t response

(d) Ground-fault pickup level, time delay, and I2t response

(3) Current-Limiting Circuit Breakers: No fusible element, frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.

(4) Integrally Fused Circuit Breakers: Thermal-magnetic trip element with current-limiting fuses; trip activation on fuse opening or on opening of fuse compartment door.

B. Molded-Case Circuit Breaker Features and Accessories: Standard frame sizes, trip ratings, and number of poles.

(1) Communication Capability: _____ communication module with functions and features compatible with power monitoring and control system, specified in Section 26 09 13 - Electrical Power Monitoring and Control.

(2) Shunt Trip: 120 V trip coil energized from separate circuit, set to trip at _____ of rated voltage.

(3) Undervoltage Trip: 120 V, set to operate at 35 to 75% of rated voltage _____ time delay.

(4) Auxiliary Contacts: _____ with “a" and “b“ contacts; “a“ contacts mimic circuit breaker contacts, “b“ contacts operate in reverse of circuit breaker contacts.

(5) Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.

(6) Position: ON and OFF, clearly marked on escutcheon; trip-to-test means on the escutcheon for manually tripping the breaker and exercising the mechanism and trip latch.

C. Enclosed, Insulated-Case Circuit Breaker and Accessories: NEMA AB 1, UL 489; fully rated circuit breaker with interrupting capacity rating to meet available fault current.

(1) _____ circuit breaker mounting. Drawout design: Circuit breaker to be withdrawn from an engaged position, to a test position, and to a disengaged position.

(2) Two-step, stored-energy closing; _____ operated.

(3) A charging handle, closed pushbutton, open pushbutton and Off/On/Charge indicator located on the breaker escutcheon and visible with the breaker compartment closed.

(4) Electronic (solid-state microprocessor-based) trip units with interchangeable rating plug, trip indicators, field-adjustable settings and the following trip functions:

(a) Instantaneous trip.

(b) Long- and short-time pickup levels.

(c) Long- and short-time time delay adjustments with I2t response.

(d) Ground-fault pickup level, time delay, and I2t response.

(5) Local and remote trip indication and control.

(6) Shunt Trip: 120 V trip coil energized from separate circuit, set to trip at _____ of rated voltage, where indicated.

(7) Undervoltage Trip: 120 V, set to operate at 35 to 75% of rated voltage _____ time delay.

(8) Auxiliary Contacts: _____ with “a“ and “b“ contacts; “a“ contacts mimic circuit breaker contacts, “b“ contacts operate in reverse of circuit breaker contacts.

(9) Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 26 09 13 - Electrical Power Monitoring and Control.

(10) Key Interlock Kit: Externally mounted to prohibit circuit breaker operation; key shall be removable only when circuit breaker is in OFF position.

(11) Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground fault protection function and/or short time function.

(12) Control Voltage: _____ V _____.

(13) Listed for 100% of breaker’s continuous ampere rating.

D. Power Circuit Breaker and Accessories: ANSI/IEEE C37.13; UL 1066; metal frame; field interchangeable electrical accessories, including shunt trip, spring release, electrical operator, auxiliary contacts and trip unit.

(1) Ratings: As indicated for continuous, interrupting, and short-time current ratings for each circuit breaker; voltage and frequency ratings same as switchboard.

(2) Operating Mechanism: Mechanically and electrically trip-free, stored-energy operating mechanism with the following features:

(a) Normal Closing Speed: Independent of both control and operator.

(b) Slow Closing Speed: Optional with operator for inspection and adjustment.

(c) Store-Energy Mechanism: _____.

(d) Means for manual opening and closing

(e) Operation counter

(3) Trip Devices: Electronic (solid-state, microprocessor-based) overcurrent trip-device system consisting of one or two current transformers or sensors per phase, a release mechanism, and the following features:

(a) Functions: Long-time pickup and delay, short-time pickup and delay, ground-fault pickup and delay and instantaneous trip functions, independent of each other in both action and adjustment.

(b) Temperature Compensation: Ensures accuracy and calibration stability from 23°F to 104°F (-5°C to 40°C).

(c) Field-adjustable time-current characteristics.

(d) Current Adjustability: Dial settings and ratings plugs on trip units or sensors on circuit breakers, or a combination of these methods.

(e) Three bands, minimum, for long-time- and short-time-delay functions; marked “minimum,” “intermediate,” and “maximum.”

(f) Pickup Points: Five minimum, for long-time- and short-time-trip functions. Equip short-time-trip function for switchable I2t operation.

(g) Pickup Points: Five minimum, for instantaneous-trip functions.

(h) Trip Indication: Labeled, battery-powered lights or mechanical targets on trip device to indicate type of fault.

(4) Auxiliary Contacts: For interlocking or remote indication of circuit breaker position, with spare auxiliary switches and other auxiliary switches required for normal circuit breaker operation. Each consists of two type “a” and two type “b” contacts wired through secondary disconnect devices to a terminal block in stationary housing; “a” contacts mimic circuit breaker contacts, “b” contacts operate in reverse of circuit breaker contacts.

(5) Drawout Features: Circuit breaker mounting assembly equipped with a racking mechanism to position circuit breaker and hold it rigidly in connected, test, and disconnected positions. Include the following features:

(a) Interlocks: Prevent movement of circuit breaker to or from connected position when it is closed, and prevent closure of circuit breaker unless it is in connected, test, or disconnected position.

(b) Circuit Breaker Positioning: An open circuit breaker may be racked to or from connected, test, and disconnected positions only with the associated compartment door closed unless live parts are covered by a full dead-front shield. An open circuit breaker may be manually withdrawn to a position for removal from the structure with the door open. Status for connection devices for different positions includes the following:

1) Test Position: Primary disconnect devices disengaged, and secondary disconnect devices and ground contact engaged.

2) Disconnected Position: Primary and secondary devices and ground contact disengaged.

(6) Arc Chutes: Readily removable from associated circuit breaker when it is in disconnected position and arranged to permit inspection of contacts without removing circuit breaker from switchboard.

(7) Padlocking Provisions: For installing at least three padlocks on each circuit breaker to secure its enclosure and prevent movement of drawout mechanism.

(8) Operating Handle: One for each circuit breaker capable of manual operation.

(9) Electric Close Button: One for each electrically operated circuit breaker.

(10) Mechanical Interlocking of Circuit Breakers: Uses a mechanical tripping lever or equivalent design and electrical interlocks.

(11) Key Interlocks: Arranged so keys are attached at devices indicated. Mountings and hardware are included where future installation of key interlock devices is indicated.

(12) Undervoltage Trip Devices: Instantaneous, with adjustable pickup voltage.

(13) Undervoltage Trip Devices: Adjustable time-delay and pickup voltage.

(14) Shunt-Trip Devices: Where indicated.

(15) Indicating Lights: To indicate circuit breaker is open or closed, for main and bus tie circuit breakers interlocked with each other or with exterior devices.

(16) Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 26 09 13 - Electrical Power Monitoring and Control.

(17) Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground fault protection function, and/or short time function.

(18) Control Voltage: _____ V _____

(19) Trip Voltage: _____ V _____, close and charge

(20) Listed for 100% of breaker’s continuous ampere rating.

E. Circuit Breaker Electronic Trip Units general characteristics:
   (1) Circuit breakers, with solid-state microprocessor based trip units:
      (a) Unit shall consist of current sensors, solid-state trip device, and solid-state adjustable time/current curve shaping elements.
      (b) Trip units shall be removable to allow for field upgrades.
      (c) Trip units shall incorporate “True RMS Sensing.”
   (2) Solid-state elements shall provide functions as indicated above.
   (3) Adjustments shall be made using non-removable, discrete steps.
   (4) Sealable transparent cover shall be provided over adjustments.
   (5) Adjustable long-time pickup (Ir) and delay shall be available in an adjustable rating plug that is UL listed as field replaceable. Adjustable rating plug shall allow for five minimum long-time pickup settings from 0.4 to 1.0 times the sensor plug (In). Other adjustable rating plugs shall be available for more precise settings to match the application. Long-time delay settings shall be at least three bands.
   (6) Short-time pickup shall allow for five minimum settings from 1.5 to 10 times Ir. Short-time delay shall be at least three bands with I2t ON and OFF.
   (7) Instantaneous settings on the trip units shall be available in five minimum bands from 2 to 15 times In. The instantaneous settings shall also have an OFF setting when short-time pickup is provided.
   (8) Trip units shall have the capability to electronically adjust the settings locally and remotely to fine increments below the switch settings. Fine increments for pickup adjustments are to be one ampere. Fine increments for delay adjustments are to be one second.
   (9) Trip unit shall indicate:
      (a) Long-time fault
      (b) Short-time fault
      (c) Instantaneous fault
      (d) Ground fault, where provided
   (10) Trip unit shall provide local trip indication and capability to indicate local and remote reason for trip, i.e., overload, short circuit or ground fault.
   (11) Trip unit shall contain means to conduct circuit breaker test, or via separate test kit.
   (12) Breaker shall be equipped with externally accessible test points to be used for field testing.
   (13) Trip units shall be available to provide real time metering. Metering functions include current, voltage, power and frequency.
   (14) Trip units shall be provided with the following standard features:
      (a) True RMS sensing
      (b) LI
      (c) LSI
      (d) LSIG/Ground-fault trip
      (e) Ground Fault Alarm (no trip), with external relay, where required
      (f) Adjustable rating plugs
      (g) LCD or LED – Long-time pickup
      (h) LCD or LED – Trip indication
      (i) Digital Ammeter
      (j) Communications
      (k) LCD dot matrix display
      (l) Advanced user interface
      (m) Protective relay functions
      (n) Neutral protection
      (o) Incremental fine tuning of settings
      (p) Selectable long-time delay bands
      (q) Power measurement
      (r) Maximum peak demand (measure of average power over a 15-minute period) continuously recorded over a one-year period
F. Ground Fault protection equipment on breakers, where indicated: _____ relay and trip unit, push-to-test feature and ground fault indicator:
   (1) Ground-fault protection with at least three adjustable short-time delay settings and three trip-time delay bands; adjustable current pickup with maximum setting of 1200 amps. Arrange to provide protection for the following:
      (a) Three-wire circuit or system

(b) Four-wire circuit or system

(c) Four-wire, double-ended substation

(2) Trip units shall be capable of the following types of ground-fault protection: _____. Ground fault sensing systems shall be changed in the field.

(3) Neutral current transformers shall be provided for 4-wire system.

(4) Ground-fault settings for circuit breaker sensor sizes 1200 A or below shall be in nine bands from 0.2 to 1.0 times In. The ground-fault settings for circuit breakers above 1200 A shall be in minimum three bands up to 1200 A.

(5) Ground-Fault Relay: UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and 3-phase current transformer/sensor.

G. Arc Energy Reduction on breakers rated or adjustable to 1200A or larger.

(1) Provide one of the following methods to reduce clearing time to less than the available arcing current:

(a) _____

H. Bolted-Pressure Contact Switch: Operating mechanism uses rotary-mechanical-bolting action to produce and maintain high clamping pressure on the switch blade after it engages the stationary contacts.

I. High-Pressure, Butt-Type Contact Switch: Operating mechanism uses butt-type contacts and a spring-charged mechanism to produce and maintain high-pressure contact when switch is closed.

(1) Main Contact Interrupting Capability: 12 times the switch current rating, minimum.

(2) Operating Mechanism: Manual handle operation to close switch; stores energy in mechanism for closing and opening.

(a) Electrical Trip: Operation of lever or push-button trip switch, or trip signal from ground-fault relay or remote-control devices, causes switch to open.

(b) Mechanical Trip: Operation of mechanical lever, push button, or other devices causes switch to open.

(3) Auxiliary Switches: Factory installed, single pole, double throw, with leads connected to terminal block, and including one set more than quantity required for functional performance indicated.

(4) Service-Rated Switches: Labeled for uses as service equipment.

(5) Ground-Fault Relay: UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and three-phase current transformer/sensor.

(a) Configuration: _____ relay and trip unit with adjustable pickup and time delay settings, push-to-test feature, and ground fault indicator.

(b) Internal Memory: Integrates the cumulative value of intermittent arcing ground-fault currents and uses the effect to initiate tripping.

(c) No-Trip Relay Test: Permits ground-fault simulation test without tripping switch.

(d) Test Control: Simulates ground fault to test relay and switch (or relay only if “no-trip” mode is selected).

(6) Open-Fuse Trip Device: Arranged to trip switch open if a phase fuse opens.

J. Fused Switch: NEMA BS 31047, UL 98; enclosed knife switch _____ type, external lockable operable handle, clips or pads to accommodate specified fuses:

(1) Rejection clips for Class R fuses

(2) Provision for Class J or Class L fuses, as applicable

(3) Fuses per requirements in Section 26 28 13 - Fuses

2.08 CONTROL POWER, COMPONENTS IDENTIFICATION, AND CONTROL WIRING

A. Control Circuits: 120 V, supplied through secondary disconnecting devices from control-power transformer.

B. Electrically Interlocked Main and Tie Circuit Breakers: Two control-power transformers in separate compartments, with interlocking relays, connected to the primary side of each control-power transformer at the line side of the associated main circuit breaker. 120 V secondaries connected through automatic transfer relays to ensure a fail-safe automatic transfer scheme.

C. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

D. Control components mounted within assembly, such as relays, pushbuttons, switches, etc.: Suitably marked for identification, corresponding to appropriate designations on manufacturer’s wiring diagrams.

E. Control Wiring: Factory installed, with bundling, lacing, and protection included; flexible conductors for #8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units; insulated locking spade terminals for all control connections, except where saddle type terminals, integral to a device; current transformer secondary leads, connected to short circuit terminal blocks; terminal blocks with suitable numbering strips for group of control wires leaving switchboard, with wire markers at each end of control wiring.

2.09 ACCESSORY COMPONENTS AND FEATURES

A. Furnish portable test set to test functions of solid-state trip devices without removal from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.

B. Furnish accessory set including tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

C. Furnish one portable, floor-supported, roller-based, elevating carriage arranged for movement of circuit breakers in and out of compartments for present and future circuit breakers.

D. Furnish overhead circuit breaker lifting devices, mounted at top front of switchboard, with hoist and lifting yokes matching each drawout circuit breaker.

E. Furnish set of tools for manually charging circuit breaker stored energy device.

F. Lockout Devices: Circuit breakers with integral, lockout/tagout devices.

G. Provide energy-reducing maintenance switching with local status indicator for all breakers 1200A and higher.

2.10 CUSTOMER METERING

A. Per requirements in Section 26 27 13 - Electrical Metering.

PART 3 - EXECUTION

3.01 COORDINATION

A. Instruct manufacturer about the location of incoming lugs, i.e., top or bottom feed based on incoming feeder entrance location.

B. Coordinate installation of housekeeping concrete pad based on actual equipment supplied:

(1) Concrete: Per requirements in Division 03 – Concrete.

(2) Dimensions: Per requirements in Section 26 05 29 - Hangers and Supports for Electrical Systems.

C. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

D. Coordinate with busway system manufacturer factory installation of termination fittings.

E. Coordinate utility company metering equipment requirements.

F. Verify with manufacturer that “touch-up” paint kit is available for repainting.

3.02 EXAMINATION

A. Examine areas and surface to receive switchboards for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for switchboard mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.03 INSTALLATION

A. Install switchboard in accordance with NEMA PB 2.1 and ANSI/NECA 400.

B. Switchboard mounting and seismic restraints:

(1) Install switchboard anchorage devices and seismic restraints based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.

(2) Bolt switchboards to concrete housekeeping pads, using anchor bolts in accordance with Section 26 05 29 - Hangers and Supports for Electrical Systems. Cast anchor bolt inserts into pads.

(3) Install bushing assemblies for anchor bolts for seismic restraints per requirements in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems.

C. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification for each switchboard, every instrument, overcurrent protective device and disconnect device. Attach nameplate to exterior of each switchboard using small corrosion-resistant metal screws and rivets. Do not use contact adhesive. Indicate switchboard manufacturer’s name and drawing number, name, amperage, voltage, phase, number of wires, short circuit current rating (amp, RMS symmetrical and MVA 3-phase symmetrical) and momentary and fault-closing ratings (amp, RMS asymmetrical). For each overcurrent protective device and disconnect device, include circuit, load and area served, voltage/phase rating, and fuse size and type, when applicable.

D. Provide framed, printed operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of switchboards.

E. Install switchboards in dedicated electrical space per NFPA 70, and as indicated on drawings.

F. Tighten electrical connectors and terminal according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

G. Install fuses in fusible switch at job site per requirements in Section 26 28 13 - Fuses.

H. Install surge arrestors in cable termination compartments and connect to each phase of circuit, per requirements in Section 26 43 00 - Surge Protective Devices (SPD).

I. Connect surge protective devices to switchboard bus per requirements in Section 26 43 00 - Surge Protective Devices (SPD).

J. Install utility company metering equipment, devices and wiring in conformance with serving utility requirements.

K. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

L. Apply temporary heat to maintain temperature according to manufacturer's written instructions.

3.04 CONNECTIONS

A. Ground switchboards according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Connect power and control wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

3.05 FIELD QUALITY CONTROL

A. Inspect switchboards for physical damage, proper alignment, connections, anchorage, seismic restraints and grounding.

B. Test continuity of each circuit.

C. Test switchboards per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

D. Interpret test results in writing and submit to Engineer.

E. Test switch operators _____ after energizing.

3.06 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.07 ADJUSTING

A. Set field-adjustable circuit breakers trip settings or change the trip settings to values indicated on drawings or recommended by the overcurrent protective device coordination study per Section 26 05 73 - Power System Studies.

B. Field adjustments or changing of trip setting and adjustment or replacement of equipment to comply with Section 26 05 73 - Power System Studies; no additional cost to Owner.

3.08 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

3.09 DEMONSTRATION

A. Provide training session by manufacturer for one workday at a job location, to train the Owner's personnel in the operation and maintenance of switchboards.

END OF SECTION 26 24 13

SECTION 26 24 16.13 - LIGHTING AND APPLIANCE PANELBOARDS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems
D. Section 26 05 33 - Raceway and Boxes for Electrical Systems
E. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems
F. Section 26 05 53 - Electrical Systems Identification
G. Section 26 05 73 - Power System Studies
H. Section 26 08 12 - Power Distribution Acceptance Tests
I. Section 26 08 13 - Power Distribution Acceptance Test Tables
J. Section 26 27 13 - Electrical Metering

1.02 DESCRIPTION

A. Section includes circuit breaker type lighting and appliance branch circuit panelboards as shown on drawings and as scheduled.

1.03 REFERENCE STANDARDS

A. NECA 407 - Recommended Practice for Installing and Maintaining Panelboards
B. NEMA EN 10250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
C. NEMA AB 1 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures
D. NEMA PB 1 - Panelboards
E. NEMA PB 1.1 - General Instructions for Proper Installation, Operation, and Maintenance of Panelboards Rated 600 Volts or Less
F. NFPA 70 - National Electrical Code
G. UL 50 - Enclosures for Electrical Equipment
H. UL 67 - Panelboards
I. UL 486A-486B - Wire Connectors
J. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures
K. UL 869A - Reference Standard for Service Equipment

1.04 SUBMITTALS

A. Product Data:
   (1) Submit catalog data showing specified features of standard products. Eliminate extraneous catalog data.
B. Shop Drawings:
   (1) Submit for review prior to manufacture. Include complete description, front view, dimensions, voltage, main bus ampacity, circuit breaker arrangement and sizes, short circuit current rating, and factory settings of individual protective devices.
   (2) Submit 1/4” (1:50) scale electrical room floor plans with panelboard locations.
C. Partial Submittals:
   (1) Panelboards shall be submitted for review together. Partial submittals of panelboards are not acceptable and will be rejected.
D. Manufacturer’s Installation Instructions:
   (1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.
E. Test Reports:
   (1) Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.
F. Closeout Submittals:
   (1) Project Record Documents:
      (a) Record actual locations of panelboards and record actual circuiting arrangements.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.

(c) Include time-current curves and selectable ranges for each type of overcurrent protective device.

(d) Include spare parts data listing, source, and current prices of replacement parts and supplies.

(e) Include manufacturer's Seismic Qualification Certification and Installation Seismic Qualification Certification.

1.05 QUALITY ASSURANCE

A. Obtain panelboards, overcurrent protective devices, components, and accessories from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with manufacturer's Seismic Qualification Certification: Submit certification that panelboards, overcurrent protective devices, accessories, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Comply with NEMA PB 1.1 and manufacturer's written instructions.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials:

(1) Furnish Owner with two keys per panelboard.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Schneider Square D

B. ABB

C. Eaton Cutler Hammer

D. Siemens

2.02 LIGHTING AND APPLIANCE BRANCH CIRCUIT PANELBOARDS

A. NEMA PB 1, UL 67 [98]

B. Fabrication:

(1) Factory assembled.

(2) Branch mains: _____ .

(3) _____.

(4) Incoming feeder lugs: _____ conductors.

(5) Multiple lugs to match number of conductors per phase.

(6) Sub-feed (double) lugs, or feed-through lugs where indicated.

(7) Filler plates.

(8) Wiring terminals for field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

(9) Unless otherwise noted on plans, panelboards fed from below shall have mains located at the bottom of the panel and panelboards fed from above shall have mains located at the top of the panel.

C. Panelboard Buses:

(1) _____
(2) Ampere rating as scheduled
(3) Ground bus: uninsulated, bonded to panelboard cabinet
(4) Insulated neutral bus: _____% of phase bus rating

D. Molded-Case Circuit Breakers:
(1) NEMA AB 1, UL 489
(2) _____ type, labeled for 75°C copper and aluminum conductors
(3) Quick-make, quick-break, with thermal-magnetic trip.
(4) Common internal trip on multi-pole breakers. Handle-ties are not permitted.
(5) Ampere rating as scheduled
(6) Listed as Type SWD for lighting circuits
(7) Listed as Type HACR for air conditioning equipment circuits
(8) Bussing, device mounting hardware, and steel knockouts in dead front where “space” is indicated
(9) Tandem circuit breakers are not acceptable
(10) For trip ratings below _____ : thermal magnetic trip
(11) For trip ratings _____ and above: electronic trip units interchangeable in the field within the frame size and field adjustable _____ and instantaneous current settings. Each adjustment shall have discrete settings and shall be independent of all other adjustments.
(12) Ground fault equipment protection (GFEP), rated 30 mA trip, to provide equipment protection for branch circuits feeding electrical heat tracing, where indicated
(13) Ground fault circuit interrupter (GFCI), rated at 4-6 mA trip for protection of personnel, where indicated

E. Cabinet
(1) NEMA EN 10250, UL 50
(2) NEMA Type 1, Type 3R (outdoor locations) _____ enclosure.
(3) Front (trim) _____ mounted with door in front with concealed self-adjusting trim clamps, and complete with cylinder-type lock and catch.
(4) Same height matching trim, where two cabinets are mounted adjacent to one another in finished areas.
(5) All sections of panelboards have the same size, where oversize cabinets are required for one section of multi-section panelboard.
(6) Boxes and fronts made of code-gauge galvanized steel.
(7) _____.

2.03 METERS

A. Provide separate metering compartments with digital meter in accordance with Section 26 27 13 - Electrical Metering.

2.04 SERVICE ENTRANCE

A. UL 869A.
B. Panelboards labeled as suitable for use as service entrance equipment where applicable and must include connection for bonding and grounding of neutral conductor.

2.05 SHORT CIRCUIT CURRENT RATING

A. Each panelboard with minimum short circuit current rating as indicated on drawings.
B. Panelboards marked with their maximum short circuit current rating at supply voltage.
C. Panelboards: _____.

2.06 SURGE PROTECTIVE DEVICES (SPD)

A. _____.

2.07 SPARE CONDUITS

A. Spare conduits per requirements in Section 26 05 33 - Raceway and Boxes for Electrical Systems.

PART 3 - EXECUTION

3.01 COORDINATION WITH MANUFACTURER

A. Instruct manufacturer about the location of additional wiring gutter space when required (i.e., top, bottom, right, left, or combination).
B. Instruct manufacturer about the location of main lugs or main circuit breaker (i.e., top or bottom feed based on incoming feeder entrance location).

C. Instruct manufacturer to provide multiple lugs where conductors in parallel or sub-feed (double) lugs or feed-through lugs are indicated.

D. Instruct manufacturer on the size of cross-connection cables for panelboards fed via sub-feed (double) lugs or feed-through lugs. Make cable size with ampacity equal to incoming feeder.

E. Verify that “touch-up” paint kit is available for repainting.

3.02 EXAMINATION

A. Verify that space indicated for panelboard mounting meets code-required working clearances and dedicated equipment space.

B. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.03 INSTALLATION

A. Install panelboards in accordance with NECA 407 and NEMA PB 1.1.

B. Install panelboards plumb and rigid without distortion of box, in accordance with manufacturer's written instructions, and in compliance with recognized industry practices.

C. Panelboard mounting and seismic restraints:

(1) Install panelboard anchorage devices and seismic restraints based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.

(2) Fasten panelboards firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.

(3) Anchor and fasten panelboards and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 05 29 - Hangers and Supports for Electrical Systems.

(4) Install two rows of steel slotted channel, with a minimum of 4 attachment points, for each panelboard section.

(5) When not located directly on wall, provide support frame of steel slotted channel anchored to floor and ceiling structure.

D. Install top breaker handle a maximum of 6’-7” (2 m) above finished floor or working platform with handle in its highest position.

E. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

F. Install as-built typewritten circuit directory in directory frame (to indicate installed circuit loads) mounted inside each panelboard door. Include description of connected loads, room number, room name, area, or item served for each branch circuit. Indicate motor names and horsepower as applicable. Cover circuit directory with colorless plastic. Coordinate with Owner and Architect to ensure that room numbers used in panel directory are final numbers assigned by Owner.

G. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification. Attach nameplate to exterior of each panelboard using small metal screws or rivets. Do not use contact adhesive.

(1) Include panelboard name, amperage, voltage, phase, and number of wires.

H. Label spare circuits as SPARE. Leave spare breakers in OFF position.

I. Room numbers used shall be those used by Owner except as otherwise directed by Architect.

J. Install panelboard in dedicated electrical space per NFPA 70 and as shown on drawings. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

K. Install filler plates in unused spaces.

L. Install three 3/4” (21 mm) spare conduits stubbed into accessible ceiling space or space designated to be ceiling space in the future for all flush-mounted panelboards. Install conduits in accordance with requirements in Section 26 05 33 - Raceway and Boxes for Electrical Systems.

M. Install three 3/4” (21 mm) spare conduits stubbed into ceiling space above and below for panelboards that serve loads on levels other than that where the panelboard is located. Install conduits in accordance with requirements in Section 26 05 33 - Raceway and Boxes for Electrical Systems.

3.04 CONNECTIONS

A. Ground panelboards according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

3.05 FIELD QUALITY CONTROL

A. Inspect for physical damage, proper alignment, anchorage, and grounding.

B. Maintain proper phasing for multi-wire circuits.

C. Test main circuit breakers in accordance with requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

3.06 REPAINTING

A. Remove paint splatters or other marks from surface of panelboards.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.07 ADJUSTING

A. Adjust fronts, covers, hinges, and locks.

3.08 CLEANING

A. Clean panelboard interiors and exteriors prior to final inspection. Remove paint splatters and other spots, dirt and debris.

END OF SECTION 26 24 16.13

SECTION 26 24 16.16 - DISTRIBUTION PANELBOARDS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems
D. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems
E. Section 26 05 53 - Electrical Systems Identification
F. Section 26 05 73 - Power System Studies
G. Section 26 08 12 - Power Distribution Acceptance Tests
H. Section 26 08 13 - Power Distribution Acceptance Test Tables
I. Section 26 27 13 - Electrical Metering
J. Section 26 28 13 - Fuses

1.02 DESCRIPTION

A. Section includes circuit breaker type and fusible switch type power distribution panelboards as shown on drawings and as scheduled.

1.03 REFERENCE STANDARDS

A. NECA 407 - Recommended Practice for Installing and Maintaining Panelboards
B. NEMA EN 10250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
C. NEMA AB 1 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures
D. NEMA FU 1 - Low-Voltage Cartridge Fuses
E. NEMA BS 31047 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)
F. NEMA PB 1 - Panelboards
G. NEMA PB 1.1 - General Instructions for Proper Installation, Operation, and Maintenance of Panelboards Rated 600 Volts or Less
H. NFPA 70 - National Electrical Code
I. UL 50 - Enclosures for Electrical Equipment
J. UL 67 - Panelboards
K. UL 486A-486B - Wire Connectors
L. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures
M. UL 512 - Fuseholders
N. UL 869A - Reference Standard for Service Equipment

1.04 SUBMITTALS

A. Product Data:
   (1) Submit catalog data showing specified features of standard products. Eliminate extraneous catalog data.
B. Shop Drawings:
   (1) Submit for review prior to manufacture. Include complete description, front view, dimensions, voltage, main bus ampacity, circuit breaker fusible switch arrangement and sizes, short circuit current rating, and factory settings of individual protective devices.
   (2) Submit 1/4” (1:50) scale electrical room floor plans with panelboard locations.
C. Partial Submittals:
   (1) Panelboards shall be submitted for review together. Partial submittals of panelboards are not acceptable and will be rejected.
D. Manufacturer’s Installation Instructions:
   (1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.
E. Test Report:
   (1) Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

F. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations of panelboards and record actual circuiting arrangements.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.

(c) Include time-current curves and selectable ranges for each type of overcurrent protective device.

(d) Include spare parts data listing, source, and current prices of replacement parts and supplies.

(e) Include manufacturer's Seismic Qualification Certification and Installation Seismic Qualification Certification.

1.05 QUALITY ASSURANCE

A. Obtain panelboards, overcurrent protective devices, components, and accessories from one source and by a single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with manufacturer's Seismic Qualification Certification: Submit certification that panelboards, overcurrent protective devices, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Comply with NEMA PB 1.1 and manufacturer's written instructions.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials:

(1) Furnish Owner with two keys per panelboard.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Schneider Square D

B. ABB

C. Eaton Cutler Hammer

D. Siemens

2.02 POWER DISTRIBUTION PANELBOARDS

A. NEMA PB 1, UL 67.

B. Fabrication:

(1) Factory assembled

(2) Individualized breaker fusible switch dead-front cover _____

(3) Incoming feeder lugs: _____ conductors

(4) Multiple lugs to match number of conductors per phase

(5) Sub-feed (double) lugs, or feed-through lugs where indicated

(6) Filler plates

(7) Wiring terminals for field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

(8) Barriers shall be placed such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations.

(9) Unless otherwise noted on plans, distribution panelboards fed from below shall have mains located at the bottom of the panel and distribution panelboards fed from above shall have mains located at the top of the panel.

C. Panelboard Buses:

(1) _____

(2) Ampere rating as scheduled

(3) Ground bus: uninsulated, bonded to panelboard cabinet

(4) Insulated neutral bus where applicable: _____ of phase bus rating

D. Molded-Case Circuit Breakers:

(1) NEMA AB 1, UL 489

(2) Bolt-on or I-line type, labeled for 75°C copper and aluminum conductors

(3) Quick-make, quick-break, with _____.

(4) Equipped with individually insulated, braced, and protected connectors

(5) Common internal trip on multi-pole breakers. Handle-ties are not permitted.

(6) Ampere rating as scheduled

(7) Front face flush with each other

(8) Large, permanent, individual circuit numbers affixed to each breaker in uniform position

(9) Tripped indication clearly shown by breaker handle taking position between “ON” and “OFF.”

(10) Listed as Type HACR for air conditioning equipment circuits

(11) Bussing, device mounting hardware, and steel knockouts in dead front where “space” is indicated

(12) For trip ratings below _____ : thermal-magnetic trip

(13) For _____ trip ratings and above: electronic trip units interchangeable in the field within the frame size and field-adjustable _____, and instantaneous current settings. Each adjustment shall have discrete settings and shall be independent of all other adjustments.

(14) Provide energy-reducing maintenance switching with local status indicator for all breakers 1200A and higher.

E. Fusible Switches:

(1) NEMA BS 31047, NEMA FU 1, UL 512

(2) Labeled for 75°C conductors

(3) Quick-make quick-break with visible blades, externally operable handle and dual horsepower ratings.

(4) Handles to physically indicate “ON” and “OFF” position.

(5) Lockable only in “OFF” position and accept three industrial type heavy-duty padlocks.

(6) Covers and handles be interlocked to prevent opening in “ON” position, with means to permit release of interlock.

(7) Large permanent individual circuit numbers affixed to each fusible switch in uniform position.

(8) Rejection clips for Class R fuses specified.

(9) Provisions for Class J or Class L fuses, as applicable.

(10) Fuses: Per requirements in Section 26 28 13 - Fuses.

F. Cabinet

(1) NEMA EN 10250, UL 50

(2) NEMA Type 1, Type 3R (outdoor locations) enclosure.

(3) Four-piece front (trim) _____ mounted _____.

(4) Same height matching trim, where two cabinets are mounted adjacent to one another in finished areas.

(5) All sections of panelboards have the same size, where oversize cabinets are required for one section of multi-section panelboard.

(6) Boxes and fronts made of code-gauge galvanized steel

(7) _____.

2.03 METERS

A. Provide separate metering compartments with digital meter in accordance with Section 26 27 13 - Electrical Metering.

2.04 SERVICE ENTRANCE

A. UL 869A

B. Panelboards labeled as suitable for use as service entrance equipment where applicable and must include connection for bonding and grounding of neutral conductor.

2.05 SHORT CIRCUIT CURRENT RATING

A. Each panelboard with minimum short circuit current rating as indicated on drawings.

B. Panelboards marked with their maximum short circuit current rating at supply voltage.

C. Panelboards: _____

PART 3 - EXECUTION

3.01 COORDINATION WITH MANUFACTURER

A. Instruct manufacturer about the location of additional wiring gutter space when required, i.e. top, bottom, right, left, or combination.

B. Instruct manufacturer about the location of main lugs or main circuit breaker (i.e., top or bottom feed based on incoming feeder entrance location).

C. Instruct manufacturer to provide multiple lugs where conductors in parallel or sub-feed (double) lugs or feed-through lugs are indicated.

D. Instruct manufacturer on the size of cross-connection cables for panelboards fed via sub-feed (double) lugs or feed-through lugs. Make cable size with ampacity equal to incoming feeder.

E. Verify that “touch-up” paint kit is available for repainting.

F. Coordinate painting of cabinets in finished areas with work performed under Division 09 - Finishes

3.02 EXAMINATION

A. Verify that space indicated for panelboard mounting meets code-required working clearances and dedicated equipment space.

B. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.03 INSTALLATION

A. Install panelboards in accordance with NECA 407 and NEMA PB 1.1.

B. Install panelboards plumb and rigid without distortion of box, in accordance with manufacturer's written instructions, and in compliance with recognized industry practices.

C. Panelboard mounting and seismic restraints:

(1) Install panelboard anchorage devices and seismic restraints based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.

(2) Fasten panelboards firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.

(3) Anchor and fasten panelboards and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 05 29 - Hangers and Supports for Electrical Systems.

(4) Install two rows of steel slotted channel, with a minimum of four attachment points, for each panelboard section.

(5) When not located directly on wall, provide support frame of steel slotted channel anchored to floor and ceiling structure.

D. Install top breaker handle a maximum of 6’-7” (2 m) above finished floor or working platform, with handle in its highest position.

E. Tighten electrical connectors and terminals according to equipment manufacturer's published torque tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

F. Install as-built typewritten circuit directory in directory frame (to indicate installed circuit loads before completing load balancing) _____. Include description of connected loads, room number, room name, area, or item served for each branch circuit. Indicate motor names and horsepower as applicable. Cover circuit directory with colorless plastic. Coordinate with Owner and Architect to ensure that room numbers used in panel directory are final numbers assigned by Owner.

G. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification. Attach nameplate to exterior of each panelboard using small, corrosion-resistant metal screws or rivets. Do not use contact adhesive.

(1) Indicate panelboard name, amperage, voltage, phase, and number of wires.

H. Label spare circuits as SPARE. Leave spare breakers in OFF position.

I. Install panelboard in dedicated electrical space per NFPA 70 and as shown on drawings. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

J. Install filler plates in unused spaces.

K. Install fuses in fusible switches, per requirements in Section 26 28 13 - Fuses.

3.04 CONNECTIONS

A. Ground panelboards according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

3.05 FIELD QUALITY CONTROL

A. Inspect for physical damage, proper alignment, anchorage, and grounding.

B. Test circuit breakers per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

C. Interpret test results in writing and submit to Engineer.

3.06 REPAINTING

A. Remove paint splatters or other marks from surface of panelboards.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint to Owner.

3.07 ADJUSTING

A. Adjust fronts, covers, hinges, and locks.

B. Circuit Breakers: Set field-adjustable trip settings or change the trip settings recommended by the overcurrent protective device coordination study per Section 26 05 73 - Power System Studies.

3.08 CLEANING

A. Clean panelboard interiors and exteriors prior to final inspection. Remove paint splatters and other spots, dirt and debris.

END OF SECTION 26 24 16.16

CC. UL 467 – Grounding and Bonding Equipment

DD. UL 486A-486B – Wire Connectors

EE. UL 489 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

FF. UL 891 – Dead-Front Switchboards

GG. ASTM D1535 – Standard Practice for Specifying Color by the Munsell System

1.04 SUBMITTALS

A. Product Data: For metering equipment, components and accessories indicated:

(1) Include data on features, components, and complete description; submit catalog cut sheets showing electrical characteristics and ratings.

(2) Include construction details, material descriptions, dimensions of individual components and profiles, and finishes. Describe operating sequences, both automatic and manual.

B. Shop Drawings:

(1) Dimensioned plans and sections or elevation layouts.

(2) Wiring Diagrams: Power, signal, and control wiring. Identify terminals and wiring designations and color codes to facilitate installation, operation, and maintenance. Indicate recommended types, wire sizes, and circuiting arrangements for field installed wiring, and show circuit protection features.

C. Manufacturer's Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations and ratings of metering equipment on single-line diagrams and plan layouts.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include manufacturer's written instructions for testing.

(c) Include spare parts data listing, source, and current prices of replacement parts and supplies.

(d) Include manufacturer's Seismic Qualification Certification and Installation Seismic Qualification Certification.

1.05 QUALITY ASSURANCE

A. Obtain metering equipment from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with manufacturer's Seismic Qualification Certification: Submit certification that metering equipment, accessories, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Receive, store, and handle modular meter center as specified in NECA 400. Use factory installed lifting provisions. Handle carefully to avoid damage to assembly internal components, enclosure, and finish.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.

(1) Potential Transformer Fuses: Equal to 10% of amount installed for each size and type, minimum of 2 of each size and type.

(2) Control-Power Fuses: Equal to 10% of amount installed for each size and type, minimum of 2 of each size and type.

(3) Fuses for Fused Switches: Equal to 10% of amount installed for each size and type, minimum of 3 of each size and type.

PART 2 - PRODUCTS

2.01 EQUIPMENT FOR UTILITY COMPANY ELECTRICAL METERING

A. Utility metering compartments in _____ per requirements in section _____.

B. Cabinets and Sockets:

(1) Current Transformer Cabinets: Comply with requirements of electrical power utility company.

(2) Meter Cabinets: Comply with requirements of electrical power utility company.

(3) Meter Sockets: Comply with requirements of electrical power utility company.

C. Modular Meter Center: Utility approved assembly of main service _____, wireways, tenant meter socket modules, and tenant feeder overcurrent protective devices, complete with interconnecting buses and other features as specified below:

(1) Manufacturers:

(a) General Electric

(b) Cutler-Hammer

(c) Siemens

(d) Square D

(2) Ratings:

(a) Nominal system voltage: _____.

(b) Main bus continuous amp: _____

(c) Short circuit current rating: _____.

(d) Components braced to withstand mechanical forces for symmetrical fault current shown.

(3) Construction:

(a) Free-standing, dead-front type; vertical sections bolted together; sides and rear covered with removable bolt-on covers; adequate ventilation within enclosure.

(b) Incoming lug locations: _____, as applicable per drawings.

(c) Environmental Limitations:

1) Ambient temperatures: Not exceeding 104°F (40°C).

2) Altitude: Not exceeding 6600 ft (2010 m) _____.

3) Temperature rise: Not to exceed 149°F (65°C) over a 104°F (40°C) ambient environment, with no derating required.

(d) Device Mounting and Type: Front accessible assembly for placement against the wall

1) Main disconnect device: Fixed individually mounted _____.

2) Tenant feeder devices: _____ _____.

3) Devices: Front removable; load connections: Front accessible.

(e) Bus:

1) Material: _____; copper: 98% conductivity.

2) Sizing: Standard size, based on 149°F (65°C) over 104 °F (40 °C).

3) Main Phase Buses: 3 phase, _____ wire; fully rated; uniform capacity for entire length of assembly; ampacity as indicated on drawings; rated for the main protective device frame size or main incoming conductors.

4) Bus arrangement: A-B-C (left to right, top to bottom, front to rear).

(f) Ground Bus: Insulated, extend full length of assembly.

1) 1/4” by 2” (6 mm by 50 mm) minimum-size, hard-drawn copper of 98% conductivity, equipped with pressure connectors for feeder ground conductors.

(g) Neutral Bus: 100% of the ampacity of phase buses, as indicated on drawings, equipped with pressure connectors for outgoing feeder neutral cables.

(4) Line and Load Terminations: _____ type, labeled for 167°F (75°C) over a 104 °F (40 °C) copper or aluminum conductors.

(5) Housing: NEMA EN 10250, Type _____ enclosure.

(6) Enclosure Finish: Factory-applied finish in manufacturer’s standard gray finish over a rust-inhibiting primer on treated metal surface.

(7) Overcurrent Protective Devices:

(a) Main disconnect device: _____

(b) Tenant feeder disconnects: _____.

(c) Molded-Case Circuit Breaker: NEMA AB 1, NEMA AB 3, UL 489 lockable handle; interrupting capacity to meet available fault current.

1) Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit breaker frame sizes 225 A and below.

2) Electronic (solid-state microprocessor based) trip unit circuit breakers: digital true RMS sensing trip units; interchangeable in the field within the frame size (field-replaceable rating plug to determine the breaker trip rating), field-adjustable settings and the following trip functions for circuit breaker frame sizes 250 A - 1200 A:

1. Instantaneous trip
2. Long- and short-time pickup levels
3. Long- and short-time delay adjustments with I2t response
4. Ground-fault pickup level, time delay, and I2t response

(d) Fused Switch: NEMA BS 31047, UL 98; enclosed knife switch _____ type, external lockable operable handle, clips or pads to accommodate specified fuses:

1) Rejection clips for Class R fuses.

2) Provision for Class J or Class L fuses, as applicable.

3) Fuses per requirements in Section 26 28 13 - Fuses.

(8) Meter Sockets: Type as approved by utility company, with rating coordinated with indicated tenant feeder circuit rating.

(a) EUSERC service areas:

1) Self-contained ring-type, with test bypass/disconnect block, rated 200 A continuous.

2) Transformer-rated 400 A and above, with provisions for mounting current transformers.

(b) Non-EUSERC service areas:

1) Self-contained ringless-type, with manual level bypass, rated 200 or 400 A continuous.

2) Transformer-rated 400 A and above, with provisions for mounting current transformers.

3) Internal wireway barriers.

4) Individual compartments with covers and sealing provisions.

(c) Completely prewired and shipped ready for installation of meters.

(9) Control Wiring: Factory installed, with bundling, lacing, and protection included; insulated locking spade terminals for all control connections, except where saddle type terminals, integral to a device; current transformer secondary leads, connected to short circuit terminal blocks; terminal blocks with suitable numbering strips for group of control wires leaving modular meter center, with wire markers at each end of control wiring.

2.02 EQUIPMENT FOR OWNER ELECTRICAL METERING

A. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:

(1) Manufacturers:

(a) Square D

(b) General Electric

(c) Siemens

(d) Cutler-Hammer

(e) Approved equal

(2) Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:

(a) Phase Currents, Each Phase: +/-0.5%

(b) Phase-to-Phase Voltages, Three Phase: +/-1%
(c) Phase-to-Neutral Voltages, Three Phase: +/-1%
(d) Megawatts: +/-2%
(e) Megavars: +/-2%
(f) Power Factor: +/-2%
(g) Frequency: +/-0.5%
(h) Megawatt Demand: +/-2%; demand interval programmable from 5 to 60 minutes
(i) Accumulated Energy, Megawatt Hours: +/-2%. Accumulated values unaffected by power outages up to 72 hours
(j) Maximum demand (measure of average power demand over a 15-minute period) continuously recorded over a one-year period.
(k) Total Harmonic Distortion, Amperes
(l) Total Harmonic Distortion, Volts
(m) Individual Amperage Harmonics through the 63rd
(n) Integral Communications Port

(3) Mounting: Display and control unit flush or semiflush, mounted in instrument compartment door.

B. Analog Meters (Ammeters, Voltmeters, and Power Factor Meters): ANSI C39.1:

(1) Manufacturers:
(a) Square D
(b) General Electric
(c) Siemens
(d) Cutler-Hammer
(e) Approved equal

(2) Meters: Taut-band, indicating type, switchboard class; 4” (100 mm) diameter or _____ square, flush or semiflush, with anti-parallax 250-degree scales and external zero adjustment.
(a) Ammeters: 5 A, full-scale movement, with a scale of zero to the primary rating of the CTs.
(b) Voltmeters: Direct reading where PTs are not shown or have a 150V, full-scale movement where PTs are shown; cover and expanded-scale range of nominal voltage plus 10 percent.
(c) Feeder Ammeters: 2-1/2” (65 mm) minimum size with 90- or 120-degree scale. Meter and transfer device with an off position, located on overcurrent device door for indicated feeder circuits only.

(3) Instrument Switches: Rotary type with off position:
(a) Ammeter Switches: Permit reading of current in each phase and maintain current transformer secondaries in a closed-circuit condition at all times.
(b) Voltmeter Switches: Permit reading of all phase-to-phase voltages and, where a neutral is indicated, phase-to-neutral voltages.

(4) Watt-Hour Meters: Flush or semiflush type, rated 5 A, 120 V, 3 phase, 3 wire, 2-1/2 elements on 3-phase, 4-wire wye systems and 2 elements on 3-phase, 3-wire delta systems; _____ minute-indicating-demand register; and provision for testing and adding pulse initiation.

(5) Recording Demand Meters: Usable as totalizing relay or as indicating and recording maximum-demand meter with 15-minute interval. Meter shall count and control a succession of pulses entering two channels. House in drawout, back-connected case arranged for semiflush mounting.

C. Instrumentation:

(1) Manufacturers:
(a) Square D
(b) General Electric
(c) Siemens
(d) Cutler-Hammer
(e) Approved equal

(2) Instrument Transformers: NEMA EI 21.1, IEEE C57.13, and the following:
(a) Potential Transformers: Secondary voltage rating of 120 V and NEMA accuracy class of 0.3 with burdens of W, X, and Y.
1) 600 V and below: external PTs not required; fused potential connection.
(b) Current Transformers: _____ type; ratios shall be as indicated with accuracy class and burden suitable for connected relays, meters, and instruments; shorting test blocks: 10 poles – 4 potential and 6 current, mounted with meter or in accessible location.
(c) Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kV.

(d) Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondaries to ground overcurrent relays to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit breaker ground-fault protection.

D. Data Communications:

(1) Means to transmit data to central control and monitoring system.

(a) Keypad and scrollable display for local reading of measured values.

E. Kilowatt-Hour Meters:

(1) Manufacturers:

(a) E-MON L.P

(b) National Meter Industries, Inc.

(c) Osaki Meter Sales, Inc.

(d) Power Measurement

(e) Square D

(f) Cutler-Hammer

(g) General Electric

(h) Siemens

(i) Approved equal

(2) Kilowatt-Hour Meter: Electronic _____ phase meters, measuring electricity used.

(a) Voltage and Phase Configuration: Designed for use on circuits with voltage rating and phase configuration indicated for its application.

(3) Kilowatt-Hour/Demand Meter: Electronic _____-phase meters, measuring electricity use and demand.

(a) Voltage and Phase Configuration: Designed for use on circuits with voltage rating and phase configuration indicated for its application.

(b) Demand Signal Communication Interface: Match signal to _____ input and arrange to convey the instantaneous, integrated, demand level measured by meter to provide data for processing and possible programmed demand control action by destination system.

(c) Programmable Contact Module: Unit shall have push-button switches and a display for setting the demand level at which an integral set of Form C contacts shall be operated to initiate indicated action.

(d) Enclosure: NEMA EN 10250, Type _____ minimum, with hasp for padlocking or sealing.

(e) Identification: Comply with Section 26 05 53 - Electrical Systems Identification.

(f) Memory Backup: Self-contained to maintain memory throughout power outages of 72 hours, minimum.

(g) Sensors: Current-sensing type, with current or voltage output, selected for optimum range and accuracy for ratings of circuits indicated for this application.

1) Type: ___ core.

(h) Meter Accuracy: Nationally recognized testing laboratory certified to comply with ANSI C12.1.

(i) Current-Transformer Cabinet: Listed or recommended by metering equipment manufacturer for use with sensors indicated.

2.03 OUTDOOR SOCKET-TYPE METERS

A. Solid-State Polyphase Energy and Demand Meters:

(1) Manufacturers:

(a) Elster Electricity, LLC, Alpha Plus Series

(b) Landis+Gyr AXS4 Series

(c) Itron (Schlumberger) Vectron SVX Series

(d) General Electric kV Series

(e) Approved equal

(2) Description: Solid-state programmable polyphase energy and demand meter, _____

(3) Applicable Standards: ANSI C12.1, ANSI C12.10, ANSI C12.18, ANSI C12.19, ANSI C12.20, IEEE C37.90.1, IEEE C62.41.1, IEEE C62.41.2, and IEEE C62.45.

(4) Features:

(a) Digital display

(b) Measurement of energy (kWh) and demand (kW)

(c) Meter reading multiplier indication on meter face

(d) Polycarbonate cover, lockable

(e) Push-type demand reset on meter face

(f) 9600 baud optical communications port

(g) KYZ pulse initiator output compatible with building automation system (BAS). KYZ module: Cable for field wiring connection in meter socket.

(5) Configuration and Electrical Ratings:

(a) Mounting arrangement: Detachable socket Type S

(b) Meter Form: _____

(c) Elements: 3

(d) Voltage and Frequency: 120 to 480 VAC, 3 phase, 4 wire wye, 60 Hz

(e) Accuracy Class: 0.2

(6) Programming Capability: Field programming device and software necessary for programming of meters by Owner in the post-contract period.

B. Transformer-Rated Meter Sockets:

(1) Manufacturer:

(a) Meter Devices Company, Inc., Series 3000

(b) Approved equal

(2) Description: Transformer-rated meter socket, pre-wired, with manual circuit closing devices and test switches, designed for application with underground service feeders.

(3) Applicable Standards: ANSI C12.7, NEMA C12.9, NEMA EN 10250, UL 50, and UL 414.

(4) Features:

(a) Two-piece cover, ring type

(b) Supplied with screw-type ring

(c) Lock-ring guard

(d) 16 ga (1.621 mm) galvannealed steel construction with plain top

(e) 5/8” (16 mm) diameter knockout mounting embossments

(f) Conduit knockouts in bottom, sides, and back

(g) Upper cover locks with internal sliding latch and meter-sealing ring

(h) Lower cover locks with stainless steel swing-latch and hasp

(i) Provisions for sealing wire or padlock

(j) Ground stud

(k) 10-pole color-coded test switch assembly with clear Lexan cover:

1) Standard switch assembly for Meter Form 9S; molded insulating base, four (4) single-pole potential switches, four (4) voltage barriers, and three (3) right hand load test jack double-pole current elements.

2) Switch assembly mounting: To enable the socket cover to be re-installed with the switches in the open position.

(l) Pre-wired with wiring harness:

1) Current transformer wiring: #12 AWG (4.00 mm2).

2) Potential wiring: #14 AWG (2.50 mm2).

3) Color coding: Same for current and potential wiring. A phase – black; B phase – red; C phase – blue; Neutral – white; Ground – green. All wiring identified with plastic sleeve wire markers. Cloth markers are not acceptable.

(m) Enclosure finish: Durable baked power epoxy.

(n) Finish color: Industry standard outdoor green color (to match pad mounted transformer), Munsell 7GY 3.29/1.5, in accordance with ASTM D1535.

(5) Configuration and Electrical Ratings:

(a) Socket arrangement: Type S

(b) Number of Terminals: 13

(c) Meter Form: 9S

(d) Elements: 3

(e) Transformer-rated, 20 A

(f) Voltage: 600 VAC, 3 phase, 4 wire wye

(g) Enclosure: NEMA 3R

(6) Accessories:

(a) 3-pole fuse block with clear Lexan cover for fusing of potential wiring inputs to watthour meter (fuse block mounting: in low-voltage compartment of pad mounted transformer).

1) Fuse clip rating: 30 A

2) Fuses: Current limiting, sized as recommended by the meter manufacturer.

(7) Current Transformers:

(a) Manufacturers:

1) General Electric Type JAB-0
2) ABB Type CMV
3) GEC Durham Industries, Inc., Type AP
4) Itron (Schlumberger) Type R6P
5) Approved equal

(b) Description: Current transformer, window-type, designed for mounting on secondary spade terminals of pad-mounted transformer.

(c) Applicable Standards: ANSI C12.11 and IEEE C57.13.

(d) Features:

1) 3-1/2” x 4-1/2” (90 mm x 115 mm) window with molded bus bar slots (“grabber” feature) designed for stable mounting on secondary spade terminals of pad mounted transformers (terminal pads with standard NEMA two-hole spacing).
2) Tin-plated, clamp-type secondary terminals.
3) Clear polycarbonate terminal cover.
4) Polarity markings.
5) Primary rating marking.
6) Shorting device.
7) Nameplate.

(e) Electrical Ratings:

1) Insulation Class: 600 V Indoor/Outdoor
2) Basic Impulse Level: 10 kV
3) Frequency: 60 Hz
4) Current Ratio: As indicated on drawings
5) Accuracy Class: 0.3 through Burden B0.2
6) Rating Factors: _____

C. Single-Position Socket Meters:

(1) Manufacturers:

(a) Siemens (Landis & Gyr brand).
(b) Milbank Manufacturing Company.
(c) Square D.
(d) Approved equal.

(2) Description: Single-position meter socket for self-contained type watthour meter, ringless type, lever bypass, designed for application with underground service feeders.

(3) Applicable Standards: ANSI C12.7, NEMA EN 10250, UL 50, and UL 414.

(4) Features:

(a) 14 ga (2.0 mm) galvanized steel panel with 16 ga (1.621 mm) galvanized steel cover
(b) Conduit knockouts in sides and bottom, hub opening and cover plate on top
(c) Cover lock with stainless steel swing-latch and hasp
(d) Provisions for sealing wire or padlock
(e) Insulated neutral bus
(f) Ground lug
(g) Enclosure finish: Durable baked powder epoxy
(h) Finish color: Industry standard Light Munsell gray in accordance with ASTM D1535

(5) Configuration and Electrical Ratings:

(a) Socket arrangement: Type S
(b) Number of Terminals: 7
(c) Meter Form: 16S
(d) Elements: 3
(e) Continuous current rating: As indicated on drawings.
(f) Voltage: 600 VAC, 3 phase, 4 wire wye, with insulated neutral bus.
(g) Enclosure: NEMA 3R

PART 3 - EXECUTION

3.01 COORDINATION

A. Coordinate adjustment and programming of metering equipment with manufacturer.

B. Instruct manufacturer about the location of incoming lugs (i.e., top or bottom feed based on incoming feeder entrance location).

C. Coordinate installation of housekeeping concrete pad based on actual equipment supplied:

(1) Concrete: Per requirements in Division 03 – Concrete.

(2) Dimensions: Per requirements in Section 26 05 29 - Hangers and Supports for Electrical Systems.

D. Coordinate with miscellaneous trades for equipment foreign to electrical installation to be outside of dedicated electrical space.

E. Verify with manufacturer that “touch-up” paint kit is available for repainting.

F. Coordinate utility company metering equipment requirements.

G. Coordinate meter data transmission with campus power monitoring system (CPMS) Building Management System (BMS) Supervisory Control and Data Acquisition (SCADA) System to integrate metering components with system architecture.

3.02 EXAMINATION

A. Examine areas and surface to receive modular meter center for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for modular meter center mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.03 INSTALLATION

A. Comply with installation requirements in NECA 1.

B. Install utility company metering equipment per requirements in Section(s) _____.

C. Install current transformer cabinets, meter cabinets or meter sockets to comply with requirements of electrical power utility company. Install empty conduits for metering leads and extend grounding connections as required by utility company.

D. Install modular meter center in accordance with NECA 400.

E. Modular meter center mounting and seismic restraints:

(1) Install modular meter center anchorage devices and seismic restraints based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.

(2) Bolt modular meter center to concrete housekeeping pad, using anchor bolts in accordance with Section 26 05 29 - Hangers and Supports for Electrical Systems. Cast anchor bolt inserts into pad.

(3) Install bushing assemblies for anchor bolts for seismic restraints per requirements in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems.

F. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification for modular meter center, every instrument, overcurrent protective device, and disconnect device. Attach nameplate to exterior of modular meter center using small corrosion-resistant metal screws and rivets. Do not use contact adhesive. Indicate modular meter center manufacturer’s name and drawing number, name, amperage, voltage, phase, number of wires, short circuit current rating (amp, RMS symmetrical and MVA three-phase symmetrical), and momentary and fault-closing ratings (amp, RMS asymmetrical). For each overcurrent protective device and disconnect device, include tenant name, load served, voltage/phase rating, and fuse size and type, when applicable.

G. Install modular meter center in dedicated electrical space per NFPA 70, and as indicated on drawings.

H. Tighten electrical connectors and terminal according to equipment manufacturer’s published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

I. Install fuses in fusible switch at job site per requirements in Section 26 28 13 - Fuses.

J. Mount meters in the locations indicated on the drawings. Mounting height: 5’-6” (1.68 m) or less from finished floor.

K. Transformer-Rated Meter:

(1) Install electricity metering equipment in or on pad-mounted transformers provided under Section 26 12 19 - Pad-Mounted, Liquid-Filled, Medium-Voltage Transformers:

(a) Install current transformers on secondary spade terminals.

(b) Install fuse block inside low-voltage compartment (for potential wiring inputs to watthour meter).

(c) Install meter socket on exterior of low-voltage compartment.

(d) Install solid-state electricity meter in meter socket.

(e) Install fuses in fuse block, one for each phase.

(f) Connect meter KYZ pulse output to BAS panel in building.

L. Self-Contained Meter:

(1) Install meter socket on _____ as indicated.

(2) Install solid-state electricity meter in meter socket.

(3) Connect meter KYZ pulse output to BAS panel in building.

3.04 FIELD WIRING

A. Install field wiring to complete the electricity metering installation.

(1) Transformer-rated meter:

(a) Current transformer wiring shall be #12 AWG (4 mm2) minimum size. Where distance to meter exceeds 22 ft (6.7 m), increase wire size to #10 AWG (6 mm2) to reduce the burden on the metering circuit.

(b) Potential wiring shall be #14 AWG (2.5 mm2).

(c) Color coding: Same for current and potential wiring. A phase – black; B phase – red; C phase – blue; Neutral – white; Ground – green. Identify all wiring with plastic sleeve wire markers. Cloth markers are not acceptable.

(d) Neatly train and lace wiring for metering installation within pad-mounted transformer compartment and meter socket enclosure using nylon cable ties.

(2) _____ meter:

(a) Field wiring for building automation system (BAS) connection to solid-state electricity meter:

1) Conduit: Install a 3/4” (19 mm) conduit routed underground from _____ to BAS panel in the building; terminate conduit within 12" (300 mm) of BAS panel.

2) Communications Wiring: In the 3/4” (19 mm) conduit, install a 3-conductor communications cable as recommended by meter manufacturer. Connect one end to cable lead from meter KYZ pulse initiator module. Leave 4 ft (1.22 m)excess cable coiled at opposite end for connection to BAS panel.

3.05 CONNECTIONS

A. Ground metering equipment according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Connect power and control wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

C. Bond meter socket enclosure to grounding facilities _____. Grounding equipment per UL 467 requirements.

3.06 FIELD QUALITY CONTROL

A. Test continuity of each circuit.

B. Test metering equipment per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables.

C. Interpret test results in writing and submit to Engineer.

D. Test Owner’s electricity-metering installation for proper operation, accuracy, and usability of output data.

(1) Connect a load of known kilowatt rating, _____ hp (kW) minimum, to a circuit supplied by metered feeder.

(2) Turn off circuits supplied by metered feeder and secure them in off condition.

(3) Run test load continuously for 8 h, minimum, or longer to obtain a measurable meter indication. Use test load placement and setting that ensures continuous, safe operation.

(4) Check and record meter reading at end of test period and compare with actual electricity used based on test load rating, duration of test, and sample measurements of supply voltage at test load connection. Record test results.

(5) Repair or replace deficient or malfunctioning metering equipment, or correct test setup; then retest. Repeat for each meter in installation until proper operation of entire system is verified.

E. Inspect modular meter center for physical damage, proper alignment, connections, anchorage, seismic restraints and grounding.

F. Verify that correct multiplier is indicated on face of meter.

G. Verify that current transformer secondary circuits are intact.

H. Inspect indicating devices for proper operation.

3.07 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.08 ADJUSTING

A. Adjustment and programming of metering equipment: By factory-authorized representative.

B. Compare meter display readings with readings taken with clamp on ammeter and handheld volt-meter.

C. Make adjustments as necessary.

3.09 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

3.10 DEMONSTRATION

A. Provide training session by manufacturer for up to 4 h at a job location, to train the Owner's personnel in the operation and maintenance of metering equipment.

END OF SECTION 26 27 13

SECTION 26 27 26 - WIRING DEVICES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 26 - Grounding and Bonding for Electrical Systems

B. Section 26 05 53 - Electrical Systems Identification

1.02 DESCRIPTION

A. Section includes general-use snap switches, wall-box dimmers, fan speed controls, receptacles, hazardous (classified) location receptacles, pendant cord-connector devices, cord and plug sets and device cover plates.

1.03 REFERENCE STANDARDS

A. IEEE C62.41.2 – Characterization of Surges in Low-Voltage (1000V and less) AC Power Circuits

B. IEEE C62.45 – Surge Testing for Equipment Connected to Low-Voltage (1000V and less) AC Power Circuits

C. NECA 1 – Good Workmanship in Electrical Contracting

D. NFPA 70 – National Electrical Code

E. NFPA 99 –Health Care Facilities

F. NEMA FB 11 – Plugs, Receptacles, and Connectors of the Pin and Sleeve Type for Hazardous Locations

G. NEMA WD 1 – General Color Requirements for Wiring Devices

H. NEMA WD 6 – Wiring Devices - Dimensional Requirements

I. NEMA EN 10250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

J. UL 20 – General-Use Snap Switches

K. UL 498 – Attachment Plugs and Receptacles

L. UL 943 – Ground-Fault Circuit-Interrupters

M. UL 1203 – Safety Explosion-Proof and Dust-Ignition Proof Electrical Equipment for Use in Hazardous (Classified) Locations

N. UL 1436 – Outlet Circuit Testers and Similar Indicating Devices

O. UL 1449 – Transient Voltage Surge Suppressors

P. UL 1472 – Solid-State Dimming Controls

Q. UL 1917 – Solid-State Fan Speed Controls

1.04 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

C. Samples: One for each type of device and wall plate specified, in each color specified.

D. Manufacturer's Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

E. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

F. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations and ratings of wiring devices.

(2) Operation and Maintenance Data:

(a) Include in manufacturers' packing label warnings and instruction manuals with labeling conditions.

(b) Include source and current prices of replacement parts and supplies.

1.05 QUALITY ASSURANCE

A. Obtain wiring devices from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory unopened packaging until ready for installation.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match products installed, are packaged with protective covering for storage and are identified with labels describing contents.

(1) TVSS Receptacles: _____ of each type installed, but no fewer than _____.

B. Furnish _____ _____ for each switch.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Cooper Wiring Devices; a division of Cooper Industries, Inc.

B. Hubbell Incorporated; Wiring Device-Kellems

C. Leviton Manufacturing Company, Inc.

D. Pass & Seymour/Legrand; Wiring Devices & Accessories

2.02 GENERAL-USE SNAP SWITCHES

A. Comply with NEMA WD 1 and UL 20.

B. Switches: _____; back and side wired; flush or surface mounting; Body and Handle: thermoplastic with _____ handle; for connection to copper or copper-clad conductors:

(1) Ratings:

(a) Voltage: _____ AC

(b) Current: _____ A

(2) Single pole

(3) Double pole

(4) Three-way

(5) Four-way

(6) Locator Light: Lighted handle type switch (single pole with _____ neon-lighted handle, illuminated when switch is “OFF.”)

(7) Pilot Light: Indicator light switch (single pole with _____ neon-lighted handle, illuminated when switch is “ON.”

(8) Locking Type: Designed to prevent tampering and unauthorized switching.

(9) Key-Operated: Single pole, with factory-supplied key in lieu of switch handle.

(10) Single-Pole, Double-Throw, Momentary Contact, Center-Off: For use with mechanically held lighting contactors.

(11) Key-Operated, Single-Pole, Double-Throw, Momentary Contact, Center-Off: For use with mechanically held lighting contactors, with factory-supplied key in lieu of switch handle.

(12) Pendant and Through-cord: For field installation on flexible cord and provided with one “ON’ and one “OFF” position.

(13) Switches for Connections to Aluminum Conductors: Comply with UL 1567.

(14) Weatherproof: _____.

(15) Dimmers are permitted to control lighting fixtures but not motorized loads or receptacles. Fan speed controls are listed for that application.

(16) Special devices may be desirable to minimize buzzing at lights, radio frequency interference, or in the case of multiwire circuits with dimmers on multiple phases, and variation in brightness due to interaction through the grounded conductor.

(17) Fluorescent luminaires, unless specifically marked otherwise, require special dimmers and dimming ballasts.

2.03 WALL-BOX DIMMERS

A. Comply with NEMA WD 1 and UL 1472.

B. Dimmer Switches: Modular, full-wave, solid-state units with integral, quiet on-off switches, with audible frequency and EMI/RFI suppression filters.

(1) Power Rating: _____ watts _____

(2) Body: Thermoplastic

(3) Control: Continuously adjustable _____; with single-pole or three-way switching.

(4) Incandescent Lamp Dimmers: 120 V; control shall follow square-law dimming curve. On-off switch positions shall bypass dimmer module.

(5) Fluorescent Lamp Dimmer Switches: Modular; compatible with dimmer ballasts; trim potentiometer to adjust low-end dimming; dimmer-ballast combination capable of consistent dimming with low end not greater than 20% of full brightness; _____277 V.

2.04 FAN SPEED CONTROLS

A. Comply with UL 1917

B. Modular, 120V, full-wave, solid-state units with integral, quiet on-off switches and audible frequency and EMI/RFI filters.

(1) Continuously adjustable _____, _____.

(2) Three-speed adjustable _____, 1.5A.

2.05 RECEPTACLES

A. Comply with NEMA WD 1, NEMA WD 6 configuration _____, and UL 498.

B. Receptacles: 125 V, _____, _____; back and side wired; flush or surface mounted; straight blade; 2 pole, 3 wire grounding; thermoplastic body; _____ as indicated on drawings.

(1) Ground Fault Circuit Interrupter (GFCI):

(a) Additional compliance with UL 943 Class A.

(b) Leakage current trip level: 4 to 6 mA.

(c) Trip time: .025 seconds nominal.

(d) _____ through type

(e) Reverse line-load function to prevent GFCI from functioning if wired incorrectly.

(f) Indicator Light: Lighted when device is tripped.

(g) Due to numerous issues with nuisance tripping, Hubbell model# GFRST83W / GFRST83R analog self-test GFCI receptacles shall not be approved. Hubbell model # GFR83W will be acceptable.

(2) Isolated Ground (IG):

(a) Ground strap isolated from mounting strap.

(b) Ground screw connected directly to ground contacts.

(3) Transient Voltage Surge Suppression (TVSS):

(a) Additional compliance with UL 1449, with integral TVSS in line to ground, line to neutral, and neutral to ground.

(b) TVSS Components: Multiple metal-oxide varistors; with a nominal clamp-level rating of 400 volts and minimum single transient pulse energy dissipation of 240 J, according to IEEE C62.41.2 and IEEE C62.45.

(c) Active TVSS Indication: Visual and audible, with light visible in face of device to indicate devise is “active” or “no longer in service.”

(4) Tamper Resistant (TR):

(a) Requires insertion of object in both left and right contacts to energize.

(b) 2- or 3-prong plug.

(5) Twist-locking:

(a) NEMA WD 6 configuration _____

(6) Switched: Upper half switched and lower half not switched.

(7) Dedicated: Labeled “Dedicated.”

(8) Special Purpose Receptacles: Specification grade, rated for voltage, amperage and NEMA configuration as noted on drawings.

2.06 HAZARDOUS (CLASSIFIED) LOCATION RECEPTACLES

A. Comply with NEMA FB 11 and UL 1203

B. Manufacturers:

(1) Cooper Crouse-Hinds

(2) EGS/Appleton Electric

(3) Killark; a division of Hubbell, Inc.

2.07 PENDANT CORD-CONNECTOR DEVICES

A. Description: Matching, locking-type plug and receptacle body connector; NEMA WD 6 configuration L5-20P and L5-20R, heavy-duty grade.

(1) Body: Nylon with screw-open cable-gripping jaws and provision for attaching external cable grip.

(2) External Cable Grip: Woven wire-mesh type made of high-strength galvanized-steel wire strand, matched to cable diameter, and with attachment provision designed for corresponding connector.

2.08 CORD AND PLUG SETS

A. Description: Match voltage and current ratings and number of conductors to requirements of equipment being connected.

(1) Cord: Thermoset-insulated, stranded-copper conductors, with Type SOOW jacket; with green-insulated grounding conductor and equipment-rating ampacity plus a minimum of 30%.

(2) Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

2.09 DEVICE COVER PLATES

A. Single and combination types to match corresponding wiring devices:

(1) Attachment: Metal screws with head color to match plate finish.

(2) Material for Finished Spaces: _____.

(3) Material for Unfinished Spaces: _____.

(4) Material for Damp Locations: _____ with while-in-use hinged cover and listed and labeled for use in “wet locations”.

B. Weatherproof Cover Plates: NEMA EN 10250, complying with type 3R weather-resistant_____ with weatherproof while-in-use hinged cover.

C. Lockable Cover:

(1) Hinged steel cover with cylinder lock.

(2) Keyed _____.

D. Tamper Resistant (TR):

(1) Slide cover over receptacle.

2.10 FINISHES

A. Color:

(1) Switch handles, receptacle faceplates, and device cover plates: _____, except as follows:

(a) Switch handles and receptacle faceplates connected to Emergency or Standby Power System: Red; labeled “Emergency.”

(b) TVSS Receptacles: Blue

(c) Isolated-Ground Receptacles: _____.

(d) UPS Receptacles: Gray

PART 3 - EXECUTION

3.01 COORDINATION

A. Special Purpose Receptacles: Coordinate final selections of NEMA configuration (locking, straight, blade, etc.) with configuration of plug on utilization equipment.

B. Receptacles for Owner-furnished equipment and equipment furnished under other divisions of specifications: Match plug configurations.

C. Cord and Plug Sets: Match equipment requirements.

D. Coordination with Other Trades:

(1) Take steps to ensure that devices and their boxes are protected. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers guided by riding against outside of the boxes.

(2) Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.

(3) Install device boxes in brick or block walls so that the device cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.

3.02 EXAMINATION

A. Verify location of wiring devices with architectural interior elevation drawings, prior to rough-in.

B. Verify outlet boxes are installed at proper height.

C. Verify wall openings are neatly cut and completely covered by wall plates.

D. Verify branch circuit wiring installation is completed, tested, and ready for connection to wiring devices.

3.03 PREPARATION

A. Clean debris from outlet boxes.

3.04 INSTALLATION

A. Comply with NECA 1, including the mounting heights listed in that standard, unless otherwise scheduled or indicated on drawings. Indicated dimensions are to center of device.

B. Conductors:

(1) Do not strip insulation from conductors until just before they are spliced or terminated on devices.

(2) Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.

(3) Length of free conductors at outlets for devices shall meet provisions of NFPA 70 , Article 300, without pigtails.

(4) Do not place bare stranded conductors directly under device screws. Use crimp on fork terminals for device terminations.

C. Device Installation:

(1) Replace all devices that have been in temporary use during construction or show signs of installation prior to completion of building finishing operations.

(2) Keep each wiring device in its package or otherwise protected until it is time to connect conductors.

(3) Do not remove surface protection, such as plastic film and smudge covers, until last possible moment.

(4) Connect devices to branch circuits using pigtails that are not less than 6” (150 mm) in length.

(5) When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, 2/3 to 3/4 of the way around terminal screw.

(6) Use a torque screwdriver when a torque is recommended or required by the manufacturer.

(7) When conductors larger than #12 AWG are installed on 15A or 20A circuits, splice #12 AWG pigtails for device connections.

(8) Tighten unused terminal screws on the device.

(9) When mounting into metal boxes, remove fiber or plastic washers used to hold device mounting screws in yokes, allowing metal-to-metal contact.

(10) Install devices plumb, level with finished surfaces and free from blemishes.

(11) Install lighting switches vertically on latch side of door within 6” (150 mm) of frame edge.

(12) Install devices above counters, 2” (50 mm) to the bottom of device above countertop or backsplash. Install all devices at same height above any one counter or fixed cabinet.

(13) Install special purpose receptacles and switches according to shop and rough-in drawings furnished by trade(s) producing such equipment. Verify locations prior to rough-in.

(14) Install weatherproof GFCI receptacles:

(a) Within 25’-0” (7.6 m) of roof-mounted mechanical equipment

(b) Outdoors

(c) As indicated on drawings

(15) Install GFCI receptacles within 6' (1.8 m)of a sink, in any direction.

(16) Group adjacent switches under single, multigang wall plates.

(17) Connect wiring device grounding terminal to _____. Ground per requirements in Section 26 05 26 - Grounding and Bonding for Electrical Systems.

D. Installation Orientations:

(1) Install ground pin of vertically mounted receptacles _____, and on horizontally mounted receptacles to the _____.

(2) Install hospital-grade receptacles in patient-care areas with the ground pin or neutral blade at the top.

(3) Install switches with handle operating vertically, with “ON” position up.

(4) Unless otherwise indicated or where space problem occurs, mount devices flush, with long dimension vertical.

E. Device Cover Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

F. Wall-Box Dimmers:

(1) Install dimmers within terms of their listing.

(2) Verify that dimmers used for fan speed control are listed for that application.

(3) Install unshared neutral conductors on line and load side of dimmers according to manufacturers’ device listing conditions in the written instructions.

G. Arrangement of Devices:

(1) Unless otherwise indicated or where space problem occurs, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

3.05 IDENTIFICATION

A. Comply with Section 26 05 53 - Electrical Systems Identification.

(1) Switches and Receptacles: Use hot, stamped or engraved machine printing with _____-filled lettering on face of cover plate, and durable wire markers or tags inside outlet boxes.

(a) Receptacles: Label shall indicate receptacle voltage, phase, and amperage _____at top of cover plate, and panel and circuit number at bottom of cover plate.

(b) Switches: Label shall indicate switch voltage, phase, and amperage at top of cover plate, and panel, circuit number and switch designation at bottom of cover plate.

(2) Engrave cover plates on all Owner-furnished equipment and equipment furnished under other divisions of these specifications with panelboard, circuit number and “emergency” (where applicable) as specified in this section. This includes headwalls, gas columns and booms, patient consoles, medical rail systems, custom casework with electrical devices, etc. _____.

3.06 FIELD QUALITY CONTROL

A. Inspect wiring devices for defects.

B. Operate wall switches with circuits energized and verify proper operation.

C. Verify receptacle device is energized.

D. Perform tests and prepare test reports:

(1) Test receptacle devices for proper polarity:

(a) Test every receptacle with receptacle circuit tester. Tester shall test for open ground, reverse polarity, open hot, open neutral, hot and ground reversed, hot or neutral and hot open. Rewire receptacles with faults and retest.

(2) Test each GFCI receptacle device for proper operation:

(a) Perform testing using an instrument specifically designed and manufactured for testing ground-fault circuit interrupters. Apply the test to the receptacle. “TEST” button operation will not be acceptable as a substitute for this test. Replace receptacles that do not shut off power with 5/1000 A within 1/40 second and retest.

(3) In healthcare facilities, prepare reports that comply with recommendations in NFPA 99.

(4) Test Instruments: Use instruments that comply with UL 1436.

(5) Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.

E. Tests for Convenience Receptacles:

(1) Line Voltage: Acceptable range is 105 V to 132 V.

(2) Percent Voltage Drop under 15A Load: A value of 5% or higher is not acceptable.

(3) Ground Impedance: Values of up to 2 ohms are acceptable.

(4) GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.

(5) Using the test plug, verify that the device and its outlet box are securely mounted.

(6) The tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

F. Test straight blade _____ for the retention force of the grounding blade according to NFPA 99. Retention force shall be not less than 4 oz (113 g).

G. Operational Tests: Demonstrate the operation of each switch with the systems fully energized and operating. Each switch shall be demonstrated three times.

H. Interpret test results in writing and submit to Engineer.

3.07 ADJUSTING

A. Adjust devices and wall plates to be flush and level.

3.08 CLEANING

A. Remove excess plaster from interior of outlet boxes.

B. Clean devices and cover plates after painting is complete. Replace stained or improperly painted devices and cover plates.

END OF SECTION 26 27 26

SECTION 26 28 13 - FUSES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 73 - Power System Studies
B. Section 26 23 00 - Low-Voltage Switchgear
C. Section 26 24 13 - Switchboards
D. Section 26 24 16.16 - Distribution Panelboards
E. Section 26 24 19 - Motor-Control Centers
F. Section 26 28 16 - Enclosed Switches and Circuit Breakers
G. Section 26 29 13 - Enclosed Controllers

1.02 DESCRIPTION

A. Section includes nonrenewable cartridge fuses, rated 600V and less, for use in low-voltage power distribution system and spare fuse cabinet.

1.03 REFERENCE STANDARDS

A. NEMA FU 1 - Low Voltage Cartridge Fuses
B. UL 248-1 - Low Voltage Fuses - Part 1: General Requirements
C. UL 248-4 - Low-Voltage Fuses - Part 4: Class CC Fuses
D. UL 248-5 - Low-Voltage Fuses - Part 5: Class G Fuses
E. UL 248-8 - Low-Voltage Fuses - Part 8: Class J Fuses
F. UL 248-10 - Low-Voltage Fuses - Part 10: Class L Fuses
G. UL 248-12 - Low-Voltage Fuses - Part 12: Class R Fuses
H. UL 248-15 - Low-Voltage Fuses - Part 15: Class T Fuses
I. UL 512 - Fuseholders

1.04 SUBMITTALS

A. Product Data:
   (1) Submit the following for each fuse type and size indicated:
      (a) Manufacturer's technical data on features, performance, electrical characteristics, ratings, and dimensions.
      (b) Time-current curves, coordination charts and tables, and related data.
      (c) Let-through current curves for fuses with current-limiting characteristics.
      (d) Fuse size for each elevator disconnect switch.
B. Closeout Submittals:
   (1) Project Record Documents:
      (a) Record actual class, size, and location of fuses.

1.05 QUALITY ASSURANCE

A. Obtain fuses from one source and by single manufacturer.
B. Comply with NFPA 70 for components and installation.

1.06 MAINTENANCE

A. Extra Materials:
   (1) Furnish to the Owner a quantity of spare fuses equal to _____% of the total quantity of each fuse class and size installed, minimum of 3 of each fuse class and size.
   (2) Furnish _____ fuse pullers for each size fuse.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Cooper Bussmann
B. Mersen
C. Littelfuse
D. Edison Fusegear

2.02 CARTRIDGE FUSES

A. NEMA FU 1, UL 248-1.

B. Characteristics: nonrenewable current-limiting cartridge fuse; current rating and class, as specified or indicated, and voltage rating consistent with circuit voltage.

C. Miscellaneous data:

UL Standard	Class	Volts	Amperage	Interrupting Rating (Amp RMS Sym.)
248-4	CC	600	0-30	200,000
248-5	G	600	0-20	100,000
248-5	G	480	25-60	100,000
248-8	J	600	0-600	200,000
248-10	L	600	601-6000	200,000
248-12	RK1	250 or 600	0-600	200,000
248-12	RK5	250 or 600	0-600	200,000
248-15	T	300	0-1200	200,000
248-15	T	600	0-800	200,000

2.03 FUSEBLOCKS

A. UL 512

B. Thermoplastic base with UL flammability 94VO

C. Clip reinforcing springs – 100A and above

D. 200,000 A RMS Sym withstand rating

E. Copper or aluminum connections

2.04 TOUCH SAFE FUSEHOLDERS

A. UL 4248

B. Thermoplastic base with UL flammability 94VO

C. Cover over fuses

D. Neon indicator lamp: “ON” when fuse opens

2.05 SPARE FUSE CABINET

A. Wall-mounted sheet metal cabinet with shelves, suitably sized to store spare fuses and fuse pullers specified with 10% capacity minimum.

B. Doors shall be hinged, with hasp for Owner’s padlock.

C. Finish shall be _____.

D. Cabinet shall have nameplate engraved “Spare Fuses” in 1/2” (13 mm) letters on door.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.

3.02 INSTALLATION

A. Verify proper fuse locations, sizes, and characteristics.

B. Install fuses in fusible devices (specified in Sections 26 23 00 - Low-Voltage Switchgear, 26 24 13 - Switchboards, 26 24 16.13 - Lighting and Appliance Panelboards, 26 24 16.16 - Distribution Panelboards, 26 24 19 - Motor-Control Centers, 26 28 16 - Enclosed Switches and Circuit Breakers, and 26 29 13 - Enclosed Controllers at job site.

C. Arrange fuses so manufacturer, class, and size are readable without removing fuse.

D. Install typewritten labels on inside door of each fused device, indicating fuse replacement information.

E. Install spare fuse cabinet ____.

3.03 APPLICATION

A. Main Service: _____.

B. Main Feeders: _____.

C. Motor Branch Circuits: _____.

D. Other Branch Circuits: _____.

3.04 CLEANING

A. Clean fuses and tighten connections prior to energizing of equipment.

END OF SECTION 26 28 13

SECTION 26 28 16 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems
D. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems
E. Section 26 05 53 - Electrical Systems Identification
F. Section 26 05 73 - Power System Studies
G. Section 26 08 12 - Power Distribution Acceptance Tests
H. Section 26 08 13 - Power Distribution Acceptance Test Tables
I. Section 26 28 13 - Fuses

1.02 DESCRIPTION

A. Section includes fusible and non-fusible disconnect switches and circuit breakers in individual enclosures.

1.03 REFERENCE STANDARDS

A. ANSI//NECA 1 - Standard Practices for Good Workmanship in Electrical Contracting
B. NEMA AB 1 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breakers Enclosures
C. NEMA BS 31047 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)
D. NFPA 70 - National Electrical Code
E. UL 98 - Enclosed and Dead Front Switches
F. UL 486A-486B - Wire Connectors
G. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures
H. UL 869A - Reference Standard for Service Equipment

1.04 SUBMITTALS

A. Product Data:
   (1) Submit catalog cut sheet indicating voltage, amperage, HP ratings, enclosure type, and dimension, fuse clip features, terminal lugs and all accessories including interlock devices, short circuit current ampere rating and factory settings of individual protective devices.
B. Manufacturer’s Installation Instructions:
   (1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.
C. Test Reports:
   (1) Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.
D. Closeout Submittals:
   (1) Project Record Documents:
      (a) Record actual locations of disconnect switches and ratings of installed fuses.
      (b) Record actual locations and continuous current ratings of enclosed circuit breakers.
   (2) Operation and Maintenance Data:
      (a) Include manufacturer’s recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      (b) Include spare parts data listing, source, and current prices of replacement parts and supplies.
      (c) Include Manufacturer’s Seismic Qualification Certification and Installation Seismic Qualification Certification.

1.05 QUALITY ASSURANCE

A. Obtain disconnect switches and enclosed circuit breakers from one source and by single manufacturer.
B. Regulatory Requirements:
   (1) Comply with NFPA 70 for components and installation.
   (2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with Manufacturer's Seismic Qualification Certification: Submit certification that disconnect switches and enclosed circuit breakers, accessories, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Comply with manufacturer's written instructions.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Schneider Square D

B. ABB-GE Industrial Solutions

C. Eaton Cutler-Hammer

D. Siemens

2.02 DISCONNECT SWITCHES

A. NEMA BS 31047, UL 98

B. Load interrupter enclosed knife switch, _____ type.

C. Fusible or non-fusible type as indicated.

D. Switch Interiors:

(1) Switch blades that are visible in "OFF" position when switch door is open.

(2) Plated current carrying parts.

(3) Removable arc suppressors to permit easy access to line side lugs.

E. Switch Mechanism:

(1) Quick-make, quick-break, with visible blades and externally operable handle.

(2) Lockable only in "OFF" position and accept three industrial type, heavy-duty padlocks.

(3) Dual cover interlock to prevent unauthorized opening of switch door when handle is in "ON" position, and to prevent closing of switch mechanism with door open.

(4) Defeater mechanism to bypass interlock.

(5) Operating handle integral part of enclosure.

(6) Handle to physically indicate "ON" and "OFF" position.

F. Ratings:

(1) Ampacity as indicated on drawings.

(2) Horsepower rated.

G. Fusible Switches:

(1) Rejection clips for Class R fuses specified.

(2) Provisions for Class J or Class L fuses, as applicable.

(3) Fuses: Per requirements in Section 26 28 13 - Fuses.

2.03 ENCLOSED CIRCUIT BREAKERS

A. NEMA AB 1, UL 489.

B. Enclosed molded-case circuit breakers:

(1) Tripped indication clearly shown on breaker handle taking position between "ON" and "OFF".

(2) 225A frame size and below: thermal-magnetic trip.

(3) 250A frame size and above: electronic (solid-state microprocessor-based) trip units interchangeable in the field within the frame size and field-adjustable ____ current settings. Each adjustment shall have discrete settings and shall be independent of other adjustments.

C. Breaker Mechanism:
   (1) Quick-make, quick-break.
D. Ratings:
   (1) Ampacity as indicated on drawings.
   (2) Listed as Type HACR for air conditioning equipment circuits.
   (3) Listed as Type SWD for lighting circuits.

2.04 LUGS

A. Front removable lugs.
B. Labeled for 75°C copper and aluminum conductors.
C. Multiple lugs to match number of conductors per phase.
D. Termination of field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

2.05 ACCESSORIES:

A. Solid neutral assembly, where required.
B. Equipment ground kit.

2.06 ENCLOSURES

A. NEMA BS 31047, NEMA AB 1, UL 98, UL 489, as applicable.
B. NEMA Type 1, Type 3R (outdoor locations) ____ enclosure.
C. Code-gauge galvanized steel.
D. Manufacturer's standard gray enamel finish over prime coat.
E. Surface-mounted. ____.

2.07 SERVICE ENTRANCE

A. UL 869A
B. Switches and circuit breakers identified for use as service entrance equipment are to be labeled for this application, provided with solid neutral assembly and equipment ground bar, and must include connection for bonding and grounding of neutral conductor.

2.08 SHORT CIRCUIT CURRENT RATING

A. Each circuit breaker shall have minimum short circuit current rating as indicated on drawings.

PART 3 - EXECUTION

3.01 COORDINATION WITH MANUFACTURER

A. Instruct manufacturer about the location of incoming lugs, i.e., top or bottom feed based on incoming feeder entrance location.
B. Verify that "touch-up" paint kit is available for repainting.

3.02 EXAMINATION

A. Examine areas and surface to receive disconnect switches and enclosed circuit breakers for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
B. Verify that space indicated for disconnect switches and enclosed circuit breakers mounting meets code-required working clearances.
C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.03 INSTALLATION

A. Install disconnect switches and/or enclosed circuit breakers in accordance with ANSI/NECA 1.
B. Install disconnect switches and/or enclosed circuit breakers level and plumb, in accordance with manufacturer's written instruction.
C. Disconnect switches and enclosed circuit breakers mounting and seismic restraints:
   (1) Install disconnect switches and enclosed circuit breakers anchorage devices and seismic restraints based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.
   (2) Fasten disconnect switches and enclosed circuit breakers firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.

(3) Anchor and fasten disconnect switches and enclosed circuit breakers and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 05 29 - Hangers and Supports for Electrical Systems.

(4) Install two rows of steel slotted channel, with a minimum of four attachment points, for each disconnect switch and enclosed circuit breaker.

(5) When not located directly on wall, install support frame of steel slotted channel anchored to floor and ceiling structure.

D. Do not support disconnect switches and/or enclosed circuit breakers by raceway.

E. Install top disconnect switch and/or enclosed circuit breaker handle a minimum of 3’-6” (1 m) and maximum of 6' 6" (2 m) above finished floor.

F. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

G. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification. Attach nameplate to exterior of each switch and/or enclosed circuit breaker using small corrosion-resistant metal screws or rivets. Do not use contact adhesive.

(1) Include switch and/or enclosed circuit breaker name, amperage, voltage, phase, and number of wires.

H. Install fuses in fusible switches at job site per requirements in Section 26 28 13 - Fuses.

3.04 CONNECTIONS

A. Ground equipment according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

3.05 FIELD QUALITY CONTROL

A. Inspect for physical damage, proper alignment connections, anchorage, and grounding.

B. Correct malfunctioning units on-site and retest to demonstrate compliance. Remove and replace with new units and retest.

C. Test disconnect switches and/or enclosed circuit breakers per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests.

D. Interpret test results in writing and submit to Engineer.

3.06 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.07 ADJUSTING

A. Circuit Breakers: Set field-adjustable trip settings or change the trip settings recommended by the overcurrent protective device coordination study per Section 26 05 73 - Power System Studies.

3.08 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

END OF SECTION 26 28 16

SECTION 26 29 13 - ENCLOSED CONTROLLERS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 05 29 - Hangers and Supports for Electrical Systems
D. Section 25 05 53 - Instrumentation Tagging
E. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems
F. Section 26 05 53 - Electrical Systems Identification
G. Section 26 08 12 - Power Distribution Acceptance Tests
H. Section 26 08 13 - Power Distribution Acceptance Test Tables
I. Section 26 28 13 - Fuses

1.02 DESCRIPTION

A. Section includes enclosed manual and magnetic motor controllers and enclosed contactors.
B. Motors shown on the drawings or specified in other Divisions of these specifications shall be provided with motorized equipment and connected under this section. Provide motor controllers and power circuit disconnect devices for all motors, unless shown or specified to be furnished with motorized equipment under other Divisions of these specifications, and by others, for installation by this contract.
C. Variable-frequency controllers furnished by Division 23 for installation by Division 26.
D. Motor Voltage Information:
   (1) Voltages available are: _____ and 480 V, 3-phase and 120, 208 and 277V single phase. Circuits are designed for motors with voltage ratings as follows:
      (a) Smaller than 1/2 hp (0.37 kW) motors: 115 V, single phase.
      (b) 1/2 hp (0.37 kW) motors and larger: _____ and 460 V, 3-phase.

1.03 REFERENCE STANDARDS

A. ANSI/NECA 1 – Standard Practices for Good Workmanship in Electrical Contracting
B. NEMA AB 1 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breakers Enclosures
C. NEMA EN 10250 – Enclosures for Electrical Equipment (1000 V Maximum)
D. NEMA ICS 2 – Industrial Control and Systems: Controllers, Contactors and Overload Relays, Rated Not More Than 2000 VAC or 750 VDC
E. NEMA ICS 4 – Industrial Control and Systems: Terminal Blocks
F. NEMA IA 10039 – Industrial Control and Systems: Control Circuit and Pilot Devices
G. NEMA IA 10030 – Industrial Control and Systems: Enclosures
H. NEMA BS 31047 – Enclosed and Miscellaneous Distribution Equipment Switches (600 V Maximum)
I. NEMA MG 00001 – Motors and Generators
J. NFPA 70 – National Electrical Code
K. UL 98 – Enclosed and Dead Front Switches
L. UL 486A-486B – Wire Connectors
M. UL 489 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breakers Enclosures
N. UL 508 – Industrial Control Equipment

1.04 SUBMITTALS

A. Product Data:
   (1) Motor controllers: Submit catalog cut sheets showing voltage, size, rating and size of switching and overcurrent protective devices, dimensions, and enclosure details.
   (2) Contactors: Submit catalog cut sheets showing voltage, size, current rating, dimensions, and enclosure details.
   (3) Factory settings and time-current curves of individual protective devices.
   (4) Confirm motor sizes and voltages with submittals of other Divisions of specifications, and/or by others, prior to Section submittals.
B. Manufacturer’s Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and/or starting of product.

C. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

D. Closeout Submittals:

(1) Project Record Documents:

(a) Record actual locations and ratings of enclosed motor controllers and enclosed contactors.

(2) Operation and Maintenance Data:

(a) Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

(b) Include spare parts data listing, source, and current prices of replacement parts and supplies.

(c) Include Manufacturer Seismic Qualification Certification and Installation Seismic Qualification Certification.

1.05 QUALITY ASSURANCE

A. Obtain motor controllers, and contactors from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with Manufacturer Seismic Qualification Certification: Submit certification that motor controllers, contactors, accessories and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

(2) Certification shall bear the seal and signature of an Engineer registered and licensed in the _____ of _____.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, water, construction debris, and traffic.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.08 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.

(1) Spare pilot lights: Furnish 1 spare lamp for every 5 installed units, but not less than 1 set of 3 of each kind.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Schneider Square D

B. ABB-GE Industrial Solutions

C. Eaton Cutler-Hammer

D. Siemens

E. Allen Bradley

2.02 MANUAL MOTOR CONTROLLERS

A. Description: NEMA ICS 2, AC general-purpose, Class A, manually operated, full-voltage controller for small motors, with ____ type overload relay, ____ and ____ operator.

2.03 FRACTIONAL-HORSEPOWER MANUAL CONTROLLERS

A. Description: NEMA ICS 2, AC general-purpose, Class A, manually operated, full-voltage controller for fractional horsepower induction motors, with _____ type overload relay, _____ pilot light, and _____ operator.

2.04 MOTOR STARTING SWITCHES

A. Description: NEMA ICS 2, AC general-purpose Class A manually operated, full-voltage controller for fractional horsepower induction motors, without thermal overload unit, with ____ pilot light, and ____ operator.

2.05 FULL-VOLTAGE NON-REVERSING MAGNETIC MOTOR CONTROLLERS

A. Description: NEMA ICS 2, AC general-purpose, Class A, magnetic controller for induction motors rated in horsepower, three-phase and single-phase, as scheduled, except where single-phase motors scheduled to be provided with built-in overload elements:
   (1) Size _____ minimum
   (2) Control Voltage: 120 V, 60 Hz
   (3) Overload Relays: NEMA ICS 2, solid-state _____, 1 overload relay per phase:
      (a) Solid-state type:
         1) Class _____ inverse-time tripping characteristics.
         2) Non-volatile operating memory.
         3) 3:1 current adjustment range.
         4) Phase loss/phase unbalance protection.
         5) Ambient temperature insensitive.
         6) Self-powered.
         7) Manual reset. Automatic recent not acceptable.
         8) Manual trip.
         9) Visible trip indication.
      (b) _____ type:
         1) Class _____ inverse-time tripping characteristics.
         2) Manual reset.
   (4) Features:
      (a) Auxiliary Contacts: NEMA ICS 2, ____ each ____ contacts in addition to seal-in contact.
      (b) Pushbuttons: ____ type.
      (c) Pilot Lights NEMA IA 10039: push-to-test LED _____, _____ type.
      (d) Hand-Off-Auto (H-O-A) Selector Switches: _____
      (e) Control Power Transformers: 120V secondary, adequate capacity to operate connected pilot, indicating and control devices, plus 100% spare capacity in each motor controller, but not less than 100VA. Fused primary and secondary, and unfused leg of secondary bonded to enclosure.
      (f) Terminals: NEMA ICS 4.
      (g) Other accessories detailed or required by drawings.

2.06 COMBINATION CONTROLLERS

A. Factory-assembled motor controllers with externally operable disconnect, _____ type, in common enclosure; means for locking disconnect handle and means for defeating cover interlock.

2.07 FULL VOLTAGE NON-REVERSING MULTI-SPEED MAGNETIC MOTOR CONTROLLERS

A. Description: Same as full voltage non-reversing single-speed magnetic motor controllers with addition of the following:
   (1) Speed selector switch
   (2) Auto-Off-Low-High selector switch

2.08 REDUCED VOLTAGE MOTOR CONTROLLERS

A. Motor controllers for NEMA rated _____ V motors 25 hp (18.4 kW) ____ and above.
B. Motor controllers for NEMA rated 460 V motors 60 hp (44.1 kW) ____ and above.

2.09 AUTOTRANSFORMER REDUCED-VOLTAGE CONTROLLERS

A. Description: NEMA ICS 2, closed transition.

2.10 MOTOR CONTROLLER ACCESSORIES

A. Factory installed devices in controller enclosure, unless otherwise indicated, as follows:
   (1) “On-Off” and “Start-Stop” pushbutton stations, pilot lights, selector switches: NEMA ICS 2, _____ duty, oiltight type.
   (2) 120 V control circuits and pilot light, unless otherwise noted.
   (3) Red pilot light to indicate motor operation.
   (4) Green pilot light to indicate motor stopped.
   (5) Minimum wire size for control circuits: #14 AWG.

(6) Stop and Lockout Pushbutton Station: Momentary-break pushbutton station with a factory-applied hasp arranged so a padlock can be used to lock pushbutton in depressed position with control circuit open, where indicated.

B. Control services: As scheduled on motor schedule or indicated.

2.11 GENERAL PURPOSE MAGNETIC CONTACTORS

A. Description: NEMA ICS 2, same as magnetic controllers, except without overload protection.

B. Poles: To match circuit configuration and control function.

C. Configuration: _____

D. Contact Rating: Match branch circuit overcurrent protection.

2.12 LIGHTING MAGNETIC CONTACTORS

A. Description: NEMA ICS 2, same as magnetic controller, except without overload protection.

B. Poles: To match circuit configuration and control function.

C. Configuration: _____

D. Contact Rating: Match branch circuit overcurrent protection.

2.13 LUGS

A. Labeled for 75°C copper and aluminum conductors.

B. Multiple lugs to match number of conductors per phase.

C. Termination of field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

D. For equipment specified in this section and for equipment furnished under other Divisions of this specification and/or by others.

2.14 MOTOR CONTROLLERS AND CONTACTOR ENCLOSURES

A. NEMA EN 10250, NEMA IA 10030.

B. NEMA Type 1, Type 3R (outdoor locations) _____ enclosure.

C. Code-gauge galvanized steel.

D. Manufacturer’s standard gray enamel finish over prime coat.

E. Surface-mounted. Flush-mounted where indicated.

PART 3 - EXECUTION

3.01 COORDINATION

A. Coordinate motor control wiring with Division 23 of these specifications.

B. Coordinate motor sizes and voltages with submittals of other Divisions of these specifications and/or by others.

C. Verify with manufacturer that “touch-up” paint kit is available for repainting.

3.02 EXAMINATION

A. Examine areas and surface to receive motor controllers and contactors for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for motor controllers and contactors mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data.

3.03 INSTALLATION

A. Install motor controllers and contactors in accordance with ANSI/NECA 1.

B. Install level and plumb, in accordance with manufacturer’s written instruction.

C. Motor controllers and contactors mounting and seismic restraints:

(1) Install motor controllers and contactors anchorage devices and seismic restraints based on design by an Engineer registered and licensed in the _____ of _____, and to comply with Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems for seismic criteria.

(2) Fasten motor controllers and contractors firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.

(3) Anchor and fasten motor controllers and contactors and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 05 29 - Hangers and Supports for Electrical Systems.

(4) Install two rows of steel slotted channel, with minimum of four attachment points, for each motor controller and contactor.

(5) When not located directly on wall, install support frame of steel slotted channel anchored to floor and ceiling structure.

(6) Do not support motor controllers and contactors only by raceway.

D. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening valves. Where manufacturer's torque valves are not indicated, use those specified in UL 486A-486B.

E. Install engraved plastic nameplates under provisions of Section 26 05 53 - Electrical Systems Identification. Attach nameplate to exterior of each motor controller and contactor, using small corrosion resistant metal screws or rivets. Do not use contact adhesive:

(1) Indicate motor served, nameplate horsepower, full load amperes, code letter, service factor, voltage/phase rating, and fuse size and type, when applicable.

F. Connect each motor terminal box to rigid conduit system with maximum 18" (450 mm) of flexible liquid-tight metal conduit. Install conduit per requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

G. Check for proper rotation and phase relationship of each motor.

H. Install fuses in fusible switch at job site pre requirements in Section 26 28 13 - Fuses.

I. Control Wiring Installation:

(1) Install wiring between motor control devices according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

(2) Install motor control wiring in accordance with control wiring diagrams and in raceways where indicated or required by contract drawings.

(3) Bundle, train, and support wiring in enclosures.

(4) Connect hand-off-automatic switch and other automatic-control devices where applicable.

(a) Connect selector switches to bypass only manual- and automatic-control devices that have no safety functions when switch is in hand position.

(b) Connect selector switches with motor-control circuit in both hand and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.04 APPLICATION

A. Select features of each motor controller to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; duty cycle of motor, and configuration of pilot device and control circuit affecting controller functions.

3.05 CONNECTIONS

A. Provide green wire ground through flexible conduit to interconnect motor frame and rigid conduit system.

B. Ground and bond motor controller and contactor enclosures according to Section 26 05 26 - Grounding and Bonding for Electrical Systems.

C. Connect power and control wiring according to Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.

D. Connect control wiring for operation, control and supervision of motorized equipment as shown on drawings and/or specified in this and other Divisions of these specifications.

3.06 FIELD QUALITY CONTROL

A. Inspect motor controllers and contactors for physical damage, proper alignment, connections, anchorage, seismic restraints and grounding.

B. Correct malfunctioning motor controllers and contactors on-site and retest to demonstrate compliance. Remove and replace with new units and retest.

C. Test continuity of each circuit.

D. Test motor controllers per requirements in Sections 26 08 12 - Power Distribution Acceptance Tests and 26 08 13 - Power Distribution Acceptance Test Tables

E. Interpret test results in writing and submit to Engineer.

3.07 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.08 ADJUSTING

A. Set field-adjustable circuit breakers trip settings or change the trip settings as indicated on drawings.

B. Adjust motor circuit protectors.

3.09 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

END OF SECTION 26 29 13

SECTION 26 32 13 - ENGINE GENERATORS

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 22 07 00 - Plumbing Insulation
B. Section 23 12 14 - Liquid Fuel Systems
C. Section 23 21 18 - Valves
D. Section 23 31 14 - Ductwork
E. Section 23 33 14 - Ductwork Specialties
F. Section 26 00 00 - General Electrical Requirements
G. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
H. Section 26 05 26 - Grounding and Bonding for Electrical Systems
I. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems
J. Section 26 08 12 - Power Distribution Acceptance Tests
K. Section 26 08 13 - Power Distribution Acceptance Test Tables
L. Section 26 23 13 - Paralleling Low-Voltage Switchgear
M. Section 26 36 23 - Automatic Transfer Switches

1.02 DESCRIPTION OF SYSTEM

A. Section describes complete package generator set, unit-mounted radiator cooling system, , microprocessor based control and monitoring panel, battery and charger, remote annunciator and drop over sound attenuated enclosure .
B. Package generator set rated for emergency.
C. Engine fuel system:

1.03 REFERENCE STANDARDS

A. NEMA MG 00001 – Motors and Generators
B. IEEE 446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications
C. NFPA 37 - Standard for Installation and Use of Stationary Combustion Engines and Gas Turbines
D. NFPA 110 – Standard for Emergency and Standby Power Systems
E. UL 2200 – Stationary Engine Generator Assemblies
F. IEC8528 Part 4 – Control Systems for Generator Sets
G. UL 142 – Steel Aboveground Tanks for Flammable and Combustible Liquids
H. UL 2085 – Protected Aboveground Tanks for Flammable and Combustible Liquids

1.04 SUBMITTALS

A. Shop Drawings
   (1) Submit for engineering review and approval prior to production release. Include the following for engine-generator:
      (a) Outline drawings of equipment showing weights
      (b) Overall dimensions including bolting template and earthquake restraints
      (c) Right hand, left hand, end, and top views of proposed assembly
      (d) Battery, battery rack, battery charger, and wiring diagrams
      (e) Vibration isolation bases, mounts, and hangers
      (f) Exhaust silencer and flexible fittings
      (g) Stub ups for fuel
      (h) Power and control wiring entrance locations
      (i) Main circuit breaker size, location, and required clearance
      (j) Lug sizes and locations
      (k) Engine-generator control panel drawings showing devices to be provided, with each device referenced to material list with complete description for device.
      (l) Weather protective enclosure installation drawings, structural calculations, lighting fixture catalog cut, conduit, and wiring.

(m) Enclosure sound performance data
(n) Muffler characteristics
(o) Calculations for starting based on step loads outlined in Paragraph 2.2, B.5.
(p) Factory certified prototype test report indicating fuel efficiency and emission levels

(2) Information on engine characteristics:
(a) Make, type, and number of cylinders
(b) Brake horsepower (bhp) available
(c) Jacket water heat rejection
(d) Cooling pump characteristics
(e) Exhaust flow rate and temperature at 25, 50, 75, and 100% rated load
(f) Ventilation requirements
(g) Combustion air requirements
(h) Fuel consumption rates at 25, 50, 75, and 100% rated load
(i) Liquid refill capacities
(j) Exhaust backpressure limitation
(k) Type and manufacturer of governor
(l) Alternator size to limit voltage dip to 10%

(3) Information on generator characteristics:
(a) Make and type
(b) Type of construction and overspeed capabilities
(c) Temperature rise
(d) Regulation characteristics
(e) Ventilation requirements
(f) Type of winding insulation
(g) KW power factor
(h) Type of exciter and voltage regulator

(4) Manufacturer seismic qualifications: Submit certification that _____, engine-generator set, batteries, battery rack, accessories, and components will withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems.

B. Interconnection detail drawing showing control and power connections in complete standby system. Control connections between components are to be labeled with identical nomenclature. Coordinate with generator manufacturer.

C. Accessories including fuel lines, flexible exhaust couplings, exhaust flange, and other exhaust system components.

D. Complete review of this specification, noting for each paragraph whether or not proposed equipment complies with project specifications, or deviates in some fashion. Justification must be provided for each deviation.

E. Complete test specification detailing testing procedures to be used to verify performance of equipment provided and aligning with NFPA 110 testing requirements. Provide written documentation of testing to be completed to engineer of record and owner for review and approval prior to starting testing.

F. Recommended spare parts lists.

G. Test Reports:

(1) Submit certified factory tests report on engine-generator delivery. Alarms, sensors, and meters must be tested and certified.

(2) Submit, upon completion of installation and testing of engine-generator sets, certified test reports from required NFPA 110 testing for each engine-generator.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Handle equipment in accordance with manufacturer's written instructions. One copy of instructions is to be included with equipment at time of shipment. Maintain factory bracing, packaging, and wrapping.

1.06 OPERATION AND MAINTENANCE MANUALS

A. Refer to Section 01 77 00 - Closeout Procedures and herein below.

B. Submit Operation and Maintenance (O&M) manuals to Engineer for review 60 days prior to acceptance of unit.

C. Installation, maintenance, and operating instruction manuals shall include the following:

(1) 100% accurate system “as-installed” drawings, interconnect diagrams, schematic diagrams, wiring diagrams, individual sub-system component manuals, operation procedures, system description with theory of operation, maintenance schedules and procedures, original programmed settings and parameters, and other information necessary for the Owner to maintain, operate, test, and troubleshoot system.

(2) The O&M manual shall contain step-by-step instructions for startup and shutdown. The first page shall contain name, address, and phone number of local representative to be called for service or parts. Follow with complete parts lists by actual ordering catalog numbers. O&M manual also shall contain four copies each of test record forms and service record forms for Owner use. Forms shall show proper interval for testing, servicing, and replacing of components, lubrication, filters, antifreeze, etc., including recommended specifications and fluid levels for lubricants.

(3) Recommended spare parts list (with pricing) for 2 yrs of operation.

D. O&M manuals shall not solely rely on sub-component manuals. Thorough consolidation of operating and maintenance information shall be available in system overview guide. Include major components of system in overview.

E. Turn final reviewed manuals over to Owner prior to conducting training of Owner personnel.

F. Seal single copy of service record forms, recommended operation and service practices for unit in plastic and wall mount in weather-protective enclosure.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Acceptable Manufacturers:

(1) Engine Generator Set - Caterpillar, Cummins, MTU, Rehlko

(2) Exhaust Silencer – Maxim, Nelson, or approved equal

(3) Isolation equipment

(4) Battery charger – Sens, La Marche, Charles Industries

2.02 RATINGS AND PERFORMANCE

A. Engine Generator Set

(1) Generator kW Output: ____

(2) Altitude _____ above sea level in ambient temperature of _____.

(3) Stable frequency regulation

B. Alternator

(1) _____ kVA, .8 Power Factor

(2) ____ V, ____ Ph, 60 Hz, ____

(3) Stable voltage regulation 0-full load less than or equal to ± .5%.

C. Transient Performance

(1) Engine

(a) Start and load in 10 seconds per NFPA 110

(b) Accept 100% block load per NFPA 110

(2) Frequency regulation _____ no load to full load. _____.

(3) Alternator

(a) AC waveform output contains <5% total harmonic distortion (THD) at full linear load when measured from line to neutral with <3% in any single harmonic, and no third-order harmonics or their multiples.

(b) Telephone influence factor < 40

(c) Telephone harmonic factor < 3

(d) _____ Fault current capability

D. Factory Prototype Test Certified

(1) Harmonic Distortion Levels

(a) Demonstrate

(2) Airflow Restriction tests

(a) Demonstrate controlled shutdown after overheating

(3) Unit tested with enclosure

(a) UL 2200 listed

(4) 30 Degree Water Spray Unit Rain Test

(a) Demonstrate no water leakage into electrical boxes

(5) Air Filter Test

(a) Demonstrate engine contains engine backfire explosion

E. Factory Production Test Certified

(1) Alternator Impedance to Ground

(2) Dielectric Testing

(a) At 1000 V and 2 times rated voltage

(3) Maximum kW Rating

(4) Engine Response Time

(5) Alternator Construction Testing

(a) Impedance Balance Tested

(6) Alternator Insulation Testing

(a) Surge Tested

2.03 FABRICATION AND MANUFACTURER

A. Engine:

(1) Type: Inline or vee

(2) Four-stroke cycle _____ at _____ RPM consistent with engine durability.

(3) Aspiration: _____

(4) Horsepower

(a) Brake Horsepower _____

(5) Displacement: _____ cylinders with maximum cubic inch displacement of _____ and a maximum BMEP consistent with engine durability.

(6) _____

(7) Fuel Type: No. 2 domestic diesel fuel oil.

(8) Engine accessories:

(a) Fuel filter

(b) Lube oil filter

(c) Intake air filter

(d) Lube oil cooler

1) Suitable for operation of generator set at full rated load in ambient temperature specified.

(e) Fuel transfer pump

(f) Fuel priming pump

1) Engine driven positive displacement, mechanical, full pressure

(g) Gear driven water pump

(h) Electronic direct fuel injection or have suitable emission control equipment

(i) Electric speed sensing governor capable of isochronous regulation.

(j) Safety-shut-offs for:

1) High water temperature

2) Low oil pressure

3) Overspeed

4) Overcranking

(9) EPA Certified Tier _____

B. Cooling System:

(1) Engine skid mounted, engine-driven radiator with blower type fan, sized to maintain safe operation at 122°F (50°C) ambient temperature.

(2) _____ discharge remote mounted radiator sized to maintain safe operation at 122°F (50°C) ambient temperature.

(3) Arrange liquid-cooled prime movers for NFPA level 1 applications for closed-loop cooling.

(4) Provide radiator with:

(a) Motor-driven fan with voltage same as generator

(b) Motor Starter

(c) Initiating contacts to actuate on generator startup

(d) Connect to generator distribution system

(e) Core guard

(f) Fan guard

(g) Mounting hardware

(h) Direct adapter flange. Ductwork with flexible connection between radiator and exhaust plenum to be provided by Division 23. Coordinate with Division 23.

(i) Flexible pipe connections at engine and radiator.

(j) Supply power for fans and pumps on remote radiators from a tap at generator output terminals or ahead of first load circuit overcurrent protective device.

(k) Heat exchangers

(5) Block Heater

(a) Water Jacket Heater: ____

(b) Maintain engine jacket water to 110°F (43°C) in ambient temperature of 30°F (-1°C)

(c) Heater to be equipped with thermostatic switch.

(d) Single phase _____ V

(e) Provide two heaters, 4500 W each minimum.

(6) Fill engine cooling system with solution of 50/50 mix ethylene glycol at initial fill.

(7) Ductwork/pipe with flexible connection between radiator and exhaust dampers to be provided by others. Refer to Section 23 51 00 - Breechings, Chimneys, and Stacks

C. Exhaust System:

(1) Furnish _____ type exhaust silencer:

(a) Sized according to manufacturer's recommendations

(b) Mount so weight is not supported by engine

(c) Flexible exhaust fitting

(d) Installation _____

(e) Refer to Section 23 51 00 - Breechings, Chimneys, and Stacks

(2) Condensate Traps

(a) Drain plug at low point of muffler

(3) Thermal Expansion

(a) Stainless steel exhaust flex to accommodate thermal growth and vibration isolation

(4) Exhaust Blankets

(a) 1" (25 mm) high temperature fiberglass cloth wrap

(b) Coordinate with weather protective enclosure.

(5) Thimble

(a) Pipe and wall of compatible construction

(6) Acceptable Back Pressure

(a) Size silencer and exhaust pipe so exhaust back pressure does not exceed maximum limitations specified by generator set manufacturer.

(7) Exhaust clearing area

D. Starting System

(1) Provide DC electric starting system with positive engagement drive. Provide DC voltage recommended by manufacturer.

(2) Provide fully automatic start-stop controls.

(3) Provide cycle cranking to open and lock out start circuit after 3 attempts to start failed engine start.

(4) Batteries

(a) Provide _____ lead-acid storage battery set:

1) Heavy duty diesel starting type

2) Voltage compatible with starting system voltage

3) Capacity to provide for 1-1/2 minutes total cranking time at 0°F (-17°C) without recharging. In accordance with NFPA Level 1.

(b) Provide vinyl coated steel battery rack.

(c) Provide starting battery heater:

1) Heater plate under battery

2) Heater type blanket around battery case

3) Thermal switch - heater control relay

4) 120 VAC input

(d) Battery cables and clamps

(5) Battery Charger
  (a) Four Rate Battery Charger
    1) Constant current, constant voltage, high-rate taper, and float equalized.
  (b) Dual Rate Battery Charger
    1) Constant current, and float equalized
  (c) Charger Accessories:
    1) Overload protection
    2) _____ line and load regulation
    3) Electronic current limit output 105%
    4) DC ammeter and voltmeter _____.
    5) UL 1236 listed and meets NFPA 110 requirements
    6) Output protection
    7) Temperature compensation
    8) Enclosed in NEMA 1 aluminum or stainless-steel enclosure
    9) Form C contacts for the following alarms
      1. AC fail
      2. Low battery volts
      3. High battery volts
      4. Charger fail
      5. Battery fault
(6) AC input voltage: _____ V
(7) When installed on the engine generator set, mount on vibration isolators.

E. Speed Control
(1) Mechanical: _____% droop
(2) Electronic: Isochronous

F. Alternator:
(1) Maximum temperature rise 275°F (135°C) at 104°F (40°C) ambient
(2) Synchronous type
(3) Self-ventilated
(4) Drip-proof construction
(5) Directly connected to engine flywheel housing with a flex coupling
(6) Capable of sustaining _____ overcurrent for 10 seconds under a 3 Ph symmetrical short circuit
(7) 120 V Anti-Condensation heater
(8) Subtransient Reactance limited to 12%
(9) Insulation
  (a) Complies with NEMA (MG1-33.4)
  (b) Class H Insulation Systems
    1) UL 1449 recognized
    2) Vacuum impregnated with epoxy varnish
    3) Fungus resistant
(10) _____.
  (a) PMG shall derive excitation current from pilot exciter mounted on the rotor shaft. It is to be able to sustain 300% of rated current for ten seconds during a fault condition.
  (b) Self-excited system to be brushless and consist of a 3 Ph armature and a 3 Ph full wave bridge rectifier mounted on the rotor shaft. Include surge suppressors to protect the diodes from voltage spikes.
(11) Rotor
  (a) _____
  (b) Winding
    1) ____
  (c) Varnish process
    1) Epoxy based material applied to each layer of magnet wire
  (d) Coil supports
    1) Driven through flexible coupling to ensure permanent alignment.

(e) End winding spacing
(f) Amortisseur windings
(g) Bearings
1) _____
2) _____

(12) Stator
(a) _____
(b) Laminations
(c) Cooling air passages and fan
1) Provide space heater to keep alternator free of moisture. Space heater to be 1500 W, 120 VAC, 1 Ph.
(d) Welded laminations to prevent cutting of wires
(e) Skewed stack to minimize slot ripple on output voltage and produce smooth voltage waveform.
(f) Pitch – Skewed design to optimize efficiency and minimize total harmonic distortion.
(g) Varnish process
1) 2 dips and bakes using Class A impregnating varnish

(13) Alternator Components
(a) Output Circuit Breaker(s)
1) _____ 100% _____ rated circuit breaker
2) Adjustable long time, long time delay, short time, and short time delay curve shaping elements
3) Shunt Trip for integration with load bank controls
4) Solid state trip fixed mounted insulated case _____ circuit breaker
5) NEC required access in front of breaker
6) Ground fault alarm only: Monitoring relay for breaker 1000A and above. Relay to be adjustable from 3.8 – 1200A and include an adjustable time delay of 0-10S.

G. Controls:
(1) NFPA 110 listed
(2) Micro-processor based solid state controls to automatically start, protect and monitor engine-generator set with panel illuminating lighting and digital display.
(3) Control panel includes:
(a) Solid state trip main circuit breaker
(b) Motor starting switch
(c) Electrically operated fuel control
(d) Relay to disconnect battery charger during cranking
(e) Switching lamps and meters to be oil tight and dust tight. All active components to be installed within a NEMA _____ enclosure. There shall be no exposed components with door open operating 750 V.
(f) Protective relays to open main circuit breaker and shut down and lockout engine on abnormal conditions including:
1) Overspeed
2) Operation of Remote Stop
3) Overcrank _____
4) Low lube oil pressure _____
5) High Engine Temp _____
6) _____
7) _____
8) _____
(g) Monitoring items shall include but is not limited to the following items and control:
1) Coolant temperature
2) Oil pressure
3) Battery voltage
4) RPM
1. Voltmeter, 3-1/2" (90 mm) dual type, 0.5% accuracy with selector switch
2. Ammeter, 3-1/2" (90 mm) dual type, .05% accuracy with selector switch
5) Frequency meter, 55-65 Hz ±0.125 Hz.

6) Running Time Meter (hours and 1/10 hours)
7) AC power metering to be 0.5% accuracy and include frequency, phase, selector switch with real time power metering including, kW, kVA, kVAR, kWh, PF, % of rated load.

(h) Control Items:
1) Voltage level adjustment rheostat
2) Overspeed level adjustment
3) Overvoltage level adjustment
4) Undervoltage level adjustment
5) Overfrequency level adjustment
6) Underfrequency level adjustment
7) Position function switch(es) marked AUTO, MANUAL RUN, OFF/RESET and STOP
8) 4 NO and 4 NC dry contacts for local and remote alarms, wired to terminal strips.
9) Emergency off mushroom button
10) Automatic remote start capability. Engine cranking system to permit minimum 4 cranking attempts of 10 seconds (adjustable) duration with rest of periods of 10 seconds (adjustable).
1. Overcrank lockout shall occur after 4 cranking attempts.

(i) In accordance with NFPA 110, Level 1, control panel shall furnish battery-powered individual visual alarm indicator functions at battery voltage and visual and audible pre-alarm:
1) Overcrank
2) Low water temperature
3) High engine temperature pre-alarm
4) High engine temperature
5) Low lube oil pressure pre-alarm
6) Low lube oil pressure
7) Overspeed
8) Low fuel main tank
9) Low coolant level
10) EPS supplying load
11) Control switch not in automatic position
12) High battery voltage
13) Low cranking voltage
14) Low voltage in battery
15) Battery charger ac failure
16) Lamp test
17) Contacts for local and remote common alarm
18) Low starting air pressure
19) Low starting hydraulic pressure

(j) Engine shut down, with audible alarm:
1) Low oil pressure
2) High engine temperature
3) Overcrank
4) Overspeed

(k) Status report:
1) Engine running
2) Circuit breaker open
3) Circuit breaker closed

(4) Visual alarm resettable only after fault condition has been corrected.

(5) Audible alarm shall include silencing circuit, which, after activation, will permit annunciation of subsequent failures.

(6) Control Panel mounting:
(a) Mounted on engine generator set in NEMA 1 enclosure on shock isolators
(b) Wall mounted in NEMA 1 enclosure
(c) Free standing in NEMA 1 enclosure

(7) Provide remote annunciator panel

(a) Compliant with NFPA Level 1 requirements.

H. Isolate engine generator set from building structure and from connecting services.

(1) Separately derived grounding system. Connect generator ground as shown on drawings to grounding electrode system.

I. Termination Bars and Connections:

(1) Silver- or tin-plated copper bus bars for terminating cables.

(2) Standard NEMA standard bolt hole spacing, for 3 Ph and neutral, within generator connection box with gasketed bolt on cover.

(3) Engine-generator set control interfaces to other system components to be made on a permanently labeled terminal block assembly. Provide labels describing connection points.

(4) Connections to engine-generator set: Flexible or isolation type connections. Include electrical, fuel, exhaust, and ventilation connections.

J. Equipment Bases:

(1) Mount complete unit on a structural steel sub-base, rectangular in shape, with sufficient rigidity to maintain alignment of generator set. Provide perimeter beams with minimum depth equal to 1/10 of longest dimension of base, except beam depth need not exceed 14" (350 mm) provided that deflection and misalignment are kept within acceptable limits as determined by manufacturer. Engine-generator set to be statically and dynamically balanced at factory. Peak-to-peak amplitude of vibration velocity in horizontal, vertical, and axial direction shall not exceed 0.65" (17 mm) per second at main structural components.

(2) Engine-generator set weight distribution is to be considered to provide uniform deflections.

(3) Bases shall provide equipment alignment and assure uniform weight distribution. Provide side brackets on bases to contain isolating mounts and reduce total installed heights of equipment.

K. Vibration Isolators:

(1) Prevent equipment vibrations from being transmitted to enclosure.

(2) Required between the structural steel sub-base and concrete housekeeping pad.

(3) Steel or cast-iron top and bottom housings incorporating 1 or more steel springs with built-in leveling bolts and built-in resilient chocks to control oscillation and withstand lateral forces in all directions.

L. Custom Walk-in Weather Protective Enclosure

(1) Include sub-base tank as described in this specification.

(2) NEMA 3R rated

(a) Sound attenuated enclosure to reduce sound level of engine generator set while operating at full rated load and ventilation to a maximum of ____ at property line from engine generator in free-field environment.

(3) Overall Size:

(a) Drawings show generator footprint, which is maximum allowed for available space.

(b) Air intake limitations as shown on drawings. System operating within space limitations indicated above.

(4) Construction:

(a) Welded, 12 ga (2.657 mm) galvanized steel to ASTM A446/A446M.

(b) Walls: 3" (80 mm) thick satin coat steel formed panels with wall studs 16" (400 mm) on center designed to withstand wind loads as required by UBC.

(c) Roof: 3" (80 mm) thick with 3" (80 mm) deep cross members every 24 inches (600 mm) minimum, seal welded construction, and crowned to prevent ponding of water.

(d) Interior insulation: 3" (80 mm) thick rigid fiberglass. Insulation lined with 22 ga perforated steel screwed in place. Intake and discharge to be lined with poly prior to lining with 22 ga perforated steel.

(e) Interior liner: 22 ga perforated galvanized steel.

(f) Base: Nominal 3" x 2" (80 mm x 50 mm) perimeter mounting angle with 7/8" (22 mm) diameter anchor holes and suited for seismic hold down.

(g) Access doors: Minimum two 18 ga galvanized steel doors, each 36" x 80" (915 mm x 2032 mm), complete with panic hardware with exterior thumb latch, ball bearing hinges, weather stripping, stainless-steel threshold, and drip edge.

(h) Lifting lugs

(5) Ventilation:

(a) Intake: complete with motorized-type damper, hood with silencer, flex connections, and 1/2" x 1/2" (13 mm x 13 mm), 16 ga (1.519 mm) galvanized bird screen.

(b) Discharge: complete with gravity-type damper with discharge duct, hood with silencer, flex connector, and 1/2" x 1/2" (13 mm x 13 mm), 16 ga (1.519 mm)galvanized bird screen.

(6) Electrical:

(a) Include panelboard wired to the following:

1) 6 battery-powered fluorescent fixtures, each with (2) 32W T-8 lamps, battery and wire guard; battery units shall have a minimum run-time of 90 minutes; Provide Columbia KL4-2 SLR, equipped with an electronic .9PF ballast and a parallel Bodine B33 ballast or approved equal.
2) (2) 3-way switches
3) 2 GFCI duplex receptacles
4) 2 block heaters wired to a junction box local to front of generator set
5) Battery charger
6) Battery heater
7) Space heater
8) 120 V circuit for day tank reverse pump
9) 120 V circuit for day tank controls

(b) Wiring shall be #12 AWG minimum in surface-mounted EMT conduit with compression fittings.

(c) Coordinate all loads type, voltage, and rating with engine-generator supplier prior to ordering panel. See panel schedules for connection of loads.

(d) Provide with 36" (920 mm) space in front of panelboard.

(e) Provide electrical connections from bottom of enclosure. Water seal around enclosure floor penetrations.

(7) Paint:

(a) Clean surfaces to SSPC-SP1, seams sealed, primed with industrial phenolic primer to 1.5 mils (0.0381 mm) D.F.T. Topcoat exterior with Clovacoat epoxy enamel to 2.0 mils (0.0508 mm) D.F.T.

(b) Coordinate color with Architect.

M. Outdoor Weather Protective Drop-Over Enclosure:

(1) Rated NEMA 3R

(2) Attenuation:

(a) Provide engine-generator set with sound-attenuated enclosure. Enclosure will reduce sound level of engine-generator set while operating at full rated load and ventilation running to maximum of _____ at 3 ft (1 m) or _____ at 21 ft (7 m) from engine-generator set in free-field environment.

(3) Overall Size:

(a) Drawings show generator footprint, which is maximum allowed for available space.

(b) Air intake requirements are to be taken into consideration and shall not prevent enclosure from operating within space limitations indicated above.

(4) Construction:

(a) Construction to be welded, 14 ga (1.9 mm) galvanized steel to ASTM A446/A446M.

(b) Package listed to UL 2200

(c) Lockable doors

(d) Include panelboard wired to the following:

1) 6 battery-powered fluorescent fixtures, each with (2) 32W T-8 lamps, battery and wire guard; battery units shall have a minimum run-time of 90 minutes; Provide Columbia KL4-2 SLR, equipped with an electronic .9PF ballast and a parallel Bodine B33 ballast or approved equal.
2) (2) 3-way switches
3) 2 GFCI duplex receptacles
4) 2 block heaters wired to a junction box local to front of generator set
5) Battery charger
6) Battery heater
7) Space heater
8) 120 V circuit for day tank reverse pump
9) 120 V circuit for day tank controls

(e) Interior lights

(f) Remote mounted emergency stop button

(g) Lifting lugs

Refer to Paragraph 2.3.N for fuel system.

(5) Ventilation:

(a) Intake: Complete with _____ damper, hood with silencer, flex connections, and 1/2" x 1/2" (13 mm x 13 mm), 16 ga (1.519 mm) galvanized bird screen to protect against ice and snow.

(b) Discharge: Complete with gravity-type damper with discharge duct, hood with silencer, flex connector, and 1" x 1/2" (13 mm x 13 mm), 16 ga (1.519 mm) galvanized bird screen.

(6) Paint:

(a) Clean surfaces to SSPC-SP1, seal seams, prime with industrial phenolic primer to 1.5 mils (0.0381 mm) D.F.T. Topcoat exterior with Clovacoat epoxy enamel to 2.0 mils (0.0508 mm) D.F.T.

(7) Power Coat Paint. Selections to include white, beige, ASA61 gray, and manufacturer factory standard. Architect to select.

N. Fuel System

2.04 SEISMIC CAPABILITY

A. Engine-generator set and components shall meet requirements of Seismic Zone of project's location without additional external bracing to building structure. Frequency modifying devices are not allowed.

2.05 LOAD PRIORITIES

A. The following load priorities shall be provided:

(1) Priority #1 – UPS

(2) Priority #2 – Elevator 1

(3) Priority #3 – Elevator 2

(4) Priority #4 – ST-101, ST-201

(5) Priority #5 – SHP-301, SHP-302

(6) Priority #6 – Spare

(7) Priority #7 – Spare

(8) Priority #8 – Spare

2.06 PRIORITY LOAD ADDING AND LOAD SHEDDING

A. Load adding and load shedding:

(1) Priority load adding and load shedding are to be provided by automatic opening and closing distribution circuit breakers in standby switchgear.

(2) Upon signal from ATS to start engine, feeder circuit breakers for Priority #1 loads shall remain closed, but feeder circuit breakers for Priority #2 loads, Priority #3 loads, Priority #4 loads, and Priority #5 loads are to be opened.

(3) Provide opening of feeder circuit breakers within no more than 6 seconds and before automatic transfer switch will be connected to engine-generator.

(4) Load adding to be done on load priority basis. Next priority loads to be added based on ascending sequential priority.

(5) Load adding of priority loads to be achieved by closing feeder circuit breakers for corresponding priorities.

(6) Load shedding shall be done on a last-on, first-off basis.

(7) Load shedding of priority loads to be achieved by opening standby switchgear feeder circuit breakers for corresponding priorities, upon signal from Building Control System (BCS) to standby switchgear.

(8) Load shedding is not performed for priority #1 loads.

2.07 INTERFACE WITH BUILDING MANAGEMENT SYSTEM (BMS)

A. Interface shall be as follows:

(1) Control panel shall incorporate communication module with digital communication port connection to building control system (BMS) via Ethernet communication.

(2) Communications shall be for the following:

TYPE	CONDITION/DESCRIPTION	RANGE/UNITS
LDI 1	Low lube oil pressure prealarm	
LDI 2	Low water temperature	
LDI 3	High engine temperature prealarm	
LDI 4	Battery charger AC failure	
LDI 5	Spare

LDI - LAN: Digital Input from control panel communication module to BMS via Ethernet communication.

LAI - LAN: Analog Input from control panel communication module to BMS via Ethernet communication.

LDO - LAN: Digital Output from BMS to communication module via Ethernet communication.

LAN – Local Area Network

(3) Provide all additional information as required for a complete and operable system.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install engine-generator set and associated equipment as indicated. Coordinate final location of equipment with General Contractor. Final location of equipment to be reviewed with Engineer prior to installation.

B. Install equipment in accordance with manufacturers recommendations. Provide equipment protection during and subsequent to installation.

3.02 ACCEPTANCE TESTS

A. Perform Acceptance Testing in accordance with Section 26 08 12 - Power Distribution Acceptance Tests and Section 26 08 13 - Power Distribution Acceptance Test Tables.

B.

3.03 LOAD TEST

A. Conduct load testing of engine-generator set, under direct supervision of factory-authorized representatives of manufacturers of engine-generator set and _____.

B. Installation is NFPA 110, _____.

C. Testing shall be provided in accordance with NFPA 110. Refer to NFPA 110 for complete testing requirements.

D. Engine-generator set test results are to be certified to comply with specification parameters or necessary corrective actions implemented and tests repeated until compliance is certified at no additional cost to Owner.

E. At conclusion of testing, service engine-generator set including replacing air, oil and fuel filters, changing lubrication oil, checking and refilling batteries, adjusting fan belts for proper tightness, and refilling of cooling system as required.

F. Provide fuel for load testing of engine-generator set.

END OF SECTION 26 32 13

SECTION 26 36 23 - AUTOMATIC TRANSFER SWITCHES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements

B. Section 26 05 29 - Hangers and Supports for Electrical Systems

C. Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems

D. Section 26 32 13 - Engine Generators

1.02 DESCRIPTION OF SYSTEM

A. Provide automatic transfer switch, 3 phase, 60 Hz, _____ pole, with _____ neutral for voltage and current as indicated on drawings.

1.03 REFERENCE STANDARDS

A. NEMA IA 10042-1 Industrial Control and Systems Part 1: Electromechanical AC Transfer Switch Equipment

B. UL 1008 Automatic Transfer Switches

1.04 SUBMITTALS

A. Submit shop Drawings for equipment provided under this Section.

1.05 QUALITY ASSURANCE

A. Obtain automatic transfer switches from one source and by single manufacturer.

B. Regulatory Requirements:

(1) Comply with NFPA 70 for components and installation.

(2) Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Certifications:

(1) Furnish Engineer with Manufacturer Seismic Qualification Certification: Submit certification that switchgear, accessories, and components will remain _____ to withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls For Electrical Systems. Include the following:

(a) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

D. _____

(1) Test system in accordance at the factory in accordance with Section 26 08 12 - Power Distribution Acceptance Tests and Demonstration of Transfer Functions.

(2) Provide _____.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchgear as required to prevent condensation.

B. Deliver in _____, individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes, and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Use factory-installed lifting provisions. Handle carefully to avoid damage to internal components, enclosure, and finish.

1.07 WARRANTY

A. Refer to Division 01 and Section 26 00 00 - General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Acceptable Manufacturers: Asco by Schneider Electric, Cummins, Russelectric by Siemens, or Zenith by ABB

2.02 AUTO-TRANSFER SWITCH

A. Auto-transfer switch:

(1) Mechanically held, electrically operated type

(2) Interlocked to ensure only 2 possible positions, normal and emergency.

(3) Rated for continuous duty in unventilated sheet metal enclosure
(4) Suitable for all classes of loads at maximum rated voltages
(5) Withstand rating that meets or exceeds withstand rating of transfer switch feeder breakers.
(6) Shall be _____ transition type as specified on drawings.
(a) For closed transition switches, provide option to trip upstream breakers if switch fails to transfer leaving both sources in parallel. Provide shunt trip capability for upstream _____ source breaker and interlock to the transfer switch.

B. Provide main contacts with silver alloy wiping action type protected by arcing contacts.
C. Provide switch components accessible from front of enclosure.
D. Provide 3 cycle short circuit rating to guarantee contact opening and no damage when transfer switch is served by molded case circuit breakers.
E. Provide 10 cycle short circuit rating to guarantee contact opening and no damage when transfer switch is served by power circuit breakers.
F. Provide switch with the following items:
(1) Adjustable 1 to 3 second time delay to override momentary voltage dips and outages.
(2) Time delay on transfer to emergency. Adjustable from 1 to 300 seconds (factory set at 3 seconds).
(3) Time delay on retransfer to normal. Adjustable from 2 seconds to 30 minutes.
(4) Full phase protection consisting of 2 phase relays and one close differential relay. Phase relays shall be set to 70% drop out, 90% pick up, and differential relays set for 92 to 95% pick-up and 83 to 85% drop-out.
(5) Pushbutton reset to normal.
(6) Pushbutton to bypass time delay on retransfer to normal.
(7) Pilot light to indicate normal position.
(8) Pilot light to indicate emergency position.
(9) Auxiliary contact to close when normal power fails.
(10) Auxiliary contact to open when normal power fails.
(11) Auxiliary contact on same shaft as main contacts (closed on normal).
(12) Auxiliary contact on same shaft as main contacts (closed on emergency).
(13) Pushbutton, or selector switch, or graphical display input to provide “Test,” “Auto,” OFF”, and “Engine Start.”
(14) Contacts to start engine-generator when normal power fails.
(15) Time delay engine start, adjustable from 0 to 5 seconds.
(16) Adjustable time delay on retransfer to normal source with 5 minute unloaded running time of standby plant:
(a) Minimum delay 2 minutes
(b) Maximum delay 25 minutes
(c) Built in circuitry to nullify time delay if emergency source fails and power is available at normal source.
(17) Relay to prevent transfer to emergency until voltage and frequency of generating plant have reached 90% of rated value.
(18) Provide bi-direction in-phase monitor or dual motor operator with programmed neutral to allow voltage decay in motor and transformer circuits.
G. Bypass/isolation switch:
(1) Dual source enclosed.
(2) Isolate transfer switch and de-energize for maintenance, testing or repair.
(3) Dual-source operation - bypass either to normal or emergency source directly to load at discretion of operator.
(4) Break-before-make operation of contacts.
(5) Operation - fully mechanical, designed to provide quick-make-quick-break of contacts and only allow switch to be fully closed or fully open with no mid position possible.
(6) Operation - possible regardless of the position or condition of the automatic transfer switch.

2.03 ELEVATOR CONTROL INTERFACE

A. Provide auxiliary contacts to provide emergency system status to elevator controller.
B. Contacts required are:
(1) Emergency power signal
(2) Pre-transfer warning signal
C. Pre-transfer warning signal relay to change state prior to operation of transfer switch in either direction.
D. These contacts are in addition to other required contacts.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install equipment in accordance with manufacturer's recommendations.

B. Provide equipment protection during and subsequent to installation.

C. Provide wiring between transfer switch and elevator controller. Final connections at elevator controller by Elevator Contractor.

D. Connect transfer switches that are part of fire pump controllers.

3.02 OPERATION

A. Parallel “start engine-generator” contacts of automatic transfer switches, such that failure of normal source at any switch shall start engine.

B. Transfer of one switch from normal to emergency shall not preclude any other switch from transferring.

C. Engine generator cool down cycle shall not start until all transfer switches have timed out back to normal source.

3.03 ACCEPTANCE TESTING

A. Perform acceptance testing in accordance with Section 26 08 12 - Power Distribution Acceptance Tests.

B. Adjust or replace equipment as needed to comply with manufacturer's specifications and resubmit corrected test reports.

END OF SECTION 26 36 23

SECTION 26 41 13 - LIGHTNING PROTECTION FOR STRUCTURES

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 05 26 - Grounding and Bonding for Electrical Systems

B. Section 26 05 33 - Raceway and Boxes for Electrical Systems

1.02 DESCRIPTION

A. Section includes lightning protection systems consisting of air terminals, roof conductors, bonding conductors, down conductors, fastener connections, and grounding.

1.03 REFERENCE STANDARDS

A. ANSI/NEMA GR 1 - Grounding Rod Electrodes and Ground Rod Electrode Couplings

B. NFPA 70 - National Electrical Code

C. NFPA 780 - Standard for the Installation of Lightning Protection Systems

D. UL 467 – Grounding and Bonding Equipment

E. UL 96 - Lightning Protection Components

F. UL 96A - Installation Requirements for Lightning Protection Systems

1.04 SUBMITTALS

A. Product Data:

(1) Submit manufacturer’s descriptive and technical literature and catalog cuts.

B. Shop Drawings:

(1) Submit installation shop drawings for the overall lightning protection system. Include physical layout of the equipment, mounting details, and relationship to other parts of the work.

(2) Submit detail drawings for each major component.

(3) Submit location, size, and material of grounding electrodes, and connection type.

(4) Submit roof adhesive data for air terminals mounted on single-ply roofing.

C. Certification, signed by Contractor, that roof adhesive for air terminals is approved by manufacturers of both the terminal assembly and the single-ply roofing material.

D. Copy of Owner’s UL Master Label Certificate.

E. Manufacturer’s Installation Instructions:

(1) Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation.

F. Closeout Submittals:

(1) Project record documents:

(a) Record active location of lighting protection system components.

(2) Operation and maintenance data:

(a) Include manufacturer’s recommended operating instructions, maintenance procedures and intervals, and preventative maintenance instructions.

1.05 QUALITY ASSURANCE

A. Qualifications:

(1) Lightning protection system materials:

(a) Consists of standard products by a manufacturer regularly engaged in production of lightning protection systems.

(b) UL Listed

(2) Lightning protection system installer: UL Listed.

B. Regulatory Requirements:

(1) Lightning protection system: Comply with NFPA 780, UL 96, and UL 96A.

C. Certifications:

(1) Furnish Owner with UL Master Label Certificate upon completion of installation providing proof that the lightning protection system is in compliance with UL 96 and UL 96A standards.

1.06 SEQUENCING

A. Coordinate installation of lightning protection with installation of other building systems and components, including supporting structures and building materials, metal bodies requiring bonding to lightning protection components, exterior and interior building finishes, and building roofing.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Thompson Lightning Protection Company
B. Harger Lightning Protection, Inc.
C. Heary Brothers Lightning Protection Company, Inc.
D. National Lightning Protection Corporation
E. Erico International Corporation
F. Approved Equal

2.02 LIGHTNING PROTECTION SYSTEM COMPONENTS

A. NFPA 780, UL 96.
B. Materials: Air terminals, main and cross-run roof conductors, bonding and down conductors, conductor fasteners, air terminal supports, chimney bands, clips, and connections: _____:
   (1) Air terminals: _____ type with a safety tip, _____.
C. ANSI/NEMA GR 1 Grounding Electrodes: 3/4” x 10 ft (19 mm x 3.05 m) long copper-clad steel ground rod.
D. Concrete-Encased Electrodes: As shown on drawings.
E. Solid Copper Ground Plate (if called for on drawings): Where shallow or rocky top soil conditions preclude the use of driven ground rods. This ground plate is 18” x 18” x 20 gauge thick (0.032” minimum) and comes complete with two premium die cast bolt pressure type cable connections for cables through #3/0.
F. Ground Ring Electrode: As shown on drawings.
G. Ground Connectors: Conform to UL 96
   (1) Bronze of the clamp type and bronze clamp accessories.
   (2) Provide in accordance with the requirements in Section 26 05 26 - Grounding and Bonding for Electrical Systems.
H. Galvanic Compatibility of Materials:
   (1) Air terminals, conductors, fasteners, and connectors shall be galvanically compatible with surfaces they are mounted to.
   (2) Copper materials in all locations except where the use of aluminum materials is necessary for galvanic compatibility.
   (3) Aluminum materials on copper roofs are not acceptable.
   (4) Aluminum materials where mounted on aluminum roofing, siding, or other aluminum surfaces.
I. Bimetallic fittings when joining metals that are not galvanically compatible.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install lighting protection to comply with UL 96A, NFPA 70, and NFPA 780. Conform to the most stringent requirement in NFPA 780.
B. Bond exterior metals including flashing, roof drains, vent stacks, fans, water pipes, metal raceways, enclosures, frames, and other non-current carrying metal parts of electrical and mechanical equipment on roof to lightning protection system.
C. Bond lower end of exhaust ducts, vent stacks, etc., passing through roof.
D. Run bonding jumpers continuously horizontally or down from point of bond to point of connection to main conductor.
E. Make down conductors electrically continuous, with direct paths from air terminals to ground connections. Avoid sharp bends and narrow loops. Protect down conductors, where necessary, to prevent physical damage or displacement to the conductor. Use PVC Schedule 40 conduits. Provide conduits in accordance with requirements in Section 26 05 33 - Raceway and Boxes for Electrical Systems .
   (1) Provide down conductors for every 100 feet of building perimeter.
   (2) For structural steel construction, utilize steel columns (bond top and bottom) in lieu of down lead conductors – every other column and not to exceed an average of 60 foot spacing.
F. Conceal system conductors and interior conductors.

G. Notify Architect at least 48 H before concealing lightning protection system components.

H. Below-grade or concealed cable connections: Use approved exothermic-welded connections for all conductor splices and connections between conductors and other components.

I. Exposed cable connections: Use approved mechanical connections.

J. Air terminals mounted on single-ply roofing: Use adhesive recommended by manufacturer of air terminals and approved by manufacturer of roofing material. Comply with adhesive manufacturer's installation instructions. For roofing work, refer to Division 07 - Thermal and Moisture Protection.

K. Attach each down conductor to the grounding electrode by _____.

L. Provide grounding electrodes with top 2 ft (0.6 m) below finished grade.

M. Ramps and covered passageways shall be protected by the lightning protection system.

N. For construction utilizing post tensioning systems to secure precast concrete sections, do not use the post tension rods as down conductors. Bond tension rods to the lightning protection and grounding system – follow recommendations of the post tension rod manufacturer.

3.02 CORROSION PROTECTION

A. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the present of moisture, unless moisture is permanently excluded from the junction of such materials.

B. Use conductors with suitable protective coatings where conditions would cause deterioration or corrosion of conductors.

3.03 FIELD QUALITY CONTROL

A. Apply for inspection by Underwriters Laboratories, Inc. (UL) to obtain UL Master Label Certificate.

B. Verify that lightning protection surge arrestor devices are installed on all incoming power and communications lines, in order to obtain UL Master label Certificate.

END OF SECTION 26 41 13

SECTION 26 43 00 - SURGE PROTECTIVE DEVICES (SPD)

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements
B. Section 26 05 26 - Grounding and Bonding for Electrical Systems
C. Section 26 23 00 - Low-Voltage Switchgear
D. Section 26 23 13 - Paralleling Low-Voltage Switchgear
E. Section 26 24 13 - Switchboards
F. Section 26 24 16.13 - Lighting and Appliance Panelboards
G. Section 26 24 16.16 - Distribution Panelboards
H. Section 26 27 26 - Wiring Devices

1.02 DESCRIPTION

A. Provide Type 1 Surge Protective Devices (SPD) for the protection of AC electrical circuits formerly known as Transient Voltage Surge Suppression (TVSS) System. Provide high energy surge current diversion and be suitable for application in Type 1 environments.
B. Modes of Protection:
   (1) Line to Ground, Line to Neutral, and Neutral to Ground for services with a neutral
   (2) For Services without a neutral, Line to Line and Line to Ground
C. Provide common and normal modes of protection.

1.03 REFERENCE STANDARDS

A. ANSI/UL 1449 Surge Protective Devices _____ Edition
B. IEEE C62.41.1 – Recommended Practice on Surge Voltages in Low Voltage AC Power Circuits FIPS PUB 94
C. IEEE C62.11 – Standard for Metal-Oxide Surge Arresters for Alternating Current Power Circuits (> 1 kV)
D. IEEE C62.41.1 Guide on the Surges Environment in Low-Voltage (1000 V and Less) AC Power Circuits
E. IEEE C62.41.2 Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits
F. IEEE C62.45 IEEE Recommended Practice on Surge Testing for Equipment Connected to Low-Voltage (1000 V and less) AC Power Circuits
G. IEEE C62.62 IEEE Standard Test Specifications for Surge Protective Devices (SPDs) for Use on the Load Side of the Service Equipment in Low Voltage (1000V and less) AC Power Circuits
H. National Electrical Code – Article 285
I. NEMA LA 1 – Surge Arresters
J. National Fire Protection Association – NFPA 20, 70, 75, and 780
K. UL 96A Installation Requirements for Lightning Protection Systems

1.04 SUBMITTALS

A. Submit Shop Drawings for equipment provided under this Section.
B. Submit shop drawings and product information for approval and final documentation in quantities listed according to Conditions of the Contract. Identify customer name, customer location, and customer order number.
C. Submit ANSI/UL 1449 Listing documentation to indicate the following:
   (1) Short Circuit Current Rating (SCCR)
   (2) Voltage Protection Ratings (VPRs) for all modes
   (3) Maximum Continuous Operating Voltage rating (MCOV)
   (4) Nominal Discharge Current rating (I-n)
   (5) Type 1 device
   (6) VPR, MCOV, I-n, and Type 1 information is posted at www.UL.com under Certifications; search using UL Category Code: VZCA. SCCRs are posted in manufacturer's published documentation.
   (7) UL data and visual inspection takes precedence over manufacturer's published documentation.

D. Provide shop drawings including manufacturer installation instruction manual and line drawings detailing dimensions and weight of enclosure, internal wiring diagram illustrating all modes of protection in each type of SPD required, wiring diagram showing field connections, and manufacturer's recommended wire and breaker sizes (if required).

E. Upon request, modules using encapsulation shall be presented without encapsulation for visual inspection, proprietary technology included. MOV type and quantity shall reflect kA ratings on cutsheets, verification of diagnostic monitoring, thermal and overcurrent protection, etc.

PART 2 - PRODUCTS

2.01 MATERIAL

A. Acceptable manufacturers:

(1) Externally mounted unit by the power distribution equipment manufacturer.

(2) Erico

2.02 PERFORMANCE CHARACTERISTICS

A. SPD shall bear the UL Mark and shall be Listed to Third Edition of ANSI/UL 1449. "Manufactured in accordance with" is not equivalent to UL Listing and does not meet intent of specification.

B. Post SPD and performance parameters at www.UL.com under Category Code: VZCA. Products or parameter without posting at UL.com are not approved.

C. Minimum surge current capacity for Service Entrance units based on 8 x 20 microsecond current waveform:

(1) 200,000 A between each phase for line-to-line mode

(2) 200,000 A each phase for line-to-ground mode

(3) 200,000 A each phase for line-to-neutral mode

(4) 200,000 A for neutral-to-ground mode

D. Minimum surge current capacity for panelboard units based on 8 x 20 microsecond current waveform:

(1) 80,000 A between each phase for line-to-line mode

(2) 80,000 A each phase for line-to-ground mode

(3) 80,000 A each phase for line-to-neutral mode

(4) 80,000 A for neutral-to-ground mode

E. Sequential Surge Current Survivability:

(1) 1,000 sequential category surges without failure.

F. Current Rating:

(1) Rated for continuous current and AIC rating of equipment protected.

(2) Mark SPD Short-Circuit Current Rating on the SPD label.

2.03 OPERATING CONDITIONS

A. Temperature range: -40°F to 122°F (-40°C to +50°C)

B. Relative humidity range: 0 to 95%, non-condensing

C. Audible noise level: > 40 dBA at 5 ft (1.5 m)

D. SPD Surface Temperature: less than 131°F (55°C)

2.04 FABRICATION

A. SPD Modules:

(1) UL Labeled as Type 1 (verifiable at www.UL.com), intended for use without need for external or supplemental overcurrent controls. Protect suppression component of every mode, including N-G, by internal overcurrent and thermal overtemperature controls. SPDs relying on external or supplementary installed safety disconnects do not meet intent of specification.

(2) Suppression components: Heavy-duty MOVs, selenium cells, or combination of both.

(3) Provide surge current diversion paths for all modes of protection: L-N, L-G, N-G in WYE systems, and L-L, L-G in DELTA systems.

(4) Provide service entrance SPD audible diagnostic monitoring by way of audible alarm.

(5) Provide service entrance SPD with 1 set of NO/NC dry contacts for alarm conditions.

(6) Provide visual LED diagnostics including a minimum of 1 green LED indicator per phase, and 1 red service LED. Include an audible alarm with on/off silence function and diagnostic test function (excluding branch).

(7) If a dedicated breaker for the SPD is not provided in the switchgear, switchboard, or panelboard include an integral UL Recognized disconnect switch. Dedicated breaker to serve as a means of disconnect for distribution SPDs.

(8) Meet or exceed the following criteria:

(a) ANSI/UL 1449 Listed Voltage Protection Ratings (VPRs) for 6kV 3000A testing as follows:

VOLTAGE	L-N L-G N-G	L-L
208Y/120V	≤800V	≤1200V
480Y/277V	≤1200V	≤2000V

(9) ANSI/UL 1449 Listed Maximum Continuous Operating Voltage (MCOV) (verifiable at UL.com):

System Voltage	Allowable System Voltage Fluctuation (%)	MCOV
208Y/120	15%	150V
480Y/277	15%	350V

(10) Provide serviceable, replaceable modules (excluding Branch).

(11) Provide warranty for a period of 10 yrs, incorporating unlimited replacements of suppressor parts if they are destroyed by transients during the warranty period.

B. Service Entrance:

(1) Install 1 primary suppressor external to the service entrance in accordance with manufacturer instructions.

(2) Install SPD on line or load side.

(3) Bond SPD ground to service entrance ground.

C. Distribution Panelboards:

(1) Install 1 suppressor external to each designated distribution panelboard.

(2) Install surge suppression device in accordance with manufacturer instructions.

D. SPD Low-Impedance Interconnect Cable:

(1) Provide low-impedance cable specifically listed for SPD installations.

(2) Low impedance approximately 25% of conventional pipe and wire for improved clamping voltage.

PART 3 - EXECUTION

3.01 APPLICATION OF SPD

A. Provide UL approved disconnect switch at Service Entrance or Transfer Switch as a means of service disconnect if a breaker sized per manufacturer's recommendations is not available.

B. Provide independent means of servicing disconnect at Distribution, MCC, and Branch such that the protected panel remains energized. A 30A breaker (or larger based on manufacturer's recommendations) may serve this function.

C. Provide SPD for each panel _____ associated with the _____ branch(es) of power.

3.02 INSTALLATION

A. Install per manufacturer's recommended practices.

B. Provide short and straight conductors not exceeding 3 ft (1 m) in length. Manufacturer-approved cables may be used that allow conductor length to extend beyond 3 ft (1 m) in length without affecting capability of unit.

C. Input conductors twisted together to reduce inductance.

D. Avoid 90-degree bends in cable.

3.03 QUALITY ASSURANCE

A. Factory test system before shipment. Include quality control check, "Hi-Pot" tests at 2 times rated voltage plus 1,000 V, ground leakage tests, and calibration.

B. Manufacturer Qualifications: Engage a firm with at least 5 yrs experience in manufacturing surge protective devices.

C. Manufacturer of equipment shall have produced similar electrical equipment for a minimum period of 5 yrs. When requested by Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with requirement.

D. Provide SPD compliant with the Restriction of Hazardous Substances (RoHS) Directive 2002/95/EC.

3.04 FIELD QUALITY CONTROL

A. Inspections before SPD startup:

(1) Visual Inspection:

(a) Verify installation per drawings.

(b) Verify phase, neutral, and ground conductors are properly sized and configured.

(2) Mechanical Inspection:

(a) Check connections for tightness.

(b) Check terminal screws, nuts and/or connectors for tightness.

(3) Electrical Inspection:

(a) Confirm input voltage.

(b) Confirm phase, neutral and ground connections are proper.

3.05 WARRANTY

A. Provide 10 yr manufacturer warranty.

END OF SECTION 26 43 00

SECTION 26 50 00 - LIGHTING

PART 1 - GENERAL

1.01 RELATED WORK

A. Section 26 00 00 - General Electrical Requirements
B. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables
C. Section 26 05 19.16 - Manufactured Wiring System
D. Section 26 05 26 - Grounding and Bonding for Electrical Systems
E. Section 26 05 33 - Raceway and Boxes for Electrical Systems
F. Section 26 09 23 - Lighting Control Devices
G. Section 26 09 43 - Network Lighting Controls

1.02 DESCRIPTION OF WORK

A. Provide complete and fully operational lighting system per Contract Drawings and Specifications.
B. Luminaires shall be provided complete with necessary accessories for proper installation.
C. Catalog numbers shown in luminaire schedule are basic luminaire types. Additional features, accessories and options specified, scheduled or necessary for proper installation shall be included.
D. Specifications and drawings convey the features and functions of luminaires only and do not show every item or detail necessary for the work.
E. Work includes final aiming and focusing of luminaires under direction of the Architect/Engineer_____.

1.03 REFERENCE STANDARDS

A. NECA/IESNA 500 - Standard for Installing Indoor Commercial Lighting Systems (ANSI)
B. NECA/IESNA 501 - Standard for Installing Exterior Lighting Systems (ANSI)
C. NECA/IESNA 502 - Standard for Installing Industrial Lighting Systems (ANSI)
D. NEMA LE 4 - Recessed Luminaires, Ceiling Compatibility
E. UL 676 – Underwater Luminaires and Submersible Junction Boxes
F. UL 773 - Plug-in Photocontrols for use with area lighting
G. UL 924 - Emergency Lighting and Power Equipment
H. UL 1574 – Track Lighting
I. UL 1598 – Luminaires
J. UL 1838 – Low Voltage Landscape Lighting Systems
K. UL 2108 – Low Voltage Lighting Systems
L. UL 2388 – Flexible Lighting Products
M. UL 2562 – Pendant Cable
N. UL 8750 – LED Light Sources for use in Lighting Products
O. ANSI C78.377 – Chromaticity
P. IESNA LM-79 – Approved Method: Electrical and Photometric Measurements of Solid-State Lighting Products
Q. IESNA LM-80 - Approved Method: Testing Lumen Maintenance of LED Light Sources
R. IESNA TM21-11 - Projecting Long Term Lumen Maintenance of LED Light Sources including Addendum A
S. IEEE STD 1789-2015 - Recommended Practices for Modulating Current in High-Brightness LEDs for Mitigating Health Risks to Viewers

1.04 QUALITY ASSURANCE

A. Luminaire and accessory components shall be constructed of materials appropriate for their use. Luminaires intended for use in marine environments shall be constructed of materials resistant to corrosion.
B. Luminaires, drivers, other components shall meet the requirements of all applicable State and Municipal codes and energy codes.
C. Provide luminaires listed and labeled by UL or other testing lab acceptable to local jurisdiction for their indicated use and installation conditions.
D. Contractor shall coordinate installation of lighting systems with all trades.

(1) Manufacturers listed in the luminaire schedule shall be assumed capable of supplying listed luminaires. Any such exceptions shall immediately be brought to the attention of Architect, Engineer, or Lighting Designer.

(2) Multiple Name Specification:

(a) When multiple manufacturers are listed, Electrical Contractor shall choose which of the listed products are to be provided.

(b) Products of the same type shall be of same manufacturer.

(3) Single Name Specification:

(a) When only one product is suitable for the application and/or no other known acceptable products exist, only one manufacturer/product is listed in the Luminaire Schedule. For such instances, Electrical Contractor shall provide the listed product with no exceptions.

(4) Contractor shall coordinate and verify compatibility of luminaires with lighting control system

(a) Control protocol indicated for luminaires matches protocol of lighting control system specified. Contractor shall coordinate and verify compatibility of all dimming luminaires with control system to ensure that dimming is flicker free, continuous dimming through the dimming range noted on the luminaire schedule.

E. Substitution requests:

(1) Will be evaluated prior to Bid.

(2) Shall follow procedures set forth in this Section under paragraph 1.7 and in Section 01 25 00 - Substitution Procedures.

(3) Shall be made not less than 10 days prior to bid date.

(4) Shall include the following information indicating that the proposed substitution is of similar construction quality and assembly, lumen output and distribution, color temperature, color consistency, and controllability:

(a) Specified and proposed manufacturer's product data sheet, noting options and features.

(b) Provide dimensioned drawing of luminaire.

(c) Provide photometric data in form of an electronic IES file on USB or via email.

(5) Provide table-top working samples and/or mockup of specified luminaire and proposed alternate.

(6) Electrical Contractor shall be responsible for all costs incurred by substitution request sample and/or mockup production and review.

(7) Equipment delivery lead time shall not be held as a valid reason for requesting luminaire substitution unless luminaire lead time from specified manufacturer is in excess of 14 weeks. It shall be sole responsibility of Electrical Contractor to determine necessary equipment lead times, deliver submittals for review in a timely fashion, and place orders accordingly to ensure timely delivery.

(8) When requesting a substitution, Electrical Contractor shall provide unit and extended pricing for specified luminaire, unit and extended pricing for proposed alternate, and unit and extended delta savings to Owner to be realized by accepting proposed alternate. If requested, provide unit pricing for each luminaire type specified to provide a baseline comparison for substitution request.

(9) Electrical Contractor shall guarantee pricing on all luminaire types for which a substitution request has been granted. This price guarantee shall be per unit and shall be maintained through the end of construction, regardless of quantity purchased.

(10) For all luminaire types using an LED light source, provide independently tested, IESNA LM-79 compliant photometry testing data and IESNA LM-80 Lumen Maintenance data.

1.05 WARRANTY

A. Exit Signs Utilizing LED Technology: Provide manufacturer’s warranty for a period of not less than five years from the date of substantial completion including parts and labor for full replacement of defective product.

B. LED Luminaires: Provide Manufacturer’s warranty for a period of not less than five years from the date of substantial completion or the specified warranty period greater than five years for repair or replacement of defective electrical parts, including light source and driver.

C. Luminaires without integral LED sources: Provide manufacturer’s warranty for a period of not less than one year from the date of substantial completion including parts and labor for full replacement of defective product.

1.06 SUBMITTALS

A. Electronic submittal format shall be limited to the greater of 500 pages or 30 MB to ensure that all pages load correctly. Bookmarks by luminaire type are required for ease of navigation. Submittals exceeding these limits should be broken in a logical fashion into multiple volumes for separate review. Measures to reduce file size should not compromise legibility or any other factors affecting ease of review.

B. Upon award of Contract, submit complete list of lighting products to be furnished, with manufacturer and catalog designations, including current unit cost. Unit price shall be for equipment only and not include installation or miscellaneous electrical costs.

C. Upon award of Contract, submit complete list of lighting products to be furnished, with manufacturer and catalog designations, including currently quoted lead times for product delivery. Should Electrical Contractor anticipate delivery schedule of any specified product may adversely impact construction schedule, they shall bring it to the attention of Owner/Architect /Lighting Designer at this time.

D. In addition to complying with requirements of Section 26 00 00 - General Electrical Requirements, submittals shall include the following:

(1) Manufacturer's product data

(2) Installation instructions

(3) Maintenance data

(4) Parts list for each luminaire accessory

(5) Photometric Data: photometric data for luminaire, including optical performance as follows:

(a) Coefficients of utilization

(b) Luminance table

(c) Candela distribution data

(d) Zonal lumens

(e) Area and roadway luminaires shall include Isocandela Charts, IES Roadway Distribution Classification and IES BUG (Backlight – Uplight – Glare) ratings.

(6) Driver schedule indicating manufacturer, type, and catalog number for each luminaire

(7) Driver cut sheet for each driver used, referencing luminaire type(s)

(8) Product color/finish

(a) Where specific finish or color is not specified and options exist, submit color or finish samples to Architect/Engineer/Lighting Designer for selection.

E. Shop Drawings for equipment provided under this Section shall include the following:

(1) Overall submittal drawings indicating luminaire size, mounting (including ceiling type), light source, shielding, and voltage attributes, as well as manufacturer's product data, installation instructions, maintenance data, and parts list for each luminaire.

(2) Catalog cutsheets lacking sufficient detail will not be accepted.

(3) Detailed drawings of linear pendant mounted and suspended luminaires including dimensions, support spacing, suspension type, power feed type and locations, driver locations, wiring and controls configuration, luminaire joint locations and end plates. Provide canopy details that indicate coordination with the ceiling system provided.

(4) Detailed drawings for each cove and linear wall system configuration including dimensions, power feed locations, driver locations, luminaire joint locations, extension plates for end and corner sections and end plates.

(a) LED strip luminaires mounted in architectural coves, provide dimensioned drawings and sections and include accessory cut sheets as specified. Within coves, all luminaires are to be mounted end to end with no more than 12” unlit split evenly between ends

(5) Detailed drawings for LED systems including LED color, color consistency, rated life, warranty, and scale plans with luminaire layout, number, type and location for drivers, and a complete bill of materials.

(6) Detailed drawings for continuous recessed or continuous surface mounted luminaires including dimensions, power feed locations, driver locations/quantity, luminaire joint locations, extension plates for end and corner sections and end plates as applicable.

(7) Detailed drawings for custom LED handrail systems including dimensions, power feed locations, driver locations/quantity, luminaire joint locations as applicable.

(8) Submit documentation that indicates specified products have been tested, or will be tested, for compatibility with the lighting controls being procured and will perform as specified. Control devices or system shall be able to control luminaires with flicker free, continuous dimming, in range specified. Electrical Contractor, luminaire manufacturer and lighting control manufacturer shall be financially responsible for any incompatibilities.

(9) Detailed drawings for nonstandard/custom luminaires indicating dimensions, weights, method of field assembly, components, features, and accessories. Details shall be scaled to a legible size.

(10) Detailed drawings for fiber optic systems including scaled plans with cable layout number and type of fiber bundles, illuminator quantity and location, and a complete bill of materials.

(11) Drawings for site lighting shall include pole data with wind loading, complete dimensions and finish, pertinent physical characteristics and accessories including mounting details, driver type and location and any specified control options.

(12) Photometric Data: Where indicated on luminaire schedule and Contract Drawings, supply complete photometric data for luminaire, including optical performance rendered by independent testing laboratory developed according to methods of the Illuminating Engineering Society of North America as follows:

(a) Coefficients of utilization

(b) Luminance table with data presented numerically, showing maximum luminaire luminance at shielding angles. Readings should be taken both crosswise and lengthwise in case of linear luminaire or luminaire with an asymmetric distribution.

(c) Candela distribution data presented graphically and numerically, in 5° increments (5°, 10°, 15°, etc.). Data developed for up and down quadrants normal, parallel, and at 11-1/2°, 45°, 67-1/2° to source if light output is asymmetric.

(d) Zonal lumens stated numerically in 10° increments (5°, 15°, etc.) as above.

(13) No variation from the general arrangement and details indicated on drawings shall be made on shop drawings unless required by actual conditions. All variations shall be marked on drawings submitted for approval.

F. Provide luminaires with factory or field finish as directed by Architect/Engineer/Lighting Designer. Verify final finish requirements before releasing luminaires for fabrication.

G. Where specific finish or color is not specified and options exist, submit color or finish samples to Architect for selection. Luminaires not having color or finish acceptable to Architect shall be replaced at no additional cost.

1.07 SAMPLES

A. Upon return of submittals, and prior to release for manufacturing, Contractor shall furnish one working sample of each luminaire for which sample requirement is noted in Luminaire Schedule.

(1) All requested samples shall be furnished as specified on luminaire schedule including: light output, correlated color temperature, distribution, lens type and finish EXCEPT sample shall be wired with minimum 6-ft cord and plug for energization at 120V.

B. Shipping: Samples shall be complete with specified LED module(s), cord and plug, ready for hanging, energizing, and examining, and shall be shipped, prepaid by Contractor, to Architect/Engineer/Lighting Designer or as otherwise advised.

C. Samples may not be returned, nor included in quantities listed for project.

D. Sample must be actual working unit.

E. All custom luminaires require a submission of material finish samples, component approval and a complete operating prototype luminaire. Prototype to be submitted prior to commencement of final luminaire fabrication and shall include specified LED modules. Modifications may be required as a result of prototype review. These modifications and others that do not materially affect the cost of the luminaire shall be incorporated at no additional cost to Owner.

1.08 LUMINAIRE MOCK-UPS

A. Upon return of submittals, and prior to release for manufacturing, Contractor shall provide mock-up on site (or at another agreed upon location) in actual architectural conditions for review by Architect/Engineer/Lighting Designer and Owner.

B. Provide type and quantity of luminaires as requested by Architect/Engineer/Lighting Designer.

C. Mock-up shall include working _____ and fastening devices.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Luminaires:

(1) As shown on Luminaire Schedule

B. LED Drivers:

(1) Shall be manufacturer recommended compatible driver.

(2) All LED drivers shall be dimming type standard unless otherwise noted. Refer to construction documents for control per application.

(3) Manufacturers must be compatible with lighting control system(s) provided and control luminaires to specified minimum output per Luminaire Schedule and controls intent documents.

(4) LED Drivers "At power levels between 100% to 1%, shall perform within the frequency (Hz) and Modulation (%) of IEEE STD 1789-2015 Low Risk level.

C. Emergency LED Battery Pack:

(1) Bodine, Dual-Lite, Iota or as specified in the Luminaire Schedule

D. Low Voltage Transformers:

(1) Q-Tran or as specified in the Luminaire Schedule

E. LED Modules:

(1) Philips Lumileds, Xicato, Cree, GE, Nichia, Osram Sylvania, Bridgelux, Citizen or as specified in the Luminaire Schedule

2.02 FABRICATION AND MANUFACTURER

A. Luminaires:

(1) Construction
   (a) Luminaires shall bear label indicating circuit voltage. Labels shall not be visible from normal viewing angles.
   (b) Luminaires shall be constructed with joints made by means of welded, brazed, screwed, or bolted construction methods.
   (c) Housings shall be so constructed that all electrical components are accessible and replaceable without removing luminaires from their mountings.
   (d) Surface temperatures of luminaires with integral drivers shall not exceed 90°C in 30°C ambient.
   (e) Luminaires recessed in ceilings utilized as air handling plenums shall be certified as suitable for the purpose and conform to NEC Article 300.
   (f) Miter cuts shall be accurate, joints shall be flush and without burrs.
   (g) Troffers with doors shall have spring-loaded door cam latches unless otherwise noted for special environments and applications.
   (h) Luminaires shall be free of light leaks and designed to provide sufficient ventilation of source to provide the photometric performance documented. Low voltage transformers and drivers shall be vented per manufacturer's specifications.
   (i) Provide inscription for exit and stairway signs to conform to applicable codes. Provide battery back-up as specified.
   (j) Verify types of ceiling construction with General Contractor prior to releasing luminaires for fabrication and delivery and provide luminaires adapted to ceiling construction used.
   (k) Coordinate recessed luminaire mounting appurtenances, flanges and trims with construction of ceiling in which luminaire is to be recessed. Provide correct luminaire mounting assembly.
   (l) Luminaire frames shall be manufactured of non-ferrous metal or be painted after fabrication.

(2) LED Luminaires are considered a lighting system with dependent components that must be evaluated as a complete system. Each LED luminaire includes a light emitting source, provisions for heat transfer, electrical control, optical control, mechanical support and protection, as well as aesthetic design elements. All LED luminaires shall:
   (a) Be NRTL 3rd party tested to applicable UL standards. Where remote drivers are specified, all drivers shall also have UL listing or equivalent and comply with code requirements.
   (b) Be tested to IESNA LM-79-19 testing using absolute photometry criteria.
   (c) Be reported greater or equal to 70% lumen maintenance at 50,000 hours of operation.
   (d) Be rapid cycle stress tested.
   (e) Have integral LED modules with a minimum operating temperature of -20°C.
   (f) Have modules that are capable of being easily replaced upon failure with a manufacturer provided replacement module without voiding the UL listing of the luminaire.
   (g) Have driver housings easily accessible for ease of maintenance.
   (h) Have a maximum operating temperature at LED junction to not exceed 90°C over the expected operating range of the luminaire.
   (i) Be RoHS compliant, lead and mercury free.
   (j) Have an LED operating frequency of + or – 120 Hz.
   (k) Must meet the appropriate Federal Communications Commission (FCC) requirements for FCC 47 CFR 15 (consumer use) and/or FCC 47 CFR Part 18 (industrial use)
   (l) Be Class A Sound rated.
   (m) Be supplied with power supply that complies with IEEE C62.41-1991.
   (n) Operate at 120 or 277 volts, ±10%.
   (o) Have reverse polarity protected at all hardwired connections and have high voltage protection in the event connections are reversed or shorted during the installation process.

(3) Lenses, Reflectors and Diffusers
   (a) All lenses or louvers shall be removable but held so that normal motion will not cause them to drop out.
   (b) All glass used in luminaires shall be made from thermal shock resistant borosilicate glass.
   (c) Optical lenses shall be free from spherical and chromatic aberrations.
   (d) Acrylic lenses shall be 100% virgin acrylic material.
   (e) Diffuser materials shall be UV stabilized in applications exposed to sunlight.
   (f) Troffer lenses shall be 0.125" (3.2 mm) thick, unless otherwise noted.
   (g) Alzak reflectors and louvers shall be low iridescent equivalent to Coil Anodizers. All Alzak parabolic cones shall be guaranteed against discoloration for a minimum of ten years.
   (h) Reflector cones shall not have visible source flashing in the cone.

(4) Optics and Adjustments

(a) Adjustable Angle Luminaire: Luminaires with adjustment beam angle shall contain reliable angle locking devices.

(5) Finishes
- (a) Provide luminaires with finish as shown in the luminaire schedule. Verify final finish requirements before releasing luminaires for fabrication.
- (b) Painted luminaires shall be painted after fabrication or “post painted”.
- (c) Ferrous parts and supports shall be rust proofed after fabrication.
- (d) For weatherproof or vaportight installations, painted finishes of luminaires and accessories shall be weather resistant using proper primers or galvanized and bonderized epoxy, so that entire assembly is completely corrosion resistant for service intended and rated for an outdoor life expectancy of not less than 20 years.

(6) Wiring
- (a) Luminaires shall be completely wired at the factory and as required by code.
- (b) Internal wiring shall contain no splices.
- (c) Connections shall be made with insulated “wire nut” type mechanical connectors except that driver connections shall comply with NEC Article 410.
- (d) Luminaires shall be provided with flexible conduit, pigtails, and equipment for external connections.
- (e) Recessed luminaires installed in inaccessible ceilings shall be UL listed for through wiring with the junction box accessible from the luminaire opening.
- (f) Cords shall be fitted with proper strain reliefs and watertight entries where required by application.

(7) Ceiling Coordination
- (a) Verify type of ceiling construction prior to releasing luminaires for fabrication and delivery.
- (b) Provide mounting appurtenance, flanges, sloped ceiling adaptors where required.
- (c) Provide mounting assembly, clips or other mechanical mounting lugs as required for support of luminaires.

(8) Track-Lighting Systems:
- (a) A lighting track system is defined as a manufactured assembly designed to support and energize luminaires that are capable of being readily repositioned on the track. Its length may be altered by addition or subtraction of sections of track. Lighting track may be either flexible or rigid depending on the specific application.
- (b) Provide lighting track types as specified in Luminaire Schedule, in lengths as indicated on lighting plans.
- (c) Lighting track system includes current carrying conductors which may convey either line voltages (120V or 277V) or low voltages (12V or 24V). Characteristics of lighting track that conveys line voltages are different than a lighting track system that conveys low voltages and as such are governed by different requirements. Therefore, they are considered individually in these Specifications.
  - 1) Line voltage (120V or 277V) Lighting Track systems:
    1. Provide components, including track, fittings, and luminaires from the same manufacturer as recommended by manufacturer for the intended use. All components shall be UL Listed and comply with the National Electric Code Standards for Lighting Track.
    2. Maintain continuity of conductors through feeds, splice fittings and boxes. Relative positions of live and neutral conductors must always be maintained along continuous run so that track fittings connect into the track in a consistent manner.
    3. Support lighting track at intervals recommended by the track manufacturer.
    4. One or two circuit Lighting Track shall be supplied with separate neutral busbars and have the ability to have each circuit separately dimmed as required when using standard voltage and low voltage luminaires with either magnetic or electronic transformers.
    5. Lighting Track shall have the ability to be dimmed or switched in selected sections in addition to dimming or switching an entire track configuration or track run.
    6. One and two circuit 120 volt Lighting Track shall be rated at 120/250 volt, 60 Hz, 2,400 watts maximum each circuit. Neutral busbar(s) shall be oversized and comparable to #10 AWG 30 amp wire to reduce the possibility of overheating due to non-linear loads and harmonics.
    7. One and two circuit 277 volt Lighting Track shall be rated at 277 volt, 50/60 Hz, 5,540 watts maximum each circuit. Neutral busbar(s) shall be oversized and comparable to #10 AWG 30 amp wire to reduce the possibility of overheating due to non-linear loads and harmonics.
    8. A separate grounding busbar shall be integral in all track lengths.
    9. 277 volt Track fittings shall be identified by a red rotor and a 277 volt label.
  - 2) Low voltage (12V or 24V) Lighting Track systems:
    1. Provide components, including track conductors, remote mounted transformers, fittings, and luminaires from the same manufacturer as recommended by the manufacturer for the intended use. Components shall be UL Listed as applicable for low voltage use.

2. Maintain continuity of conductors through feeds, splice fittings and boxes. Relative positions of conductors must always be maintained along continuous run so that track fittings connect into track in a consistent manner.
3. Support lighting track at intervals recommended by track manufacturer.
4. One and two circuit low voltage Lighting Track shall be supplied with three conductors and have the ability to have each circuit separately switched with either magnetic or electronic transformers provided by the track manufacturer. Two circuit low voltage Lighting Track can only be dimmed if both circuits are fed from the same transformer and as a result, separate circuit dimming shall not be attempted or permitted.
5. All transformers shall be supplied with both primary and secondary voltage over-current protection devices that shall remain readily accessible for maintenance and testing purposes.
6. Lighting Track shall have the ability to be dimmed or switched in selected sections in addition to dimming or switching an entire track configuration or track run. Separate, single circuit transformers are required for each independently controlled circuit with the use of electrically isolated couplers.
7. Conductors used in low voltage Lighting Track shall be, at minimum, equivalent to #10 AWG 30 amp wire or heavier and be capable of carrying a 300 watt load (at 12 volts) up to 32 ft (9.8 m) from transformer feed within range of luminaire voltage tolerance. At 24 volts, conductors shall be capable of supplying a 600 watt load up to 60 ft (18.3 m) from transformer feed within range of luminaire voltage tolerance.
8. If taut strung cable conductors are used as low voltage Lighting Track system, they shall have a Kevlar core to prevent strain on outer current carrying conductors.
9. Only insulated type taunt strung cable conductors shall be used in order to comply with local electrical codes governing installation.

(9) FIBER OPTIC LUMINAIRES
- (a) General Constructions and Materials: Illuminators and fibers shall be of one manufacturer to ensure compatibility.
- (b) Illuminators: Shall meet all conditions previously listed for LED luminaires.
- (c) Where fans are used for cooling, they shall be low noise and quiet running.
- (d) Illuminators shall have ultraviolet and infrared absorbing filters to prevent degradation of fiber.
- (e) Provide suitable thermal cut out protection.
- (f) All fibers shall be cut and installed per manufacturers specifications.

(10) Outdoor Lighting Systems:
- (a) Provide luminaires, mounting arms, brackets, poles, hand-hole covers, base components, and all other accessories for a complete assembly. Manufacturers shall be responsible for proper fitting of elements and structural integrity of unit
- (b) Provide poles as shown on luminaire schedule.
  - 1) Poles shall have hand-holes.
  - 2) Fusing for each luminaire head shall be located in hand-hole near base of pole.
  - 3) Pole base anchor bolts shall be galvanized.
- (c) Exterior Luminaires:
  - 1) Shall operate at a minimum ambient temperature of 0°F (-17°C).
  - 2) Shall be fully gasketed, with UL wet location label.
  - 3) Shall have approved wire mesh screens for ventilation openings.
  - 4) Anodized aluminum reflectors shall have minimum of 0.00079” (0.02 mm) anodizing thickness.
- (d) Pole/Luminaire combination shall have EPA rating that will withstand site wind conditions.
- (e) All castings and extrusions shall be given minimum one coat of baked-on clear lacquer, unless painted finish is specified.
- (f) Aluminum surfaces shall receive a duronodic or polyester powder paint finish.
- (g) Cast-in Luminaire housings installed directly in concrete shall be fabricated of hot dip galvanized steel or cast aluminum or composite.
- (h) Where cast aluminum housings are used, give two coats of asphaltum paint prior to installation.
- (i) Provide 1/8” thick x 2” diameter (3 mm thick x 50 mm diameter) solid neoprene grommets at each point light luminaire surfaces are mounted to concrete structure.

2.03 LED SOURCES

A. Static white LED sources shall be:
- (1) Minimum CRI of 85 unless otherwise noted on Luminaire Schedule
- (2) Less than 5% flicker

(3) Within 0.004 on the CIE 1976 diagram for color spatial uniformity
(4) Within 0.007 on the CIE 1976 diagram for color maintenance over the rated lifetime of the source
(5) Binned within a 3-step MacAdam ellipse minimum, or as indicated in Luminaire Schedule
(6) Color temperature as noted on Luminaire Schedule
(7) Have a published life rating based on the point at which LED sources reach L70 lumen maintenance and tested in accordance with IES LM80-08 Approved Method: Testing Lumen Maintenance of LED light sources and IES TM-21-11: Projecting Long Term Lumen Maintenance of LED Light Sources
(8) L70 rated life shall be a minimum of 50,000 hours.
(9) LED modules, unless otherwise noted, shall be provided by light fixtures manufacturer and integral to luminaire.
(10) Screw-base LED replacement lamps, where required and listed on the luminaire schedule, shall meet dimming, output, CCT and CRI as specified. 25,000 hours is acceptable L70 rated life for these products.

2.04 DRIVERS

A. Drivers for use in cold or freezer rooms, parking structures, loading docks, and outdoors shall be low temperature type.
(1) Driver shall have lowest temperature rating available in standard manufacture for its type.
B. Drivers shall be located in luminaire they serve, unless otherwise noted.
C. LED Drivers and Power Supplies shall:
(1) Operate system LEDs within the current limit specification of the LED manufacturer.
(2) Be supplied with over-temperature protection circuitry.
(3) Be programmable via manufacturer-provided means to allow for LED replacement modules to be “tuned” to match the output of remaining adjacent modules in the event that some time has passed and there has been lumen depreciation.
(4) Be within a NEMA enclosure.
(5) Be equipped with knockouts to accommodate standard conduit sizes
(6) Have a Power Factor to be = or > than 0.9
(7) Dimmable LED drivers must be compatible with dimming system(s) provided and control luminaires per luminaire schedule and controls documentation.
(8) ETL certified, CBM and UL Listed, high power factor, and meet or exceed NEMA and ANSI Standards.
(9) Be Class A sound rated
(10) be Equipped with resetting thermal sensitive device.
(11) Operate with input power of 60 Hz and voltage as scheduled.
(12) Meet or exceed all ANSI or NEMA standards
(13) Be Capable of operating LEDs with less than 5% flicker
(14) Be DMX compatible in Color changing LED luminaires.
(15) At power levels between 100% to 1%, shall perform within the frequency (Hz) and Modulation (%) of IEEE STD 1789-2015 _____ level.
D. Emergency LED Drivers shall:
(1) Be UL 924 listed
(2) Operate LED luminaire at 10W minimum output for _____ minutes with efficacy equal to or greater than the normal power efficacy.
(3) Have high temperature nickel-cadmium battery. _____
(4) Be installed _____ luminaires
(5) Have solid state charging
(6) Battery to be recharged within 24 h
(7) _____

2.05 LOW VOLTAGE TRANSFORMERS

A. Transformers and power supplies shall be:
(1) Sized to compensate for voltage drop over indicated distances
(2) Locally fused
B. Transformers shall have line voltage switch within reach.
C. Provide adequate ventilation to meet code and manufacturers requirements.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Marking:

(1) Voltage identification: Luminaires designed for voltages other than 110-125 volt circuits shall be clearly marked with rated voltage.

(2) Markings must be clear and shall be located to be readily visible to service personnel but invisible from normal viewing angles when luminaires are in place.

B. Installation of Luminaires:

(1) Housing, glassware, reflectors and refractors shall be clean and free of chips, cracks and scratches.

(2) Install decorative luminaires, reflector cones, baffles, aperture plates, lenses, trims, and decorative elements of recessed luminaires after completion of ceiling tile, plastering, painting, and general cleanup is completed. Where luminaire location or construction does not permit sequential installation, all reflectors, lenses, flanges and other visible surfaces shall be carefully protected.

(3) Light leaks between ceiling trim of recessed luminaires and ceiling are not allowed.

(4) Locations

(a) Install luminaires at locations and heights as indicated.

(b) Do not scale electrical drawings for locations of luminaires.

(c) Architectural reflected ceiling plans show locations of luminaires.

(d) Where noted on the drawings, the exact location of luminaires shall be confirmed (in the field) with the Architect/Engineer prior to installation.

(e) Where luminaires are to be concealed, or surface mounted in highly visible public spaces, a small sampling of luminaires shall be installed, adjusted and aimed for Architect/Engineer's review approval, prior to installing remaining luminaire of same type.

(f) Mount all luminaires so as to maintain full range of motion.

(g) Install luminaires plumb, square, and level with ceilings and walls.

(h) Coordinate stem, rod, chain, or aircraft cable hanger lengths with job conditions. Provide extra length of adjustable supports where diffusers are mounted directly above light fixtures to facilitate air balancing efforts.

(i) Industrial type luminaires in unfinished areas, which are near obstructions such as ducts and pipes, shall be:

1) Suspended so that bottom of luminaire is no higher than bottom of obstruction

2) Located at height of lowest luminaire

3) Minimum height: 8’-0” (2.4 m)

4) Shall not be located until locations of obstructions are determined.

5) Where a minimum height of 8’-0” (2.4 m) is unachievable, wall mounted luminaires shall be utilized.

(5) Support

(a) Support surface mount luminaires from building structure.

(b) Metal decking shall not be pierced for luminaire support.

(c) Provide luminaires and/or luminaire outlet boxes with hangers to support luminaire weight.

(d) Troffers shall be held in place by support clips.

(e) Provide plaster frames for recessed luminaires in plaster ceilings.

(f) Rigid metallic pipe stems shall be utilized for the support of pendant mounted luminaires, unless otherwise noted.

(g) Stem hangers shall be equipped with aligner box covers or canopies so that stems hang vertically, irrespective of the angle of the surface they are mounted from.

(h) Wherever a luminaire or its hanger canopy is attached to a surface mounted outlet box, a finishing ring shall conceal the outlet box.

(i) Yokes, brackets and supplementary supporting members needed to mount luminaires to suitable ceiling members shall be furnished and installed by Contractor. Verify mounting hardware required prior to installation.

(j) Recessed luminaires shall be supported with 12 ga (2.657 mm) wire hangers, 2 per luminaire, at diagonally opposite corners.

(k) Troffers and luminaires over 55 lbs (25 kg), such as 4x4 ft (1200x1200 mm) shall be supported with 12 ga (2.657 mm) wire hangers, 4 per luminaire, 2 at 45 degree diagonals, and two perpendicular to structure. Wire hangers and attachment to structure shall be capable of supporting 4 times luminaires weight.

(l) In areas with seismic requirements, suspended or pendant mounted luminaires shall be able to swing 45 degrees in any direction without hitting an obstruction. In the event hitting an obstruction is unavoidable, guy wires will be used to secure the luminaire in place.

(m) Surface luminaires installed in grid ceilings shall be supported by independent support clips and 12 ga (2.657 mm) wire.

(n) Exit signs installed in grid ceilings shall be supported by electrical box hanger and additional 12 ga (2.657 mm) wire installed from box to structure.

(o) Support surface mounted luminaires greater than 2 ft (0.6 m) in length at a minimum of each additional 2 ft (0.6 m), or as recommended by manufacturer.

(p) Brace suspended luminaires installed near ducts or other constructions with solid pendants or threaded rods.

(q) Rigidly align continuous rows of luminaires.

(r) Luminaire types with remote mounted driver shall have:

1) Proper support for driver weight.

2) Mounting distance from remote driver to luminaire per manufacturer's recommendations.

(6) Mounting and Enclosures

(a) Install flush mounted luminaires to eliminate light leakage.

(b) For luminaires mounted adjacent to insulation, provide barrier to prevent insulation from coming in contact with luminaire, unless luminaire is approved for installation in contact with such insulation.

(c) Provide approved fire rated enclosures around luminaires in fire rated ceilings.

(7) Conduit and Wiring

(a) Wire for connections to modules and auxiliaries shall be suitable for temperature, current, and voltage conditions.

(b) Recessed luminaires shall have final connections made with flexible metal conduit, not in excess of 72” (1830 mm), with THHN conductors and green wire ground conductor.

(c) Conduit shall be hidden from normal view in all possible cases. In public areas where surface mounted conduit must be used, Contractor shall install conduit as unobtrusively as possible. Contractor shall obtain field approval by the Architect for all exposed conduit runs prior to rough in.

(8) In-Grade Luminaires:

(a) Where installed in tree grates, furnish burial light lens and louver to tree grate manufacturer for coordination of opening.

(b) Provide adequate drainage system per manufacturer's recommendations.

C. Installation of Outdoor Pole Bases

(1) Contractor shall provide bases for luminaires.

(2) Pole base details shall be provided by the project structural engineer.

(3) Provide handhole for electrical connection within 4’-0” of pole base.

(4) Contractor shall:

(a) Rough-in conduits

(b) Coordinate spacing, base dimensions, heights, orientation of bases, etc. as necessary.

(5) Where square or rectangular poles or luminaire heads are used, Contractor shall verify orientation with Architect/Engineer/Lighting Designer.

D. Pole Installation:

(1) Install luminaires, poles, hardware, etc., for complete system.

(2) Use web fabric slings (not chain or cable) to raise and set poles.

E. Grounding:

(1) Ground luminaires and metal poles according to Division 26 Section “Grounding and Bonding for Electrical Systems”.

(2) Poles:

(a) Install 10 ft (3 m) driven ground rod at each pole.

(3) Nonmetallic Poles:

(a) Ground metallic components of lighting unit and foundations. Connect luminaires to grounding system with #10 AWG conductor.

3.02 SUBSTANTIAL COMPLETION

A. Quality Control:

(1) At Date of Substantial Completion, replace LED modules/LED luminaires which are not operating properly.

(2) Protection wrapping on lensed or louvered luminaires shall be removed before installation of furniture, but after finish work is complete.

(3) Deliver spare equipment to Owner's representative.

B. Tests:

(1) Give advance notice of dates and times for field tests.

(2) Provide instruments to make and record test results.

(3) Verify normal operation of each luminaire after luminaires have been installed and circuits have been energized.

(4) Verify operation of luminaires with lighting control system and daylight harvesting systems. Any dimmed fixtures shall exhibit no signs of flickering.

(5) Replace or repair malfunctioning luminaires and components, then retest. Repeat procedure until all units operate properly.

(6) Report results of tests.

C. Adjusting and Cleaning:

(1) Clean luminaires of handling marks, dust and dirt.

(2) Cleaning and touch-up work shall be performed in accordance with luminaire manufacturer's recommendations.

(3) Damaged luminaires or components shall be replaced with new.

(4) Keep luminaires clean and protected for remainder of construction period.

(5) Verify orientation of directional luminaires prior to installation.

(a) This includes wall washers, cove lighting, floodlights, exterior area lights and adjustable accent luminaires. Contractor shall provide electrician's services to aim, adjust, and focus luminaires, as required, at direction of Architect/Engineer. These electricians shall be available at times designated by Architect/Engineer and shall be provided at no extra charge to Owner over base bid. Contractor shall provide equipment for luminaries' focus including ladders and mechanical lifting systems.

(6) Program preset dimming system lighting levels.

(7) Program ambient light sensors integral to luminaires for appropriate illumination levels as indicated in control narrative or in lighting control specifications.

(8) Program occupancy sensors integral luminaires for appropriate time delay as indicated in control narrative or in lighting control specifications.

(9) Exterior poles, bollards, bases and other exterior luminaires shall be painted to match factory color where finish has been damaged.

(10) No light leaks shall be permitted at ceiling line from any visible part or joint.

D. Training

(1) Contractor shall provide Owner with _____ complete hardcopy and (1) digital copy of Operations and Maintenance manuals.

(a) All "Approved as Noted" comments shall be corrected/picked-up in this record manual set.

(b) Each manual shall contain specific information pertaining to the equipment installed. Each manual shall contain at a minimum:

1) Detailed as built shop drawings for all lighting equipment installed.

2) Manufacturer's product cut sheets for all equipment installed keyed by type as to as built drawings.

3) Manufacturer's complete installation instructions for all equipment installed keyed by type to as built drawings.

4) Equipment maintenance requirements and schedules.

5) Equipment manufacturer contacts.

6) Equipment manufacturer warranties.

1. Luminaires
2. Drivers
3. LED modules

(2) Contractor shall provide qualified personnel onsite to provide a minimum of one day of training to Owner's representatives.

(3) This training shall cover:

(a) Luminaire use and maintenance

(b) Architectural lighting system use and maintenance

SECTION 27 11 00 COMMUNICATIONS EQUIPMENT ROOM FITTINGS

SECTION 27 13 00 COMMUNICATIONS BACKBONE CABLING

SECTION 27 15 00 COMMUNICATIONS HORIZONTAL CABLING

SECTION 27 41 00 AUDIOVISUAL SYSTEMS

SECTION 27 41 00.1 AUDIOVISUAL SYSTEMS EQUIPMENT SCHEDULE

SECTION 27 41 00.2 AUDIOVISUAL SYSTEMS CABLE SCHEDULE

SECTION 27 51 29 TWO-WAY COMMUNICATION SYSTEM

SECTION 27 53 19 EMERGENCY RESPONDER RADIO REINFORCEMENT SYSTEM

SECTION 27 00 00 - GENERAL COMMUNICATIONS REQUIREMENTS

PART 1 GENERAL

1.01 SCOPE

A. This section details references, standards, guidelines, requirements and conditions common to all Division 27 work.

B. Work under this Section and related sections is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.02 DESCRIPTION

A. Intent of drawings and specifications is to obtain complete systems tested, adjusted, and ready for operation.

B. Except as otherwise defined in greater detail, terms "provide", "furnish" and "install" as used in Division 27 contract documents shall have the following meanings:

(1) "Provide" or "provided" shall mean "furnish and install".

(2) "Furnish" or "furnished" does not include installation.

(3) "Install" or "installed" does not include furnishing.

C. Include incidental details not usually shown or specified, but necessary for proper installation and operation.

D. Check, verify and coordinate work with drawings and specifications prepared for other trades. Include modifications, relocations or adjustments necessary to complete work or to avoid interference with other trades.

E. Included in this contract are connections to equipment provided by others. Refer to Architectural, Electrical, Integrated Automation, Mechanical, Security and final shop drawings for equipment being furnished under other sections for exact locations of outlets and various connections required.

F. Information given herein and on drawings is as exact as could be secured but is not guaranteed. Do not scale drawings for exact dimensions.

G. Where architectural features govern location of work, refer to architectural drawings.

H. Perform work in "neat and workmanlike" manner as defined in ANSI/NECA 1 "Standard Practices for Good Workmanship in Electrical Contracting".

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0526 - Grounding and Bonding for Communications Systems

(2) Section 27 0528.29 - Hangers and Supports for Communications Systems

(3) Section 27 0528.33 - Raceway and Boxes for Communications Systems

(4) Section 27 0528.36 - Cable Tray for Communications Systems

(5) Section 27 0528.39 - Surface Raceways for Communications Systems

(6) Section 27 0553 - Communications Systems Identification

(7) Section 27 1000 - Structured Cabling

(8) Section 27 1100 - Communications Equipment Room Fittings

(9) Section 27 1300 - Communications Backbone Cabling

(10) Section 27 1500 - Communications Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) Section 26 0593 – Electrical Systems Firestopping

(2) Also refer to individual technical sections identified above.

C. Utility Services:

(1) Campus network services will be provided via fiber optic connection to the tunnel system located near the basement of Reynolds Hall, Server Room 108.

D. Continuity of Service:

(1) No service shall be interrupted or changed without permission from Architect and Owner. Obtain written permission before work is started.

(2) When interruption of services is required, persons concerned shall be notified and shall agree upon a time.

E. Cleaning and Repair

(1) Clean and repair existing materials and equipment that remain or will be reused.

F. Concrete Work:

(1) Provide cast-in-place concrete as required by contract documents unless otherwise noted.

(2) Concrete shall comply with Division 03 - Concrete.

(3) Provide anchor bolts, metal shapes and templates required to be cast in concrete or used to form concrete for support of equipment.

G. Painting:

(1) Furnish equipment with factory applied prime finish unless otherwise specified.

(2) If factory finish on equipment furnished by Contractor is damaged in shipment or during construction, refinish equipment to satisfaction of Engineer.

(3) Furnish one can of touch up paint for each factory finish, which will be final finished surface of product.

(4) Contractor is responsible for painting of plywood in Telecommunications Equipment Rooms. Refer to Drawings.

1.04 REQUIREMENTS OF REGULATORY AGENCIES

A. Rules and regulations of Federal, State and local authorities and utility companies, in force at time of execution of contract shall become part of this specification.

1.05 REFERENCES AND STANDARDS

A. Design, cable and component selection, and installation practices shall conform with following:

(1) ANSI/NFPA 70 - National Electrical Code

(2) Local Electrical Code

(3) Country, state and local health, safety and building codes

(4) UL 444 - Communications Cables

(5) Standards identified in individual Technical Sections.

(6) BICSI Telecommunications Distribution Methods Manual (TDMM)

(7) TIA 568.C - Commercial Building Telecommunications Cabling Standard (including applicable Addenda)

(8) TIA 569-C - Commercial Building Standard for Telecommunications Pathways and Spaces

B. Agencies or publications referenced herein refer to the following:

(1) ANSI American National Standards Institute

(2) ASME American Society of Mechanical Engineers

(3) ASTM American Society for Testing and Materials

(4) BICSI Building Industry Consulting Services International

(5) FIPS Federal Information Processing Standards

(6) FCC Federal Communications Commission

(7) ICEA Insulated Cable Engineers Association

(8) IEEE Institute of Electrical and Electronics Engineers

(9) NEC National Electrical Code

(10) NECA National Electrical Contractors Association

(11) NEMA National Electrical Manufacturers Association

(12) NESC National Electrical Safety Code

(13) NETA National Electrical Testing Association

(14) NFPA National Fire Protection Association

(15) NIST National Institute of Standards and Technology

(16) OSHA Occupational Safety and Health Administration

(17) TIA Telecommunications Industry Association

(18) UL Underwriters Laboratories, Inc.

C. Work shall be in accordance with latest edition of codes, standards or specifications unless noted otherwise.

1.06 DEFINITIONS

A. The following definitions are applicable to communications environments and shall apply to this document and its companion sections for clarification and direction.

(1) Entrance facility - an entrance to building for both public and private network service cables and/or wireless services including entrance point of building and continuing to Entrance Room.

(2) Entrance Room - room where both public and private network service cables and/or wireless services are terminated. Service provider(s) point-of-demarcation (DEMARC) is typically located here.

(3) Equipment Room (Telecom): an environmentally controlled centralized space for telecommunications equipment that usually houses main or intermediate cross-connect. Backbone cabling, cabling to Building Entrance and horizontal cabling may be terminated here.

(4) Guarantee - promise or an assurance that attests to quality or durability of product or service or that task will be performed in specified manner. Used interchangeably with "Warranty" in these documents.

(5) Intra-building - within single building.

(6) Inter-building - between 2 or more buildings.

(7) IP Telephony – Use of Internet Protocol (IP) for two-way transmission of conversations. Sometimes referred to as “Voice over Internet Protocol (VoIP)”.

(8) Rack Unit - standard measurement of vertical mounting space on an equipment rack. Each Rack Unit is 1-3/4” high.

(9) Voice over Internet Protocol – Refer to IP Telephony.

B. Typical NEMA Enclosures and Usage

(1) Refer to Section 26 0000 – General Electrical Requirements.

(2) NEMA 1 - Indoors. Falling dirt

(3) NEMA 2 - Indoors. Falling dirt. Falling liquids. Light splashing

(4) NEMA 3 - Outdoors. Sleet, snow, rain. Windblown dust

(5) NEMA 3X - Same as NEMA 3 plus corrosion resistant

(6) NEMA 3S - Same as NEMA 3 plus mechanism operable when ice covered

(7) NEMA 3SX - Same as NEMA 3S plus corrosion resistant

(8) NEMA 3R - Outdoors. Rain, snow, sleet

(9) NEMA 3RX - Same as NEMA 3R plus corrosion resistant

(10) NEMA 4:

(a) Indoors - Falling dirt. Falling and light splashing liquids. Flying dust, lint and fibers. Hose down

(b) Outdoors - Rain, sleet, snow. Wind blown dust. Hose down

(11) NEMA 4X - Same as NEMA 4 plus corrosion resistant

(12) NEMA 5 - Indoors. Falling Dirt. Falling Liquids. Settling dust, lint and fibers

(13) NEMA 6:

(a) Indoors - Falling dirt. Falling and light splashing liquids. Flying dust, lint and fibers. Hose down. Temporary submersion.

(b) Outdoors - Rain, snow, sleet. Windblown dust. Hose down. Temporary submersion.

(14) NEMA 6P:

(a) Indoors - Same as NEMA 6 / Indoors plus corrosion resistant. Prolonged submersion.

(b) Outdoors - NEMA 6 /Outdoors plus corrosion resistant. Prolonged Submersion.

(15) NEMA 7 - Indoors. Class I, Division 1 or 2, Groups A, B, C or D. (Flammable gas).

(16) NEMA 9 - Indoors. Class II, Division 1 or 2. Groups E, R, or G. (Combustible dust).

(17) NEMA 12 - Indoors. Falling Dirt. Falling liquids. Flying dust, lint and fibers. Oil or coolant seepage.

(18) NEMA 13 - Same as NEMA 12 plus oil or coolant spraying or splashing.

1.07 ABBREVIATIONS AND ACRONYMS

A. The following abbreviations and acronyms shall apply to this document and its companion sections for clarification and direction.

(1) AFF Above Finished Floor

(2) ATM Asynchronous Transfer Mode

(3) AWG American Wire Gauge

(4) BAS Building Automation Systems

(5) BTU British Thermal Unit

(6) CATV Community Antenna Television

(7) CCTV Closed-Circuit Television

(8) CDDI Copper Distributed Data Interface (Cisco Systems trade name for TP-PMD)

(9) cm centimeters

(10) °C degrees Celsius

(11) °F degrees Fahrenheit

(12) DTMF Dual Tone Multi Frequency

(13) EIA Electronic Industries Alliance

(14) EF Entrance Facility

(15) ER Entrance Room

(16) EIDF Equipment Intermediate Distribution Facility

(17) FDDI Fiber Distributed Data Interface

(18) ft feet

(19) GbE Gigabit Ethernet
(20) Hz Frequency in Hertz (k = kilo, M = Mega, G = Giga)
(21) ID Inside Diameter
(22) in inch
(23) IPT IP Telephony
(24) kg kilogram
(25) lbs pounds
(26) LAN Local Area Network
(27) MATV Master Antenna Television
(28) MC Main Cross-connect
(29) m meters
(30) mm millimeters
(31) Mbps Megabits per second
(32) µm micrometer (10-6.56 yard (6 meter)
(33) OD Outside Diameter
(34) PBX Private Branch Exchange (Telephone Switch)
(35) pF pico-Farad (10-12 Farad)
(36) PVC Polyvinyl Chloride
(37) RU Rack Unit
(38) sq ft square feet (area)
(39) TP-PMD Twisted Pair Physical Medium Dependent
(40) TR Telecommunications Room
(41) WAN Wide Area Network
(42) WLAN Wireless Local Area Network
(43) VoIP Voice over Internet Protocol

B. Refer also to technical sections for additional terminology.

1.08 LISTING

A. Refer to technical sections of this Division of work for listing requirements.

1.09 SUBMITTALS

A. Submit shop drawings for equipment provided under this Section:
(1) Refer to Division 01 - Submittal Procedures.
(2) Note that for satisfying submittal requirements for Division 27, "Product Data" is usually more appropriate than true "Shop Drawings" as defined in Division 01. However, expression "Shop Drawings" is generally used throughout specification.
(3) Mark catalog sheets and drawings to indicate specific items submitted.
(a) Markings shall be reproducible (e.g. arrow, boxed, encircled, checkmark).
(b) Where sheet includes multiple product options, mark proposed option(s).
(4) Include proper identification of equipment by name and/or number, as indicated in specification and shown on drawings.
(5) When manufacturer's reference numbers are different from those specified, provide correct cross-reference number for each item. Mark and annotate submittals accordingly.
(6) Group submittals by Section to include complete documentation of related systems, products and accessories. Where applicable, dimensions shall be marked in units to match those specified.
(7) Submittals shall be in electronic form or on paper per Division 01.
(a) Documents in electronic form shall be ADOBE Acrobat PDF.
(b) Paper documents shall be original catalog sheets or photocopies thereof.
(c) Facsimile (fax) sheets will not be accepted.
(8) Engineer’s Review is to confirm compliance with performance, interoperability, physical, and other pertinent requirements of project. Review is not to confirm quantities nor that all required items have been submitted.
(9) When equipment and items specified include accessories, parts and additional items under one designation, submittals shall be complete and include required components.
(10) Include wiring diagrams for electrically powered or controlled equipment.
(11) Submit equipment room layouts drawn to scale, including equipment, raceways, accessories and clearance for maintenance.

(12) Where submittals cover products containing potentially hazardous non-metallic materials, include "Material Safety Data Sheet" (MSDS) from manufacturer stating physical and chemical properties of components and precautionary considerations required.

(13) Submit shop drawings or product data as soon as practicable after signing contracts. Submittals must be approved before installation of materials and equipment.

(14) Submittals, which are not complete, not permanent, or not properly checked by Contractor, will be returned without review.

(15) "Coordination Drawings", which are normally prepared by Contractor to coordinate work among various trades and to facilitate installation, shall not be submitted for Division 27 work unless specifically requested in technical sections. These types of drawings typically include dimensioned piping, ductwork, communications and/or electrical raceway layouts.

(a) Unless specifically requested in Division 27 technical sections, submittals of coordination drawings will be returned without review.

B. Certificates and Inspections:

(1) Obtain and pay for inspections required by authorities having jurisdiction and deliver certificates approving installations to Owner unless otherwise directed.

C. Operation and Maintenance Manuals:

(1) Refer to Division 01 - Operation and Maintenance Data.

(2) Upon completion of work but before final acceptance of system, submit to Architect for approval, 3 copies of operation and maintenance manuals in loose-leaf binders. If "one copy" is larger than 2” thick or consists of multiple volumes, submit only one set initially for review. After securing approval, submit 3 copies to Owner.

(3) Manuals shall be organized by specification section number and shall have table of contents and tabs for each piece of equipment or system.

(4) Manuals shall include the following:

(a) Copies of shop drawings

(b) Manufacturer's operating and maintenance instructions. Include parts lists of items or equipment. Where manufacturer's data includes several types or models, applicable type or model shall be designated.

(c) CD ROM's of O&M data with exploded parts lists where available

(d) Phone numbers and addresses of local parts suppliers and service companies

(e) Internet/WEB page addresses where applicable

(f) Wiring diagrams

(g) Start up and shut down procedure

(h) Factory and field test records

(i) Additional information, diagrams or explanations as designated under respective equipment or systems specification section

(5) Instruct Owner's representative in operation and maintenance of equipment. Instruction shall include complete operating cycle on all apparatus.

(6) O&M manuals and instructions to Owner shall be provided prior to request for final payment.

D. Record Documents:

(1) Refer to General Conditions of Contract, and Division 01 - Closeout Procedures. Prepare complete set of record drawings in accordance with Division 01.

(2) Use designated set of prints of contract documents as prepared by Architect to mark-up for record drawing purposes.

1.10 JOB CONDITIONS

A. Building Access:

(1) Arrange for necessary openings in building to allow for admittance of all apparatus.

B. Cutting and Patching:

(1) Refer to General Conditions of Contract, and Division 01 - Cutting and Patching.

(2) Perform cutting and patching required for complete installation of systems unless otherwise noted. Patch and restore work cut or damaged to original condition. This includes openings remaining from removal or relocation of existing system components.

(3) Provide materials required for patching unless otherwise noted.

(4) Do not pierce beams or columns without permission of Architect and then only as directed. If openings are required through walls or floors where no sleeve has been provided, hole shall be core drilled to avoid unnecessary damage and structural weakening.

(5) Where alterations disturb lawns, paving, walks, etc., replace, repair or refinish surfaces to condition existing prior to commencement of work. This may include areas beyond construction limits.

C. Housekeeping and Cleanup:

(1) Refer to Division 01 - Closeout Procedures.

(2) Periodically as work progresses and/or as directed by Architect, remove waste materials from building and leave area of work broom clean. Upon completion of work, remove tools, scaffolding, broken and waste materials, etc. from site.

1.11 WORK BY OWNER

A. Owner will provide:

(1) Active electronics for interface with building voice and data cabling systems

(2) Communications connecting patch cords for horizontal cabling and fiber optics.

(3) Wireless Access PointsRack mounted UPS system

1.12 QUALITY ASSURANCE

A. Refer to the individual technical sections for general product quality requirements, manufacturer qualifications, and contractor qualifications and certification requirements.

1.13 GUARANTEE

A. Refer to Division 01 for general Guarantee (Warranty) requirements.

B. Refer to technical sections for Guarantee requirement for each system.

(1) Where no guarantee requirements are called out, guarantee for one year after acceptance by Owner equipment, materials, and workmanship to be free from defect.

C. Repair, replace or alter systems or parts of systems found defective at no extra cost to Owner.

D. Wherein fulfilling requirements of any guarantee, if Contractor disturbs any work guaranteed under another contract, restore such disturbed work to condition satisfactory to Architect and guarantee such restored work to same extent as it was guaranteed under such other contract.

E. Guarantees shall include labor, material and travel time.

PART 2 PRODUCTS

2.01 PRODUCT SUBSTITUTIONS

A. Refer to Division 01 - Product Requirements.

PART 3 EXECUTION

3.01 GENERAL

A. Verify elevations and measurements prior to installation of materials.

3.02 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to site under provisions of Division 01.

B. Store and protect products under provisions of Division 01.

C. Store in clean, dry space.

D. Maintain factory wrapping or provide cover to protect units from dirt, water, construction debris, and traffic.

E. Handle in accordance with manufacturer's written instructions.

F. Handle carefully to avoid damage to components, enclosure, and finish. Lift only with lugs provided for the purpose.

3.03 FLOOR, WALL, ROOF AND CEILING OPENINGS

A. Coordinate location of openings, chases, furred spaces, etc. with appropriate Contractors. Provide during progress of construction sleeves and inserts that are to be built into structure.

B. Temporary sleeves, if used to form wall openings, shall be removed prior to installation of permanent materials. Permanent sleeves for wall penetrations shall be minimum 24 ga galvanized sheet metal unless otherwise noted.

C. Steel sleeves, when required, shall be Schedule 40 carbon steel pipe with integral water stop.

D. For core drilled holes, size and location shall be reviewed and approved by Structural Engineer prior to execution.

E. Submit product data and installation details for penetrations of building structure. Submittal shall include schedule indicating penetrating materials, (including steel conduit, PVC conduit, cables, cable tray), sizes of each, opening sizes and sealant products intended for use.

F. Where penetrations of fire-rated assemblies are involved, seal penetrations with appropriate firestopping systems as specified in Division 26.

G. Submit complete penetration layout drawings showing openings in building structural members including floor slabs, bearing walls, shear walls. Indicate and locate, by dimension, required openings including those sleeved, formed or core drilled. Drawings shall be approved by the structural engineer prior to preparing openings in structural member.

H. Openings for penetrations shall be minimum 1/2” larger on all sides than outside dimensions of raceways or cables. However, where fire resistant penetrations are required, size openings in accordance with recommendations of firestopping systems manufacturer.

I. Seal non fire-rated floor penetrations with non-shrink grout equal to Embeco by Master Builders, or urethane caulk, as appropriate.

J. Seal non-rated wall openings with urethane caulk.

K. Where penetrations occur through exterior walls into building spaces, use steel sleeves with integral water stop, similar to type "WS" wall sleeves by Thunderline Corporation. Seal annular space between sleeves and pipe with "Link-Seal" modular wall and casing seals by Thunderline Corporation, or sealing system by another manufacturer approved as equal by Architect. Sealing system shall utilize Type 316 stainless steel bolts, washers and nuts.

L. Finish and trim penetrations as shown on details and as specified hereinafter.

M. Provide chrome or nickel plated escutcheons where raceways pass through walls, floors or ceilings and are exposed in finished areas. Size escutcheons to fit raceways for finished appearance. Finished areas shall not include mechanical/electrical rooms, janitor’s closets, storage rooms, etc., unless suspended ceilings are specified.

N. In areas subject to washdown procedures the, penetrations shall be sealed.

(1) Provide gasketed device cover plates with an additional continuous bead of silicone caulk between device plate and adjacent wall, ceiling or floor surface.

(2) Once wiring is installed, surround wiring with 1” barrier of silicone caulking around conductors within device box hub.

(3) Caulk shall be resistant to microbiological growth.

3.04 EQUIPMENT ACCESS

A. Install raceways, junction and pull boxes, and accessories to permit access to equipment for maintenance. Relocation of raceways, or accessories as required to provide access, shall be provided at no additional cost to Owner.

B. Install equipment with ample space allowed for removal, repair or changes to equipment. Provide ready accessibility to equipment and wiring without moving other equipment, which is to be installed or which is already in place.

C. Access doors in walls, chases, or inaccessible ceilings will be provided under Division 08 - Access Doors and Frames, unless otherwise indicated. Access doors shall be for purpose of providing access where equipment requiring servicing, repairs or maintenance is located in walls, chases or above inaccessible ceilings.

D. Provide necessary coordination and information to Trade Contractor under Division 08 - Access Doors and Frames. This information shall include required locations, sizes and rough-in dimensions, without limitations.

E. Provide access doors where equipment, requiring access for servicing, repairs and maintenance is located in walls, chases or above inaccessible ceilings, unless otherwise noted. Access frames and doors shall be as manufactured by Milcor, Incorporated, or similar, of style applicable to surface. Access doors used in fire-rated construction shall have UL label. Access doors shall be steel, prime coated, except use stainless steel doors in ceramic tile walls, toilet rooms, locker rooms, and in areas subject to excessive moisture. Access doors shall be of sufficient size to allow for total maintenance. Location of access doors shall be coordinated with General Contractor and location of equipment shall be roughed in accordingly.

F. Locate communications outlets and equipment to fit details, panels, decorating or finish at space. Architect reserves right to make minor position changes of outlet locations before work has been installed.

G. Verify room door swings before installing wall-mounted communications outlets and install boxes on latch side of door unless otherwise noted.

3.05 EQUIPMENT SUPPORTS

A. Provide supporting steel not indicated on drawings as required for installation of equipment and materials including angles, channels, beams, hangers.

B. Concrete anchors, used for attachment to concrete, shall be steel shell with plug type. Plastic, rawhide or anchors utilizing lead are not allowed.

C. Do not support equipment or cable pathways from metal roof decking.

3.06 SUPPORT PROTECTION

A. In occupied areas, mechanical rooms and areas requiring normal maintenance access, certain equipment must be guarded to protect personnel from injury.

B. Provide minimum 1/2”thick Armstrong Armaflex insulation or similar product applied with Armstrong 520 adhesive on lower edges of equipment, including bus duct, cable tray, pull boxes and electrical supporting devices suspended less than 7 ft above floors, platforms or catwalks in these areas.

C. Threaded rod or bolts shall not extend beyond supporting element and shall be protected as described above.

3.07 CABLE PROTECTION

A. Protect cabling and termination components from contact with, and potential application of, foreign materials.

(1) Foreign material is defined as material that is not part of cabling assembly and termination components when delivered from manufacturer.

(2) Examples include paint overspray and drywall compound.

B. Cabling and components that come into contact with foreign materials shall be replaced at no cost to project.

(1) Solvents and other cleaning agents shall not be used to remove foreign materials that have already accumulated on cabling and components.

3.08 HOUSEKEEPING PADS

A. Not applicable to this Division of work.

3.09 LEAD SHIELDING

A. Wherever installation of this Contractor's equipment destroys radiological integrity of wall, floor, or ceiling, this Contractor shall be responsible to provide suitable lead shielding to maintain that integrity. Coordinate these requirements with General Contractor.

3.10 ACCEPTANCE TESTING

A. Prior to testing, submit to owner (or Owner’s representative) and Engineer, proposed schedule for acceptance testing.

(1) This notification shall be minimum of 10working days in advance to allow for participation by Owner and/or Engineer.

B. Prior to testing, submit written description of intended test procedures and submit sample test forms to Engineer.

(1) Submitted information shall include proposed file naming format to be used in identifying cable, pair or optical fiber which is subject of test record.

(2) Failure to provide above information shall be grounds for Engineer or Owner to reject any Documentation of related testing and to require repeat of affected test.

C. Conduct tests during course of construction when identifiable portion(s) of installation is complete.

(1) Alternatively, testing can be conducted after entire installation is complete if this does not delay project schedule.

D. Provide equipment and personnel necessary to conduct acceptance tests.

E. Testing shall be completed and accepted by Owner and Engineer before Owner furnished equipment and cross connects are installed.

F. Document tests.

G. When equipment or systems fail to meet minimum test requirements, replace or repair defective work or materials as necessary and repeat inspection and test. This shall be at no additional cost to the owner. Replacement materials shall be new.

H. This Contractor is responsible for certifying, in writing, equipment and system test results. Certification shall include identification of portion of system tested, date, time, test criteria and name and title of person signing test certification documents.

I. Maintain copies of certified test results, including those for failed tests, at project site. At completion of project, include copies of test records and certifications in O&M Manuals.

3.11 START-UP

A. Systems and equipment shall be started, tested, adjusted and turned over to Owner ready for operation.

(1) This includes "Owner-Furnished, Contractor-Installed" (OFCI) and "Contractor-Furnished, Contractor-Installed" (CFCI) systems and equipment.

B. Follow manufacturer's pre-start-up checkout, start-up, trouble shooting and adjustment procedures.

C. Contractor shall provide services of technician/installer knowledgeable in start-up and checkout of types of systems and equipment on project.

D. Provide start-up services, by manufacturer's representative where specified or where Contractor does not have qualified personnel.

E. Coordinate start-up with trades.

3.12 DOCUMENTATION

A. Upon completion of installation, Contractor shall provide System Documentation. Documentation shall include:

(1) Acceptance Test Results

(2) Record Drawings

(3) All Approved Submittals

(4) Manufacturer's Warranty Documents

B. Submit System Documentation in accordance with Division 01 "Project Record Documents".

(1) Documents shall be submitted in same electronic format in which they were received from Architect and Engineer.

(2) Document updates shall be performed in native software format matching original design team documents.

(a) Scans of hand marked documents shall not be allowed.

(3) Update documents to reflect installed conditions for equipment shown on documents.

C. Submit documentation within ten (10) working days of the completion of testing of each testing phase (e.g. subsystem, cable type, area, floor) or 3 weeks prior to scheduled occupancy of subject area, whichever is sooner. This is inclusive of Test Result and draft Record Drawings.

(1) Draft drawings may include mark-ups done by hand.

(2) Machine generated (final) copies of Record Drawings shall be submitted within 30 working days of completion of each testing phase.

(3) Documentation will include all aspects of systems covered by these specifications that are required for systems to be fully functional.

(4) For structured cabling this includes the horizontal link from the TO to the HC, backbone cabling from the HC to the MC, cross-connections, interconnections and/or patch cords that are the responsibility of the contractor.

D. Submit Acceptance Test Results in electronic form for review and distribution.

(1) Interim documentation of Test Results (if applicable) may be submitted via email or on CD-ROM.

(2) Final documentation of Test Results shall be submitted on CD-ROM.

(3) Test results shall be submitted in format(s) native to test instrument(s) used in performing testing.

(4) Where unique software (other than an MS-Word□ compatible Word Processor or MS-Excel□ spreadsheet) is required for viewing of test results, Contractor shall provide along with above documentation, one licensed copy of such software. Software shall run on MICROSOFT Windows-based personal computer.

E. Acceptance Test results shall include description of sub-system tested, equipment/cable/outlet I.D., reference and test setup, test equipment type/model and serial number(s), equipment location and direction of test (if applicable), test frequencies/wavelengths, date and operator name(s).

F. Engineer or Owner may request that 10% random re-test be conducted on cable system - at no additional cost - to verify documented findings. Tests shall be a repeat of those defined above and in technical sections.

(1) Owner may also perform independent testing to verify results.

(2) If findings contradict documentation submitted by Contractor, additional testing can be requested to extent determined necessary by Engineer or Owner, including 100% re-test. This re-test shall be at no additional cost to Owner.

G. Documentation - including hard copy and electronic forms of Test Data and Record Drawings - shall become property of Owner.

H. Refer also to Technical Sections for requirements specific to covered subsystems.

3.13 CLEANING

A. After installation is complete, Contractor shall clean all systems.

B. Vacuum debris from system components, enclosures, junction boxes and pull boxes prior to testing and again prior to completion.

C. Thoroughly clean equipment of stains, paint spots, dirt and dust. Remove temporary labels not used for instruction or operation.

END OF SECTION 27 00 00

SECTION 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.01 SCOPE

A. This section includes product and execution requirements for Grounding and Bonding that are unique to communications systems and not included in Division 26 sections.

1.02 DESCRIPTION

A. Grounding and Bonding infrastructure for communications includes Cabling, Busbars and Connectors.

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0528.33 - Raceway and Boxes for Communications Systems
(3) Section 27 0528.36 - Cable Tray for Communications Systems
(4) Section 27 0528.39 - Surface Raceways for Communications Systems
(5) Section 27 0553 - Communications Systems Identification
(6) Section 27 1000 - Structured Cabling
(7) Section 27 1100 - Communications Equipment Room Fittings
(8) Section 27 1300 - Communications Backbone Cabling
(9) Section 27 1500 - Communications Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) Section 26 0526 - Grounding and Bonding for Electrical Systems

1.04 REFERENCES AND STANDARDS

A. Refer to Section 27 0000 - General Communications Requirements which identifies pertinent References and Standards.

B. In addition, the following apply:

(1) IEEE/ANSI 142 - Recommended Practice for Grounding of Industrial and Commercial Power Systems.
(2) IEEE 837 - Standard for Qualifying Permanent Connections Used in Substation Grounding.
(3) UL 467 Electrical Grounding and Bonding Equipment
(4) ANSI J-STD-607-B - Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
(5) ANSI J-STD-607-D - Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

1.05 DEFINITIONS

A. Refer to Section 27 0000 - General Communications Requirements which provides information on Definitions used in this and related sections.

B. Additional definitions (per referenced standards):

(1) Telecommunications Main Grounding Busbar: Busbar placed in convenient and accessible location and bonded by means of bonding conductor for telecommunications to building service equipment (power) ground.
(2) Secondary Bonding Busbar: Interface to building telecommunications grounding system generally located in telecommunications room. Common point of connection for telecommunications system and equipment bonding to ground, and located in telecommunications room or equipment room.
(3) Primary Bonding Busbar: Conductor that interconnects telecommunications bonding infrastructure to building's service equipment (power) ground.
(4) Telecommunications Bonding Backbone: Conductor that interconnects tele-communications main grounding busbar to telecommunications grounding busbar.
(5) Grounding Equalizer: Conductor that interconnects elements of telecommunications grounding infrastructure.
(6) Exothermic Weld: Method of permanently bonding two metals together by controlled heat reaction resulting in molecular bond.
(7) Irreversible Compression: Permanent mechanical bond between conductors or conductor and connector using mechanical or hydraulic tool.

C. Cross-Reference of Bonding and Grounding Nomenclature:

Preferred Terms used in this Specification	Other Industry Terms
Grounding Equalizer (GE)	Backbone Bonding Conductor (BBC)
Telecommunications Main Grounding Busbar (TMGB)	Primary Bonding Busbar (PBB)

Telecommunications Grounding Busbar (TGB)	Secondary Bonding Busbar (SBB)
Telecommunications Bonding Conductor (TBC)	Bonding Conductor for Telecommunications (BCT)

1.06 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements which provides information on Abbreviations and Acronyms used in this and related sections.

B. Additional abbreviations and acronyms (per referenced standards):

(1) Telecommunications Main Grounding Busbar - TMGB

(2) – Secondary Bonding Busbar - SBBTelecommunications Bonding Backbone - TBB

(3) Grounding Equalizer - GE

1.07 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements which identifies Work by Owner affecting sub-system(s) covered by this section.

1.08 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements which provides general guidelines for product or installation information to be submitted by Contractor.

1.09 QUALITY ASSURANCE

A. Refer to Section 27 0000 - General Communications Requirements which identifies general quality assurance requirements for the Project.

1.10 GUARANTEE

A. Refer to Division 01, General Conditions, and General Requirements - Guarantee Documents for general warranty requirements.

PART 2 PRODUCTS

2.01 TELECOMMUNICATIONS BUSBARS

A. Material: Copper (aluminum not permitted)

(1) 1/4” thick

B. Pre-drilled

(1) 3/8” Diameter

(2) Hole spacing per ANSI Joint Standard J-STD-607-B

(3) Hole pattern shall accommodate two-hole lugs

C. Insulators and stand-off brackets shall electrically isolate busbar from wall or other mounting surface.

D. Busbars shall be listed by nationally recognized testing laboratory.

E. Size:

(1) Telecommunications Main Ground Busbar (TMGB) – 12”12” x 4” .

(2) Telecommunications Grounding Busbar (TGB) – 12” x 4”

2.02 CONDUCTORS

A. Material: Stranded copper (aluminum not permitted)

B. Bonding Conductors shall be insulated.

(1) Green Jacket or Black Jacket marked with Green Tape or Green adhesive labels per NEC Guidelines

C. Size:

(1) Telecommunications Bonding Conductor (TMGB to Grounding Electrode): As indicated on Project Drawings

(2) Telecommunications Bonding Backbone (TBB; TMGB to TGB): As indicated on Project Drawings

(3) Grounding Equalizer (GE): As indicated on Project Drawings

2.03 CONNECTIONS

A. Mechanical Connectors

(1) Connector Body shall:

(a) Be high-strength, high-conductivity cast copper alloy

(b) Be 2 bolt type

(2) Bolts, nuts, washers and lock-washers: Silicon Bronze

(a) Shall be supplied as part of connector body

(b) Split bolt connector types are not allowed

(3) Connector shall:

(a) Meet or exceed UL 467

(b) Be clearly marked with catalog number, conductor size and manufacturer.

B. Compression Connectors

(1) Connector Body: pure wrought copper.

(a) Conductivity shall be no less than 99% by IACS standards.

(2) Connector shall:

(a) Meet or exceed performance requirements of IEEE 837, latest revision

(b) Be factory filled with an oxide-inhibiting compound

(c) Be clearly marked with manufacturer, catalog number, conductor size and required compression tool settings

(3) Connection shall be irreversible.

C. Exothermic Weld Connections

(1) Not Allowed

PART 3 EXECUTION

3.01 SEQUENCING AND SCHEDULING

A. Permanently attach communications grounds prior to energizing communications equipment.

3.02 TOPOLOGY

A. Refer to the project drawings.

3.03 INSTALLATION

A. Provide required elements and miscellaneous hardware necessary to establish Telecommunication Grounding infrastructure as specified.

B. Install Products in accordance with manufacturer's instructions.

(1) Install Compression Connectors with compression, tool and die system, as recommended by manufacturer of connectors.

C. Grounding connections shall be tight and shall be made with UL listed grounding devices, fittings, bushings, etc.

D. On the Telecommunications Bonding Conductor, Telecommunications Bonding Backbone (TBB) and Grounding Equalizer (GE) all connections shall be Compression type.

E. Locate SBBs and TMGB per drawings.

F. Telecommunications Bonding Backbone (TBB) shall be continuous and not interrupted by Secondary Bonding Busbar

(1) SBBs shall be bonded to TBB via tap off of TBB.

(a) Exception is "last" SBB on TBB (e.g. furthest from TMGB).

(2) Grounding Equalizer(s) (GE) shall connect to TGBs to be interconnected.

G. Insulate Busbars from their support.

H. Connections shall be bare metal to bare metal contact.

(1) Clean surfaces of paint, dirt, oil, etc.

I. Connections shall be exposed and visible for inspection at all times.

(1) Do not install insulation over ground connections.

J. Terminate each grounding conductor on its own terminal lug.

(1) Multiple conductors on single lug not permitted.

3.04 FIELD QUALITY CONTROL

A. Inspect grounding and bonding system conductors and connections for tightness and proper installation.

B. Test resistance of each TGB to ground.

(1) Maximum resistance to ground shall be less than 5 Ohms.

3.05 DOCUMENTATION

A. Accurately record actual locations of grounding electrode(s), busbars and backbone grounding conductors.

END OF SECTION 27 05 26

SECTION 27 05 28.29 - HANGERS AND SUPPORTS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.01 SCOPE

A. This section includes product and execution requirements for items unique to communications systems and not included in Division 26 sections.

B. Refer to Section 27 0000 – General Communications Requirements and 26 0529 - Hangers and Supports for Electrical Systems - Part 1 for requirements for Reference Standards, Submittals, Quality Assurance, Delivery/Storage/Handling, and Guarantee.

1.02 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0528.33 - Raceway and Boxes for Communications Systems
(3) Section 27 0528.36 - Cable Tray for Communications Systems
(4) Section 27 0549 - Seismic Anchorage and Restraints
(5) Section 27 1000 - Structured Cabling
(6) Section 27 1100 - Communications Equipment Room Fittings
(7) Section 27 1300 - Communications Backbone Cabling
(8) Section 27 1500 - Communications Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) Section 26 0529 - Hangers and Supports for Electrical Systems

1.03 REFERENCES AND STANDARDS

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

PART 2 PRODUCTS

2.01 PRODUCTS COMMON WITH ELECTRICAL SYSTEMS

A. Refer to Section 26 0529 - Hangers and Supports for Electrical Systems - Part 3 for:

(1) Hanger Rods
(2) Beam Clamps
(3) Wall Anchors
(4) Metal Framing

2.02 J-TYPE CABLE SUPPORT HOOKS

A. Cable support hooks shall be a wide-base type for use in a non-continuous pathway.

B. Hook material shall be Galvanized metal or Nylon for smooth cable pull and corrosion resistance.

(1) Hook may be coated to reduce cable friction.
(2) Hook material shall be rigid. Flexible material not allowed.

C. Hooks shall:

(1) Comply with UL, cUL, NEC and TIA requirements for structured cabling systems.
(2) Be designed to limit cable bending per cable manufacturers' recommendations.
(3) Be capable of being installed in a single- or multiple-hook ("tree") configuration.
(4) Incorporate a latch or other mechanism to retain cable.

PART 3 EXECUTION

3.01 PRODUCTS COMMON WITH ELECTRICAL SYSTEMS

A. Refer to Section 26 0529 - Hangers and Supports for Electrical Systems - Part 3 for all products identified in Part 1.

3.02 J-TYPE CABLE SUPPORT HOOKS

A. Where installed free-air above suspended ceiling or below raised floor, support cables using J-hook type cable supports installed in accordance with manufacturer's installation requirements.

B. Support hooks from structure. Do not support from ceiling grid, conduit or other trades work.

C. Space J-hook cable supports every 4 ft or in accordance with cable manufacturer's specifications, whichever distance is shorter.

D. J-hook fill capacities shall be per manufacturer's recommendations and shall consider diameter of cable type(s) being installed.

END OF SECTION 27 05 28.29

SECTION 27 05 28.33 - RACEWAY AND BOXES FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.01 SCOPE

A. This section includes product and execution requirements for items unique to communications and not included in Division 26 sections.

1.02 DESCRIPTION

A. Refer to Section 26 0533 - Raceway and Boxes for Electrical Systems - Part 1 for requirements for Standards, Submittals, Quality Assurance, Delivery/Storage/Handling, and Guarantee for:

(1) Outlet Boxes
(2) Pull and Junction Boxes
(3) Raceways and Wireways (including sleeves, expansion fittings, penetrations and seals)
(4) Poke-through Fittings
(5) Floor Boxes
(6) Cable Supports

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0526 - Grounding and Bonding for Communications Systems
(3) Section 27 0528.29 - Hangers and Supports for Communications Systems
(4) Section 27 0528.36 - Cable Tray for Communications Systems
(5) Section 27 0528.39 - Surface Raceways for Communications Systems
(6) Section 27 0553 - Communications Systems Identification
(7) Section 27 1000 - Structured Cabling
(8) Section 27 1100 - Communications Equipment Room Fittings
(9) Section 27 1300 - Communications Backbone Cabling
(10) Section 27 1500 - Communications Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) Section 26 0533 - Raceway and Boxes for Electrical Systems

1.04 REFERENCES AND STANDARDS

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

PART 2 PRODUCTS

2.01 PRODUCTS COMMON WITH ELECTRICAL SYSTEMS

A. Refer to Section 26 0533 - Raceway and Boxes for Electrical Systems - Part 2 for Outlet Boxes for Communications, Pull and Junctions Boxes for Communications, Raceways for Communications, and other products identified in Part 1.

PART 3 EXECUTION

3.01 PRODUCTS COMMON WITH ELECTRICAL SYSTEMS

A. Refer to Section 26 0533 - Raceway and Boxes for Electrical Systems - Part 3 for Outlet Boxes for Communications, Pull and Junctions Boxes for Communications, Raceways for Communications, and other products identified in Part 1.

(1) COMMUNICATIONS RACEWAYS

B. Optical Fiber Communications Cable Raceway (Innerduct):

(1) Minimum innerduct size: 1”, unless otherwise noted on drawings.
(2) Extend innerduct to termination and/or storage enclosure.
(3) Provide couplings designed for innerduct size and type where innerduct enters a termination and/or storage enclosure.
(4) Splice innerduct segments using couplings designed for that purpose, where not installed in a continuous length.
(5) Provide 200 lb nylon pull cord in empty innerduct. Leave at least 12” of slack at each end of pull wire. Cap innerduct at both ends.

(6) Label innerduct with tags indicating cable type and cables contained therein.

(a) Label in each maintenance hole, pull box and communications equipment room, where exiting a conduit and at 20 ft intervals in cable tray or where otherwise exposed.

END OF SECTION 27 05 28.33

SECTION 27 05 28.36 - CABLE TRAYS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.01 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0526 - Grounding and Bonding for Communications Systems
(3) Section 27 0528.29 - Hangers and Supports for Communications Systems.
(4) Section 27 0528.33 - Raceway and Boxes for Communications Systems
(5) Section 27 1000 - Structured Cabling
(6) Section 27 1100 - Communications Equipment Room Fittings
(7) Section 27 1300 - Communications Backbone Cabling
(8) Section 27 1500 - Communications Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) Section 26 0526 - Grounding and Bonding for Electrical Systems
(2) Section 26 0529 - Hangers and Supports for Electrical Systems
(3) Section 26 0533 - Raceway and Boxes for Electrical Systems
(4) Section 26 0536 - Cable Trays for Electrical Systems
(5) Section 26 0593 - Electrical System Firestopping

1.02 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESCRIPTION

A. Provide complete cable tray system including straight tray sections, fittings, splice plates, and cable tray supports to support cable systems in locations as indicated on drawings.

B. Cable tray system is intended to carry communications cable only. Fire alarm system and overhead page cables are not allowed.

1.04 REFERENCE STANDARDS

A. ASTM A 123 - Specification for Zinc (Hot-Galvanized) Coatings on Products Fabricated from Rolled, Pressed, and forged Steel Shapes, Plates, Bars, and Strip.

B. ASTM A 446 - Specification for Zinc-Coated (Galvanized) by Hot-Dip Process, Structural (Physical) Quality.

C. ASTM A 525 - Specification for Steel Sheet, Zinc-Coated Galvanized by Hot Dip Process.

D. ASTM A 607 - Specification for Steel Sheet and Strip, Hot-rolled and Cold-Rolled, High Strength, Low Alloy Columbium or Vanadium.

E. ASTM B 633 - Specification for Electro-deposited Coatings of Zinc on Iron and Steel.

F. NEMA VE 1 - Metal Cable Tray Systems.

G. NEMA VE 2 - Cable Tray Installation Guidelines

H. BICSI - Telecommunications Distribution Methods Manual (TDMM)

1.05 SUBMITTALS

A. Submit shop drawings for equipment provided under this Section.

B. Submit as-built drawings showing floor plan locations, elevation changes, and conduit drops.

PART 2 PRODUCTS

2.01 MANUFACTURER

A. Acceptable Manufacturers

(1) Cooper B-Line (FLEXTRAY™)
(2) Chalfant Cable Trays
(3) Mono-Systems (Mono-Mesh™)
(4) MP Husky
(5) Legrand (CABLOFIL®)
(6) WBT

2.02 MATERIALS AND FABRICATION

A. Materials of Construction:

(1) Materials shall be adequately protected against corrosion or made of corrosion resistant material.

B. Wire Mesh Trays

(1) Tray shall be continuous, rigid, welded steel wire mesh cable management system.

(2) Maximum mesh dimension shall be 2 x 4 inches (50 x 100 mm).

(a) Wire diameter shall be at least 0.2 inch (5 mm).

(3) Material shall be carbon steel wire, ASTM A510, Grade 1008. Wire welded, bent, and surface treated after manufacture

(4) Finish shall be Electro-Plated Zinc Galvanizing per ASTM B 633, Type III, SC 1 or Electro-plated yellow zinc dichromate in accordance with ASTM B 633, Type III, SC 2.

(5) Dimensions:

(a) Inside width: As indicated on Project Drawings

(b) Loading depth (NEMA VE 1): 4" minimum

(6) Tray system shall not present sharp edges, burrs or projections injurious to wiring.

(7) Hardware, including splice connectors and support components, shall be furnished by tray manufacturer.

(8) Tray shall be UL classified for use as an equipment grounding conductor.

(9) Tray shall be designed to support volume capacity of cables and provide safe mechanical support for spans up to 8 feet (243.84 cm) on center. Tested load deflection data is available either in accordance with NEMA VE 1 or IEC 61537 standards

(10) Splice plates shall be bolted type made specifically for tray type provided.

(a) Splice plate construction shall be designed to permit splice location at any point within support span without diminishing cable tray rated loading capacity.

2.03 SUPPORT SYSTEM

A. Supports shall comply with product requirements defined in specification section 26 0529 - Hangers and Supports for Electrical Systems.

B. Flexible cordage/wire shall not be used.

2.04 ACCESSORIES

A. Special accessories shall be furnished as required to protect, support, and install cable tray system.

(1) Accessories include section splice plates, expansion plates, blind-end plates, specially designed ladder dropouts and barriers.

PART 3 EXECUTION

3.01 GENERAL

A. Provide complete cable tray system, including straight tray sections, fittings, splice plates, and cable tray supports to support cable systems in locations, as indicated on drawings.

B. Comply with manufacturer’s recommended installation practices in addition to applicable standards and codes.

C. Completed installation shall present smooth surfaces and rounded edges with no burrs, projections or sharp edges that may prove injurious to installed wiring.

3.02 WIRE MESH

A. Cut wires in accordance with manufacturer’s instructions.

B. Cut wires with side action bolt cutters to ensure integrity of galvanic protective layer.

C. Cut each wire with one clean cut to eliminate grinding or touch-up.

3.03 INSTALLATION

A. Install metallic cable tray in accordance with NEMA VE 1 and VE 2.

B. Provide manufacturer’s standard clamps, hangers, brackets, splice plates, reducer plates, blind ends, connectors, and grounding straps as required.

C. Provide blind end plates for trays that dead end.

D. Provide full-width dropouts (4" minimum bend radius) where cables exit from tray bottom.

E. Join cable tray system sections at ends using manufacturer prefabricated splice plates.

(1) No more than one cable tray splice shall be placed between support spans.

F. Tray system shall be accessible, with sufficient space provided about cable trays to permit side and top access for installation and maintenance of cables.

(1) Coordinate installation of cable tray to maintain clearance between cable tray and other trades work.

(2) Clearance shall be minimum 18" on at least one side, 12" on top and 6" below cable tray.

(3) Tray shall not restrict removal of ceiling panels or lighting assemblies.

(4) Notify Engineer for clarification and direction before proceeding with installation if access conditions cannot be met.

G. Do not install cable tray below re-heat coils, VAV boxes, traps, or other building components that require access from below.

H. Refer to specification section 27 1000 - Structured Cabling for separation requirements from potential EMI sources.

I. Provide prefabricated expansion splice plates at intervals as defined in NEMA VE 2 and where cable tray systems cross building expansion joints.

J. Provide minimum of 1 expansion splice plate in straight runs which exceed 12 ft for tray installations in exterior areas.

K. Field fabricate fittings in accordance with manufacturer's instructions.

(1) Minimum inside radius of fittings shall approximate 12-inch radius available using ladder-type cable tray.

L. Where cable tray would penetrate fire rated wall, stop tray at wall and fasten tray end to wall.

(1) Provide quantity of (1) 4" sleeve , threaded on both end for each 4" of cable tray width..

(2) Sleeves shall extend 4" beyond both sides of fire rated wall as required to meet UL fire rated assembly requirements. Final assembly shall carry UL listing to maintain fire and smoke rating of wall penetrated.

(3) Provide UL listed grounding connectors and conductors to extend cable tray grounding path through wall penetration.

M. Where cable tray distribution system encounters inaccessible ceiling area, provide sufficient 4" EMT sleeves/conduit through area to maintain same available cross sectional area as cable tray.

(1) Each sleeve/conduit shall maintain maximum of 40% cable fill ratio.

N. Provide cable tray liner that matches manufacturer's product line in all areas as indicated by the Architectural drawings.

O. Secure barriers into cable tray system using prefabricated barrier strip clips. Join barriers at ends using manufacturer prefabricated barrier strip splices.

P. Provide bolts and nuts in all holes of cable tray fittings per manufacturer's installation instructions.

Q. Cable tray systems shall be electrically continuous.

R. Nicks and scratches and ends of cut sections with galvanized coatings shall be coated, with approved coating that matches cable tray finish, after tray installation.

3.04 SUPPORT

A. Support cable tray system utilizing trapeze hangers from building or other structural steel members, angle brackets from vertical structural steel members, upright angle brackets on pipe racks, or directly upon horizontal structural steel members of the building or pipe racks.

(1) Center run hangers are not allowed.

(2) Cable tray may be wall mounted only in cases where trapeze mounting from above is not possible due to obstructions. Contractor shall review such situations with Engineer for approval prior to installation.

B. Supports shall be constructed from formed shape channel members 1.625" x 1.625", pre-galvanized 14 Ga. steel complete with nuts, bolts, washers, lock washers and tray clamps as required for complete and finished installation.

(1) Where formed mounting assemblies are part of manufacturer's integrated cable tray system, these may be used in compliance with manufacturers recommended practices.

C. Threaded rod used for tray support shall be 3/8" minimum diameter.

D. Size, anchor, and space supports to sustain weight of cable tray system, cable, and tubes that are to be installed into cable tray, and 200 lbs excess on any individual section, with safety factor of 1.5 minimum when supported as simple span and tested per NEMA requirements. Load and safety factors are applicable to all tray components.

E. Calculate supports based on 60 lbs/ft load of cables and tubes. Support spans shall not exceed manufacturer's recommendations.

F. Total vertical tray deflection shall not exceed 1-1/2" between supports when tray is loaded to capacity.

G. Include dynamic loads in calculations for outside area installations.

H. Maximum allowable deviation of tray, from level horizontal plane measured across width of tray, is one half of one inch (1/2") with tray loaded to capacity.

(1) Approval of installation method does not relieve contractor from meeting above deviation requirement. If additional support is needed, as determined by project engineer, contractor shall provide additional support at no additional cost

3.05 GROUNDING

A. Cable tray systems shall be electrically continuous.

(1) Bonding Jumpers shall be used between discontinuous tray sections as called for in manufacturer's installation guidelines to maintain grounding continuity of cable tray system.

(2) Grounding connections to tray shall be made using a UL listed mechanical connection.

B. Connect each cable tray system subassembly to building ground system using grounding clamps and grounding conductors. Provide 3.0 ohm maximum resistance to building ground connection.

C. Cable tray shall not be connected to instrumentation grounding system.

D. Bond conduits to cable tray as defined by NEC references in NEMA VE-1 and VE-2.

END OF SECTION 27 05 28.36

SECTION 27 05 28.39 - SURFACE RACEWAYS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.01 DESCRIPTION

A. This Section includes product and execution requirements for items unique to communications and not included in Division 26 Sections.

B. Refer to Section 26 0533.13 - Surface Raceway System - Part 1 for References, Standards, Submittals, Quality Assurance, Delivery/Storage/Handling, and Guarantee.

1.02 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements.

(2) Section 27 1000 - Structured Cabling.

(3) Section 27 1300 - Communications Backbone Cabling.

(4) Section 27 1500 - Communications Horizontal Cabling.

B. Related sections in other Divisions of Work:

(1) Section 26 0533.13 - Surface Raceway System.

PART 2 PRODUCTS

2.01 PRODUCTS COMMON WITH ELECTRICAL SYSTEMS

A. Refer to Section 26 0533.13 - Surface Raceway System - Part 2.

PART 3 EXECUTION

3.01 PRODUCTS COMMON WITH ELECTRICAL SYSTEMS

A. Refer to Section 26 0533.13 - Surface Raceway System - Part 3.

END OF SECTION 27 05 28.39

SECTION 27 05 53 - COMMUNICATIONS SYSTEMS IDENTIFICATION

PART 1 GENERAL

1.01 SCOPE

A. This section details product and execution requirements for labeling of communications cabling, termination components, pathways and spaces for Communications Systems.

1.02 DESCRIPTION

A. All components shall be clearly labeled to identify them as unique throughout the project.

B. Labeling requirements include identification of Rooms, Equipment Racks, Telecommunications Outlets, Horizontal and Backbone Cabling, Termination Hardware, Patch Panels and Grounding.

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0526 - Grounding and Bonding for Communications Systems
(3) Section 27 1000 - Structured Cabling
(4) Section 27 1100 - Communications Equipment Room Fittings
(5) Section 27 1300 - Communications Backbone Cabling
(6) Section 27 1500 - Communications Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) Refer to individual technical sections identified above (if applicable).

1.04 REFERENCES AND STANDARDS

A. Refer to Section 27 0000 - General Communications Requirements which identifies pertinent References and Standards.

B. Other applicable references and standards include:

(1) TIA-606-C - Administration Standard for the Telecommunications Infrastructure of Commercial Buildings.

1.05 DEFINITIONS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Definitions used in this and related sections.

1.06 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Abbreviations and Acronyms used in this and related sections.

1.07 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements which identifies Work by Owner affecting sub-system(s) covered by this section.

1.08 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide general guidelines for product and/or installation information to be submitted by contractor.

B. Prior to installation, provide samples of label types planned for the project.

(1) Samples shall include examples of lettering to be used and shall follow standards detailed below.

1.09 QUALITY ASSURANCE

A. Refer to Section 27 0000 - General Communications Requirements which identifies general quality assurance requirements for the project.

PART 2 PRODUCTS

2.01 GENERAL

A. Labels and markings shall be physically and chemically resistant to damage that would make label unreadable.

B. Cable labels shall be self-laminating, White/Transparent Vinyl (or other substrates facilitating easy application and flex as cables are bent) and incorporate an integrated clear lamination which covers printed part of label when label is wrapped around cable.

(1) If cable jacket is white, provide cable label with printing area that is a color other than white to easily distinguish label from cable jacket.

(2) Labels shall be of adequate size to accommodate circumference of cable(s) being marked and properly self-laminate over full extent of printed area of label.

(3) Labels on larger cables (e.g. Copper Backbone) may be wrapped with clear non-removable tape.

C. Labels shall use aggressive adhesives that stay attached even to the most difficult to adhere to jacketing. Tags shall be non-removable.

(1) Exceptions:

(a) Telecommunications Outlet labels that are placed in recessed label holders.

(b) Telecommunications Ground tags secured with cable ties.

(c) Innerduct Tags secured with cable ties.

PART 3 EXECUTION

3.01 GENERAL

A. Labeling shall be by mechanical means.

(1) Hand lettered designations are not allowed.

B. Tags shall be non-removable.

(1) Exceptions:

(a) Telecommunications Outlet labels that are placed in recessed label holders.

(b) Telecommunications Ground tags secured with cable ties.

(c) Innerduct Tags secured with cable ties.

C. Characters shall be Black Ink and printed on background of contrasting color.

D. Labels shall match hardware layout and design.

E. Labels shall be as large as practicable while fitting properly.

F. No lettering shall be smaller than 10-point.

G. Label cables with tag which is wrapped around cable sheath.

(1) Clean cable sheath thoroughly before applying label.

(2) Labels shall not be obscured by termination hardware.

3.02 ROOM IDENTIFICATION

A. Telecommunications Rooms shall be identified per the Architectural Drawings according to plan room number and will be labeled with building signage located outside the room.

B. Room IDs will be:

(1) Equipment Room 112

(2) Telecommunications Rooms 210, 305, 405

(3) Telecommunications AV Rooms Main 136, 216, 311, 411

3.03 EQUIPMENT RACK IDENTIFICATION

A. Label each Equipment Rack with a single numeral beginning with the number one at the rack closest to the wall.

(1) TR-##, where:

(a) "TR" will be the room ID where the rack is located.

(b) "#" is the sequential number for the rack starting at "1".

B. Position Labels at top of rack.

C. Characters shall be 1-inch minimum.

3.04 TELECOMMUNICATIONS OUTLET

A. Label each Telecommunications Outlet (TO) connector with unique identifying code.

B. Telecommunications Outlet connector numbering shall result in logical numbering sequence in work area.

(1) Labeling plans that results in random TO numbering in work area are not acceptable.

C. Place Faceplate labels on outside of cover.

D. Position Labels in recessed label holders on faceplate and covered with clear plastic covers.

(1) Where Communications Outlet Faceplates not incorporating recessed holders are allowed, faceplate labels shall be protected with clear laminate.

E. Telecommunications Outlet labeling code shall be as follows:

(1) TR-RPP-##, where:

(a) “TR” is identifier for the room ID where the cable terminates in horizontal cross-connect.

(b) “R” is identifier for Equipment Rack where cable terminates

1) Numerical character starting at “1”.

(c) "PP" is Patch Panel on which cable is terminated at HC.

1) Number starting at “01”.

2) Panel numbering shall be from Top (of Rack) to Bottom.

(d) "##" is sequential POSITION of Jack on Panel

1) 1 - 48 is typical

2) Position sequence shall be Left-Right and Top-Bottom.

(2) Example: 101-103-25represents 25th Jack Position in 3rd Panel on Equipment Rack “1” in Telecom Room "".”101”

(a) Faceplate labels can use common TR identifiers on each label strip. For example, two data jacks served from TR 101 sharing common label strip may be represented by:

101

103-25 103-26

3.01 HORIZONTAL CABLING

A. Label each horizontal cable at Telecommunications Outlet and at horizontal cross-connect with unique identifying code.

B. Cable shall be labeled at both ends within 4" of cable choke (end of jacket).

C. Horizontal labeling code shall be same as identified for Telecommunications Outlet above:

3.02 MODULAR PATCH PANEL

A. Label each patch panel and port at horizontal cross-connect with unique identifying code.

B. Patch panel labeling code shall be same as identified for Telecommunications Outlet above:

(1) Label Panel I.D.beginning at the top with #01

(a) Panel numbering shall be from Top to Bottom

(2) Label Individual Port I.D.

(a) Port I.D. shall be from Left to Right, Top to Bottom.

(b) Manufacturers port labeling is acceptable.

C. Room number is not required on modular patch panels.

D. Equipment Rack number is not required on modular patch panels.

3.03 BACKBONE FIBER OPTIC CABLING

A. Label each backbone cable at both ends at termination point with unique identifying code.

B. Label shall be placed on adhesive labels adhered to cable sheath.

C. Label Intra-building cables with:

(1) From and to locations,

(2) Fiber type (core/cladding diameter)

(3) Fiber count

(a) Where multiple cable is installed between same end-points, labeling shall indicate sequential fiber numbering.

1) For example 144-fibers provided as two 72-fiber cables would be labeled "001-072" and "073-144".

(4) Date installed.

(5) Example 72-fiber cable from ER106 to TR3164 installed October 2009:

ER106-TR3164

50/125 001-072

10/2009

D. Label Inter-building cables with:

(1) From and to locations,

(2) Fiber type (core/cladding diameter)

(3) Fiber count

(a) Where multiple cable is installed between same end-points, labeling shall indicate sequential fiber numbering.

1) For example 144-fibers provided as two 72-fiber cables would be labeled "001-072" and "073-144".

(4) Date installed.

(5) Example 72-fiber cable from Building 108 ER to Building 110 ER installed October 2009:

ER108-ER110

50/125 001-072

10/2009

3.04 FIBER OPTIC PATCH PANELS

A. Label each fiber coupling in patch panel or workstation outlet with unique identifying code.

B. Patch panel labels shall be visible from front of panel without opening panel cover.

C. Place labels in manufacturer designated labeling areas.

D. Label Fiber Optic Patch Panels with unique labeling code to identify:

(1) Cable Destination Cable Number/ ID

(2) Fiber type (core/cladding diameter)

(3) Fiber (or coupler) number of each panel position.

(a) Port I.D. shall be from Top to Bottom, Left to Right,

(b) Manufacturers port labeling is acceptable.

E. Label Fiber Optic Patch Panels with unique labeling code to identify:

(1) Patch panel number in rack

(2) Fiber (or coupler) number of each panel position.

(a) Port I.D. shall be from Top to Bottom, Left to Right,

(b) Manufacturers port labeling is acceptable.

F. Room number is not required on fiber optic patch panels.

G. Equipment Rack number is not required on fiber optic patch panels.

3.05 INNERDUCT

A. Innerduct containing fiber optic cable installed under this project shall be labeled where exposed.

(1) Includes areas where innerduct is installed in trays and in equipment rooms.

B. Label innerduct with durable Yellow Polyethylene tag that reads "CAUTION FIBER OPTIC CABLE"

(1) Tag shall provide blank spaces for adding fiber count and cable destination information.

C. Label Tag to include:

(1) Identifier(s) of cable(s) contained therein.

(a) Use Backbone Cable labeling formats as described above.

D. Hand lettering is acceptable on tag

(1) Use an indelible type ink.

E. Tag shall be secured to Innerduct using self-locking ties.

3.06 TELECOMMUNICATIONS GROUNDS

A. Label Grounds as close as practicable to point of termination.

B. Labels shall be non-metallic and include the following:

WARNING

IF THIS CONNECTOR OR CABLE IS LOOSE OR MUST BE REMOVED, PLEASE CALL THE BUILDING TELECOMMUNICATIONS MANAGER.

(a) 3.11 TAG PLAN

1) A. Provide a “Tag Plan” that will meet the following criteria for each ER/TR.

(b) 1. 21” W x 15” H plan shall be labeled “As-Built” plotted floor plan showing the WAO locations throughout the area served by the ER/ TR.

(c) 2. The tag plan shall be secured to the wall in each ER and TR as designated in Appendix A.

(d) 3. A clear plexiglass sheet 22” W x 19” H shall be secured to the plywood lined wall. Fastener locations shall be on top and bottom only.

(e) 4. The tag plan shall slide behind the plexiglass from left to right.

(f) 5. This plan shall be updated to reflect any move, add or change to the area served by the ER/ TR.

(g) 6. See Appendix A of the University OF Arkansas, Communications Infrastructure Specification. TAG PLAN drawings for clarification.

END OF SECTION 27 05 53

SECTION 27 10 00 - STRUCTURED CABLING

PART 1 GENERAL

1.01 SCOPE

A. This section details product and execution requirements for Structured Cabling for Communications Systems.

1.02 DESCRIPTION

A. Systems shall include cabling, termination hardware and active components, installed as indicated on drawings and specifications.

B. Cables and equipment shall be provided, tested, and terminated, including proper grounding and bonding.

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0526 - Grounding and Bonding for Communications Systems
(3) Section 27 0528.29 - Hangers and Supports for Communications Systems
(4) Section 27 0528.33 - Raceway and Boxes for Communications Systems
(5) Section 27 0528.36 - Cable Tray for Communications Systems
(6) Section 27 0528.39 - Surface Raceways for Communications Systems
(7) Section 27 0553 - Communications Systems Identification
(8) Section 27 1100 - Communications Equipment Room Fittings
(9) Section 27 1300 - Communications Backbone Cabling
(10) Section 27 1500 - Communications Horizontal Cabling
(a) Section 27 4100 – Audio Visual Systems

B. Related sections in other Divisions of Work:

(1) Refer to individual technical sections identified above (if applicable).

1.04 REFERENCES AND STANDARDS

A. Refer to Section 27 0000 - General Communications Requirements which identifies pertinent References and Standards.

B. In addition:

(1) TIA 568-C - Commercial Building Telecommunications Cabling Standard (including applicable Addenda)
(2) TIA 569-C - Commercial Building Standard for Telecommunications Pathways and Spaces.
(3) BICSI Telecommunications Distribution Methods Manual (TDMM)
(4) TIA-758-B - Customer-Owned Outside Plant Telecommunications Infrastructure Standard
(5) TIA-598-D: Optical Fiber Cable Color Coding.
(6) TIA 455-21-A: Mating Durability for Fiber Optic Interconnecting Devices
(7) TIA 526-14-C: Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant
(8) TIA-526-7-A: Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant
(9) UL-910: Tests for Flame Propagation and Smoke-Density Values for Electrical and Optical-Fiber Cables used in Spaces Transporting Environmental Air
(10) UL-1666: Tests for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts
(11) IEEE 802.3af and 802.3at Power-over-Ethernet Standards.
(12) IEEE 802.3an 10 Gigabit Standard

1.05 DEFINITIONS

A. Refer to Section 27 0000 - General Communications Requirements for general terminology used in Division 27 sections.

B. In addition, the following definitions are applicable to communications environments and shall apply to this document and its companion sections for clarification and direction:

(1) Backbone Cabling - cable or conductors between telecommunications rooms, or floor distribution terminals, entrance facilities, and equipment rooms within or between buildings. Backbone cabling may be twisted pair copper, fiber optic or coaxial.
(2) Cable - assembly of 1 or more conductors or optical fibers within enveloping sheath, constructed so as to permit use of conductors singly or in groups.
(3) Cable ID - unique alpha-numeric identification used for tagging of backbone or horizontal cabling.

(4) Channel - end-to-end transmission path to which application-specific equipment is connected. Same as "Permanent Link", but also includes patch cords at Telecommunications Outlet and in Telecom Room.

(5) Consolidation Point (CP): A location for interconnection between horizontal cables extending from the horizontal cross-connect and horizontal cables extending to the telecommunication outlet at the workstation.

(6) Contractor: Telecommunications Contractor or sub-contractor(s) responsible for installation, termination, test and documentation of communications cabling, termination components, pathway hardware, telecommunications equipment room hardware and related components detailed in technical sections of this Division of work.

(7) Cross-Connect - group of connection points between cabling runs and/or equipment used to administer building wiring using patch cords or wire jumpers.

(8) Horizontal Cabling - Cables connecting Telecommunications Outlets to horizontal or intermediate cross-connect. Sometimes referred to as "Station Cabling".

(9) Horizontal Cross-connect (HC) – Connection of horizontal cabling to other cabling (e.g. horizontal, backbone or equipment) using patch cords or wire jumpers.

(10) Interconnection - Connection scheme using connecting hardware for the direct connection of a cable to another cable without a patch cord or jumper

(11) Main Cross-connect (MC) – Connection between backbone cables, entrance cables and equipment cables using patch cords or wire jumpers.

(12) Outlet ID - unique alpha-numeric identification used for referencing Telecommunications Outlet or connectors therein.

(13) Permanent (Cable) Link - includes Telecommunications Outlet, horizontal (station) cable and termination hardware in Telecom Room.

(14) Service Loop - Surplus cable, typically located at or near point of termination to enable future changes.

(15) Telecommunications Outlet (TO) - device assembly located in work area on which horizontal cabling terminates and which can receive modular connectors. It is interface between Station Cable and end user's equipment.

(16) Telecom Room - an enclosed space for housing telecommunications equipment, horizontal and backbone cable terminations, and cross-connect cabling, that is recognized location of horizontal cross-connect.

(17) Zone Box - An enclosure used to house one or more of the following; a) a consolidation point, b) a horizontal connection point, c) building automation system outlets.

(18) Zone Cabling - Extends permanent horizontal cabling to a shared termination (consolidation) point in the work area. Passive system extends link to workstation through at interconnect at the Consolidation Point (CP). Active system includes system electronics at the CP.

C. “10-gigabit” or “10G” performance criteria, if applicable, refers to support of 10GBASE-T application over 4-connector channel up to 109.36 yards (100 meters) and meeting requirements of TIA-568-C.2.

D. The following definitions are specific to the Project environment and shall apply to this document and its companion sections for clarification and direction.

1.06 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements for general terminology used in Division 27 sections.

B. In addition, the following abbreviations and acronyms shall apply to this document and its companion sections for clarification and direction:

(1) 8P8C Eight-Position, Eight-Conductor. Used in clarifying jack type; a.k.a. "RJ-45".

(2) CM Communications cable rated for General Purpose use

(3) CMP Communications cable rated for use in Plenum areas

(4) CMR Communications cable rated for use in Risers and vertical runs

(5) CP Consolidation Point

(6) ELFEXT Equal-Level Far-End Cross Talk (pair-to-pair)

(7) FEXT Far-End Cross Talk

(8) F/UTP Foiled Unshielded Twisted Pair

(a) No shielding around individual pairs and an overall foil shield under the cable jacket

(9) HC Horizontal Cross-connect

(10) HCP Horizontal Connection Point (e.g. for TIA-862)

(11) IDF Intermediate Distribution Frame

(12) MC Main Cross-connect

(13) MDF Main Distribution Frame

(14) MPTL Modular Plug Terminated Link

(15) N Newton

(16) NEXT Near End Cross Talk
(17) OFNP Optical Fiber Nonconductive Plenum
(18) OFNR Optical Fiber Nonconductive Riser
(19) OTDR Optical Time Domain Reflectometer
(20) PBX Private Branch Exchange (Telephone Switch)
(21) PoE Power-over-Ethernet
(22) PSNEXT Power Sum Near End Cross Talk
(23) S/FTP Screened Foiled Twisted Pair
(a) (Individual foil shield around each individual pair and an overall braided shield under the cable jacket.)
(24) S/UTP Screened Unshielded Twisted Pair
(a) (No shielding around individual pairs and an overall braided shield under the cable jacket.)
(25) SF/UTP Screened Foiled Unshielded Twisted Pair
(a) (No shielding around individual pairs and overall foil and braided shields under the cable jacket.)
(26) TO Telecommunications Outlet
(27) TR Telecommunications Room
(28) USOC Universal Service Order Code
(29) UTP Unshielded Twisted Pair
(a) (No shielding around pairs nor overall under cable jacket.)
(30) U/FTP Unshielded Foiled Twisted Pair
(a) (Individual foil shield around each individual pair and no overall braided shield under the cable jacket.)

1.07 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements which identifies Work by Owner affecting sub-system(s) covered by this section.

1.08 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements which provides general guidelines for product or installation information to be submitted by Contractor.
B. In addition, Submit:
(1) Contractor Certification documents which document their participation in Installers Program operated by Manufacturer of Cabling or Termination Components used.
(a) Upon request, Certified Installer(s) assigned to Project shall be identified to Engineer.

1.09 QUALITY ASSURANCE

A. General:
(1) Cable and Equipment Manufacturer(s) shall be company specializing in communications cable, accessories and/or equipment with minimum of 5 years documented experience in producing cable, accessories and/or equipment similar to those specified herein.
B. Contractor Qualifications:
(1) Qualified personnel utilizing state-of-the-art equipment and techniques shall complete cable and equipment installation and termination.
(2) Contractor shall have been in this business for minimum of 5 years and shall have successfully completed 4projects equal in magnitude of system specified in the following sections.
C. Contractor shall have necessary certifications to provide for Warranty as specified herein.
(1) Contractor shall be an active participant in Installers Program operated by Manufacturer of Cabling or Termination Components used.
(a) Contractor shall be participant in this program at time of Bidding and remain so throughout project.

1.10 GUARANTEE

A. Refer to Division 01, General Conditions, and General Requirements - Guarantee Documents and Section 27 0000 - General Communications Requirements for general guarantee requirements.
B. Warranty structured cable system as follows:
(1) 4-pair Category-rated Horizontal CopperPermanent Link for no-less than20 years from date of substantial completion of work.
(2) Fiber Optic Backbone for no-less than20years from date of substantial completion of work.
C. Warranty shall be direct from manufacturer(s) of cabling and connecting components to Owner.

PART 2 PRODUCTS

2.01 GENERAL

A. Refer to individual Technical Sections.

2.02 POWER OVER ETHERNET

A. All cable and connecting components that comprise the TIA horizontal cabling “Permanent Link” from Horizontal Cross-connect to Telecommunications Outlet shall be compliant with the applicable requirements for “DTE Power via the MDI” to provide at least 25.5Wat the Powered Device as defined by the IEEE 802.3atstandard.

B. Cabling shall be UL-LP listed at a minimum of 0.5A.

C. Connecting hardware shall comply with IEC 60512-99-001for engaging and separating connectors under electrical load and connectors used in twisted pair communication cabling with remote power.

2.03 SYSTEM REQUIREMENTS

A. Structured cabling products shall be designed to work together as a fully-warranted system.

B. Acceptable Category 6A systems shall be:

(1) CommScope SYSTIMAX GigaSPEED X10D

PART 3 EXECUTION

3.01 GENERAL

A. Refer to individual technical specification sections for detailed Cable Routing and Installation, Testing and Documentation requirements. The following apply to communications cabling and termination work.

B. Installation shall be per manufacturers' recommendations.

C. Label cables and termination components per Section 27 0553 - Communications Systems Identification.

3.02 CABLE INSTALLATION

A. Run cabling in raceways provided, or as designated on floor plans, and support from building structure.

(1) Where installed in free-air, support cables using J-hook type cable supports installed in accordance with manufacturer’s installation requirements. Refer to Section 27 0528.29 - Hangers and Supports for Communications Systems for installation requirements.

(a) J-hook fill capacities shall be per manufacturer’s recommendations and shall consider diameter of cable type(s) being installed.

(b) Route cable/hooks at right angles, parallel to construction.

(2) Where installed in Cable Tray, lay cables neatly in tray.

(a) Do not tie. .

(b) Provide sufficient slack in cables to allow for unequal expansion coefficients of cable tray and cables. This requirement is in addition to slack required at cable tray expansion joints.

B. Route and support cable in Equipment Rooms and Telecom Rooms utilizing "D-type" mounting rings, J-hooks and overhead cable runway.

C. Cable shall be free of tension at both ends.

(1) In cases where cable must bear stress, provide Kellems grips to spread stress over longer length of cable.

D. Provide required installation tools to facilitate cable pulling without damage to cable jacket.

E. Keep cables clear of other trades work.

F. During pulling operation provide an adequate number of workers to allow cable observation at points of raceway entry and exit, as well as to feed cable and operate pulling machinery.

G. Pull cables in accordance with cable manufacturer's recommendations and ANSI/IEEE C2 Standards.

H. Pull cable by hand unless installation conditions require mechanical assistance.

I. Do not exceed recommended pulling tensions and bending radii.

(1) Where mechanical assistance is used, ensure that maximum tensile load for cable is not exceeded.

(a) This may be in form of continuous monitoring of pulling tension, use of "break-away" or other approved method.

(2) Replace cables bent or kinked to radius less than recommended dimension.

(a) This shall be at no expense to Owner.

J. Install cables splice-free unless otherwise specified.

K. Avoid abrasion and other damage to cables during installation.

(1) Visually inspect cables for cuts, blisters and abrasions during installation.

L. Pulling lubricant may be used and shall:

(1) Be non-injurious to cable jacket and other materials used.

(2) Not harden or become adhesive with age.

M. Repair damage to interior spaces caused by installation of cable, raceway or other hardware. Repairs must match preexisting color and finish of walls, floors and ceilings.

N. Replace contractor-damaged ceiling tiles to match color, size, style and texture.

O. Provide pull cord 200 lb minimum) with cable installed in conduit or innerduct.

P. Neatly lace, dress and support cabling.

Q. In vertical pathway, support cables on each floor using industry recognized support methods designed specifically for that purpose.

(1) Strap vertical runs as required, to prevent sagging of cables.

R. To reduce effects of EMI, adhere to thefollowing minimum cable separation distances.

(1) 5” from power lines of 2 kVA

(2) 18” from high voltage lighting (including fluorescent and LED)

(a) When using LED lighting, stated separation distance shall be from cables to LED drivers.

(3) 39” from power lines of 5 kVA or greater

(4) 47” from transformers and motors

3.03 FIELD TESTING

A. Refer to Section 27 0000 - General Communications Requirements for general guidelines regarding requirements for scheduling and performing compliance testing.

B. Cabling shall be 100% fault free unless otherwise noted. If any Channelis found to be outside specification defined herein, identify and correct problem up to and including replacement of cable and associated termination(s). Then repeat applicable tests.

C. Test each cabling sub-system (e.g. backbone, horizontal, etc.) end-to-end.

D. Where sub-systems are to be interconnected or cross-connected by the contractor, test individual sub-system followed by a test of the connected links

(1) Performance and documentation requirements shall default to the lesser of the two connected systems if different.

(2) Example 1: Combined Backbone-Horizontal Link

(a) Test and document individual Backbone and Horizontal Cabling Sub-systems.

(b) Cross-connect sub-systems.

(c) Repeat testing on combined cabling from MC - TO through HC.

(d) Performance and documentation requirements shall be based in this example on backbone cabling (continuity, pair integrity, etc.).

(3) Example 2: Interconnected Zone Cabling Link

(a) Test and document individual HC – CP links.

(b) Install interconnect cabling CP – TO

(c) Repeat testing on combined cabling from HC – TO through CP.

(d) Performance and documentation requirements shall be based in this example on TIA Permanent Link for Horizontal Cabling.

E. Test instrument shall be configured using template for exact cable under test (e.g. by manufacturer product designation).

(1) If no template is available, enter cable parameters for the cable per manufacturer’s product data.

(a) Nominal Velocity of Propagation (NVP) used for copper cable type under test shall be traceable to manufacturers' product data.

(b) Refractive Index used for fiber optic cable type under test shall be traceable to manufacturers' product data.

(2) Test results obtained using incorrect cable parameters will be rejected.

F. Test instrument shall be calibrated as defined by instrument manufacturer at least once every 12 months or as required by test instrument manufacturer if that results in more frequent calibration runs.

(1) Test instrument calibration date shall be present in test results documentation.

G. Refer to individual Technical Sections for system-specific guidelines regarding requirements for scheduling and performing compliance testing.

3.04 DOCUMENTATION

A. Refer to Section 27 0000 - General Communications Requirements for general guidelines regarding requirements for project Documentation.

B. Refer to individual Technical Sections for system-specific guidelines regarding requirements for project Documentation.

C. Information added by Contractor to Record Drawings shall include:

(1) Backbone and horizontal cable routes

(2) Telecommunications outlet locations and identification

(3) Other detail necessary to document cable installation

3.05 OWNER TRAINING

A. Provide training for Owner's personnel on operation and maintenance of total system and each component.

B. Training to include:

(1) Overview of System Topology and General Concepts

(2) Overview of Product Used

(3) Overview of Equipment Room Layouts

(4) Overview of Labeling Formats

(5) Overview of Test Results and their meaning

(6) Overview of Documentation

C. Training shall be held atProject Site] and shall be conducted during normal working hours.

D. Training session duration shall be not less than (1) h

(1) Provide one such session.

(2) Coordinate with owner to schedule session(s). Provide adequate notification to allow owner to schedule staff.

E. Attendance shall be by owner staff .

(1) Number of Students per session shall be 6

(2) Materials shall be provided for the number of students indicated.

F. Provide example course materials and instructor background in advance of training session(s).

G. Owner may videotape session(s) for use as future refresher materials for owner technical staff.

END OF SECTION 27 10 00

SECTION 27 11 00 - COMMUNICATIONS EQUIPMENT ROOM FITTINGS

PART 1 GENERAL

1.01 SCOPE

A. This section details product and execution requirements for Communications Equipment Room Fittings for Communications Systems.

1.02 DESCRIPTION

A. Communications Equipment Room Fittings include:

(1) Racks, Frames and Enclosures

(2) Cable Runway

(3) Patch Panels

B. Refer to Project Drawings for Equipment Room layout and equipment placement.

1.03 RELATED WORK

A. Refer to Section 27 0000 - General Communications Requirements which identifies related specification sections in this and other Divisions (if applicable).

1.04 REFERENCES AND STANDARDS

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

B. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements

(2) Section 27 0526 - Grounding and Bonding for Communications Systems

(3) Section 27 0528.29 - Hangers and Supports for Communications Systems

(4) Section 27 0528.33 - Raceway and Boxes for Communications Systems

(5) Section 27 0553 - Communications Systems Identification

(6) Section 27 1000 - Structured Cabling

(7) Section 27 1300 - Communications Backbone Cabling

(8) Section 27 1500 - Communications Horizontal Cabling

C. Related sections in other Divisions of Work:

(1) Refer to individual technical sections identified above (if applicable).

1.05 DEFINITIONS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Definitions used in this and related sections.

1.06 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Abbreviations and Acronyms used in this and related sections.

1.07 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements which identifies Work by Owner affecting sub-system(s) covered by this section.

1.08 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide general guidelines for product or installation information to be submitted by Contractor.

1.09 QUALITY ASSURANCE

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which identify general quality assurance requirements for the Project.

1.10 GUARANTEE

A. Refer to Division 01, General Conditions, and General Requirements - Guarantee Documents for general warranty requirements.

B. Refer to Section 27 1000 - Structured Cabling for particular Warranty requirements for Structured Cabling. Those requirements apply to cable and components covered in this section.

PART 2 PRODUCTS

2.01 CABINETS, RACKS, FRAMES AND ENCLOSURES

A. Manufacturers: CPI, Commscope

B. Equipment racks shall be:
   (1) Constructed of anodized aluminum
   (2) Color Black
   (3) Supplied with ground bar 19” wide by 1” high and 6 AWG ground lugs
   (4) Supplied with minimum of 12 releasable cable support ties (e.g. "hook and loop")
   (5) Supplied with spare screws (minimum of 50)
   (6) Configured with Channel uprights spaced to accommodate industry standard 1” mounting

C. Free Standing Equipment Rack shall comply with general requirements above and shall:
   (1) Be 84” in height
      (a) Have minimum of 45usable rack mounting units (RU)
   (2) Be self-supporting
   (3) Have Minimum base footprint of 15” x 20”
   (4) Be double-sided drilled and tapped to accept 12-24 screws
      (a) Uprights shall be drilled on back to accept cable brackets, clamps, power strip(s).
      (b) Hole pattern on rack front and back shall be per EIA/TIA specifications 5/8” – 5/8” – 1/2”

D. Cable Management
   (1) Manufacturers: CommScope,
   (2) Vertical Cable Management shall:
      (a) Provide for cable routing on front and rear of each rack
      (b) Be 8” wide (minimum) when installed between two racks. Commscope VCM-DS-84-8B
      (c) Be 8” wide when installed at end of rack row. Commscope VCM-DS-84-8B
      (d) Mount on spacers attached to rack uprights and not on upright
      (e) Be accessible from front and rear of rack
      (f) Be designed to space slots/fingers at 1 RU intervals to align with rack-mounted equipment

E. Miscellaneous
   (1) Releasable Cable Support Ties shall be:
      (a) Hook & Loop type
      (b) Individual units with latch
         1) Roll of hook & loop material is not acceptable.

2.02 CABLE RUNWAY

A. Manufacturers: CPI Chatsworth Products 10250-712 and associated required accessories.

B. Cable Runway shall:
   (1) Be constructed of 0.065” thick steel
   (2) Utilize tubular stringers to support rungs.
      (a) Stringers shall be 1-1/2” high.
      (b) Rungs shall be welded to stringers and shall be spaced 9” on center.
   (3) Be painted with black epoxy

C. Runway width(s) shall be as shown on drawings.

2.03 MODULAR PATCH PANELS

A. Manufacturers: Commscope 360-IPR-1100A-E-GS6-2U-48

B. Panels shall:
   (1) Consist of Modular-to-IDC connector system
   (2) Be rack-mountable in standard EIA 19” equipment racks
   (3) Be 2 RUs high
   (4) Accommodate 48-port modular jacks in two rows of 24-ports
   (5) Be designed to terminate 4-pair, 100-Ohm UTP] cables
   (6) Have ability to terminate 22-26 AWG plastic insulated, solid and stranded copper conductors.
   (7) Be designed to maintain cable's pair twists as closely as possible to point of mechanical termination.
   (8) Have cable support and strain relief devices to secure cables at IDC connector.
      (a) Panel and cable support hardware shall ensure that cabling minimum bend radius requirements are satisfied.

(9) Have port identification numbers on both front and rear of panel.

(10) Have color-coded pair designations on rear of panel.

C. Modular Jacks in Panel shall:

(1) Be non-keyed, 8 position, 8-conductor (8P8C)

D. Panels shall meet or exceed TIA Category 6A 10-gigabit performance criteria.

2.04 FIBER OPTIC PATCH PANELS

A. Manufacturers: Commscope 360 G2

B. Patch Panels shall:

(1) Be enclosed assemblies

(2) Incorporate hinged or retractable front cover

(3) Be rack mountable on standard TIA 19” equipment racks

(4) Provide for strain relief of incoming cables

(5) Incorporate radius control mechanisms to limit bending of fiber to manufacturer's recommended minimums of 1.2”, whichever is larger

(6) Provide protection to both "facilities" and "user" sides of couplings.

(7) Be configured to require only front access when patching

(8) Incorporate patch cable routing space internal to patch panel enclosure.

(a) Routing space shall be front-accessible.

(9) Include provisions for permanent labeling of fiber optic cables.

(a) Labeling shall be accessible from front of patch panel and shall not require disassembly of patch panel enclosure or removal of front cover.

C. Couplings shall be mounted on assembly that snaps into patch panel enclosure.

(1) This assembly shall be designed to accept variety of coupler types including, ST, SC, duplex SC and high-density mini-connectors.

(2) Coupling type shall be LC duplex

(3) Coupling Color shall be as follows:

(a) Single-mode: BLUE

D. Access to inside of panel enclosure during installation shall be from front and rear.

(1) Panels that require disassembly of cabinet to gain entry will not be accepted.

E. Incoming cables shall not be accessible from patching area of panel.

(1) Enclosure shall provide physical barrier to access of such cables.

(2) Where factory-terminated cable assemblies ("pigtails") are spliced to cable, enclosure shall incorporate hardware for securing of splice tray and required cable, buffer tube and pigtail slack.

PART 3 EXECUTION

3.01 GENERAL

A. Refer to project Drawings for communications equipment room layout and equipment placement.

B. New communications equipment rooms must be free from dust, dirt, and other foreign materials before installation of any termination hardware or termination of copper or fiber optic cables.

(1) Door to room must be closed during termination if area outside room is not dust-free.

C. Follow manufacturer’s recommended installation and termination practices.

D. Provide necessary assistance to allow Owner or Carrier personnel to establish service on new cable system.

(1) Includes general wiring overview, cable pair identification, and cross connect documentation (if applicable).

3.02 EQUIPMENT RACKS AND CABLE MANAGEMENT

A. Provide equipment racks as shown on project Drawings.

B. Assemble racks per manufacturer’s recommendations. Remove paint at the point(s) of contact of assembly hardware or use internal-external tooth lock washers to pierce paint to maintain ground continuity.

C. Bolt racks to floor.

D. Secure racks to cable runway as described below.

E. Provide Horizontal and Vertical Cable Management in equipment racks Drawings

(1) Provide horizontal cable management above and below each rack mounted patch panel.

(2) Provide vertical cable management between adjacent equipment racks and at rack row ends.

F. Provide each rack with:

(1) Minimum of fifty (50) 12/24 mounting screws,

(2) Minimum of twelve (12) releasable (e.g. "hook & loop") cable support ties.

G. Bond each rack mounted ground bar to the secondary bonding backbone.

(1) Use #6 AWG or larger copper conductor (green jacket).

3.03 CABLE RUNWAY

A. Provide cable runway and accessories necessary for complete system.

B. Size and layout of cable runway shall be as shown on project Drawings.

C. Install above equipment racks 7’-6”

D. Align with equipment racksas shown on drawings

(1) Where parallel to rack row, align center of runway with center of rack.

(2) Where at right-angle to rack, align center of runway with center of rack.

E. Brace to racks with support brackets made by runway or rack manufacturer intended for this purpose.

F. Use radius drops where cables drop from tray to rack and at elevation changes of 6” or more.

G. Maximum allowable deviation of runway from level horizontal plane measured across length of cable runway shall be 1/2”, with tray loaded to capacity.

H. Where cable runway is supported from building structure:

(1) Provide 3/8” threaded rods for support of 12” wide or smaller runway.

(2) Provide 1/2” threaded rods for support of runway greater than 12” in width.

I. Bond runway components together using manufacturer's standard accessories.

J. Fasten cables to runway at intervals not to exceed 4 feet (121.92 cm)

3.04 MODULAR PATCH PANELS

A. Provide panels per project documents

B. Mount patch panels in 19” equipment racks.

C. Position cables in sequence of:

(1) Telecommunications Outlet ID for horizontal cabling

(2) Pair number for backbone cabling

D. Terminate cables using 568B wiring standard.

E. Provide horizontal management above and below each patch panel.

F. Provide minimum of 4 screws to secure each patch panel onto rack.

3.05 FIBER OPTIC PATCH PANELS

A. Provide Fiber Optic Patch Panels and coupling assemblies at horizontal and main cross-connect locations

(1) Provide minimum of 4 screws to secure each patch panel onto rack.

B. Provide couplings in coupling assemblies and mount coupling assemblies and blank covers in patch panels.

C. Position fibers consecutively - starting with lowest number - and mapped "position for position" between patch panels.

(1) There shall be no transpositions in cabling.

D. Keyways on duplex couplings shall be oriented to establish "cross-over" in cabling system.

(1) Convention defined by TIA-568-C.0 (Annex B, Section B.3.2) shall be used.

(2) Reverse-pair positioning shall not be used.

E. Provide blank covers for unused coupling assembly spaces in panels.

F. Follow manufacturer's guidelines for connector type(s) provided.

G. 1. Clean couplings with foam swab and isopropyl alcohol prior to connection insertion. Blow dry with compressed air.Provide dust caps for couplings.

H. Where factory-terminated cable assemblies ("pigtails") are spliced to cable, prepare and splice cables and fibers per manufacturers' guidelines.

3.06 FIELD TESTING

A. General

(1) Refer to Section 27 0000 - General Communications Requirements and 27 1000 – Structured Cabling for guidelines regarding documentation requirements.

(2) Refer to referenced technical sections for detailed requirements to testing of each cable sub-system.

3.07 DOCUMENTATION

A. General

(1) Refer to Sections 27 0000 - General Communications Requirements and 27 1000 – Structured Cabling for guidelines regarding documentation requirements.

END OF SECTION 27 11 00

SECTION 27 13 00 - COMMUNICATIONS BACKBONE CABLING

PART 1 GENERAL

1.01 SCOPE

A. This section details product and execution requirements for backbone cabling for Communications Systems.

1.02 DESCRIPTION

A. Backbone Cabling links telecommunications rooms or floor distribution terminals, entrance facilities, and equipment rooms within or between buildings.

B. Backbone cable types include:

(1) Fiber Optic

C. Refer to Project Drawings which detail Backbone Cable System topology and conductor/fiber counts.

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0526 - Grounding and Bonding for Communications Systems
(3) Section 27 0528.29 - Hangers and Supports for Communications Systems
(4) Section 27 0528.33 - Raceway and Boxes for Communications Systems
(5) Section 27 0528.36 - Cable Tray for Communications Systems
(6) Section 27 0528.39 - Surface Raceways for Communications Systems
(7) Section 27 0553 - Communications Systems Identification
(8) Section 27 1000 - Structured Cabling
(9) Section 27 1100 - Communications Equipment Room Fittings
(10) Section 27 1500 - Communications Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) Refer to individual technical sections identified above (if applicable).

1.04 REFERENCES & STANDARDS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which identify pertinent References and Standards.

1.05 DEFINITIONS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Definitions used in this and related sections.

1.06 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Abbreviations and Acronyms used in this and related sections.

1.07 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements which identifies Work by Owner affecting sub-system(s) covered by this section.

1.08 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide general guidelines for product or installation information to be submitted by Contractor.

B. In addition, submit:

(1) One 3 ft section of each cable type from cable reels sent to site for Engineer's final approval.
(a) Section shall have manufacturer's cable markings visible.

1.09 QUALITY ASSURANCE

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which identify general quality assurance requirements for the Project.

1.10 GUARANTEE

A. Refer to Division 01, General Conditions, and General Requirements - Guarantee Documents for general warranty requirements.

B. Refer to Section 27 1000 - Structured Cabling for particular Warranty requirements for Structured Cabling. Those requirements apply to cable and components covered in this section.

PART 2 PRODUCTS

2.01 GENERAL

A. Cables and Termination hardware shall be technically compliant with and installed in accordance with referenced TIA documents.

B. Cables shall be Underwriters Laboratory (UL) listed, comply with Article 800 (Communications Circuits) of National Electrical Code and shall meet specifications of NEMA (low loss), UL 444, and ICEA (where applicable).

2.02 FIBER OPTIC CABLE

A. General

(1) Manufacturers (Cable): CommScope

(2) Manufacturers (Optical Fiber): Corning, Alcatel

(3) Fibers utilized in installed cable shall be traceable to manufacturer.

B. Optical Fiber - General

(1) Optical fibers shall:

(a) Be sufficiently free of surface imperfections and occlusions to meet optical, mechanical, and environmental requirements of this specification.

(b) Have been subjected to minimum tensile proof test by fiber manufacturer equivalent to 100 kpsi.

(2) Factory optical fiber splices are not allowed.

(3) Coatings shall be mechanically strippable without damaging optical fiber.

C. Single-mode Optical Fibers:

(1) Fiber Type: Single-mode

(2) Strand Count: as shown on Drawings

(3) Transmission Windows: 1310 nm, 1550 nm

(4) Core Diameter: 8.3 micron

(5) Cladding Diameter: 125 micron ± 1 micron

(6) Coating Diameter: 245micron± 10 micron

(7) Maximum Attenuation:

(a) 1310 nm0.5 dB/km (at 23° ± 5°C)

(b) 1550 nm0..5-dB/km (at 23° ± 5°C)

(c) When tested in accordance with FOTP 3, "Procedure to Measure Temperature Cycling Effects on Optical Fibers, Optical cable, and Other Passive Fiber Optic Components", average change in attenuation over rated temperature range of cable shall not exceed 0.05 dB/km at 1550 nm. Maximum attenuation change shall not exceed 0.15 dB/km at 1550 nm.

(d) Water Peak Attenuation: 1383 ± 3 nm (dB/km) ≤ 0.4

(8) Point Discontinuity: < 0.1 dB at specified wavelengths

D. Indoor Backbone Fiber Optic Cable

(1) Cable shall:

(a) Be suitable for installation in free air, in building risers, in conduit, in cable tray and in innerduct.

(b) Be dielectric materials (no conductive materials).

(2) Cable shall meet the following specifications:

(a) Buffer Diameter: 900 micron (tight buffer)

(b) Jacket Color

1) Single-mode: YELLOW

(c) Cable Rating: OFCP

(d) Strength Member: Aramid Yarn

(e) Storage Temperature: 40°F to 158°F (no irreversible change in attenuation)

(f) Operating Temperature: 34°F to 158°F (no irreversible change in attenuation)

(g) Humidity Range: 0 to 100%

(h) Maximum Tensile Strength:

1) During Installation – 2700 N (no irreversible change in attenuation)

2) Long Term – 1000 N

(i) Bending Radius:

1) During Installation - 20 times cable diameter

2) No Load - 10 times cable diameter

2.03 FIBER OPTIC CONNECTORS

A. Manufacturers: Corning

B. Connectors shall:

(1) Be ST type.

(2) Accept fibers having clad diameter of 125 micron.

(3) Accept fibers having buffered diameter of 900 micron.

(4) Sustain minimum of 200 mating cycles.

C. Connector ferrule shall be ceramic or glass-in-ceramic

D. Connectors shall meet the following performance criteria:

(a) Test Procedure Max. Attenuation Change

(2) Cable Retention (TIA-455-6) 0.2 dB

(3) Durability (TIA-455-21) 0.2 dB

(4) Impact (ANSI/TIA/EIA-455-2) 0.2 dB

(5) Temperature Life (TIA/EIA-455-4) 0.2 dB

(6) Humidity (TIA/EIA-455-5) 0.2 dB

E. Optical fiber shall be:

(1) Secured within connector ferrule with adhesive, or

(2) Mechanically secured and mated to a factory-installed fiber stub that is fully bonded into the ferrule. Mechanical “splice” inside connector shall include an index matching gel.

F. Attenuation per connector shall not exceed 0.5 dB.

G. Reflectance (maximum) when mated with patch-cord made up of connectors of comparable design shall be as follows:

(1) Single-mode: 55 dB

H. Color of [LC Connector shall be as follows:

(1) Single-mode: BLUE

I. Strain-relief boot of ST Connector shall indicate fiber type as follows:

(1) Single-mode: YELLOW

PART 3 EXECUTION

3.01 CABLE INSTALLATION AND TERMINATION

A. General

(1) Provide cables as shown on Project Documents.

(2) Size cables as shown on Project Documents.

(3) Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling for general cable installation requirements.

B. Backbone UTP Voice Cable:

(1) Terminate cables on backbone voice cable blocks.

(a) Maintain cables pair twists to within 1” of termination.

(b) Remove cable jacket only to extent required to make terminations.

C. Fiber Optic Cable

(1) Route backbone fiber optic cable in innerduct.

(2) Ground metallic cable sheath (if applicable) per Code.

(a) Provide armored fiber ground kit for armored cable terminations. Install as directed by kit manufacturer.

1) Ground inter-building cable at one end

2) Ground intra-building cabling at both ends

(b) Connect armored fiber ground kit to rack mounted grounding reference.

(3) Terminate fiber strands on Fiber Optic Connectors mated to couplings mounted in Fiber Optic Patch Panels.

(a) Terminate all fibers.

(4) Follow manufacturer's guidelines for connector type(s) provided.

(a) Clean connectors with specialized dry-cleaning product from Fluke or Cletop.

(5) Fibers with coatings <900 micron shall be furcated (fanned-out) to minimum of 900 micron before termination.

(a) Provide buffer tube fan-out kits for fibers terminated in patch panel couplings.

(6) Provide cable slack in each backbone fiber optic cable.

(a) Slack shall be in addition to length of fiber required for termination requirements.

(b) Store cable slack in enclosure designed for this purpose.

(c) Slack required shall be as follows:

1) Backbone Intra-Building: Minimum of 16 feet each cable if applicable (487.68 cm) coiled and secured at one end (preferably at Telecom Room).

2) Backbone Inter-Building: Minimum of 50 feet each cable if applicable feet (1524 cm) coiled and secured at one end (preferably at Equipment Room).

3) Maintenance Holes/Manholes: Minimum of 1-1/2 times inside dimension of Maintenance Hole/Manhole.

3.02 FIELD TESTING

A. General

(1) Refer to Section 27 0000 - General Communications Requirements for general guidelines regarding requirements for scheduling and performance of compliance testing.

(a) Contractor shall be responsible for testing each system end-to-end.

B. Backbone Fiber Optic Cable Testing

(1) Pre-Installation Testing

(a) Pre-installation testing shall be done at contractor option.

(b) Submit cable manufacturer's test report for each reel of cable provided.

1) Verify fiber attenuation, bandwidth and length values as specified on cable data sheets supplied with cable reels.

(c) Visually inspect reels and packaging for damage.

(2) Post-Installation Testing

(a) Clean fiber optic connectors before beginning testing.

1) Using fiber tester capable of fiber end face inspection is strongly encouraged to help minimize requirement for retesting due to dirty connectors.

(b) Testing shall include:

1) Optical Attenuation

2) Optical Time Domain Reflectometry (OTDR)

(c) Optical Return LossOptical Attenuation

1) Light Source: FP LASER for 1300 nm tests.

2) Measure Optical Attenuation on terminated fibers.

1. Include optical connectors and couplings installed at fiber endpoints.

3) Test multimode fibers using TIA 526-14A, Method B.

4) Test single-mode fibers using TIA 526-7-1998 (MethodB).

5) Test fibers in both transmission directions.

6) Test single-mode fibers at 1310 ± 10 nmand 1550 ± 10 nmwavelengths.

7) Fiber lengths less than or equal to 300 ft shall test to ≤ 2.0 dB loss.

8) Fiber lengths greater than 300 ft shall test to loss value less than link loss budget for installed connectors and fibers.

(d) Optical Time Domain Reflectometry (OTDR)

1) OTDR testing shall not be used as the sole method for establishing optical attenuation link loss.

2) Verify fiber integrity using an Optical Time Domain Reflectometer (OTDR).

1. Includes terminated and (if applicable) un-terminated fibers.

3) OTDR(s) shall incorporate high-resolution optics and short pulse-width options optimized for viewing of short cable sections.

1. Pulse-width shall be 10-ns or less for cable lengths greater than 109.36 yards (100 meters).

2. Pulse-width shall be 5-ns or less for cable lengths less than 109.36 yards (100 meters).

4) OTDR traces shall be performed in one direction using access jumpers at transmit and receive ends.

1. Remote end of tail cord has no requirement for reference grade termination

5) OTDR traces shall be performed in two directions using access jumpers at transmit and receive ends

1. Remote end of tail cord shall meet same reference grade requirements as launch end cord.

2. Perform bi-directional OTDR measurements according to requirements of TIA-526-7-A, clauses H.6 and H.7.

3. Minimum length of access jumper at launch end shall be minimum 330 ft long for multimode or 990 ft long for single-mode, unless recommended otherwise by test equipment manufacturer.

6) Test multimode fibers at 850 ± 30 nm wavelength.
7) Test single-mode fibers at 1310 ± 10 nm wavelengths.
8) Examine traces for continuity and anomalies to confirm fiber link integrity.
    1. Point discontinuities in excess of 0.2 dB for multimode fibers or 0.1 dB for single-mode fibers shall be cause for rejection of cable.
    2. Any reflection in trace - except at patch panels - shall be cause for rejection of cable.
    3. Submitted test results shall show only fiber under test and shall have trace boundaries set to show fiber under test and not launch cords or other extraneous data.
    4. Set event markers to accurately reflect overall attenuation of installed fiber optic cable and connectors.
9) OTDR tested links showing excessive backscatter immediately following connector shall have connector cleaned and/or re-polished and then retested.

(e) Optical Return Loss
1) Testing shall include Optical Return Loss (ORL) measurement for each installed single mode fiber optic connector. Follow OTDR manufacturer's requirements for required tester settings, including scattering coefficient.
2) Perform ORL with a Back Reflection Meter or an OTDR.
    1. OTDR shall be capable of measuring fiber connector reflectance and produce accurate (± 2 dB) reflectance measurements
3) Test result cursors shall be placed at appropriate locations before tests are submitted for review. OTDR testers including automatic cursor positioning functions shall use said functions to position cursors accurately for measurement.

3.03 DOCUMENTATION

A. General
(1) Refer to Section 27 0000 - General Communications Requirements for general guidelines regarding documentation requirements.

B. Backbone Fiber Optic Cable
(1) Files containing Attenuation and OTDR traces of individual optical fiber "signatures" shall be so named as to identify each individual fiber by location in cable system and fiber number or color.
(2) OTDR test results shall be consistent in format and presentation, including:
(a) Scale
1) Scale or window of test result view shall show only enough trace to view fiber under test plus launch cords at both ends.
2) View shall not show backscatter beyond end of fiber.
(b) Pulse width
(c) Units (English or Metric)
(d) Cursor placement
(e) Labeling

END OF SECTION 27 13 00

SECTION 27 15 00 - COMMUNICATIONS HORIZONTAL CABLING

PART 1 GENERAL

1.01 SCOPE

A. This section details product and execution requirements for Horizontal (Station) Cabling subsystem for Communications Systems.

1.02 DESCRIPTION

A. Horizontal cabling subsystem is portion of communication link that connects horizontal or intermediate cross-connect (typically at Telecom Room) and Telecommunications Outlet.

B. Horizontal Cable types include:

(1) 4-pair Copper Unshielded Twisted Pair (UTP)

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0526 - Grounding and Bonding for Communications Systems
(3) Section 27 0528.29 - Hangers and Supports for Communications Systems
(4) Section 27 0528.33 - Raceway and Boxes for Communications Systems
(5) Section 27 0528.36 - Cable Tray for Communications Systems
(6) Section 27 0528.39 - Surface Raceways for Communications Systems
(7) Section 27 0553 - Communications Systems Identification
(8) Section 27 1000 - Structured Cabling
(9) Section 27 1100 - Communications Equipment Room Fittings
(10) Section 27 1300 - Communications Backbone Cabling

B. Related sections in other Divisions of Work:

(1) Refer to individual technical sections identified above (if applicable).

1.04 REFERENCES AND STANDARDS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which identifies pertinent References and Standards.

1.05 DEFINITIONS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Definitions used in this and related Sections.

B. In this section, "Telecommunications Outlet" is considered to consist of Frame/Faceplate into which Modular Jacks or other couplings snap, Modular Jacks, blanks fitted to unused jack positions, and labeling/identification components.

1.06 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide information on Abbreviations and Acronyms used in this and related Sections.

1.07 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements which identifies Work by Owner affecting sub-system(s) covered by this section.

1.08 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which provide general guidelines for product or installation information to be submitted by Contractor.

B. In addition, submit:

(1) Samples of each Telecommunications Outlet Faceplate type to confirm color and material.
(2) One 3 ft section of each cable type from cable reels sent to site for Engineer's final approval.
(a) Section shall have manufacturer's cable markings visible.
(3) Nominal Velocity of Propagation (NVP) for 4-pair Horizontal Copper Cable.

1.09 QUALITY ASSURANCE

A. Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling which identify general quality assurance requirements for the Project.

1.10 GUARANTEE

A. Refer to Division 01, General Conditions, and General Requirements - Guarantee Documents for general warranty requirements.

B. Refer to Section 27 1000 - Structured Cabling for particular Warranty requirements for Structured Cabling. Those requirements apply to all cable and components covered in this section.

PART 2 PRODUCTS

2.01 GENERAL

A. Cables and Termination hardware shall be technically compliant with and installed in accordance with referenced TIA documents.

B. Cables shall be Underwriters Laboratory (UL) listed, comply with Article 800 (Communications Circuits) of National Electrical Code and shall meet specifications of NEMA (low loss), UL 444, and ICEA (where applicable).

C. Horizontal (Station) Cable and Termination Components (Jack, Patch Panel) are specified to function as System.

(1) Where required for warranty purposes, manufacturers of cabling and termination components used (if more than one) shall recognize each other in their Certification Programs.

D. 4-Pair Horizontal Copper Cables and Modular Jacks are application independent (e.g. no distinction between “voice” and “data”).

2.02 4-PAIR HORIZONTAL COPPER CABLE

A. Manufacturers: Refer to System Requirements list in 27 1000

B. Cables shall be suitable for installation in environment defined

C. Cabling shall be packaged to minimize tangling and kinking of cable during installation.

D. Configuration:

(1) Number of Pairs: 4 twisted pair

(a) Pair twists of any pair shall not be same as any other pair.

(b) Pair twist lengths shall be selected by manufacturer to ensure compliance with crosstalk requirements of TIA 568.

(2) Conductors: insulated solid annealed copper pairs

(a) Category 6A: 23 AWG

(b) Pairs of 4-pair cables shall be identified by banded color code in which conductor insulation is marked with dominant color and banded with contrasting color.

1) By pair number, pair colors or dominant band are:

1. Pair 1: Tip - White/Blue; Ring - Blue (or Blue/White)
2. Pair 2: Tip - White/Orange; Ring - Orange (or Orange/White)
3. Pair 3: Tip - White/Green; Ring - Green (or Green/White)
4. Pair 4: Tip - White/Brown; Ring - Brown (or Brown/White)

(3) Shield: None

(a) Drain Wire: None

(4) Cable Rating: NEC Article 800 Type CMP, UL listed

(5) Maximum outside diameter:

(a) Category 5e: 0.22 inches (5.59 mm)

(b) Category 6: 0.25 inches (6.35 mm)

(c) Category 6A: 0.28 inches (7.11 mm)

(6) Cabling rated Category 6A shall include a non-continuous shield component under the outer cable jacket.

E. Horizontal Data Cable:

(1) Shall meet or exceed TIA Category 6A performance requirements.

(2) Shall notincorporate an overall shield.

(3) Jacket Color: Lime Green

F. Horizontal Cable for Building Automation:

(1) Shall meet or exceed performance requirements of TIA Category 5.

(2) Shall not incorporate an overall shield.

(3) Jacket Color: Blue

2.03 TELECOMMUNICATIONS OUTLET

A. Manufacturers: Refer to System Requirements list in 27 1000

B. Connectors and modular jacks)) shall snap onto faceplate.

(1) In surface-mount designs (if applicable) Jacks and connectors may mount to frame onto which coverplate is mounted.

C. Work Area Faceplate

(1) Wall-mounted faceplates intended to be used in general work areas shall:

(a) Be configured to mount on standard, single gang opening when wall mounted.

(b) Accommodate minimum of4modular jacks and connectors.

(c) Be constructed of high impact plastic (except where otherwise noted).

(d) Incorporate recessed designation strips at top and bottom of frame for identifying labels.

1) Triple row faceplates with no provisions for labeling of middle outlet row are not acceptable.

2) Designation strips shall be fitted with clear plastic covers.

3) Designation strips and covers shall be positioned over faceplate mounting screws.

(2) Faceplate Color: to match electrical device faceplates.

D. Wall-mount Telephone Faceplate

(1) Faceplates intended to be used in locations where wall mounted telephone set is required shall:

(a) Be stainless steel construction.

(b) Accommodate 1 modular jack meeting performance requirements for "Voice" jack as defined above.

1) Modular jack shall be positioned to mate with wall-mounted telephone.

(c) Mount on standard single gang opening.

(d) Include mating lugs for mounting wall-mounted telephone.

E. Faceplate - Wireless Access Point Location

(1) Faceplates supporting Wireless Access Point (AP) shall:

(a) Accept 2 modular jacks or connectors.

(b) Be Surface-mounted

(c) Be made of High Impact thermoplastic.

(d) Incorporate recessed designation strips at top and bottom of frame for identifying labels.

(2) Faceplate Color: to match electrical device faceplates.

F. Faceplate - Surface Raceway

(1) Faceplates intended to be used on surface raceway shall:

(a) Accept 4 modular jacks or connectors.

(b) Snap into raceway opening and be retained by integral latching tabs.

1) Match standard opening of raceway type(s) to be installed.

(c) Have an optional extender bracket available to increase mounting depth.

(d) Be made of High Impact thermoplastic.

(e) Incorporate recessed designation strips for identifying labels

1) Raceway faceplate color shall be TBD per Owner.

G. Faceplate - Modular Furniture

(1) Faceplates intended to be used on modular furniture shall:

(a) Accept 4 modular jacks or connectors.

(b) Snap into modular furniture opening and be retained by integral latching tabs.

(c) Match standard opening of furniture type(s) to be installed. Furniture types include:

(d) TBD per OwnerHave an optional extender bracket available to increase mounting depth as required to maintain cable bend radius within manufacturers' recommendations.

(e) Be made of High Impact thermoplastic.

(f) Incorporate recessed designation strips for identifying labels.

1) Modular furniture faceplate color shall TBD per Owner.

2.04 MODULAR JACK

A. Manufacturers: Refer to "Telecommunications Outlet" above.

B. Modular Jacks shall be:

(1) 8-position, 8-conductor (8P8C)

(2) Non-keyed

C. Jacks shall have an attached color-coded wiring instruction label as an aid to installer.

D. Interface between jack and station cable shall be insulation displacement type contact.

E. Termination components shall maintain cable's pair twists as closely as possible to point of mechanical termination.

F. Jack contacts shall have minimum of 50 micro-inches of gold plating.

G. Data Jack shall:

(1) Meet or exceed performance requirements of Category 6A

(2) Be color Lime Green

(a) Alternately, color-coded Bezel or Icon may be used to identify Jack type.

PART 3 EXECUTION

3.01 GENERAL

A. Refer to project Drawings for outlet and Consolidation Point locations.

B. Provide Modular Jacks, Coaxial Connectors (if applicable) and Fiber Optic couplings (if applicable) in faceplates as shown on Project Documents.

(1) Provide 1faceplate per Telecommunications Outlet symbol shown on Project Documents.

(2) Provide 1modular furniture mounted faceplate per modular furniture symbol shown on Project Documents.

C. Maximum 4-pair Category-rated horizontal cable length shall not exceed 295 feet (8991.6 cm) measured from horizontal cross-connect (typically at TR) to Telecommunications Outlet.

(1) Includes slack required for installation and termination.

(2) Contractor is responsible for installing station cable to avoid unnecessarily long runs.

(3) Any area that cannot be reached within above constraints shall be identified and reported to Engineer prior to installation.

D. Follow manufacturers recommended termination practices.

3.02 CABLE INSTALLATION AND TERMINATION

A. General

(1) Refer to Section 27 0000 - General Communications Requirements and Section 27 1000 - Structured Cabling for general cable installation requirements.

(2) Provide "Service Loop" for every Horizontal Cable in ceiling above outlet.

(a) Loop length shall be 3.3 feet (100.58 cm)

(b) Total length of 4-pair Category-rated horizontal cable including loop shall not exceed 295 feet (8991.6 cm).

(c) Place loop in ceiling at last support (e.g. J-Hook) before cables enter fishable wall, conduit, surface raceway or box.

(d) Coil loop in figure 8 configuration.

(e) Loop radius (minimum) shall be 4X minimum bend radius for cable.

(3) During installation, minimum bend radius shall be eight times outside diameter of UTP cables and 20 times outside diameter of fiber cables.

(4) Limit size of cable bundles along cable pathways and in communications equipment rooms to maximum of 12-24 cables.

(5) .

3.03 TELECOMMUNICATIONS OUTLET

A. Faceplates shall be configured to provide connectivity as required by location. Refer to drawings.

B. Mount modular jacks and connectors into faceplates and secure faceplates to outlet box, raceway or modular furniture.

(1) Use faceplate extender if required to provide adequate clearance between jack and furniture or raceway panel to maintain minimum cable bend radius.

(2) Provide blank(s) in unused jack/connector positions. Match color of blank to faceplate color.

C. Position Telecommunications Outlet for wall-mounted telephone in area clear of other utilities and wall mounted hardware.

(1) Coordinate with other trades to maintain 8” clear space (minimum) on all sides from faceplate centerline.

3.04 FIELD TESTING

A. Refer to Sections 27 0000 - General Communications Requirements and 27 1000 – Structured Cabling for guidelines regarding testing requirements common to all Division 27 Structured Cabling sections.

(1) In addition, refer to sub-sections below for cable type under test.

B. 4-Pair Horizontal Copper Cable

(1) Test from:

(a) Horizontal Cross-connect (HC) to Jack at Telecommunications Outlet (TO).

(2) Testing shall be per TIA-568 Permanent Link test configurations.

(3) Maximum length of station cable shall not exceed 300 feet (9144 cm)

(4) Cables shall be free of shorts within pairs, and be verified for Continuity, Pair Validity and Polarity, and Wire Map (Conductor Position on Modular Jack).

(a) Identify and correct defective, split or mis-positioned pairs.

(5) In addition to above, Performance Testing shall be performed on all cables. Testing of Transmission Performance shall include the following:

(a) Length

(b) Insertion Loss / Attenuation

(c) Pair-to-pair NEXT

(d) PSNEXT

(e) Pair-to-pair ELFEXT (Equal Level Far End Cross-talk)

(f) PSELFEXT

(g) Return Loss

(h) Propagation Delay

(i) Delay Skew

(j) Alien Crosstalk (AXTalk) – 10G Cable Systems only

1) AXTalk measurement method shall be as required by the manufacturer(s) of cabling/connecting components installed to certify the system for warranty.

(6) Test cables to maximum frequency defined by standards covering specified performance category.

(7) Perform Transmission Performance Testing using test instrument designed for testing to specified frequencies.

(a) Test records shall verify "PASS" on each cable and display specified parameters - comparing test values with standards based "templates" integral to unit.

(8) .]

3.05 DOCUMENTATION

A. Refer to Sections 27 0000 - General Communications Requirements and 27 1000 – Structured Cabling for documentation guidelines.

B. Information added by Contractor to Record Drawings relating to Horizontal Cabling shall include cable routes, outlet locations and numbering and other detail necessary to document cable installation.

END OF SECTION 27 15 00

SECTION 27 41 00 – AUDIOVISUAL SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

(1) General provisions – Functional description of audiovisual systems.

(2) Product descriptions and requirements.

(3) Execution, standards, and commissioning requirements.

B. Related Requirements

(1) Section 26 05 00: Common Work Results for Electrical Systems

(2) Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications, apply to this Section.

1.02 REFERENCES

A. Definitions

(1) When the following abbreviations and definitions are used in relation to the work for this Section they shall have the following meanings:

(a) AEI NW: Affiliated Engineers NW, Inc.

(b) AHJ: Authority Having Jurisdiction

(c) AV Consultant, Consultant, Engineer: AEI

(d) AVSC: Audiovisual Systems Contractor

(e) Boxes: Outlet, Junction or Pull Boxes

(f) Code: All applicable codes currently enforced at project location

(g) Compression: Compressed using leverage powered (hydraulic or equivalent) crimping tool.

(h) Connection: All materials and labor required for equipment to be fully operational

(i) Exterior Location: Outside of or penetrating the outer surfaces of the building's weather protective membrane.

(j) Fully Operational: Tested, approved, and operating to the satisfaction of the AHJ, contract documents, and the Consultant.

(k) Furnish: Deliver to the job site

(l) Install: To enter permanently into the project and make fully operational.

(m) Mfr.: Manufacturer

(n) NEC: National Electrical Code, National Fire Protection Association, Publication #70

(o) Noted: Shown or specified in the contract documents

(p) Provide: Furnish and install

(q) Required: As required by code, AHJ, contract documents, or manufacturer for the installation to be fully operational

(r) Shown: As indicated on the drawings or details

B. Reference Standards

(1) The referenced codes establish a minimum level of requirements. Where provision of the various codes conflict with each other, the more stringent provision shall govern. If any conflict occurs between referenced codes and this specification, the codes are to govern. Compliance with code requirements shall not be construed as relieving the AVSC from complying with any requirements of the drawings or specifications which may exceed the requirements of the governing codes and rules and not contrary to same.

(2) Perform all work and provide materials and equipment in accordance with the latest referenced codes and standards of the following organizations:

(a) ANSI - American National Standards Institute

(b) ASTM - American Society for Testing and Materials

(c) BICSI - Building Industry Consulting Services International

(d) EIA - Electronics Industries Association

(e) FCC - Federal Communications Commission

(f) IBC – International Building Code

(g) ICEA - Insulated Cable Engineers Association

(h) IEEE - Institute of Electrical and Electronics Engineers

(i) ISO - International Organization for Standardization

(j) NEMA - National Electrical Manufacturer's Association

(k) NFPA - National Fire Protection Association
(l) NFPA 70 – National Electrical Code
(m) NEC - National Electrical Code
(n) TIA - Telecommunications Industry Association

(3) Install the AV systems based on the following:
(a) ANSI/AVIXA Standard 2M-2010, AV Systems Design and Coordination
(b) ANSI/AVIXA Standard 3M-2011, Projected Image Contrast Ratio
(c) ANSI/AVIXA Standard 10.2013, AV Systems Performance Verification
(d) ANSI/AVIXA Standard A102.01.2017, Audio Coverage Uniformity in Listener Areas
(e) AVIXA Standard F501.01.2015, Cable Labeling for Audiovisual Systems
(f) ANSI/AVIXA Standard V202.01.2016, Display Image Size for 2D Content in Audiovisual Systems
(g) "Dashboard for Controls Design Guide", April 2005, AVIXA International

1.03 SYSTEM DESCRIPTION

A. The systems integrator will provide complete and working systems, based on the operational requirements set forth in the specification.

B. Work Includes:
(1) Provision of complete sound reinforcement, video presentation, audio and video teleconferencing, and control systems.
(2) Connection to and integration with other equipment provided by others including room lighting and shades.
(3) Generate all shop drawings and information for the complete installation and wiring of the system.
(4) Provide (or sub-contract for) the on-site installation and wiring and provide on-going supervision and coordination during the implementation phase.
(5) Initial adjustment of the systems as herein prescribed and provision of all test equipment for the system checkout and acceptance tests.
(6) Training in the operation and maintenance of the systems for personnel designated by the Owner.

C. Contract Drawings:
(1) The work of this Section and related sections is shown on the TAV-xx series of drawings and equipment schedules.
(2) The drawings do not show all requirements of the specifications. The drawings and specifications are complementary and what is called for (or shown) in either is required to be provided as if called for in both. If in conflict, the specifications shall take precedence. Notify the Consultant immediately of any conflicts.
(3) Equipment racks, connection panels, and all other associated devices are shown diagrammatically only and indicate the general character and approximate location. Furnish, install, and place in satisfactory condition all AV equipment, cabling and all other materials required for the systems shown or noted in the contract documents, so that it is a complete system which is fully operational and fully tested.

D. Operation:
(1) General
(a) Provide for amplification of program audio sources and local sound reinforcement of presentations and classes.
(b) Provide display of video sources such as computers and video teleconferencing.
(c) Allow easy setup and operation of the audiovisual and sound reinforcement systems by a wide variety of users.
(d) System override from the fire alarm control panel in case of a fire or emergency. Activating the fire alarm system will automatically mute any audio sources in the system.
(2) Room Descriptions
(a) Engagement Hub
(b) McMillon Center
(c) Active Learning Classroom
(d) 50, 72, 90, and 135 Seat Classroom
(e) Team Room
(f) Open Collab
(g) Digital Signage
(3) Audiovisual Control System
(a) The audiovisual systems will be configured from remote control panels located at the control room and a location near the stage. The control system will allow an operator to control the following:
1. System ON/OFF
2. Select system pre-sets such as Normal operation (which will require and operator to take over all controls) and Auto operation (which will engage the automix function of the DSP.

3. Volume control of individual sources and master volume
4. Video source selection and control
5. Video display/projector control

1.04 ADMINISTRATIVE REQUIREMENTS

A. Coordination

(1) Conform to Division 1 for coordination of work with other Sections.

(2) The AVSC shall continually interface and coordinate the work with the work of other Contractors and/or other trades and shall examine all drawings and specifications of other trades including the mechanical, architectural, and structural for construction details and coordination.

(3) Obtain submittals, shop drawings, and other information for all equipment to be furnished by the Owner or under other divisions of the specifications.

(4) Prior to roughing-in, verify the exact location of all devices with Architect.

(5) Provide coordination to the Owner in relation to special installation details associated with all AV hardware. This will include but is not limited to mounting details of loudspeakers, I/O panels, equipment, projectors, equipment racks, and any other project related coordination between the AV integration and building construction.

(6) Special attention is called to the following items for coordination.

(a) Conduit, cable tray, boxes, and other raceway components.

(b) Location of casework, cabinets, counters, doors, and equipment racks so that all equipment is clear of and in proper relation to these items.

(c) Mounting, recessing, and concealing cameras, video projectors, video displays, loudspeakers and loudspeaker clusters, and other associated equipment in specially constructed casework and niches.

(7) The AVSC will not be paid for work associated with the relocation of equipment, conduits, cabling, or any other materials requiring removal or reinstallation resulting from a lack of coordination prior to installation.

B. Pre-Installation Meetings

(1) Arrange in accordance with Division 1.

(2) Attendance: AVSC, installer, Owner, Architect, AV Consultant, and those requested to attend.

(3) Meeting time: Minimum four (4) weeks prior to beginning work of this Section and work of related Sections affecting work of this Section.

(4) Location: Project site.

C. Sequencing and Scheduling

(1) Conform to Division 1 for sequencing and scheduling to meet Progress Schedule Critical Path and long lead items.

(2) The AVSC shall schedule its work to prevent conflicts with other activities in the building and shall execute without claim for extra payment moderate moves or changes as are necessary to accommodate other equipment or preserve symmetry and pleasing appearance.

1.05 SUBMITTALS

A. A complete set of submittal documents will include shop drawings, product data, and network device inventory, as described below, and submitted simultaneously for review and comment.

B. Submit under provisions of Division 1.

C. The AVSC agrees that submittals and shop drawings processed by the AV Consultant are not change orders. The purpose of submittals and shop drawings by the AVSC is to demonstrate to the AV Consultant that the AVSC understands the design concept, that he demonstrates his understanding by indicating which equipment and material he intends to furnish and install, and by detailing the fabrication and installation methods he intends to use.

D. The AVSC alone accepts all responsibility for assuring that all materials furnished under this Division of the specifications meet in full all requirements of the contract documents. The AV Consultant's review is for general conformance with the design concept and contract documents. Markings or comments shall not be construed as relieving the AVSC from compliance with the project plans and specifications, nor departures there from. The AVSC remains responsible for details and accuracy for confirming and correlating all quantities and dimensions, for selecting fabrication processes and for techniques of assembly.

E. Submittals and shop drawings that are incomplete or that contain insufficient information will be returned without review, for re-submittal.

F. Shop Drawings:

(1) Floor plans, showing the layout of devices, cabling, and wiring within raceway systems. Include the number of cables, type of cables, and size of raceway for each run.

(2) Wiring diagrams showing point to point connections between components. Include wire numbers and color-coding for each connection point, with numbers corresponding to those of the wire-run list.

(3) Rack panel layout for each equipment cabinet.

(4) Scaled and dimensioned drawings of all custom assemblies and fabricated items, including but not limited to the following. Include details of all components, materials, finishes, and colors.

(a) Control panel mounting
(b) Projector and display mounting frames and hardware
(c) Input and output panels, including mounting of panels in casework.
(d) Speaker clusters

(5) Preliminary cable numbering lists.

G. Product data:
(1) Equipment list based on specified equipment list and other additional equipment or materials needed for complete systems. Include:
(a) Manufacturer
(b) Model number
(c) Descriptions
(d) Quantity
(e) Specification reference
(2) Product data by system or room, with brochures and/or catalog cuts for all items of equipment and hardware. Provide as PDF documents downloadable from the project website, on USB memory stick, or on CD/DVD ROM.
(3) Provide a single product data sheet for any devices used in multiple rooms.
(4) For each item, indicate listing by UL or other approved testing agency. For audio power amplifiers, indicated the NEC Class of output wiring.
(5) Printouts from web pages are not acceptable.
(6) Itemize variations from the specification in a separate enclosure. Refer to section, paragraph, and item of the specifications and clearly state the variation.

H. Networked Device Inventory
(1) Inventory of all network-attached devices in the project. Include:
(a) Device, manufacturer, and model number
(b) Physical location
(c) Default gateway IP address
(d) Addressing scheme
(e) IP address
(f) Subnet mask
(g) Host name
(h) DNS server(s)
(i) Ports required
(j) Transport protocol
(k) Multicast/Unicast
(2) Provide Networked Device Inventory in Microsoft Excel 2010 format.

1.06 CLOSEOUT SUBMITTALS

A. Conform to provisions of Division 1.

B. Maintenance and Operating Data and Instructions to Owner’s Personnel: Conform to Division 1. AVSC shall prepare Operations and Maintenance Manuals for each system or facility provided under these specifications. The information included must be the exact equipment installed, not the complete "line" of the manufacturer. Where sheets show the equipment installed and other equipment, the installed equipment shall be neatly and clearly identified on such sheets.

C. The manuals shall contain all the information needed to operate and maintain all systems and equipment provided in the project. It shall be presented and arranged in a logical manner for efficient use by the Owner's operating personnel. The information provided shall include but not be limited to the following:
(1) Equipment manufacturers, makes, model numbers, serial numbers, sizes, etc. Include addresses and telephone numbers for each manufacturer. List loose items separately.
(2) A copy of the delivery receipt for Loose Items.
(3) Description of system configuration and operation including component identification and equipment interconnect diagram.
(4) Manufacturers’ recommended operation instructions for each item of equipment.
(5) Overall system operating instructions, custom written for this specific project.
(6) Warranty Information, including but not limited to:
(a) An overall Statement of Warranty from the AVSC for the complete systems.
(b) A copy of the Manufacturers' warranties for each item of equipment so covered.
(c) Instructions for obtaining warranty service from the AVSC, and from each Manufacturer.

(d) Service manuals for each item of equipment as published by the manufacturers, and other manufacturers' servicing data.

(e) Complete parts list including reordering information, recommended spares and anticipated useful life (if appropriate). Parts lists shall give full ordering information assigned by the original parts manufacturer. Relabeled and/or renumbered parts information as reassigned by equipment supplier not acceptable.

(f) "As-built" Shop Drawings, including point to point wiring diagrams.

(g) "As-built" Cable Numbering Lists.

(7) Service manuals for each item of equipment as published by the manufacturers, and other manufacturers' servicing data.

(8) Complete parts list including reordering information, recommended spares and anticipated useful life (if appropriated). Parts list shall give full ordering information assigned by the original parts manufacturer. Relabeled and/or renumbered parts information as reassigned by equipment supplier not acceptable.

(9) "As-built" Shop Drawings, including point to point wiring diagrams.

(10) "As-built" Cable Numbering Lists.

(11) Copies of all test results. Include the names of the individuals performing and witnessing the tests, and the manufacturer and model of each item of test equipment which was used. Include block diagrams of the test setup for tests which involve more than one item of test equipment.

(12) Wiring diagrams for each system shall be complete drawings for the specific system installed under the contract. "Typical" line diagrams will not be acceptable unless marked to indicate the exact field installation.

(13) Networked Device Inventory

(a) Inventory of all network-attached devices in the project, including:

1. Device Properties
2. Manufacturer
3. Model number
4. Description
5. Software version(s)
6. Firmware version(s)
7. MAC address

(b) Inter-Device Communication

1. Transport protocol
2. Multicast/unicast
3. Codec
4. Incoming and outgoing peak bps
5. Average incoming and outgoing bps

(c) Routing and Addressing

1. Physical location
2. Default gateway IP address
3. Addressing scheme
4. IP address
5. Subnet mask
6. Host name
7. DNS server(s)
8. Ports required

(14) Provide Networked Device Inventory in Microsoft Excel format.

D. The information contained in the manuals shall be grouped in an orderly arrangement by specification index. The manuals shall have a typewritten index and divider sheets between categories with identifying tabs. The completed manuals shall be bound in heavy-duty slant-ring binders (3 "D" rings), or with hardboard covers and screw-post bindings. O & M manuals shall not exceed 5" thickness. Provide two or more volumes if required. The covers shall be labeled with the name of the job, Owner, Architect, Engineer, Contractor and year of completion. The spine shall be labeled with the name of the job, Owner and year of completion. Labeling may be laser-printed inserts in clear plastic overlays or imprinting by silk-screening or hot stamping. Include the following information:

(1) Project Title

(2) Project Number

(3) Owner/Operator (Owner's Name)

(4) Architect (Architect's Name)

(5) Engineer (AEI)

(6) Contractor

(7) Completion Date

E. Submit a preliminary copy 15 days prior to substantial completion of the project for checking and review.

F. Project Record Documents: Conform to provisions of Division 1.

(1) Continually record the actual "as-built" installation on a set of prints kept readily available at the project during construction. These prints shall be used for this purpose alone. At the completion of the work, Contractor shall furnish the Architect a set of reproducible record drawings (Xerox type) and the set of mark-ups. Final payment to the Contractor will not be authorized until these prints have been submitted to and accepted by the Architect.

(2) Record drawings shall include, at a minimum, updates of all sheets of the Shop Drawings.

1.07 QUALITY ASSURANCE

A. Qualifications

(1) Manufacturer's Qualifications: Firm (material producer) with not less than five years of production experience whose published literature clearly indicates general compliance of products with requirements of this section.

(2) Equipment Suppliers: Audio, video, and control components shall be supplied and installed by an authorized factory distributor of specified products. Submit statement of distributorship/dealership prior to acceptance of bid.

(3) AVSC Qualifications:

(a) Work in this section shall be performed by an AVSC with the following qualifications:

1. Complies with the requirements of Division 1.
2. Is licensed to perform work of this type in the project jurisdiction
3. Has at least five (5) years of verifiable direct experience with the devices, equipment, and systems of the type and scope specified herein.
4. Fully staffed and equipped maintenance and repair facility.

(b) The AVSC or their employees shall hold the following certifications:

1. AVIXA CTS-D (Certified Technology Specialist-Design)
2. AVIXA CTS-I (Certified Technology Specialist-Installation)
3. Video switching and routing system
4. AV control system programming
5. Audio DSP Programming
6. Synergetic Audio Concepts Sound Reinforcement for Technicians

(c) Provide copies of all certifications with bid

(d) The AVSC shall be a factory-authorized dealer for the major components specified including items such as microphones, audio processing equipment, power amplifiers, loudspeakers, video interfaces, video switchers and processors, video displays, and integrated audiovisual control system.

(e) The AVSC shall appoint a designated supervisor with the appropriate certifications. The supervisor shall be present and in responsible charge of all work in the fabrication shop and on the project site during all phases of the installation and testing of the system(s). To ensure continuity, this supervisor shall be the same individual throughout the execution of the work unless illness, loss of personnel, or other reasonable circumstances intervene.

(f) The AVSC shall use skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work in this Section. These personnel shall have at least three years direct experience in similar work, evidence of which shall be verified in writing with appropriate references at the time of bid.

(g) Other contractors bidding this work who cannot meet the above qualifications must employ the services of a qualified AVSC who meets the above qualifications. This AVSC shall supervise the installation and perform all wiring connections.

B. System Performance Requirements

(1) Audio System

(a) Systems shall provide clear, natural sound uniformly distributed throughout the listening areas. The entire electro-acoustic system shall be carefully balanced and equalized to provide a high order of intelligibility and gain without feed back or reverberant coloration. Adequate power capability shall be provided to insure the necessary dynamic range and prevent distortion at peak levels.

(b) Acoustic Frequency Response: 50 Hz to 15 kHz, 3dB/octave roll-off above 2000 Hz ±2dB. Measured at continuous one-third octave bands at seated ear height.

(c) Sound System Coverage: as measured in accordance with ANSI/AVIXA A102.01:2017, Audio Coverage Uniformity in Listener Areas.

(d) Intelligibility: Greater than 0.75 STI at any seat in the audience area.

(e) Noise: System noise shall not exceed an equivalent input noise of -120dBu based on a 20 kHz noise bandwidth. Predominant noise component in the system output under any operating condition will be that of the input stages. Adjustment of any system controls shall produce no audible clicks, pops, thumps, or other spurious noises.

(f) Acoustic Signal-to-Noise Ratio (including crosstalk and hum at all input/output levels): 60dB.

(g) Dynamic Range:

1. General: All systems shall include a 10dB peaking factor to any location at seated ear height and at less than 5% total acoustic harmonic distortion. When the system is driven to maximum output, clipping shall occur first in the power amplifiers.
2. Conference Rooms: The system shall deliver a minimum sound pressure level of 75 dB
3. Multifunction Rooms: The system shall deliver a minimum sound pressure level of 85 dB

(h) Total Harmonic Distortion: 0.05% maximum from 20Hz to 20kHz.

(i) Polarity: A positive pressure at any system microphone shall produce a positive pressure from the speakers.

(2) Analog Video System

(a) Systems shall provide, clear, bright, and natural images viewable throughout the respective designed viewing area. Each video display system shall be balanced for color and brightness and free from extraneous interference or artifacts.

(b) Frequency Response:

1. Composite: Flat from 30Hz to 6MHz, +/-2% (ref.=1MHz)
2. YC: Flat from 30Hz to 10MHz, +/-2% (ref.=1MHz)
3. Component: Flat from 30Hz to 100MHz, +/-2% (ref.=1MHz)
4. RGBHV: Flat from 30Hz to 300MHz, +/-2% (ref.=1MHz)

(c) Signal-to-Noise Ratio (including crosstalk and hum at all input/output levels): 60dB, p-p signal to RMS noise

(d) Differential Gain: <2%

(e) Differential Phase: <2 degrees at 3.58MHz

(f) Tilt: <2%

(g) System Gain: Unity, +/-1%

(h) System Levels: <2% between sources

(i) Timing: <20nS, Y/C, Y/Cr/Cb, RGB

(j) Luminance: In conformance with NTSC RS-170A standards

(k) Chroma level: In conformance with NTSC RS-170A standards

(l) Observable noise or hum: None

(3) Digital Video System

(a) Audio & Video Switching

1. Provide 12.8 Gbps of backplane throughput to support 1080p 36-bit (Deep) Color video resolutions without compression.
2. Support at least 6.75Gbps of data transfer on each input and output to support 1080p 36-bit (Deep) Color video resolutions without compression.
3. Support 8 channel audio.
4. Support audio breakaway from video.
5. Insert less than 5us of latency from AV input to AV output.
6. Support the HDMI specification of less than 1 in $1x10^{-9}$ bit errors at 1080p 36-bit (Deep) Color.
7. Down-mix multi-channel audio into 2-channel audio to route audio content to both multi-channel and 2-channel sinks.
8. Dither between standard and deep color video signals on each input and output.
9. Support the following AV signal inputs:
    a. HDMI 1.3a (High Definition MultiMedia Interface)
    b. DVI 1.1 (Digital Visual Interface)
    c. Display Port Multimode 1.1
    d. Analog RGB
    e. YPbPr
    f. S-Video
    g. CVBS
    h. SPDIF
10. Analog Stereo Audio

11. Transcode and scale the AV signals to a single signal type for distribution.
12. Support the following digital video formats and data rates (Gbps)
    a. 1080p Deep Color: 6.75
    b. 1600x1200: 4.86
    c. 1920x1200: 4.62
    d. 1080p: 4.44
    e. 1360x768: 2.54
    f. 720p/1080i: 2.22
    g. 1024x768: 1.91
13. Audio & Video Signal Distribution
    a. Route AV signals from any input to any output.
14. Use shielded twisted pair structured cabling to carry the AV signals.
15. Use shielded twisted pair structured cabling specified to 1.2GHz of bandwidth or greater.
16. Transmit the following control signals for AV sources and sinks over the same cable plant:
    a. RS-232
    b. Infrared
    c. Ethernet
    d. USB Human Interface Device-class devices
    e. Contact closure
17. EDID Management
    a. Allow configuration of the EDID presented to sources on each AV input.
    b. Configure each input independently.
    c. Present an EDID to each input that includes only the video timings and audio formats common all sinks connected to the outputs.
    d. Allow the user to enter each input's EDID video timings individually.
    e. Allow the user to enable and disable support for the following items in each input's EDID.
    f. Deep color
    g. 3D support
18. HDCP Management
    a. Support HDCP 1.1 or greater.
    b. Detect the number of KSVs supported by each source.
    c. Cache the KSVs from each connected sink.
19. Signal Detection
    a. Report the following incoming signal information to an AV control system:
    b. Signal detect
    c. Horizontal and vertical resolution
    d. Signal refresh rate
    e. Presence of HDCP
20. Report the following information to an AV control system:
    a. HDCP authentication status for each source and sink
    b. EDID Preferred video timing for each sink

C. Control System

(1) System shall utilize a remote-controlled switching and processing system for control of audiovisual system components.

(2) The system shall provide controls for selecting system on/off, audio and video input selection, audio volume, signal routing and processing, codec connection and volume, projection screen up/down, projector lift control, camera control, and lighting control.

(3) User Interfaces:

(a) The control panel interface layout will conform to the AVIXA International "Dashboard for Controls Design Guide", published April 2005.

(b) Control system user interface conforms to control functions described in Paragraph 1.4 D.5 of this specification, and with the Owner's standard classroom AV control panel interfaces to the greatest extent possible and all pages and buttons operate as intended.

(4) Connections to other systems:

(a) All IP-controlled equipment properly configured with IP addresses, host names, time servers, gatekeeper addresses, network configurations, and subnets as applicable. All system connections are operational and devices communicating correctly.

(b) All control system programming installed and communicating properly with the equipment as intended.

(c) Confirm control system interfaces exist and are functional for devices outside the scope of this section such as activation of lighting control presets, drapes, shades, screens, security, life safety, and HVAC systems.

(5) Power Cycling: Confirm the control system will restart and resume full operation following cycling of AC power to the control system.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery and acceptance requirements

B. Storage and handling requirements

C. Packaging waste management

1.09 SITE CONDITIONS

A. Ambient Conditions: Verify field measurements before beginning fabrication or installation.

1.10 WARRANTY

A. Refer to warranty provisions specified in Division 1.

B. Manufacturer: Include all provisions of the standard manufacturer's backed warranty for each piece of equipment and remain in effect for a period as stated by the manufacturer. AVSC shall be an authorized service representative for all equipment supplied as part of this project unless appropriate approval from owner has been granted prior to equipment procurement or installation. The warranty shall also cover the accuracy of technical documentation, and signal quality as specified and documented during the testing process of this project.

C. AVSC: Guarantee all work installed under this specification. Make good, repair or replace, at the Contractor's own expense, any defective work, materials or parts which may show themselves within one year after final acceptance, if in the opinion of the Architect or Engineer said defect is due to imperfection in material, design, or workmanship.

D. During the warranty period, respond to any warranty calls within four hours of having received and logged any requests for service.

E. Special Warranty: Provide the cost of an additional one-year warranty beyond what is described in this specification.

PART 2 - PRODUCTS

2.01 GENERAL

A. Quality of Materials and Equipment

(1) All materials and equipment supplied by the Contractor shall be new and shall meet or exceed the latest published specification of the manufacturer in all respects.

(2) At the time of submittal, the Contractor shall supply the latest model for each piece of equipment.

(3) All equipment shall be UL listed, or equivalent.

B. Manufacturer:

(1) All accessories, including rack mounting hardware, power supplies, etc., shall be obtained from the original equipment manufacturer. Unless otherwise noted or specified, third party accessories shall not be used.

(2) Do not provide an assortment. For each category, provide products of the same manufacturer; for each item, provide the same model for all pieces.

C. Substitutions:

(1) Substitutions of equal equipment beyond the alternatives listed will be permitted only when approved prior to bidding, in accordance with the procedures given in Section 01 25 13 – Product Substitution Procedures.

(2) Submit requests for substitutions for products prior to bid. All requests must be received by the Owner in writing no later than **[10]** days prior to bid date.

(3) Itemize any variation from the specifications. For each item, refer to the pertaining Section and Paragraph, and indicate the reason for, and/or the advantage of, the substitution.

(4) Substitutions will not be accepted if they impact overall system design and functionality.

(5) Requests for substitution which do not comply with these requirements will not be considered.

D. Product Options:

(1) Where these specifications include model or series numbers, the provided equipment (including substitutions) shall meet or exceed the manufacturer's published specifications for the specified model or series the same as if the manufacturer's published specifications were enumerated within these project specifications.

(2) This requirement is in addition to the other requirements given in the project specifications.

(3) This requirement is not intended to apply to characteristics (such as color or appearance) which do not affect the performance, function, or reliability.

E. Owner-Furnished or Owner-Supplied Equipment

(1) The AVSC, as needed, shall be responsible for removing and/or obtaining OFE equipment from the Owner's location and transporting it to his shop. At the AVSC's facility, he shall ascertain that the OFE equipment is performing at or above factory specifications.

(2) If the equipment is not operating "as-new" or is missing accessories necessary to properly integrate the equipment into the system as intended, the AVSC shall provide a proposal, including a time line, for returning the equipment to "as-new" condition and providing the needed accessories.

F. Wireless Equipment: Prior to ordering equipment, the AVSC shall coordinate the frequencies of all wireless devices to prevent unwanted interaction between devices and rooms. This includes, but is not limited to, wireless microphones, assisted listening system devices, wireless control panels, etc.

G. Spare Parts: Provide one full set of spare video projector lamps.

2.02 EQUIPMENT SCHEDULE

A. Refer to the attached Equipment Schedule, 274100.1.

2.03 EQUIPMENT RACKS

A. Provide hardware as required to provide finished install of specified racks, doors, rack rails, side panels, top and bottom sections, fans, etc.

(1) Where racks are shown together, gang together using factory-provided hardware.

B. Provide hardware as required for standard 19" rack mounting of equipment.

(1) Equipment that does not include manufacturer-provided rack hardware shall utilize a factory-made rack-mount kit such as manufactured by Middle Atlantic Products.

2.04 POWER DISTRIBUTION

A. Provide plug strips or plug mold as required to connect AC power to all associated equipment in racks, equipment consoles and custom mounting enclosures. Provide a minimum of one plug strip or plug mold per rack.

B. Provide master power control and sequencing equipment, to be controlled by the AV Control System.

C. Where applicable use rack manufacturer part or plug strip kit.

2.05 CABLE

A. Refer to the attached schedule, 274100.2: Cables and Connectors

B. Provide wire and cables which are UL-listed and marked for their Class of wiring, per NEC.

C. Trade numbers shown are for general-purpose cables for use in raceway and where otherwise allowed by NEC and other codes. Prior to installation, the AVSC shall verify, for each installation situation, with the local authority having jurisdiction that non-plenum and non-riser rated cables are acceptable. If plenum or riser-rated cables are required, provide cables so rated with equivalent electrical characteristics to those specified below.

PART 3 - EXECUTION

3.01 GENERAL

A. Conform to manufacturer's instructions and provisions of Contract Documents. Where in conflict, assume requirements that are more stringent and verify with Architect before beginning work.

3.02 EXAMINATION

A. Verification of Conditions: Verify conditions as satisfactory to receive work of this Section before beginning.

B. Pre-Installation Testing

C. Evaluation and Assessment

3.03 PREPARATION

A. Protection of In-Place Conditions

B. Surface Preparation

C. Demolition/Removal

3.04 INSTALLATION

A. In the installation of equipment and cable, consideration shall be given not only to operational efficiency, but also to overall aesthetic factors.

B. Equipment Mounting

(1) Equipment (except portable equipment) shall be firmly held in place. Fastenings and supports shall be adequate to support their loads with a safety factor of at least three. Equipment shall be braced for seismic conditions according to applicable codes and regulations.

(2) Rack-mounted equipment:

(a) Install vent panels between amplifiers.

(b) Install blank panels to fill any unused rack spaces.

(c) Mount mixers, controls, and patch panels at working height.

(d) Within racks, install cables and wiring neatly, forming straight lines and smooth corners. Bundle separately, or install in separate plastic ducts, the microphone, line-level audio, speaker, control, video, and power wiring.

(3) Loudspeakers:

(a) Do not support speaker enclosures with lay-in tiles or GWB. Provide adequate support (using attachments to structural elements and/or metal mounting bars) for back-boxes so that no perceptible sag will occur once speaker and grille are mounted. Assume a loudspeaker weight of 10 pounds, at a minimum.

(b) Caulk enclosures to ceiling surface (e.g. lay-in tile or GWB) to form an airtight seal.

(c) Verify polarity of each speaker voice coil prior to installation and connect to maintain uniform polarity.

(d) Tap 70-volt transformers as shown, or to provide an amplifier load between 60% and 90% of rated capacity with all speaker-line attenuators (if any) set for minimum attenuation.

(e) Install speaker and baffles to provide tight seal with ceiling and enclosure. Do not caulk baffle to ceiling.

(f) Install so speaker grille is centered in tile or building element, with sides of grille or line between mounting fasteners parallel to ceiling grid or building lines.

C. Raceway

(1) Install wire and cable only within raceway systems. Do not install wire or cable in wall cavities or ceiling plenums/attic spaces without the use of raceway (conduit or cable tray), without the explicit written permission of Owner, or as otherwise noted on the drawings.

(2) Maintain conduit fills equal to or less than those given by Table 1 of Chapter 9 of the NEC, regardless of the class of wiring.

D. Cable Installation

(1) Install wire and cable only within the raceway systems provided under Division 26. Do not install wire or cable in wall cavities or ceiling plenums/attic spaces without the use of raceway (conduit or cable tray) unless otherwise noted on the drawings.

(2) Maintain conduit fills equal to or less than those given by Table 1 of Chapter 9 of the NEC, regardless of the class of wiring.

(3) Use only cable lubricants that are compatible with the jacket materials.

(4) Upon completion of pull, clean exposed cables and surfaces to be completely free of lubricant and residue.

(5) Protect installed conductors from painting, overspray, and taping or patching compounds.

(6) Cable splices are allowed only in accessible junction boxes, using insulated crimp-on connectors, soldering covered with heat shrink, or other methods approved by the Engineer.

(a) Do not splice in conduits or cable tray.

(b) Splicing with wire nuts is prohibited.

(7) Install cables and wiring neatly, forming straight lines and smooth corners, without deformation, kinks, scrapes, or cuts of the jacket or insulation.

(a) Maintain the minimum bend radius of cables as recommended by the manufacturer.

(b) Do not use cable ties in the cable tray or overhead junction boxes, except where otherwise shown or otherwise directed in writing by the Engineer.

(c) Do not cinch cable ties tightly; leave loose enough so each cable can be easily moved through the cable bundle. There should be no deformation of the outer cable jacket.

(d) Where installed without raceway, support cables with D-rings or J-hooks at minimum intervals of 24”. Do not put J-hooks at equal distances; space randomly.

(e) Where bundles are subject to flexing, enclose bundle with nylon webbing or spiral wrap; do not use cable ties.

(f) Where cables are installed vertically, provide support at regular intervals. Maximum distance between supports shall not exceed 80 percent of the manufacturers' recommended maximum vertical drop, or 50% of the recommended maximum pulling tension, whichever is less.

(g) At a minimum, support cables at each floor with clamping strain relief.

(8) Cable assemblies run in conduit and/or cable trays should provide for a minimum of five (5) feet of excess cable on each end to allow for relocation of equipment or re-termination of cable in the future.

E. Signal Separation:

(1) All AV system cables shall be grouped according to the signals being carried and installed in separate raceways. To reduce signal contamination, separate groups shall be formed for the following cable families:

(a) Audio cables carrying signals less than – 20dBm (microphone circuits)

(b) Audio cables carrying signals between – 20dBm and +20dBm (analog line-level circuits)

(c) Audio cables carrying signals above +20dBm (including Class 1 and Class 2 loudspeaker circuits)

(d) Analog video and broadband CATV cables

(e) Digital audio, video, network, or telephone cables

(f) Power and lighting cables

(g) Control cables

(2) Minimum separation from other circuits:

(a) From power and switched lighting circuits: at least **24”**.

(b) From dimmed lighting circuits: at least **48”**.

(c) Where runs are adjacent for less than **80 ft**, the required spacing may be halved (**12”**, or **24”** from dimmed lighting circuits).

(d) Where runs are adjacent for less than **6 ft**, or where circuits cross at right angles, separations of **2”** may be used.

(e) Where AV circuits cross or intersect with power or lighting circuits, cross at 90 degrees (plus or minus 2 degrees) to the greatest extent possible.

F. Rack Cable Installation

(1) All cable entry shall be through the tops of racks or through entrance holes in the base of the rack. No cable shall enter racks through front, rear, or side panel openings.

(2) Cables shall not protrude from the back of racks.

(3) Where bundles enter racks, arrange neatly without crossovers. Secure cable bundles within racks and equipment consoles with Velcro cable ties.

(4) As a general practice, all power cables, control cables, and high-level cables shall be run on the left side of an equipment rack as viewed from the rear. All other cables shall be run on the right side of an equipment rack, as viewed from the rear.

(5) Inside each rack, cables ties shall be placed at appropriate intervals of no greater than six inches for vertical bundles and no greater than two inches for horizontal bundles.

(6) All vertical cable bundles shall be attached to the rack frame.

(7) Provide flexible service loops for cable assemblies so that equipment in racks or equipment consoles can be fully pulled out for service without cutting wire ties or putting undue stress on cable assemblies. This includes:

(a) Equipment in casework or racks which have less than 1 meter of clearance for rear access.

(b) Equipment with sliding mounting hardware.

G. Connections and Terminations

(1) Prior to connection, verify freedom from shorts or grounds of all conductors (including shields and drain wires) of all cables.

(2) All cables shall have proper connector housing.

(3) All AV system wire, after being cut and stripped, shall have the wire strands twisted back to their original lay and be terminated by approved soldered or mechanical means.

(4) Serve shielded cables with heat shrink tubing to insulate shield and drain wire. Unused wires at the end of a cable shall remain un-stripped and shall be laid back and held in place with wire ties.

(5) Make connections to plugs, receptacles, connectors, or solder terminals with rosin-core solder using temperature-controlled solder stations.

(6) Ensure that no un-insulated wire is exposed beyond its pin.

(7) Utilize only multi-core flux resin with 60/40 tin-lead non-corrosive construction, designed for electronic equipment use.

(8) Soldering shall utilize good engineering practices and completed solder connections shall appear shiny and smooth with no visible imperfections, cracks, or cold-solder joints.

(9) Make connections to screw connections using insulated spade lugs or Phoenix-style connector blocks. Ensure that no un-insulated wire is exposed beyond its pin.

(10) For all crimp-type connectors and pins, utilize only crimp tools rated for the crimp pin type, size and wire gage being assembled. Consult the manufacturer’s specifications and recommendations for crimping.

(11) Utilize only gold-plated crimp pins.

(12) If a signal path requires that the signal pass through more than one device, each device must have looping input capability, or a distribution amplifier must be used to feed the signal to the devices. Do not use a video "T" in place of a video distribution amp to route signals to more than one device.

(13) All audio circuits shall be balanced (high, low, shield) except where otherwise indicated. Where cable runs between equipment exceed 20 feet, balance boxes shall be used to convert unbalanced circuits to balanced circuits.

(14) Wire all three and five pin audio connectors and quarter-inch phone jacks (mono and stereo) in accordance with IEC-268.

(a) For three pin connectors, Pin 1 is ground, Pin 2 is positive, and Pin 3 is negative.

(b) For five pin connectors, Pin 1 is ground, Pin 2 is left positive, Pin 3 is left negative, Pin 4 is right positive, and Pin 5 is right negative.

(c) For quarter-inch stereo phone jacks, Tip is positive, Ring is negative, and Sleeve is ground.

(d) For quarter-inch mono phone jacks, Tip is positive, and Sleeve is ground.

(15) The strain relief of the connector shall fully engage cable jacket.

H. Wire Numbering
   (1) Develop a wire numbering system to uniquely identify each AV cable.
   (2) Number or color code individual conductors of cables to identify circuits and connections.
   (3) Record number and color codes on the "AS-BUILT" drawings.
   (4) For each system, include the following on the wire run list, for each cable:
      (a) Cable number
      (b) Signal type
      (c) Cable type
      (d) "To" destination
      (e) "From" destination
      (f) Room and equipment location for both ends of the cable
      (g) Approximate length of cable run
   (5) Provide the cable numbering list as a computerized spreadsheet, in a format compatible with Microsoft Excel (version 6.0 or higher). As part of the O&M Manuals, provide:
      (a) Printed copies in each Manual.
      (b) One set of electronic files, on CD-ROM in a format compatible with IBM-PCs.

I. Cable Labeling
   (1) Label all cabling in conformance with AVIXA Standard F501.01:2015, Cable Labeling for Audiovisual Systems.

J. Grounding and Shielding
   (1) Rack Grounding:
      (a) Install a single-point grounding system for each system. Where multiple systems are installed in a single grouping of racks, they shall be considered one system for grounding purposes.
      (b) Verify integrity of grounding systems and isolated receptacles prior to connection of equipment.
      (c) Prior to installing or connecting equipment, temporarily disconnect ground wires (installed under Division 26) from equipment cabinet(s), and measure impedance between each ground wire and its cabinet. Verify electrical isolation (minimum resistance of 1 Megohm) between rack cabinets and raceway and conductive structure. Record results for test report. Reconnect ground wires.
   (2) Connect shield and grounding conductors as follows:
      (a) Connect shields of microphone wiring to receptacle and patch panel common.
      (b) Insulate shields from connector shell, plates, boxes, and raceway.
      (c) Connect shields of wiring from patch panel to control console inputs only to control console (insulate at patch panel).
      (d) Connect shields of balanced line level circuits at patch panel only; insulate at the opposite end of the cable. For balanced circuits that do not terminate at patch panels, connect shields at input ends only; insulate at output ends. Use this standard as needed to correct ground hum issues.
   (3) Maintain shield and drain wire continuity through junction boxes and intermediate termination points. Insulate shields from raceway or other conductive building elements. Maintain shields to within 3 inches of connected devices and maintain twisting of pairs of wires to within 1/2 inch of connector or device termination.
   (4) Make any modifications to grounding and shielding which are necessary to eliminate extraneous noise and RFI, prevent parasitic oscillations, and other signal instabilities, and to meet overall systems noise specifications. Record any deviations from the above guidelines, and the reasons that each deviation was deemed necessary.
   (5) Do not remove or defeat grounding terminal of 3 conductor power cords and maintain safety grounding and bonding as required by the NEC.
   (6) The overall governing requirements are that the wiring systems shall not induce or pick up perceptible noise, and that the predominant components of the noise floor of all signal paths shall be normal "thermal" noise of the upstream devices.
   (7) Because of the great number of possible variations in grounding systems, it shall be the responsibility of the AVSC to follow good engineering practice, as outlined above, and to deviate from these practices only when necessary to minimize crosstalk and to maximize signal-to-noise ratios in the audio, video, and control systems.

K. Interface with Other Work

L. Cutting Building Construction
   (1) Obtain permission from the Architect or Owner and coordinate with other trades prior to cutting. Locate cuttings so they will not weaken structural components. Cut carefully and only the minimum amount necessary. Cut concrete with diamond core drills or concrete saws except where space limitations prevent the use of such tools.
   (2) All construction materials damaged or cut into during the installation of this work must be repaired or replaced with materials of like kind and quality as original materials by skilled labor experienced in that building trade.

M. Penetrations of Fire Rated Elements
   (1) Must be provided such as to retain that rating.
N. Painting
   (1) The AVSC will repaint or arrange to repaint existing building components such as walls, frames, etc. which are scratched or marred by the AVSC during installation.
   (2) The AVSC will repaint or refinish equipment, loudspeaker grilles, microphones, or other AV system components which are scratched or marred by the AVSC during installation.

3.05 SYSTEM START-UP
A. System Start-Up: Conform to provisions of Division 1..

3.06 SYSTEM TESTS AND ADJUSTMENTS
A. Inspect and adjust after installation.
B. Repair or replace defective equipment or installations.
C. Testing and adjustment of equipment shall be performed by qualified technicians with general knowledge of video and audio systems alignment and trouble shooting, and knowledge of specific equipment and systems in this project.
D. Manuals: All manufacturers' maintenance or alignment manuals shall be present during testing and adjustment procedures.

3.07 TEST EQUIPMENT
A. Test Equipment:
   (1) Test equipment shall be in good mechanical and electrical condition.
   (2) Non-professional test equipment or home-built kit equipment is not acceptable.
   (3) This list constitutes the minimum instrumentation required to perform the tests in the checklists and does in no way imply a comprehensive list for engineered AV systems testing. Additional instrumentation may be required to verify performance on an item of equipment, or to quantify environmental and other issues to expedite corrective actions by others.
      (a) Sensitive AC voltmeter, -80 dBu sensitivity, 20-30 kHz response, able to measure signal to noise ratio, THD, electrical audio levels within the system. Note that some systems require measurements up to 100 volts and may require an external pad.
      (b) Sound pressure level meter, ANSI Type II, with A and C weighting filters, fast or time-averaged.
      (c) Audio signal generator, 20-30 kHz, sine wave, pink noise.
      (d) Amplified loudspeaker 100 mm producing 60 dBA at one meter, and 70 dBA at one-meter, pink noise, sine wave, speech files.
      (e) 200 MHz oscilloscope, with TV sync.
      (f) Analog video signal generator NTSC/PAL, plus computer patterns at all required resolutions and refresh rates required for the systems under test. For systems with composite video, include PLUGE pattern.
      (g) Digital video signal generator for computer patterns for all resolutions and refresh rated required for the systems under test, HDMI/DVI.
      (h) The ability to measure STI-PA (source and analyzer).
      (i) Colorimeter/luminance meter, 10% accuracy.
      (j) Infrared thermometer.
      (k) Test media with known levels (audio, video, etc.): CDs, VHS, DVDs, etc.
      (l) AC/DC multimeter.
      (m) Light meter, lux/foot-candles.
      (n) Outlet tester (to test power outlet wiring).
      (o) Cable sets, cable assemblies, adapters as required to sample and measure in or out of circuit as required.
      (p) Patch and jumper cables
      (q) Reference standards required for testing
      (r) Software to adjust remotely controlled signal processors, with necessary computer and related hardware. Provide enough cabling to permit controlling computer to be in loudspeaker service areas while signal processors remain in equipment cabinets.
B. Test Instrument Calibration
   (1) Testing firm shall have calibration program which assures test instruments are maintained within rated accuracy.
   (2) Accuracy shall be directly traceable to the National Institute of Standards and Technology (NIST).
   (3) Instruments shall be calibrated in accordance with the following frequency schedule:
      (a) Field instruments: Analog, 6 months maximum: Digital, 12 months maximum.
      (b) Laboratory instruments: 12 months.
      (c) Leased specialty equipment: 12 months where accuracy is guaranteed by lessor.

(4) Dated calibration labels shall be visible on test equipment.

(5) Records, which show date and results of instruments calibrated or tested, must be kept up-to-date.

(6) Up-to-date instrument calibration instructions and procedures shall be maintained for test instrument.

(7) Calibrating standard shall be of higher accuracy than instrument tested.

3.08 MEASUREMENTS AND PERFORMANCE TESTING

A. Verify that the systems are in conformance with the performance criteria in Section 27 41 00 – Audiovisual Systems, paragraph 1.9.B and 1.9.C.

B. Work Includes:

(1) Provide all test equipment necessary for system checkout and acceptance tests.

(2) Perform initial system testing and adjustment as herein prescribed.

(3) Prepare and submit Audiovisual System Testing Report. Use 27 4100.3 – Audiovisual Systems Commissioning Checklist.

(4) Participate in and assist with operational system commissioning as herein prescribed.

C. Successful completion of tests and inspections shall determine suitability for first beneficial use by the Owner.

D. Systems to be inspected and tested:

(1) Sound systems, including:

(a) System inputs and outputs

(b) Wired and wireless microphone systems

(c) Audio program sources

(d) Preamplifiers, mixers, analog signal processors, and digital signal processors

(e) Audio signal distribution network

(f) Distribution amplifiers and power amplifiers

(g) Loudspeakers

(h) Assistive listening systems

(i) Recording equipment

(2) Video presentation systems, including:

(a) Video program sources

(b) Video switchers and routers

(c) Video signal processing equipment

(d) Video distribution equipment

(e) Video displays and projection systems

(3) Digital signage systems

(a) Content management software

(b) Audiovisual signal acquisition interfaces

(c) Digital signage servers

(d) Digital signage distribution

(e) Video displays

(4) Audiovisual control systems

(a) Control system network

(b) Control system processors

(c) Control system interface panels

(d) Control system software interfaces

E. The AVSC shall:

(1) Coordinate testing schedule with Construction Manager, Owner, and Engineer.

(2) Notify Owner and Engineer two weeks before testing.

(3) Perform initial system testing and adjustments.

(4) Prepare test results with comparison to specified performance and technical requirements, industry standards, and manufacturer's values and tolerances.

(5) Assure system equipment is installed in accordance with contract documents, is operational, and within industry and manufacturer's tolerances.

(6) Participate in and assist with systems acceptance testing.

(7) Assure suitability for operation.

F. The Engineer shall:
   (1) Participate in and assist with systems acceptance testing.
   (2) Recommend acceptance or rejection of the installed systems prior to final completion.

G. The Construction Manager/Owner shall:
   (1) Ensure facilities are ready for the work described in this section.
   (2) Participate in and assist with systems acceptance testing.

H. Preliminary Systems Testing and Adjustment Report
   (1) Provide one copy of preliminary testing report in Acrobat PDF format. Test report shall include the following:
      (a) Signed statement on Contractor's letterhead that preliminary systems testing, and adjustment has been completed and the system is ready for acceptance testing by the Engineer.
      (b) Completed AV Systems Commissioning Checklist for each system or room.
      (c) Recorded measurements of all systems.
      (d) List of equipment used to perform tests. Identify the following:
         1. Type
         2. Manufacturer
         3. Model number
         4. Serial number
         5. Date of last calibration
         6. Documentation of calibration leading to NIST standards
      (e) Name(s) of personnel performing tests
      (f) Signature of project manager responsible for performance and oversight of system testing and adjustments.
   (2) Provide completed reports to Engineer no later than 10 days after completion of checklists, testing, and adjustments unless otherwise directed.

I. Audio:
   (1) Verify that the system is completely free from hum, noise, parasitic oscillation, and RFI.
   (2) Measure and record the impedance of each speaker load at the main junction box or rack cabinet and total load on each amplifier. At a minimum, make measurements at 100, 1000, and 10,000 Hertz. Make corrections as required so that the load impedance of each loudspeaker circuit is equal to or greater than rated load impedance of the amplifier.
   (3) Verify that positive pressure at any microphone produces positive pressure from each loudspeaker. Verify that signal polarity is correct and consistent for all circuits and paths. Reverse polarity if required, and record which circuit was reversed.
   (4) With signal processors in bypass mode, adjust gain controls so all components except power amplifiers reach rated nominal output simultaneously. For components which have rated maximum outputs between 18 and 25dBm and line level inputs, adjust each component for unity gain.
   (5) Set audio distribution amplifiers for unity gain unless otherwise specified by the Engineer. Record final settings of each unit.
   (6) Adjust power amplifier input attenuators so power amplifiers reach clipping at 10dB above 0VU on the mixing console output meter.
   (7) Re-adjust gains if required for proper operation of each system and component. Measure and record any such re-adjustments; also record the reason adjustment was deemed necessary.
   (8) Measure and record the electronic signal-to-noise ratio of each complete signal path with all microphone inputs at full gain, or at gain settings which correspond to the onset of ringing for a single microphone, whichever is lower gain, and other controls at normal settings. During test, terminate microphone receptacles with 200-ohm resistors.
   (9) Adjust bandwidth, filter slopes, time offset correction, and signal levels of each crossover. Measure and record final settings of each unit.
   (10) Adjust equalizers to optimize the specified frequency responses. Measure and record the electronic frequency response and the acoustic frequency response of the system before and after adjustments.
   (11) Adjust time delay units to shift the apparent acoustic origin to the main loudspeakers. Measure and record delay settings for each circuit.
   (12) Adjust automatic mixers, automatic level controllers, and other signal processors to optimize use of microphones for speech using the expected (normal) microphone positions.
   (13) Measure and record the impedance of each speaker load at the main junction box or rack cabinet and total load on each amplifier. At a minimum, make measurements at 100, 1000, and 10,000 Hertz.
   (14) Make corrections as required so that the load impedance of each loudspeaker circuit is equal to or greater than rated load impedance of the amplifier.

(15) Slowly sweep all low frequency and full range speaker systems with sine waves at 25% of rated maximum amplifier power output, or at 50% of rated continuous power capacity of loudspeakers, whichever is less, from 20 Hz to 20 kHz. Observe for audible or perceptible vibration or rattling of speaker components, mounting apparatus, or building elements. Under this Section, correct vibration or rattling of speakers or mounting apparatus to the satisfaction of the Engineer. Report vibration or rattling of other building elements to the Engineer; include frequency, characterization of observed rattling or vibration, and recommendations for correcting the rattling or vibration in the report.

(16) Measure and record the maximum sound pressure level of pink noise at onset of amplifier clipping. Make measurement using both A-weighted and un-weighted (flat) settings of the Sound Level Meter (SLM).

(17) Measure and record the acoustic frequency response of the system at the four corners of the seating area, in the middle of the seating area, and at the middle rear of the seating area.

(18) Measure and record the acoustic frequency response at each location provided in the Audio Coverage Uniformity Plan (ACUP)

(19) Measure and record the speech intelligibility of the system at each location listed above (or each location provided in the ACUP).

(20) Perform tests with the measuring microphone at the seated ear height of the audience, within designated seating areas. All interior finishes and furnishings shall be in place during measurements.

(21) Make the above measurements for all loudspeaker systems.

(22) Set gain of initial input stage to match nominal output level of program sources (Microphones, wireless receivers, program sources, etc.)

(23) Perform final equalization in the presence of the Engineer.

J. Video

(1) Verify that all signals comply with the recommended manufacturer's specifications for each item of equipment.

(2) Observe each signal for AC hum or noise. Correct as required so that no hum or noise is either visible in the displayed pictures or detectable on a scope.

(3) Set signal levels to NTSC RS-170A specifications for luminance level and chroma level, gain and phase.

(4) Test signals for differential phase, differential gain, chrominance to luminance delay, multi burst frequency response and signal to noise ratio.

(5) After equipment alignment, check all signal paths from the most up-stream point in the system to verify unity gain at the final destination. Set all equalizing video distribution amplifiers to achieve correct luminance and chrominance gain at each signal destination.

(6) Measure and record initial conditions for black level, gain level, color level values, tint and gray scale values prior to making any adjustments.

(7) Measure and record final conditions for black level, gain level, color level values, tint and gray scale values after making any adjustments.

K. Digital Video

(1) Demonstration and acceptance tests shall be done by a Crestron DMC-E Certified Engineer.

(2) Verify the AV switching equipment has been installed and configured correctly. Measure and record the following information in electronic format:

(a) Number of HDCP KSVs "Keys" supported by each source

(b) Video timing, HDCP use, and audio format of each source when operating

(c) Video timings and supported audio formats for each connected sink

(d) Video timings and supported audio formats presented in the EDID to each source. The preferred video timing shall be indicated.

(e) Cable length on all shielded twisted pair cable used for AV distribution

(f) Data rate supported by each shielded twisted pair cable used for AV distribution

L. Control Systems

(1) Verify all systems connections are operational and devices pass signal as specified.

(2) Audio and video network devices: Verify all IP-connected signal processing equipment is properly configured with IP addresses, gatekeeper addresses, network configurations, and subnets as applicable.

(3) Control system network devices: Verify all IP-connected signal processing equipment is properly configured with IP addresses, gatekeeper addresses, network configurations, and subnets as applicable.

(4) External devices:

(a) Applies to drapes, shades, screens, lights, security, life safety, and HVAC systems or devices.

(b) Confirm all external devices and systems operate as specified prior to connection to AV control system.

(c) Confirm control system interfaces exist and are functional.

(d) Confirm control system functions not obvious from control flow diagrams.

(5) Control system communications: Confirm all control system programming installed and properly communicating with intended equipment or systems.

(6) Control system user interface:

(a) Confirm user interface conforms to user or specified requirements.

(b) Confirm all pages and buttons operate as intended.

(7) Control system power cycling and recovery: Confirm control system will restart and resume full operation following cycling of AC power to the control system.

(8) Document results of all system testing.

3.09 SYSTEM ACCEPTANCE TESTING

A. When the work is complete and ready for Acceptance Testing, notify the Architect and the Consultant in writing. Include copies of final inspection certificates.

B. Include:

(1) Letters from the AVSC and all AV Subcontractors, on their respective letterheads, certifying that the AV systems are substantially complete, fully tested and adjusted, fully operational, and ready for inspection, final testing, and tuning.

(2) Preliminary audiovisual systems commissioning checklist.

(3) Digital photographs of the completed installation. Include photographs of:

(a) An elevation view of the front wall of each room equipped with projection screen(s), showing the screen, loudspeakers, and other system elements.

(b) A view of each equipment room, showing the equipment racks, backboards, terminal cabinets, and other installed materials.

(c) An elevation view of each equipment rack cabinet taken with the front door (if any) fully open, and a view of the interior of each equipment rack cabinet.

(d) A view of each type of wall-mounted device, including cameras, monitors, control panels, etc.

(e) A view of each type of ceiling-mounted device, including loudspeakers, etc.

(f) Close-up views of each type of input panel and output panel.

(g) Close-up views of each type of floor box/pocket with the covers open, and with the covers closed.

(h) Professional photographs are not required; color snapshots with minimum size of 3” x 5” is acceptable. Photographs shall be legible, well lighted, and well-focused, and composed to fill the image with the intended subject as much as possible.

(4) List of discrepancies and corrective action taken.

C. Acceptance Testing

(1) The Engineer will schedule a site visit once the AVSC’s Completion Report has been submitted and approved. Allow at least 10 calendar days between receipt of Completion Report by Engineer and the earliest desired date for the site visit by Engineer. The AVSC is encouraged to communicate informally with the Engineer prior to submission of Completion Report to coordinate the scheduling of the Engineer’s site visit.

(2) The AVSC will assist the Engineer in performing acceptance tests, equalization, and other system adjustments.

(3) The AVSC will assist the Engineer in making final tests, equalization, and other adjustments. This shall include listening and viewing tests, including subjective tests by observers and various positions, under various operating conditions.

(4) All final, as-built drawings, run sheets, manuals, and other required documents shall be on hand.

(5) Manuals: All manufacturers' maintenance, service, and alignment manuals shall be present during testing and adjustment procedures.

(6) System Acceptance Tests will be supervised by the Engineer and will consist of the following:

(a) A physical inventory will be taken of all equipment on site and will be compared to equipment lists in the contract documents.

(b) The operation of all system equipment shall be demonstrated by the AVSC.

(c) The operation of the control systems/touch panels will be reviewed for acceptance by the Owner.

(d) Listening and viewing tests, including subjective tests by observers at various positions, under various operating conditions.

(e) A random verification of measurements submitted with the audiovisual systems commissioning checklist.

(f) Final adjustments to signal processors and system gain settings.

(7) The Contractor shall provide on-site personnel who performed the installation and testing.

(8) Contractor shall make any adjustments, including but not limited to re-wiring of speaker taps, resetting of gain controls, changes in shielding or grounding, and minor changes in wiring and termination, which are deemed necessary by the Engineer. Such work shall be included in the base bid contract amount.

(9) Make any adjustments, including but not limited to re-wiring of speaker taps, resetting of gain controls, changes in shielding or grounding, and minor changes in wiring and termination, which are deemed necessary by the Engineer. Such work shall be included in the base bid contract amount.

D. Additional Site Visits

(1) Additional site visits may be deemed necessary by the or AV Consultant if any of the following conditions are found during the initial acceptance testing site visit:

(a) Items of equipment which are missing or non-operational.

(b) Items of equipment which do not meet the specifications, or the manufacturers published performance criteria.

(c) Hum, buzz, or noise which degrades the signal to noise ratio of any circuit by more than 5 decibels from the manufacturers' rated signal-to-noise ratios for the upstream components.

(d) Audio distortion which is audible or video distortion which is visible.

(e) Any other conditions which are not in accordance with the specifications, drawings, AV Systems Contractor's submittals, Completion Report, or audiovisual systems commissioning checklist.

(2) In the event further adjustment is required, or defective equipment must be repaired or replaced, tests may be suspended or continued at the option of the Engineer.

(3) The AVSC shall make every possible effort to correct the deficiencies during the site visit to avoid additional site visits.

(4) The AVSC will render reasonable assistance to avoid additional site visits, including extending the site visit, so long as it does not hamper other work of the site visit.

(5) Any charge for additional time incurred by the Consultant required to observe system tests due to improper system installation or previous failed systems, shall be the responsibility of, and charged directly to, the AVSC.

(6) If additional site visits are deemed necessary, the Owner will submit a written notification of the reasons with descriptions of the deficiencies to be corrected.

(7) If additional site visits are deemed necessary:

(a) The Consultant will submit a written notification of the reasons with descriptions of the deficiencies to be corrected.

(b) Under this Section, with no increase in the Contract amount, the AVSC shall pay for the additional site visits by the Consultant, in the form of reimbursement to the Owner or Architect for their actual cost of services by AEI NW. AEI NW will bill the additional services for the additional site visit(s) at its prevailing standard hourly rates for time (including travel time), plus actual costs for travel per diem, and related expenses.

3.10 CLEANING

A. Leave installations clean and premises free from residue and debris from work of this Section.

B. Waste Management:

(1) AVSC shall continually remove debris, cuttings, crates, cartons, etc., created by his work. Perform clean up daily to eliminate hazard to the public, other workmen, the building or the Owner's employees. Before acceptance of the installation, AVSC shall carefully clean cabinets, panels, lighting fixtures, wiring devices, cover plates, etc., to remove dirt, cuttings, paint, plaster, mortar, concrete, etc. Blemishes to finished surfaces of apparatus shall be removed and new finish equal to the original applied.

(2) Remove dirt and debris from the interior of enclosures, outlet boxes, pull and junction boxes, and equipment cabinets.

(3) Clean equipment to remove plaster, taping or patching compound, overspray, paint spills, oil, grease, dust, fingerprints, or other dirt or contaminants to restore equipment to original finish and condition.

3.11 CLOSEOUT ACTIVITIES

A. Demonstration

(1) After substantial completion of the work and after all tests and final inspection of the work by the AV Consultant, the Contractor shall demonstrate the systems and instruct the Owner's designated operating and maintenance personnel in their operation and maintenance. The Contractor shall arrange scheduled instruction periods with the Owner. The Contractor's representatives shall be superintendents or foremen knowledgeable in each system, and suppliers' representatives when so specified.

B. Training

(1) At the completion of installation, submit a written request to the Owner to schedule the training sessions, at least two weeks in advance of the requested dates.

(2) At a minimum, provide the following sessions of training for systems users, covering operations. Each session shall be for at least the specified number of hours and number of attendees per session.

(a) General Operations: at least one session for operations and management staff.

(b) Technical Operations: at least two sessions for AV technical staff, covering detailed operations and maintenance.

(3) At least one of each type of class (as selected by Owner's representative) shall be video-taped by the contractor, with copies of tapes turned over to the Owner's representative as part of the O&M manuals.

(4) All maintenance and operational aspects of the systems shall be described and demonstrated to personnel selected by the Owner. The sessions shall be conducted by a representative thoroughly familiar with the characteristics of the system. O&M manual information regarding the system shall be submitted to the Owner prior to scheduling the instruction session. The training session should cover the following areas:

(a) General operation of all systems and functions.

(b) Explanation and orientation of all technical documentation.

(c) Explanation of signal flow including all signal paths through routing switchers and patching.

(d) Basic system troubleshooting and preventive maintenance.

(e) Explanation of system warranty and process for owner to follow during system malfunctions to obtain customer support from the AVSC.

3.12 ATTACHMENTS

A. Schedules

(1) Section 27 41 00.1 – Audiovisual Systems Equipment Schedule

(2) Section 27 41 00.2 – Audiovisual Systems Cable Schedule

SECTION 27 51 29 - TWO-WAY COMMUNICATION SYSTEM

PART 1 GENERAL

1.01 SCOPE

A. This section includes product and execution requirements for Two-way Communication System.

1.02 DESCRIPTION

A. Refer to Section 27 0000 - General Communications Requirements.

B. Complete, turnkey Two-way Communication system compliant with all applicable codes and standards referenced herein and as indicated on drawings.

C. Two-way Communication system shall include following major components:

(1) Two-way Communication Call Stations

(2) Two-way Communication Master Stations

(3) Two-way Communication Power Supplies

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements

(2) Section 27 0526 - Grounding and Bonding for Communications Systems

(3) Section 27 0528.29 - Hangers and Supports for Communications Systems

(4) Section 27 0528.33 - Raceway and Boxes for Communications Systems

(5) Section 27 1000 Structured Cabling

(6) Section 27 1500 Horizontal Cabling

B. Related sections in other Divisions of Work:

(1) REQUIREMENTS OF REGULATORY AGENCIES

(a) Refer to Section 27 0000 - General Communications Requirements.

(2) REFERENCES AND STANDARDS

(a) Refer to Section 27 0000 - General Communications Requirements.

(b) Design, cable and component selection, and installation practices shall conform with following:

1) IBC International Building Code

(3) NFPA 70 - National Electrical Code

(4) NFPA 72 - National Fire Alarm and Signaling Code

(5) NFPA 101 - Life Safety Code

1.04 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements for general terminology used in Division 27 sections.

1.05 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements.

1.06 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements.

1.07 AUTHORITY HAVING JURISDICTION REVIEW MEETING

A. Prior to shop drawing submittal preparation, Contractor shall arrange and conduct meeting with Authority Having Jurisdiction (AHJ) to review and coordinate design and installation of Two-Way Communication system.

(1) At minimum, attendees shall include:

(a) AHJ

(b) Owner’s project manager, facilities/buildings and grounds/maintenance representative, security representative, and information technology/information systems representative

(c) General Contractor project manager and site superintendent/field foreman

(d) Division 26 site superintendent/field foreman

(e) Division 27 project manager and site superintendent/field foreman

(f) Two-Way Communication system subcontractor/supplier project manager

(2) At minimum, meeting agenda topics shall include:

(a) Review of proposed system equipment and devices

(b) Identification and discussion of proposed system's functional capabilities and limitations

(c) Identification and review of device locations

(d) Step-by-step review of system deployment execution plan

(e) Review of installation, configuration, programming, and testing schedule and of how those relate to overall construction schedule, including identification of interdependencies, project milestones, and critical dates.

(3) Meeting shall be scheduled with two weeks' minimum notice.

(a) Contractor shall publish meeting agenda and distribute agenda and configuration and programming guide to invited attendees minimum of one week prior to meeting.

(4) Contractor shall take detailed notes during meeting and publish meeting minutes within one week after meeting. Minutes shall be distributed to attendees, Architect, and Engineer, and be included in Operation and Maintenance Manual.

PART 2 PRODUCTS

2.01 GENERAL

A. System shall provide two-way voice communication between call stations and master station

B. If master station is not answered, system shall provide two-way voice communication with external constantly attended station and shall automatically communicate location of station initiating call using pre-recorded message unique to each call station.

2.02 TWO-WAY COMMUNICATIONS CALL STATIONS

A. Basis of Design:

(1) Rath 2400-808NSP

B. Acceptable Alternates:

(1) Cornell

C. Features:

(1) Flush wall-mounted

(2) Stainless steel faceplate

(3) Red mushroom-style pushbutton

(4) Red "call received" indicator lamp

(5) Microphone

(6) Speaker

D. Specifications:

(1) Operating Environment: 50° - 120° F

2.03 TWO-WAY COMMUNICATIONS MASTER STATIONS

A. Basis of Design:

(1) Rath 2500-16RCF

B. Acceptable Alternates:

(1) Cornell

C. Features:

(1) Flush wall-mounted

(2) Powder-coated steel enclosure with hinged door

(3) Visual and audible indication of incoming call

(4) Handset

(5) Handsfree speakerphone

(6) Modem for automatic dial-out

D. Specifications:

(1) Operating Environment: 50° - 120° F

2.04 TWO-WAY COMMUNICATIONS POWER SUPPLIES

A. Basis of Design:

(1) Rath RP7700104

B. Acceptable Alternates:

(1) Cornell

C. Features:

(1) Integral battery backup

(2) Secondary power supply (battery backup) shall have sufficient capacity to operate system under quiescent load (system operating in nonalarm condition) for minimum of 24 hours and, at end of that period, shall be capable of operating all alarm notification appliances used for evacuation or to direct aid to location of emergency for 5 minutes.

D. Specifications:

(1) Input: 120 VAC

(2) Output 24 VDC

2.05 TWO-WAY COMMUNICATIONS CABLE

A. General

(1) Refer to manufacturer's published product installation instructions for additional information and requirements. Wherever a discrepancy is identified between Project Documents and manufacturer's published product installation instructions, more stringent requirement shall govern.

(2) Cable shall be plenum or riser rated as dictated by environment in which cable is installed.

(3) Cable installed in wet or damp locations, including, but not limited to, in-slab and buried conduit, shall be rated for installation in wet locations.

(4) Two-way Communications system cabling shall be UL 2196 certified and have minimum pathway survivability of Level 2 or 3, provided via either of following:

(a) Cable with CI rating for free-air installation

(b) Cable with CIC rating for installation in conduit

2.06 TWO-WAY COMMUNICATION J-TYPE CABLE SUPPORT HOOKS

A. Refer to 27 0528.29 for information and requirements

2.07 TWO-WAY COMMUNICATION RACEWAY AND BOXES

A. Refer to 27 0528.33 for additional information and requirements.

B. Conduit:

(1) Minimum 3/4" trade size.

(2) No flexible conduit of any type.

C. Boxes:

(1) Minimum 4" square 2-1/8" deep.

PART 3 EXECUTION

3.01 INSTALLATION

A. General

(1) Wiring color coding for each device type shall be consistent throughout installation.

B. System Supervision

(1) System wiring shall be supervised.

(2) Two-way telephone communications circuit installation conductors shall be monitored for open circuit and short circuit fault conditions that would cause the telephone communications circuit to become fully or partially inoperative.

(a) Two-way telephone communications circuit fault conditions shall result in trouble signal in accordance with Section 10.14 of NFPA 72.

(3) Failure of either primary or secondary power supply shall result in trouble signal in accordance with section 10.14 of NFPA 72.

C. Two-way Communications Call Stations

(1) Coordinate rough-in requirements with Division 26 Contractor prior to commencement of work on site.

(2) Coordinate exact locations with Owner, Architectural elevations, and work by other trades prior to rough-in.

(3) Install in accordance with Americans with Disabilities Act and Americans with Disabilities Act Accessibility Guidelines.

D. Two-way Communications Master Stations

(1) Coordinate rough-in requirements with Division 26 Contractor prior to commencement of work on site.

(2) Coordinate exact locations with Owner, Architectural elevations, and work by other trades prior to rough-in.

(3) Install in accordance with Americans with Disabilities Act and Americans with Disabilities Act Accessibility Guidelines.

E. Cable

(1) Systems Identification:

(a) Label system device cabling with unique alphanumeric identifiers that include:

1) Architectural room number
2) Associated system device type
3) Unique alphanumeric identifier

(b) Refer to Section 27 0553 for additional information and requirements.

F. Configuration and Programming

(1) Coordinate programming with Owner.

3.02 TRAINING

A. Contractor shall provide to Owner's designated representative(s) a minimum of one (1) 1-hour on-site training session related to work under this section within thirty (30) days of substantial completion.

END OF SECTION 27 51 29

SECTION 27 53 19 - EMERGENCY RESPONDER RADIO REINFORCEMENT SYSTEM

PART 1 GENERAL

1.01 SCOPE

A. This section includes product and execution requirements for Emergency Responder Radio Reinforcement system.

1.02 DESCRIPTION

A. Design and provision of a complete, turnkey Emergency Responder Radio Reinforcement system compliant with all applicable codes and standards referenced herein and as indicated on drawings.

B. The Emergency Responder Radio Reinforcement system shall include the following major components:

(1) Donor Antenna(s)
(2) Surge Protection
(3) Bi-Directional Amplifier / Repeater
(4) Splitters
(5) Directional Couplers/Taps
(6) Coverage Antennas
(7) Uninterruptible Power Supplies

1.03 RELATED WORK

A. Related Division 27 Sections include:

(1) Section 27 0000 - General Communications Requirements
(2) Section 27 0526 - Grounding and Bonding for Communications Systems
(3) Section 27 0528.29 - Hangers and Supports for Communications Systems
(4) Section 27 0528.33 - Raceway and Boxes for Communications Systems
(5) Section 27 0528.36 – Cable Trays for Communications Systems
(6) Section 27 0553 – Communications Systems Identification
(7) Section 27 0593 – Communications Firestopping
(8) Section 27 1300 – Communications Backbone Cabling
(9) Section 27 1500 – Communications Horizontal Cabling
(10) Section 27 1600 – Communications Connecting Cords and Adapters

B. Related sections in other Divisions of Work:

(1) Section 26 4113 - Lightning Protection for Structures

1.04 REFERENCES AND STANDARDS

A. Unless otherwise noted, design, products, installation, and completed work shall conform with the current version of the following, including applicable addenda and errata:

(1) United States Table of Frequency Allocations, current version
(2) Federal Communications Commission Table of Frequency Allocations, current version
(3) FCC 47 CFR Part 90.219
(4) FCC OET Bulletin 65
(5) IFC International Fire Code
(6) UL 2524 Standard for In-building 2-Way Emergency Radio Communication Enhancement Systems
(7) NFPA 1: Fire Code
(8) NFPA 72: National Fire Alarm and Signaling Code
(9) NFPA 1221: Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems

1.05 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 27 0000 - General Communications Requirements for general terminology used in Division 27 sections.

B. In addition, following abbreviations and acronyms shall apply to this document:

(1) ACG: Automatic Gain Control
(2) AHJ: Authority Having Jurisdiction
(3) ATP: Acceptance Test Plan
(4) AWS: Advanced Wireless Service
(5) BDA: Bi-Directional Amplifier

(6) BOM: Bill-of-Material
(7) BRS: Broadband Radio Service
(8) BTS: Base Transceiver Station
(9) CDMA: Code Division Multiple Access
(10) C/N: Carrier-to-Noise Ratio
(11) CWDM: Coarse Wave Division Multiplexing
(12) DAS: Emergency Responder Radio Reinforcement System
(13) DAS: Two-way Radio Communications Enhancement System
(14) DAQ: Delivered Audio Quality
(15) DWDM: Dense Wave Division Multiplexing
(16) EBS: Educational Broadband Service
(17) ESMR: Enhanced Specialized Mobile Radio
(18) ERRC: Emergency Responder Radio Coverage
(19) FCC: Federal Communications Commission
(20) GUI: Graphical User Interface
(21) iDEN: Integrated Enhanced Digital Network
(22) LMR: Land Mobile Radio
(23) LTE: Long Term Evolution
(24) MIMO: Multiple-Input and Multiple-Output
(25) MTBF: Mean Time Between Failure
(26) NFPA: National Fire Protection Association
(27) NMS: Network Management System
(28) NTIA: National Telecommunications and Information Administration
(29) PCS: Personal Communications System
(30) PSE: Public Safety Entity
(31) PSN: Public Safety Network
(32) RF: Radio Frequency
(33) RoF: Radio-over-Fiber
(34) RoHS: Restriction of Hazardous Substances
(35) RSL: Received Signal Level
(36) RX: Receive
(37) SISO: Single-Input, Single-Output
(38) SMR: Specialized Mobile Radio
(39) SMS: Short Message Service
(40) SNIR: Signal-to-Noise Interference Ratio
(41) SNMP: Simple Network Management Protocol
(42) SOW: Statement of Work
(43) TSL: Transmit Signal Level
(44) TX: Transmit
(45) VSWR: Voltage Standing Wave Ratio
(46) WSP: Wireless Service Provider

1.06 DEFINITIONS

A. Refer to Section 27 0000 - General Communications Requirements for general terminology used in Division 27 sections.

B. In addition, the following definitions are applicable to this document:

(1) Active: DAS components that require AC/DC power for operation
(2) Carrier Approval: Expressed approval to interconnect to the WSP macro network
(3) Channel: A path for an RF transmission between two points
(4) Component: A main system element of the DAS
(5) Contractor: The prime contractor bidding the project
(6) Passive: DAS components that do not require AC/DC power for operation

1.07 WORK BY OWNER

A. Refer to Section 27 0000 - General Communications Requirements which identifies Work by Owner affecting sub-system(s) covered by this section.

1.08 SUBMITTALS

A. Refer to Section 27 0000 - General Communications Requirements which provides general guidelines for product or installation information to be submitted by Contractor.

B. In addition, Submit:

(1) Initial RF site survey and analysis report, to include:

(a) Data collection point locations

(b) RF spectrum shots

(c) RF data plot maps

(2) Floor plans documenting proposed coverage antenna locations

(3) RF propagation modeling maps

(4) SNIR maps

(5) Link budget calculations, for both downlink path and uplink path

(6) Maximum Permissible Exposure calculation documentation

(a) Prepared by independent third party

(7) Documentation that each WSP and PSN has reviewed and approved proposed equipment and Contractor's design

(8) Follow-up RF site survey and analysis report, to include:

(a) Data collection point locations

(b) RF spectrum shots

(c) RF data plot maps

(d) Documentation of changes to initial system design required due to results of follow-up RF site survey, where required, to include as applicable:

1) Floor plans documenting proposed coverage antenna locations

2) RF propagation modeling maps

3) SNIR maps

4) Link budget calculations, for both downlink path and uplink path

5) Maximum Permissible Exposure calculation documentation

6) Prepared by an independent third party

7) Documentation that each WSP and PSN has reviewed and approved proposed equipment and Contractor's design

PART 2 PRODUCTS

2.01 GENERAL

A. System shall be a BDA style turnkey system capable of integral support of RF signals for PSNs managed by FCC.

B. System shall support each PSN on each frequency currently being used by PSEs serving project area.

(1) Coordinate directly with each PSE prior to the commencement of design work to confirm frequencies active on the project's scheduled date of substantial completion.

C. System shall be expandable to support each frequency band allocated by FCC for PSN use, in a MIMO antenna environment without replacement of or addition to the system's passive infrastructure.

D. System shall be capable of receiving PSN AHJ approval.

E. System shall include filtering of all frequencies unused by PSN signals in area in which project is located.

F. System shall be capable of upgrade, without need for additional hardware or software, to support changes to other frequencies within deployed frequency bands to maintain PSN coverage as originally designed.

G. System shall be expandable to extend coverage for all Public Safety frequencies supported to future new additions without need for additional head end equipment.

H. Passive system components shall be:

(1) Broadband

(2) MIMO compatible

(3) PIM (passive intermodulation) compliant

2.02 ANTENNAS

A. Broadband Donor Antenna

(1) Antennas shall feature multi-band design accommodating applicable Public Safety frequencies in a single pole-mounted antenna.
(2) Temperature range: -40°F to 140°F.
(3) Rated for outdoor use.

B. Coverage Antennas – Omnidirectional
(1) Antennas shall feature multi-band design accommodating multiple frequency bands in a single ceiling-mounted antenna
(2) Antenna beam width:
(a) Horizontal: 360° omnidirectional
(b) Vertical: 65-80° nominal
(3) Temperature range: -40°F to140°F.
(4) Rated for indoor use.

C. Coverage Antennas - Directional
(1) Antennas shall feature multi-band design accommodating multiple frequency bands in a single wall-mounted antenna
(2) Antenna beam width:
(a) Horizontal: 110° directional
(b) Vertical: 90° nominal
(3) Temperature range: -40°F to 140°F.
(4) Rated for indoor use.

2.03 BI-DIRECTIONAL AMPLIFIERS

A. Where BDA is used to drive DAS, BDA shall be modular design and use digital filtering to mitigate interference.
B. BDA shall be standard 19" rack or wall mountable.
C. BDA shall be able to individually control power level of each frequency band amplified.

2.04 CABLING

A. Feeder and riser coaxial cables shall be plenum rated.
B. Backbone, antenna distribution, radiating, and fiber optic cables shall be plenum rated.

PART 3 EXECUTION

3.01 PSN SUPPORT COORDINATION MEETING

A. Prior to Contractor's design work commencement, Contractor shall arrange and conduct coordination meeting to review and coordinate Emergency Responder Radio Reinforcement system support of PSN frequencies.
(1) At minimum, attendees shall include:
(a) AHJ and representatives of public safety entities utilizing supported PSN frequencies
(b) Owner's project manager, facilities/buildings and grounds/maintenance representative, security representative, and information technology/information systems representative
(c) Construction Manager/General Contractor project manager and site superintendent/field foreman
(d) Division 26 site superintendent/field foreman
(e) Division 27 project manager and site superintendent/field foreman
(f) Emergency Responder Radio Reinforcement subcontractor/supplier project manager
(2) At minimum, meeting agenda topics shall include:
(a) Confirmation of PSN frequencies and channel loading currently being used by PSEs serving project area
(b) Identification of planned or potential changes in active frequencies and/or channel loading that may be implemented prior to scheduled date of substantial project completion
(c) Identification and discussion of proposed system's functional capabilities and limitations
(d) Step-by-step review of system design and deployment execution plan
(e) Review of survey, design, installation, configuration, programming, and testing schedule and of how those relate to overall construction schedule, including identification of interdependencies, project milestones, and critical dates.
(3) Meeting shall be scheduled with minimum of two weeks' notice.
(a) Contractor shall publish meeting agenda and distribute agenda and configuration and programming guide to invited attendees minimum of one week prior to meeting.
(4) Contractor shall take detailed notes during meeting and publish meeting minutes within one week after meeting. Minutes shall be distributed to attendees, Architect, and Engineer, and be included in Operation and Maintenance Manual.

3.02 PRE-DESIGN SITE SURVEY

A. After specified coordination meetings and before completion of design, Contractor shall conduct pre-design site survey.

B. Data collection points shall:

(1) Include potential donor antenna locations and elevations

(a) Every effort shall be made to be accurate in locating potential donor antenna locations and elevations on site during survey, to ensure survey measurements are conducted within 10 feet (304.8 cm) of actual locations, including elevation.

(2) Be sufficient in quantity and location to provide accurate and sufficiently granular data throughout coverage areas

(3) Be sufficient in quantity and location to properly inform Contractor's design

C. Survey measurements shall include:

(1) Baseline RF noise at and adjacent to supported frequencies

(2) Signal strength of each supported PSN's macro signals, at supported frequencies

D. Survey data shall be submitted to Architect and Engineer and be included in Operation and Maintenance Manual.

3.03 DESIGN

A. Where DAS is used in lieu of a two-way in-building wired emergency communications system, DAS design shall be approved by AHJ.

B. Contractor is solely responsible for design of Emergency Responder Radio Reinforcement System.

C. Contractor shall design Emergency Responder Radio Reinforcement System in accordance with manufacturer's instructions and recommendations, industry standard best practices, and requirements of supported PSNs. Where discrepancies arise, more stringent requirement will govern.

D. Contractor shall design Emergency Responder Radio Reinforcement System to provide performance specified herein throughout the coverage areas and to meet approval of all supported PSNs.

E. Refer to Architectural drawings for building occupant information.

3.04 PRE-INSTALLATION SITE SURVEY

A. Contractor shall conduct pre-installation site survey no more than thirty (30) days prior to commencement of installation work on site to acquire updated measurement data.

(1) Pre-installation site survey shall be conducted after walls are built and after glazing is installed.

(2) Where pre-design site survey is conducted within thirty days of commencement of installation work and fulfills all requirements for both pre-design site survey and pre-installation site survey, separate pre-installation site survey is not required.

B. Data collection points shall:

(1) Include potential donor antenna locations and elevations

(a) Every effort shall be made to be accurate in locating potential donor antenna locations and elevations on site during survey, to ensure survey measurements are conducted within 10 feet (304.8 cm) of actual locations, including elevation.

(2) Be sufficient in quantity and location to provide accurate and sufficiently granular data throughout coverage areas

(3) Be sufficient in quantity and location to properly verify Contractor's design

C. Survey measurements shall include:

(1) Baseline RF noise at and adjacent to supported frequencies

(2) Signal strength of each supported PSN's macro signals, at supported frequencies

(3) Continuous wave (CW) testing to validate propagation modeling

D. Survey data shall be submitted to Architect and Engineer and be included in Operation and Maintenance Manual.

E. Contractor shall update their design as required by updated survey data.

3.05 WORK SEQUENCE

A. Coordinate schedule of Emergency Responder Radio Reinforcement system work to ensure Certificate of Occupancy is obtained in accordance with project schedule.

3.06 EQUIPMENT SUPPORTS

A. Donor Antenna Mounts

(1) Donor antenna assemblies including antenna(s), antenna cable, antenna mount/mast, and associated accessories and hardware shall be designed and installed to withstand sustained winds of ≥ 100 miles (160.93 kilometers) per hour from any direction with all devices, equipment, and material installed and with up to 6 inches (152.4 mm) of radial ice accumulated.

(2) Make donor antenna mounts/masts and associated components, accessories, and hardware electrically continuous and properly ground to lightning protection system. Refer to Section 26 4113 for conductor sizing and termination requirements, and for additional information and requirements.

3.07 INSTALLATION

A. Design and installation shall be performed and overseen by FCC GROL licensed technician employed by installing contractor.

B. Equipment Locations

(1) Install antenna(s) in coverage areas. Refer to drawings for additional information.

(2) Install donor antenna and main system head end equipment where indicated on drawings. Refer to drawings for additional information.

(3) Install system floor-level equipment (splitters, directional couplers / taps, etc.) where indicated on drawings in telecommunications rooms. Refer to drawings for additional information.

(4) Active system components, including transmitter, receiver, signal booster components, external filters and battery system components, shall be contained in NEMA 4 or 4X enclosures.

C. Power Supplies

(1) Primary power source

(a) Emergency Responder Radio Reinforcement system active electronics shall be fed via minimum 20-amp emergency power electrical circuit(s), dedicated to Emergency Responder Radio Reinforcement system head end equipment.

(2) Secondary power source

(a) System shall include battery back-up sufficient to power system at 100 percent system operation for minimum of twenty-four (24) hours.

(3) Power supply system shall be equipped with emergency power off (EPO) switch adjacent to BDA or Signal Booster in an approved location. EPO shall disconnect both circuit breaker and secondary power supply simultaneously.

(4) Coordinate power requirements, quantities, connection locations, and schedule for activating power with on-site Division 26 Contractor prior to commencement of work on site.

D. Cabling

(1) Where DAS is used in lieu of two-way in-building wired emergency communications system, DAS shall have pathway survivability of Level 1, Level 2, or Level 3.

(2) Riser cables shall be routed through 2-hour rated enclosure.

(3) Connection between riser and feeder cables shall be made within 2-hour rated enclosure.

(a) Passage of feeder cable in and out of 2-hour rated enclosure shall be fire-stopped to 2-hour ratings.

E. Properly ground system components with minimum 6 AWG bonding conductor terminated with two-hole compression lugs.

(1) Refer to Section 27 0526 for additional information and requirements.

F. Provide and configure filtering to maximize composite power for PSN frequencies being supported.

G. Properly terminate unused RF ports on system devices, including amplifiers, splitters, directional coupler / taps, etc.

H. Donor Antennas

(1) Coordinate donor antenna locations and mounting method with Architect and GC prior to rough-in.

(2) Fasten donor antennas and associated mounting components. with stainless steel fasteners.

(3) Bond donor antenna cables to ground at point where cable connects to antenna and at point where cable transfers off antenna mounting structure.

(4) Provide in-line surge protection on antenna cables, at point where cable enters building.

(a) Properly ground surge protection components with minimum 6 AWG bonding conductor terminated with two-hole compression lugs.

(b) Refer to Section 27 0526 for additional information and requirements.

(5) Weatherproof exterior antenna cable connections with manufacturer-approved assembly.

I. Coverage Antennas shall be installed in accessible ceilings.. Coordinate antenna locations with work by other trades to ensure that direct access to antenna is maintained after project completion.

J. System shall provide uniform coverage. Radio coverage shall be provided throughout building as percentage of floor area.

(1) Building shall be considered to have acceptable emergency responder radio coverage when signal strength measurements in 95 percent of all areas on each floor of building meet signal strength requirements.

(2) Minimum signal strength of -95 dBm shall be receivable within the building.

(3) Minimum signal strength of -95 dBm shall be received by agency's radio system when transmitted from within building.

(4) Critical areas, including fire command centers, fire pump rooms, exit stairs, exit passageways, elevator lobbies, standpipe cabinets, sprinkler sectional valve locations, and other areas deemed critical by AHJ, shall be provided with 99 percent floor area radio coverage.

(a) General building areas shall be provided with 90 percent floor area radio coverage.

(5) Minimum inbound signal strength sufficient to provide usable voice communications, as specified by AHJ, shall be provided throughout coverage area. Inbound signal level shall be sufficient to provide minimum of DAQ 3.0 for either analog or digital signals.

(6) Minimum outbound signal strength sufficient to provide usable voice communications, as specified by AHJ, shall be provided throughout coverage area. Outbound signal level shall be sufficient to provide minimum DAQ 3.0 for either analog or digital signals.

(7) Isolation shall be maintained between donor antenna and inside antennas to minimum of 20 dB under operating conditions.

K. System shall not interfere with operation of other electronic systems.

3.08 SYSTEM MONITORING

A. Fire Alarm System

(1) System shall include automatic supervisory signals for malfunctions of emergency responder radio reinforcement system annunciated by fire alarm system in accordance with NFPA 72.

(a) Monitoring for system integrity shall comply with NFPA 72, Chapter 10.

(b) Provide visual and labeled indications for each supervised system component.

(c) System supervisory signals shall include:

1) Donor antenna malfunction

2) Active RF emitting device failure

3) Low-battery capacity indication when 70 percent of the 24-hour operating capacity has been depleted

4) System component failure

(d) Power supply supervisory signals shall include the following for each RF emitting device and system component:

1) Loss of normal AC power

2) Failure of battery charger

(e) Communications link between fire alarm system and emergency responder radio reinforcement system shall be monitored for integrity.

B. Dedicated Panel

(1) Dedicated monitoring panel shall be provided within fire command center to annunciate status of RF emitting devices and system component locations. Monitoring panel shall provide visual and labeled indications of following for each system component and RF emitting device:

(a) Normal AC power

(b) Loss of normal AC power

(c) Battery charger failure

(d) Low battery capacity (to 70 percent depletion)

(e) Donor antenna malfunction

(f) Active RF emitting device malfunction

(g) System component malfunction

(2) Communications link between dedicated monitoring panel and emergency responder radio reinforcement system must be monitored for integrity.

3.09 INSPECTION AND TESTING

A. Test plan shall include tests necessary to verify that installed system meets specified requirements and requirements of each PSE.

B. Scheduling

(1) Testing shall be scheduled minimum of two weeks prior to scheduled date of final completion.

(a) Contractor shall coordinate with each PSE to arrange for them to observe system testing.

C. Data collection points

(1) Data collection points shall include:

(a) All donor antenna locations

(b) Signal level at each stair landing and elevator lobby

(c) Signal level at locations as required by AHJ

(2) Be sufficient in quantity and location to properly verify that system's performance meets specified requirements and requirements of each PSE.

(a) At a minimum, each floor shall be divided into twenty equal areas and data shall be collected at or as near as is practical to the center of each area.

D. Survey measurements shall include:

(1) Baseline RF noise at and adjacent to supported frequencies

(2) Signal strength of each supported PSN's macro signals, at supported frequencies

(3) Continuous wave (CW) testing

(4) Signal strength of each supported PSN's system coverage signals, at all supported frequencies

E. At no additional cost to Owner, Contractor shall adjust, modify, and/or add to system as necessary to achieve performance required by AHJ.

3.10 ATTIC STOCK

A. Contractor shall provide following spare devices and equipment as Owner's attic stock:

(1) Donor Antennas: One (1) of each type provided

(2) Coverage Antennas: Five (5) of each type provided

(3) Surge Suppressors: 100% of the quantity installed of each type provided.

(4) Fuses: 20% of each type provided as part of system devices and equipment, minimum ten (10) of each type provided.

3.11 TRAINING

A. Contractor shall provide to Owner's designated representative(s) a minimum of one (1) 4-hour on-site training session related to work under this section within thirty (30) days of substantial completion.

END OF SECTION 27 53 19

END OF DIVISION 27

DIVISION 28 – ELECTRONIC SAFETY AND SECURITY

SECTION 28 0000 **GENERAL ELECTRINIC SAFETY AND SECURITY REQUIREMENTS**

SECTION 28 1000 **ELECTRONIC ACCESS CONTROL**

SECTION 28 2000 **VIDEO SURVEILLANCE**

SECTION 28 4610 **ADDRESSABLE FIRE DETECTION AND ALARM SYSTEMS**

SECTION 28 00 00 - GENERAL ELECTRONIC SAFETY AND SECURITY REQUIREMENTS

PART 1 GENERAL

1.01 SCOPE

A. This section details references, standards, guidelines, requirements, and conditions common to all Division 28 work.

B. Work under this Section and related sections is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

C. Systems constituting Division 28 scope of work include the following Electronic Safety and Security devices as show in the Project documents.

(1) Electronic Access Control Devices

(2) Video Surveillance

D. Fire Detection and Alarm under Section 283116 is not included as part of these general requirements.

1.02 DESCRIPTION

A. Intent of drawings and specifications is to obtain complete systems tested, adjusted, and ready for operation.

B. Except as otherwise defined in greater detail, terms "provide", "furnish", and "install" as used in Division 28 Contract Documents shall have following meanings:

(1) "Provide" or "provided" shall mean "furnish and install".

(2) "Furnish" or "furnished" does not include installation.

(3) "Install" or "installed" does not include furnishing.

C. Include incidental details not usually shown or specified but necessary for proper installation and operation.

D. Check, verify, and coordinate work with drawings and specifications prepared for other trades. Include modifications, relocations, adjustments, etc. necessary to complete work and/or to avoid interference with other trades.

E. Included in this contract are connections to equipment provided by others. Refer to Architectural, Electrical, Integrated Automation, Mechanical, Communications, and final shop drawings for equipment being furnished under other sections for exact locations of outlets and various connections required.

F. Information given herein and on drawings is as exact as could be secured but is not guaranteed. Do not scale drawings for exact dimensions.

G. Where Architectural features govern location of work, refer to Architectural drawings.

H. Perform work in "neat and workmanlike" manner as defined in ANSI/NECA 1 "Standard Practices for Good Workmanship in Electrical Contracting".

1.03 RELATED WORK

A. Related Division 28 Sections include:

(1) Section 28 1000 - Electronic Access Control

(2) Section 28 2000 - Video Surveillance

B. Refer to individual technical sections identified above for additional related sections.

C. Related sections in other Divisions of Work:

(1) Section 26 0593 – Electrical Systems Firestopping

(2) Section 27 1000 - Structured Cabling

(3) Section 27 1100 - Communications Equipment Room Fittings

(4) Section 27 1300 - Communications Backbone Cabling

(5) Section 27 1500 - Communications Horizontal Cabling

(6) Section 27 1600 - Communication Connecting Cords, Devices and Adapters

(7) Refer to individual technical sections identified above for additional related sections.

D. Temporary Services:

(1) Not applicable to this project.

E. Continuity of Service:

(1) No service shall be interrupted or changed without permission from Owner and Architect / Engineer. Obtain written permission before work is started.

(2) When interruption of services is required, persons concerned shall be notified and shall agree upon schedule.

F. Demolition:

(1) Not applicable to this project.

G. Cleaning and Repair

(1) Clean and repair existing materials and equipment that remain or is to be reused.

H. Concrete Work:

(1) Not applicable to thjs Division of work.

I. Painting:

(1) Painting of equipment will be done under Division 9 unless specified otherwise or is to be furnished with factory applied finish coats.

(2) Furnish equipment with factory applied prime finish unless otherwise specified.

(3) If factory finish on equipment furnished by Contractor is damaged in shipment or during construction, refinish equipment to satisfaction of Architect / Engineer.

(4) Furnish one can of touch up paint for each factory finish, which will be final finished surface of product.

1.04 REQUIREMENTS OF REGULATORY AGENCIES

A. Rules and regulations of Federal, State, and local authorities and utility companies in force at time of execution of contract shall become part of this specification.

B. Perform work in accordance with laws, codes, regulations, ordinances, etc. of jurisdiction in which project site is located and in accordance with Owner's published standards.

C. Perform work in accordance with referenced standards, guidelines, and industry best practices.

D. Perform work in accordance with manufacturer's instructions, guidelines, recommendations, etc.

E. Where discrepancy exists between laws, codes, regulations, ordinances, guidelines, industry best practices, Owner's published standards, manufacturer's instructions, manufacturer's guidelines, manufacturer's recommendations, etc. and Contract Documents, most stringent requirement or direction that complies with laws, codes, regulations, and ordinances shall govern.

F. Changes to work conveyed by Contract Documents made after letting of contract to comply with applicable laws, codes, regulations, ordinances, Owner's published standards, or Contract Documents or to comply with requirements of Authority Having Jurisdiction shall be made by Contractor without any cost to Owner.

G. Contractor shall include in their bid costs to procure permits, licenses, approvals, etc. applicable to work performed, including:

(1) Costs to prepare documents for applications, submittals, etc. for review by Authority Having Jurisdiction

(2) Application, submittal, etc. charges, fees, taxes, etc.

(3) Contractor shall include in their bid costs for inspections of work performed related to permits, licenses, approvals, etc. or laws, codes, regulations, ordinances, or Owner's published standards.

1.05 REFERENCES AND STANDARDS

A. Design, cable and component selection, and installation practices shall conform with following:

(1) Local Electrical Code

(2) Federal, State of Arkansas and City of Fayetteville safety and building codes.

(3) UL 444 - Communications Cables

(4) NFPA 730 - Guide for Premises Security 2006 Edition

(5) NFPA 731 – Standard for the Installation of Electronic Premises Security Systems 20060 Edition

(6) BICSI Electronic Safety and Security Design Reference Manual, First Edition, 2006

(7) FCC Federal Communications Commission
(8) ICEA Insulated Cable Engineers Association
(9) IEEE Institute of Electrical and Electronics Engineers
(10) NEC National Electrical Code
(11) NECA National Electrical Contractors Association
(12) NEMA National Electrical Manufacturers Association
(13) NESC National Electrical Safety Code
(14) NETA National Electrical Testing Association
(15) NFPA National Fire Protection Association
(16) NIST National Institute of Standards and Technology
(17) OSHA Occupational Safety and Health Administration
(18) TIA Telecommunications Industry Association
(19) UL Underwriters Laboratories, Inc.

C. Work shall be in accordance with latest edition of codes, standards, specifications, etc. unless noted otherwise.

1.06 DEFINITIONS

A. Following definitions are applicable to communications environments and shall apply to this document and its companion sections for clarification and direction.

(1) Building Entrance Facility: An entrance to building for both public and private network service cables and/or wireless services including entrance point of building and continuing to Equipment Room. . Service provider(s) point-of-demarcation (DEMARC) is typically located here.
(2) Equipment Room (Main Telecommunications Room): An environmentally controlled centralized space where Electronic Safety and Security equipment such as head end equipment, servers, control panels, power supplies, and systems wiring and cabling terminations will reside.
(3) Guarantee: Promise or an assurance that attests to quality or durability of product or service or that task will be performed in specified manner. Used interchangeably with "Warranty" in these documents.
(4) Intra-building: Within single building.
(5) Inter-building: Between 2 or more buildings.
(6) Rack Unit: Standard measurement of vertical mounting space on an equipment rack. Each Rack Unit is 1-3/4” high.

B. Typical NEMA Enclosures and Usage

(1) Refer to Section 26 0000 – General Electrical Requirements.

1.07 ABBREVIATIONS AND ACRONYMS

A. Following abbreviations and acronyms shall apply to this document and its companion sections for clarification and direction.

(1) 8P8C Eight-Position, Eight-Conductor. Used in clarifying jack type; a.k.a. "RJ-45".
(2) ACMS
(3) AFF Above Finished Floor

B. Refer also to technical sections for additional terminology.

1.08 LISTING

A. Refer to technical sections of this Division of work for listing requirements.

1.09 SUBMITTALS

A. Submit shop drawings for equipment provided under this Section:
(1) Refer to Division 01 - Submittal Procedures.
(2) Provide documentation demonstrating compliance with requirements specified in 280000 - 1.13 - Quality Assurance below.
(3) Note that for satisfying submittal requirements for Division 28, "Product Data" is usually more appropriate than true "Shop Drawings" as defined in Division 01. However, expression "Shop Drawings" is generally used throughout specification.
(4) Mark catalog sheets and drawings to indicate specific items submitted.
(a) Markings shall be reproducible (arrow, boxed, encircled, checkmark, etc.).
(b) Where sheet includes multiple product options, mark proposed option(s).
(5) Include proper identification of equipment by name and/or number, as indicated in specification and shown on drawings.
(6) When manufacturer's reference numbers are different from those specified, provide correct cross-reference number for each item. Mark and annotate submittals accordingly.
(7) Group submittals by Section to include complete documentation of related systems, products, and accessories. Where applicable, dimensions shall be marked in units to match those specified.
(8) Submittals shall be in electronic form or on paper per Division 01.
(a) Documents in electronic form shall be ADOBE Acrobat PDF.
(b) Paper documents shall be original catalog sheets or photocopies thereof.
(c) Facsimile (fax) sheets will not be accepted.

(9) Engineer's Review is to confirm compliance with performance, interoperability, physical, and other pertinent requirements of project. Review is not to confirm quantities nor that all required items have been submitted.

(10) When equipment and items specified include accessories, parts, and/or additional items under one designation, submittals shall be complete and include required components.

(11) Include wiring diagrams for electrically powered or controlled equipment.

(12) Where submittals cover products containing potentially hazardous non-metallic materials, include "Material Safety Data Sheet" (MSDS) from manufacturer stating physical and chemical properties of components and precautionary considerations required.

(13) Submit documentation demonstrating each Contractor-proposed server, networked storage appliance, and computer workstation hardware, BIOS, and operating system configuration meets Application Software manufacturer's recommendations for optimal performance for scope defined in project documents and meets Owner's requirements for those devices.

(14) Submit calculations based on manufacturer's recommendations documenting Contractor-proposed battery capacity for each Uninterruptible Power Supply provides specified minimum battery run time.

(15) Submit equipment room layouts drawn to scale, including equipment, raceways, accessories, and clearance for maintenance.

(16) Submit shop drawings or product data as soon as practicable after signing contracts. Submittals must be approved before installation of materials and equipment.

(17) Submittals which are not complete, not permanent, or not properly checked by Contractor, will be returned without review.

(18) "Coordination Drawings", which are normally prepared by Contractor to coordinate work among various trades and to facilitate installation, shall not be submitted for Division 28 work unless specifically requested in technical sections. These types of drawings typically include dimensioned piping, ductwork, communications, and/or electrical raceway layouts.

(a) Unless specifically requested in Division 28 technical sections, submittals of coordination drawings will be returned without review.

1.10 UPON REQUEST BY THE OWNER OR ENGINEER, SUBMIT TWO-FOOT SECTION OF CABLE(S) OF THE TYPE(S) TO BE SENT TO THE SITE FOR FINAL APPROVAL.

A. This two-foot section shall have the manufacturer's cable markings visible.

B. Upon request, samples from every reel sent to the site shall be provided.

C. Certificates and Inspections:

(1) Obtain and pay for inspections required by authorities having jurisdiction and deliver certificates approving installations to Owner unless otherwise directed.

D. Operation and Maintenance Manuals:

(1) Refer to Division 01 - Operation and Maintenance Data.

(2) Upon completion of work but before final acceptance of system, submit to Architect / Engineer for approval, 3 copies of operation and maintenance manuals in loose-leaf binders. If "one copy" is larger than 2" thick or consists of multiple volumes, submit only one set initially for review. After securing approval, submit 3 copies to Owner.

(3) Manuals shall be organized by specification section number and shall have table of contents and tabs for each piece of equipment or system.

(4) Manuals shall include following:

(a) Copies of shop drawings

(b) Manufacturer's operating and maintenance instructions. Include parts lists of items or equipment. Where manufacturer's data includes several types or models, applicable type or model shall be designated.

(c) CD ROMs of O&M data with exploded parts lists where available

(d) Phone numbers and addresses of local parts suppliers and service companies

(e) Internet/Web page addresses where applicable

(f) Wiring diagrams

(g) Start up and shut down procedure

(h) Factory and field test records

(i) Additional information, diagrams, or explanations as designated under respective equipment or systems specification section

(5) Instruct Owner's representative in operation and maintenance of equipment. Instruction shall include complete operating cycle on all apparatus.

(6) O&M manuals and instructions to Owner shall be provided prior to request for final payment.

E. Record Documents:

(1) Refer to General Conditions of Contract and Division 01 - Closeout Procedures. Prepare complete set of record drawings in accordance with Division 01.

(2) Use designated set of prints of Contract Documents as prepared by Architect to mark-up for record drawing purposes.

1.11 JOB CONDITIONS

A. Building Access:

(1) Arrange for necessary openings in building to allow for admittance of all apparatus.

B. Cutting and Patching:

(1) Refer to General Conditions of Contract and Division 01 - Cutting and Patching.

(2) Perform cutting and patching required for complete installation of systems unless otherwise noted. Patch and restore work cut or damaged to original condition. This includes openings remaining from removal or relocation of existing system components.

(3) Provide materials required for patching unless otherwise noted.

(4) Do not pierce beams or columns without permission of Architect / Engineer and then only as directed. If openings are required through walls or floors where no sleeve has been provided, hole shall be core drilled to avoid unnecessary damage and structural weakening.

(5) Where alterations disturb lawns, paving, walks, etc., replace, repair, or refinish surfaces to condition existing prior to commencement of work. This may include areas beyond construction limits.

C. Housekeeping and Cleanup:

(1) Refer to Division 01 - Closeout Procedures.

(2) Periodically as work progresses and/or as directed by Architect / Engineer, remove waste materials from building and leave area of work broom clean. Upon completion of work, remove tools, scaffolding, broken and waste materials, etc. from site.

1.12 WORK BY OWNER

A. Owner will provide:

(1) Telecommunications service data and internet

(2) Active telephone electronics, including analog/digital/VoIP private branch exchange (PBX), telephones, fax machines, and modems, for interface with building structured cabling systems

(3) Active Ethernet networking electronics, including modems, routers, firewalls, switches, wireless Ethernet access points, for interface with building structured cabling systems

(a) Does not include Contractor-provided active Ethernet networking electronics specified in Division 28 Technical Sections as part of Division 28 scope.

(4) Active office electronics, including server computers, data storage appliances, workstation computers, scanners, and printers

(a) Does not include Contractor-provided server computers, data storage appliances, workstation computers, scanners, or printers specified in Division 28 Technical Sections as part of Division 28 scope.

(5) Connections from active telephone and Ethernet networking electronics to Contractor provided structured cabling (e.g. patch cords).

(a) Does not include Contractor-provided connections for Contractor-provided equipment, devices, etc.

1.13 QUALITY ASSURANCE

A. Refer to individual technical sections for general product quality requirements, manufacturer qualifications, and contractor qualifications and certification requirements.

B. Products

(1) Only products of reputable manufacturers, as determined by Architect / Engineer, will be acceptable. Manufacturers shall have minimum of five (5) years of documented experience in designing, manufacturing, delivering, and supporting specified material.

(2) Where Contract Documents require product, material, or assembly that hasn't been specified by brand or trade name, provide product, material, or assembly meeting specified requirements, as supplied and warranted by system vendor. If system vendor does not offer product, material, or assembly, provide product, material, or assembly per system vendor's recommendation.

C. Contractor

(1) Contractor shall have minimum of five (5 years' documented experience providing and servicing specified equipment, devices, components, materials, and systems.

(2) Contractor shall have documented history of successfully completing minimum of five (5) projects of scope and magnitude equal to or greater than that specified in Contract Documents.

(3) Contractor shall have minimum of five (5) years' documented history of being continuously current on manufacturer's training and certifications applicable to specified equipment, devices, components, materials, and systems they propose for use on project.

(4) Contractor shall have minimum of five (5) years' documented history of being certified by manufacturer to offer and support manufacturer warranties applicable to specified equipment, devices, components, materials, and systems they propose for use on project.

(5) Contractor's staff assigned as project manager, site superintendent, and foreman shall each have documented history of successfully completing minimum of five (5) projects of scope and magnitude equal to or greater than that specified in Contract Documents.

(6) Contractor's staff assigned as site superintendent and foreman and Contractor's staff assigned to perform installation, termination, configuration, programming, and testing shall have minimum of five (5) years' documented experience of being continuously, individually certified by manufacturer on specified equipment, devices, components, materials, and systems proposed and approved for use on project.

(7) Contractor shall have in-house service department staffed with technicians who are individually manufacturer-certified to install and service specified equipment, devices, components, materials, and systems proposed and approved for use on project, and who are equipped with tools, equipment, materials, etc. necessary to install and service specified equipment, devices, components, materials, and systems proposed and approved for use on project.

(a) Contractor's in-house service department shall offer maximum 4-houron-site service call response time 24 hours a day, 7 days a week, 365(6) days a year.

(8) Contractor and subcontractor(s) shall only employ workers who are properly trained to execute work being performed and are skilled in their trade.

(9) Contractor and subcontractor(s) shall own and maintain equipment, tools, etc. to execute work performed in manner consistent with laws, codes, regulations, ordinances, standards, guidelines, industry best practices, manufacturer's instructions, etc.. Workers shall be properly trained in use of equipment, tools, etc. necessary for them to complete work performed.

(10) Inability to demonstrate compliance with requirements listed above shall disqualify Contractor from self-performing work conveyed by Contract Documents, and Contractor shall then, at no additional cost to Owner, subcontract with another firm qualified to perform work.

1.14 GUARANTEE

A. Refer to Division 01 for general Guarantee (Warranty) requirements.

B. Refer to technical sections for Guarantee requirement for each system.

(1) Where no guarantee requirements are called out, guarantee two years after acceptance by Owner equipment, materials, and workmanship to be free from defect.

C. Repair, replace, or alter systems or parts of systems found defective at no extra cost to Owner.

D. Wherein fulfilling requirements of any guarantee, if Contractor disturbs any work guaranteed under another contract, restore such disturbed work to condition satisfactory to Architect / Engineer and guarantee such restored work to same extent as it was guaranteed under such other contract.

E. Guarantees shall include labor, material, and travel time.

PART 2 PRODUCTS

2.01 GENERAL

A. Provide new materials, unless specifically noted otherwise in Contract Documents.

B. Where manufacturer has replaced part number with newer part number, provide manufacturer's version that is most current offering available at time of installation.

C. Where manufacturer has published end of life or similar notice for part number, notify Architect / Engineer of notice and manufacturer's recommended substitution. Where manufacturer offers no substitution, provide Architect / Engineer three (3) options to consider for acceptable alternates.

D. Where multiple manufacturers' names or manufacturers' names and part numbers are listed, basis of design listed shall be considered benchmark for quality, features, and functionality for that material.

E. Include hardware, details, options, modules, accessories, subassemblies, etc. not shown or specified, but necessary for proper installation and operation.

F. Where one or more of same item of material is required, all such units shall be provided as same manufacturer and part number.

G. Refer to technical sections for additional information and requirements.

2.02 PRODUCT SUBSTITUTIONS

A. Refer to Division 01 - Product Requirements.

PART 3 EXECUTION

3.01 GENERAL

A. Verify elevations and measurements prior to installation of materials.

B. Examine all drawings and specifications to familiarize themselves with the type of construction to be used, and the nature and extent of work provided by other trades.

C. Beginning installation means Contractor accepts existing conditions.

D. Verify dimensions and the correct locations of hardware before proceeding with the installation of hardware, cabling and/or connections.

E. Identify and report to Owner any existing damage to walls, flooring, tiles and furnishings in the work area prior to start of work.

F. Repair all damage caused by the cable, raceway, or miscellaneous material to the interior surfaces during the communication installation.

G. Repairs must match preexisting color and finish of walls, floors and ceilings.

H. Replace any contractor damaged ceiling tiles to match color, size, style and texture and shall not be taken from Owner's attic stock.

I. Secure all rooms and offices when not in use.

J. At no time shall the Equipment Room or any Telecommunications Rooms be unattended if unsecured.

K. Assume that all installation work including cable placement, termination and testing shall be performed between the hours of 7:00 a.m. to 5:00 p.m. Monday through Friday unless stated otherwise in the bid.

L. Complete installation work using qualified personnel utilizing state-of-the-art equipment and techniques.

M. Test and document installation upon completion as defined in the technical sections.

N. Products selection, installation plans and termination layouts must be reviewed and approved by the Owner prior to construction.

3.02 THE REVIEW DOES NOT EXEMPT THE CONTRACTOR FROM MEETING ANY OF THE REQUIREMENTS STATED IN THIS DOCUMENT.

3.03 DELIVERY, STORAGE, AND HANDLING

A. Refer to Division 01 for additional information and requirements.

B. Transport, handle, and store materials in manner that avoids damage, preserves their original condition as delivered from manufacturer, is consistent with manufacturer’s guidelines and instructions, and maintains applicable manufacturer warranties.

(1) Protect material from deleterious substances, agents, contaminants, and conditions, including dust, dirt, debris, moisture, chemicals, chemical compounds, corrosion, temperatures outside material’s published tolerance range.

(2) Protect material from damage due to intentional or incidental contact, vandalism, neglect, etc.

C. Handle materials in accordance with recommended procedures, precautions, and remedies described in material safety data sheets, where applicable.

(1) Where applicable, lift only with lugs provided for purpose.

D. Store materials in clean, dry, secure, temperature-controlled location.

E. Maintain manufacturer’s original material packaging and shipping packaging until material is installed.

F. Store cable according to manufacturer's recommendations at a minimum.

G. Store cable in a location protected from vandalism and weather.

(1) If cable is stored outside, cover with opaque plastic or canvas with provision for ventilation to prevent condensation and for protection from weather.

H. Follow manufacturer's storage specifications - in particular, those relating to temperature.

I. Confine all tools, materials and equipment to area designated by the Owner.

J. Clean up and dispose of all debris and rubbish resulting from work on a daily basis.

(a) Clean up of the dust, debris, shipping and packaging material associated with their installation.

K. Provide storage containers as required. The Owner's disposal containers, shall not to be utilized without written authorization.

L. Contractor shall include in their bid costs to deliver, store, and handle materials.

3.04 FLOOR, WALL, CEILING, AND ROOF OPENINGS

A. Coordinate location of openings, chases, furred spaces, etc. with appropriate Contractors. Provide during progress of construction sleeves and inserts that are to be built into structure.

B. Temporary sleeves, if used to form wall openings, shall be removed prior to installation of permanent materials. Permanent sleeves for wall penetrations shall be minimum 24 ga galvanized sheet metal unless otherwise noted.

C. Steel sleeves, when required, shall be Schedule 40 carbon steel pipe with integral water stop.

D. For core drilled holes, size and location shall be reviewed and approved by Structural Engineer and Owner prior to execution.

E. Submit product data and installation details for penetrations of building structure. Submittal shall include schedule indicating penetrating materials, (including steel conduit, PVC conduit, cables, cable tray), sizes of each, opening sizes and sealant products intended for use.

F. Where penetrations of fire-rated assemblies are involved, seal penetrations with appropriate firestopping systems as specified in Contract Documents.

G. Submit complete penetration layout drawings showing openings in building structural members including floor slabs, bearing walls, shear walls. Indicate and locate, by dimension, required openings including those sleeved, formed or core drilled. Drawings shall be approved by structural engineer prior to preparing openings in structural member.

H. Openings for penetrations shall be minimum 1/2” larger on all sides than outside dimensions of raceways or cables. Where fire resistant penetrations are required, size openings in accordance with recommendations of firestopping systems manufacturer.

I. Seal non fire-rated floor penetrations with non-shrink grout equal to Embeco by Master Builders, or urethane caulk, as appropriate.

J. Seal non-rated wall openings with urethane caulk.

K. Where penetrations occur through exterior walls into building spaces, use steel sleeves with integral water stop, similar to type "WS" wall sleeves by Thunderline Corporation. Seal annular space between sleeves and pipe with "Link-Seal" modular wall and casing seals by Thunderline Corporation or sealing system by another manufacturer approved as equal by Architect / Engineer. Sealing system shall utilize Type 316 stainless steel bolts, washers, and nuts.

L. Finish and trim penetrations as shown on details and as specified hereinafter.

M. Provide chrome or nickel-plated escutcheons where raceways pass through walls, floors, or ceilings and are exposed in finished areas. Size escutcheons to fit raceways for finished appearance. Finished areas shall not include mechanical/electrical rooms, janitor’s closets, storage rooms, etc., unless suspended ceilings are specified.

3.05 EQUIPMENT ACCESS

A. Install raceways, junction and pull boxes, and accessories to permit access to equipment for maintenance. Relocation of raceways or accessories as required to provide access shall be provided at no additional cost to Owner.

B. Install equipment with ample space allowed for removal, repair, or changes to equipment. Provide ready accessibility to equipment and wiring without moving other equipment, which is to be installed or which is already in place.

C. Access doors in walls, chases, or inaccessible ceilings will be provided under Division 08 - Access Doors and Frames, unless otherwise indicated. Access doors shall be for purpose of providing access where equipment requiring servicing, repairs, or maintenance is located in walls, chases, or above inaccessible ceilings.

D. Provide necessary coordination and information to Trade Contractor under Division 08 - Access Doors and Frames. This information shall include required locations, sizes, and rough-in dimensions, without limitations.

E. Provide access doors where equipment requiring access for servicing, repairs, and maintenance is located in walls or chases or above inaccessible ceilings, unless otherwise noted. Access frames and doors shall be as manufactured by Milcor, Incorporated, or similar, of style applicable to surface. Access doors used in fire-rated construction shall have UL label. Access doors shall be steel, prime coated, except use stainless steel doors in ceramic tile walls, toilet rooms, locker rooms, and in areas subject to excessive moisture. Access doors shall be of sufficient size to allow for total maintenance. Location of access doors shall be coordinated with General Contractor and location of equipment shall be roughed in accordingly.

F. Locate equipment, devices, etc. to fit details, panels, decorating, finish, etc. at space. Architect / Engineer reserves right to make minor position changes of outlet locations before work has been installed.

G. Verify room door swings before installing wall-mounted equipment, devices, etc. and install on latch side of door unless otherwise noted.

3.06 EQUIPMENT SUPPORTS

A. Provide supporting steel not indicated on drawings as required for installation of equipment and materials including angles, channels, beams, hangers, etc..

B. Concrete anchors, used for attachment to concrete, shall be steel shell with plug type. Plastic, rawhide, or anchors utilizing lead are not allowed.

C. Do not support equipment or cable pathways from metal roof decking.

3.07 SUPPORT PROTECTION

A. In occupied areas, mechanical rooms, and areas requiring normal maintenance access, certain equipment must be guarded to protect personnel from injury.

B. Provide minimum 1/2" thick Armstrong Armaflex insulation or similar product applied with Armstrong 520 adhesive on lower edges of equipment, including bus duct, cable tray, pull boxes, and electrical supporting devices suspended less than 7 ft above floors, platforms, or catwalks in these areas.

C. Threaded rod or bolts shall not extend beyond supporting element and shall be protected as described above.

3.08 CABLE AND CONDUCTOR PROTECTION

A. Protect cabling and termination components from contact with, and potential application of, foreign materials.

(1) Foreign material is defined as material that is not part of cable assembly and termination components when delivered from manufacturer.

(2) Examples include paint overspray and drywall compound.

B. Cable and components that come into contact with foreign materials shall be replaced at no cost to project.

(1) Solvents and other cleaning agents shall not be used to remove foreign materials that have already accumulated on cable and components.

3.09 HOUSEKEEPING PADS

A. Not applicable to this Division of work.

3.10 INSPECTION AND TESTING

A. General

(1) Submit with shop drawings documentation of proposed inspection and test procedures.

(a) Inspection and testing shall not commence without Architect / Engineer's approval of proposed procedures. Commencement of inspection and testing without Architect / Engineer's approval of proposed procedures shall be grounds for Architect / Engineer and Owner to reject documentation of related inspection and testing and require repeat of related inspection and tests at no additional cost to Owner.

(2) Prior to testing, visually inspect work to verify completion and compliance with applicable requirements.

(3) Coordinate and schedule testing to be complete minimum of fifteen (15) working days prior to scheduled occupancy, such that Architect / Engineer and Owner have minimum of ten (10) working days to review draft test results and Owner has minimum of five (5) working days to prepare phase area for occupancy.

(4) Coordinate and schedule testing phases to be complete minimum of fifteen (15) working days prior to scheduled occupancy of each construction phase, such that Architect / Engineer and Owner have minimum of ten (10) working days to review draft test results and Owner has minimum of five (5) working days to prepare phase area for occupancy.

(5) Conduct tests during course of construction when identifiable portion(s) of installation is complete.

(a) Alternatively, testing may be conducted after entire installation is complete, where doing so does not delay project schedule.

(6) Coordinate testing of work under this Division connected to or integrated with work under other sections with contractors of other trade(s) involved.

(7) Owner and/or Architect / Engineer may, at their option, be in attendance to witness testing. Submit proposed schedule for acceptance testing to Owner and Engineer minimum of ten (10) working days in advance to facilitate their participation.

(8) Provide equipment and personnel to conduct acceptance tests.

(9) Work shall be 100% fault free, unless otherwise noted. Where systems, equipment, devices, cable, etc. fail to meet required performance on criteria under test, replace or repair defective work and/or materials at no additional cost to Owner and repeat inspection and test. Replacement materials shall be new.

B. Testing Cable

(1) Test installed cable in accordance with applicable standards and cable manufacturer's and equipment manufacturer's published requirements, guidelines, and best practices.

(2) At minimum, testing of installed cable shall include:

(a) Test for opens on each conductor

(b) Test for conductor to conductor shorts, among all conductors

(c) Test for conductor to ground shorts, for each conductor (where applicable)

(d) Test for compliance with applicable cable performance standards (e.g., , Category 6, Category 6A, OS2, , etc.)

1) Refer to Section 27 1000 for additional information on and requirements for testing structured cabling.

(e) Tests recommended by manufacturer of associated equipment or devices.

C. Testing Devices

(1) Verify proper operation of each feature and function of each device.

(2) Verify that each device has been configured and programmed in accordance with requirements of Contract Documents and Owner's direction.

D. Test Documentation

(1) Document and certify test results in writing.

(2) Maintain copies of certified test results, including those for failed tests, at project site through completion of project.

E. Re-Testing

(1) Architect / Engineer or Owner may, at their option, request that random 10% re-test be conducted by this Contractor at no additional cost to Owner to verify documented findings. Re-testing conducted shall be an exact repeat of those conducted and documented previously.

(2) Owner may, at their option, also perform independent re-testing to verify documented findings.

(3) If re-test findings contradict previous test documentation submitted by Contractor, additional re-testing shall be performed by this Contractor at no additional cost to Owner. Extent of such additional re-testing, including 100% re-test, shall be determined solely by Architect / Engineer and Owner.

F. After successful completion of Contractor's testing, Contractor shall also facilitate and participate in functional performance testing that is separate and unique from Contractor's testing. Refer to functional performance testing specifications for additional information and requirements.

3.11 START-UP

A. Systems and equipment shall be started, adjusted, tested, etc. and turned over to Owner ready for operation.

(1) This includes "Owner-Furnished, Contractor-Installed" (OFCI) and "Contractor-Furnished, Contractor-Installed" (CFCI) systems and equipment.

B. Provide services of manufacturer-trained and -certified technician who is knowledgeable in start-up, adjustment, and checkout of systems and equipment provided and is experienced with specific materials provided.

(1) Where Contractor does not employ such technician directly on their own staff, Contractor shall provide at no additional cost to Owner such services from manufacturer's personnel.

C. Where specified, provide at no additional cost to Owner, services of manufacturer's personnel for start-up, adjustment, and checkout of systems and equipment provided.

D. Follow manufacturer's pre-start-up checkout, start-up, trouble shooting, and adjustment procedures.

E. Coordinate start-up with Owner and other trades.

3.12 DOCUMENTATION

A. Upon completion of installation, Contractor shall provide System Documentation. Documentation shall include:

(1) Acceptance Test Results

(2) Record Drawings

(3) Approved Submittals

(4) Manufacturer's Warranty Documents

B. Submit System Documentation in accordance with Division 01 "Project Record Documents".

(1) Documents shall be submitted in same electronic format in which they were received from Architect / Engineer.

(2) Document updates shall be performed in native software format matching original design team documents.

(a) Scans of hand marked documents shall not be allowed.

(3) Update documents to reflect installed conditions for equipment shown on documents.

C. Submit documentation within ten (10) working days of completion of testing of each testing phase (e.g. subsystem, cable type, area, floor, etc.) or 3 weeks prior to scheduled occupancy of subject area, whichever is sooner. This is inclusive of Test Result and draft Record Drawings.

(1) Draft drawings may include mark-ups done by hand.

(2) Machine generated (final) copies of Record Drawings shall be submitted within 30 working days of completion of each testing phase.

(3) Documentation will include all aspects of systems covered by these specifications that are required for systems to be fully functional.

(a) For structured cabling this includes horizontal link from TO to HC, backbone cabling from HC to MC, cross-connections, interconnections and/or patch cords that are responsibility of contractor.

D. Submit Acceptance Test Results in electronic form for review and distribution.

(1) Interim documentation of Test Results (if applicable) may be submitted via email or on CD-ROM.

(2) Final documentation of Test Results shall be submitted on CD-ROM.

(3) Test results shall be submitted in format(s) native to test instrument(s) used in performing testing.

(4) Where unique software (other than an MS-Wordf compatible Word Processor or MS-Excelf spreadsheet) is required for viewing of test results, Contractor shall provide along with above documentation, one licensed copy of such software. Software shall run on MICROSOFT Windows-based personal computer.

E. Acceptance Test results shall include description of sub-system tested, equipment/cable/outlet I.D., reference and test setup, test equipment type/model and serial number(s), equipment location and direction of test (if applicable), test frequencies/wavelengths, date, and operator name(s).

F. Engineer or Owner may request that 10% random re-test be conducted on cable system - at no additional cost - to verify documented findings. Tests shall be repeat of those defined above and in technical sections.

(1) Owner may also perform independent testing to verify results.

(2) If findings contradict documentation submitted by Contractor, additional testing can be requested to extent determined necessary by Engineer or Owner, including 100% re-test. This re-test shall be at no additional cost to Owner.

G. Documentation - including hard copy and electronic forms of Test Data and Record Drawings - shall become property of Owner.

H. Refer also to Technical Sections for requirements specific to covered subsystems.

3.13 CLEANING

A. Refer to Division 01 for additional information and requirements.

B. Refer to individual technical sections for additional information and requirements specific to work under that section.

C. Contractor shall, periodically, throughout execution of work under this section and/or as directed by Architect / Engineer, Owner, Construction Manager, or General Contractor, remove waste materials, trash, rubbish, debris, etc. generated by execution of work under this section from building and leave work areas broom clean.

(1) Construction waste shall be managed in accordance with provisions of Division 01 Section Construction Waste Management.

D. Prior to installation of active electronics, Electronic Safety and Security spaces must be cleaned to an ISO 14644-1 Class 8 standard.

E. After installation is complete and prior to Owner’s final acceptance, Contractor shall clean work provided under this section.

(1) Remove unused materials, tools, installation equipment, etc. from site.

(2) Faceplates, devices, components, equipment, enclosures, junction boxes, pull boxes, etc. shall be clean and free of stains, dust, dirt, debris, oil, grease, paint, and other foreign material.

(3) Interiors of equipment enclosures, junction boxes, pull boxes, etc. shall be clean and free of wire/cable scraps, pieces of wire/cable insulation, stains, dust, dirt, debris, oil, grease, paint, and other foreign material.

(4) Remove temporary labels not used for instruction or operation.

(5) Walls and floors of Electronic Safety and Security spaces and equipment rooms shall be clean and free of dust, dirt, debris, oil, grease, paint, and other foreign material.

(6) Remove and properly dispose of waste materials, trash, rubbish, debris, etc. generated by execution of work under this section.

(7) Contractor’s cleaning protocol shall not damage provided materials or invalidate manufacturer’s warranty on provided materials.

(a) Contractor’s cleaning protocol shall only include methods and use of solvents, chemicals, compounds, and agents approved by material manufacturer for use on their product.

END OF SECTION 28 00 00

SECTION 28 10 00 - ELECTRONIC ACCESS CONTROL

PART 1 GENERAL

1.01 SCOPE

A. This section includes product and execution requirements for Electronic Access Control. Unless noted otherwise, work under this section is subject to requirements of Section 28 0000.

1.02 DESCRIPTION

A. Provide a fully operational and functional Electronic Access Control system to be compliant with applicable codes and standards referenced herein and as indicated on drawings.

B. The Electronic Access Control system shall include the following major components:

(1) Intelligent System Controllers
(2) Credential Reader Interface Modules
(3) Input Control Modules
(4) Output Control Modules
(5) Electronic Access Control Panel Enclosures
(6) Electronic Access Control Panel Power Supplies
(7) Electrified Door Locking Hardware Power Supplies
(8) Credential Readers
(9) Credentials
(10) Electrified Door Locking Hardware
(11) Latch Bolt Monitors
(12) Door Position Monitors
(13) Request to Exit Devices
(14) Integrated Locksets
(15) Remote Door Release Buttons
(16) Electronic Access Control Cable
(17) Integration to the University Security Management System (SMS).

C. Electronic Access Control system shall be provided by Owner's incumbent vendor, Triple S, under subcontract to Contractor.

(1) Triple S Alarm Company
(a) Christian Talmage
(b) 2820 Cantrel Rd. little Rock AR 72202
(c) 501.664.4599
(d) Email: ctallmage@triplesinc.onmicrosoft.com

1.03 RELATED WORK

A. Related Division 28 Sections include:

(1) Section 28 1000 - General Electronic Safety and Security Requirements
(2) Section 28 1300 – Video Surveillance System

1.04 REQUIREMENTS OF REGULATORY AGENCIES

A. In addition to requirements listed in Section 28 0000:

(1) Contractor is solely responsible for securing Work Permit for Electronic Access Control prior to the commencement of work on site.
(a) Contractor shall prepare and submit Work Permit application submittal documents and forms.
(b) Contractor shall include in their bid costs, charges, fees, taxes, etc. associated with securing Work Permit.

1.05 REFERENCES AND STANDARDS

(a) The Work under this Section is subject to requirements of the Contract Documents including the General Conditions, Supplementary Conditions, and sections under Division 1 General Requirements.
(b) Refer to Section 28 00 00 - General Electronic Safety and Security Requirements which identifies References and Standards applicable to all Division 28 work. Other applicable standards are as follows:
1) UL 294 - Access Control System Units.
2) UL 1076 - Proprietary Burglar Alarm Units and Systems.
3) FCC Rules and Regulations Part 15, Radio Frequency Devices

1.06 DEFINITIONS

A. Refer to Section 28 0000 for additional information and requirements.

1.07 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 28 0000 for additional information and requirements.

1.08 LISTING

A. Refer to Section 28 0000 for additional information and requirements.

1.09 SUBMITTALS

A. In addition to requirements listed in Section 28 0000, Submittals shall also include the following:

(1) Shop Drawings:

(a) Submit Contractor-prepared Electronic Access Control Schedule that documents for each controlled and/or monitored portal each Electronic Access Control device, connection, function, and integration listed in Division 08 Door Schedule and Division 08 Door Hardware Group, specified herein and on drawings, and per Contractor coordination with Owner, to include:

1) Door Number
2) Room Name
3) Plan Reference
4) Door Hardware Group
5) Electronic Access Control devices and connections
6) Functionality Features:
7) Integrations

(2) Certificates and Inspections

(a) Refer to Section 28 0000 for additional information and requirements.

(3) Operation and Maintenance Manuals

(a) Refer to Section 28 0000 for additional information and requirements.

(4) Record Documents

(a) Refer to Section 28 0000 for additional information and requirements.

1.10 JOB CONDITIONS

A. Refer to Section 28 0000 for additional information and requirements.

1.11 WORK BY OWNER

A. In addition to items listed in Section 28 0000, Owner will also provide:

(1) Existing Electronic Access Control system Server(s) and server Application Software
(2) Existing Electronic Access Control system Workstation(s) and workstation Application Software

1.12 QUALITY ASSURANCE

A. Refer to Section 28 0000 for additional information and requirements.

1.13 GUARANTEE

A. Refer to Section 28 0000 for additional information and requirements.

PART 2 PRODUCTS

2.01 GENERAL

A. Refer to Section 28 0000 for additional information and requirements.

B. Unless noted otherwise, the following equipment and devices shall be the products of a single manufacturer and designed, manufactured, marketed, sold, and supported as an integrated system:

(1) Electronic Access Control System Application Software
(2) Intelligent System Controller
(3) Credential Reader Interface Modules
(4) Input Control Modules
(5) Output Control Modules
(6) Electronic Access Control Panel Enclosure
(7) Electronic Access Control Panel Power Supply
(8) Credential Readers
(9) Credentials

2.02 ELECTRONIC ACCESS CONTROL SYSTEM APPLICATION SOFTWARE

A. Basis of Design:

(1) Expansion of the existing University of Arkansas Security Management System (SMS) as required to provide adequate software and or licensing to include this new building.

B. Acceptable Alternates:

(1) AMAG Symmetry

2.03 ELECTRONIC ACCESS CONTROL SYSTEM SERVER HARDWARE

A. Server Hardware

(a) Provide adequate server hardware for the expansion of the existing SMS system to include required licensing and increased storage capacity.

2.04 ELECTRONIC ACCESS CONTROL SYSTEM WORKSTATION HARDWARE

A. Provide new workstation if required for this project

2.05 ELECTRONIC ACCESS CONTROL SYSTEM BADGING STATION HARDWARE

A. Provide system badging station hardware if required for this project.

2.06 INTELLIGENT SYSTEM CONTROLLERS

A. Components specified by Security Contractor.

B. Device quantities per Security contract documents.

2.07 CREDENTIAL READER INTERFACE MODULES

A. Components specified by Security Contractor.

B. Provide device quantities per Security contract documents.

2.08 INPUT CONTROL MODULES

A. Components specified by Security Contractor.

B. Provide device quantities per Security contract documents.

2.09 OUTPUT CONTROL MODULES

A. Components specified by Security Contractor.

B. Provide device quantities per Security contract documents.

2.10 ELECTRONIC ACCESS CONTROL PANEL ENCLOSURES

A. Components specified by Security Contractor.

B. Provide device quantities per Security contract documents.

2.11 ELECTRONIC ACCESS CONTROL PANEL POWER SUPPLIES

A. Components specified by Security Contractor.

B. Provide device quantities per contract documents.

2.12 ELECTRIFIED DOOR LOCKING HARDWARE POWER SUPPLIES

A. Where specified in Division 08 as part of Division 08 scope:

(1) Provided by Division 08. Refer to Division 08 for additional information and requirements.

B. Where not specified in Division 08 as part of Division 08 scope:

(1) Components specified by Security Contractor.

(2) Device quantities per Security contract documents.

2.13 DIGITAL ALARM COMMUNICATION TRANSMITTER

(1) Components specified by Security Contractor.

(2) Provide device quantities per Security contract documents.

2.14 CREDENTIAL READERS

A. Components specified by Security Contractor.

B. Credential Reader quantities as shown on Technology Contract Documents.

2.15 CREDENTIALS

A. s Provide credential types and quantities per Security Contract Documents and Owner requirements

2.16 ELECTRIFIED DOOR LOCKING HARDWARE

A. Provided by Division 08. Refer to Division 08 for additional information and requirements.

2.17 LATCH BOLT MONITORS

A. Provided by Division 08. Refer to Division 08 for additional information and requirements.

2.18 DOOR POSITION MONITORS

A. Provided by Division 08. Refer to Division 08 for additional information and requirements.

2.19 REQUEST TO EXIT DEVICES

A. Request to Exit Switch integral to Electrified Door Locking Hardware

(1) Provided by Division 08. Refer to Division 08 for additional information and requirements.

2.20 INTEGRATED LOCKSETS

A. Electrified door-leaf-mounted locksets that integrate Credential Reader(s), Electrified Door Locking Hardware, Latch Bolt Monitor(s), Door Position Monitor(s), and/or Request-to-Exit Device(s) in to lockset hardware.

B. Specified and provided by Division 08. Refer to Division 08 for additional information and requirements.

2.21 DURESS / PANIC BUTTONS

A. Components specified by Security contractor.

B. Provide device quantities per Security contractor contract documents

2.22 ELECTRONIC ACCESS CONTROL CABLE

A. General

(1) Refer to manufacturer's published product installation instructions for additional information and requirements. Wherever a discrepancy is identified between Project Documents and manufacturer's published product installation instructions, the more stringent requirement shall govern.

(2) Cable shall be plenum or riser rated as dictated by the environment in which the cable is installed. Refer to Mechanical drawings for additional information and requirements.

(3) Cable installed in wet or damp locations, including, but not limited to, in-slab and buried conduit, shall be rated for installation in wet locations.

B. Provide appropriate Access Control cable as specified by Security Contractor.

2.23 ELECTRONIC ACCESS CONTROL RACEWAYS AND BOXES

A. Refer to Section 26 0533 for additional information and requirements.

B. Device Back Boxes:

(1) Wall Mounted Devices:

(a) Dimensions: Minimum 4" square, 2-1/8" deep

(b) Plaster Ring: Single gang

(2) Door Frame Mounted Devices

(a) Dimensions: Minimum 4" x 2", 1-1/4" deep

C. Conduit:

(1) Wall Mounted Devices:

(a) Minimum 1" trade size.

(2) Door Frame Mounted Devices:

(a) Minimum 1/2" trade size.

(3) No flexible conduit of any type.

(4) No conduit bodies or conduit outlet bodies of any type.

2.24 ELECTRONIC ACCESS CONTROL SURFACE RACEWAYS

A. Refer to 26 0533 for additional information and requirements.

B. Size device back box per applicable code, in accordance with device manufacturer's recommendations, and to match form factor of device.

C. Minimum raceway capacity equivalent to 1" trade size conduit.

2.25 CREDENTIAL READER PEDESTAL WITH ENCLOSURE

A. Specified and provided by Security contractor

PART 3 EXECUTION

3.01 PRE-CONSTRUCTION COORDINATION MEETING

A. Prior to preparing and submitting shop drawings, Contractor shall arrange and conduct pre-construction coordination meeting to review and coordinate Electronic Access Control installation requirements.

(1) Attendees shall include: TBD per Owner's request.

3.02 CONFIGURATION AND PROGRAMMING COORDINATION MEETING

A. After Section 28 1000 shop drawings have been approved, Contractor shall arrange and conduct a configuration and programming coordination meeting to review and coordinate aspects of Electronic Access Control device and equipment configuration and programming.

(1) At a minimum, attendees shall include: TBD per Owner's request.

3.03 GENERAL

A. Refer to Section 28 0000 for additional information and requirements.

3.04 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 28 0000 for additional information and requirements.

3.05 LOCATIONS OF WORK

A. Refer to Section 28 0000 for additional information and requirements.

3.06 FLOOR, WALL, CEILING, AND ROOF OPENINGS

A. Refer to Section 28 0000 for additional information and requirements.

3.07 EQUIPMENT ACCESS

A. Refer to Section 28 0000 for additional information and requirements.

3.08 EQUIPMENT SUPPORTS

A. Refer to Section 28 0000 for additional information and requirements.

3.09 SUPPORT PROTECTION

A. Refer to Section 28 0000 for additional information and requirements.

3.10 CABLE AND CONDUCTOR PROTECTION

A. Refer to Section 28 0000 for additional information and requirements.

3.11 HOUSEKEEPING PADS

A. Refer to Section 28 0000 for additional information and requirements.

3.12 INSTALLATION

A. Refer to Section 28 0000 for additional information and requirements.

B. General

(1) Integrate new work under this project into Owner's existing system.

(2) Install security devices per Security Contract Documents

C. Configuration and Programming

(1) Coordinate each aspect of configuration and programming with Owner.

(2) Coordinate IP address and other Ethernet networking requirements with Owner a minimum of six weeks prior to commencement of programming work.

3.13 INSPECTION AND TESTING

A. Refer to Section 28 0000 for additional information and requirements.

B. Demonstration

(1) After successful completion of testing and prior to final acceptance, demonstrate each facet of operation of each controlled and/or monitored portal, each controlled and/or monitored device, and each point of integration with equipment and/or devices of other building systems and/or equipment on site with Owner for Owner's approval. Where deficiencies are observed, repair or replace deficient work and/or materials at no additional cost to Owner and repeat demonstration until Owner approves work and/or materials.

(2) Coordinate demonstration schedule to align with overall project schedule and accommodate attendees' schedules.

(3) Coordinate attendance and participation in demonstration by at least one representative of Owner, Division 08 Contractor, and each trade whose work is controlled and/or monitored by or integrated with Electronic Access Control.

(4) Document results of each facet of demonstration, including observed deficiencies, remediation, and re-demonstration results.

C. Verification Follow-Up Visits

(1) Contractor shall include in their bid a minimum of two (2) unique visits to the site to review operation of each controlled and/or monitored portal and system device on site with Owner.

(2) Schedule of Visits:

(a) The first of these visits will occur within six (6) months of substantial completion, or at Owner's request, whichever comes first.

(b) The second of these visits will occur within twelve (12) months of substantial completion, or at Owner's request, whichever comes first.

(c) Contractor shall tentatively coordinate scheduling for both visits upon substantial completion of work on site, but before final acceptance of the project.

(3) At a minimum, Contractor shall provide for an average of fifteen (15) minutes per controlled and/or monitored portal or system device installed under this project or a total of eight (8) hours on site for each visit, whichever is longer.

(4) After each visit, Contractor shall prepare a report detailing observation of operation at each controlled and/or monitored portal or system device, discussion about each controlled and/or monitored portal or system device with Owner, and adjustments made.

(5) Contractor's bid shall include all labor costs associated with visits, to include:

(a) Off-site pre-preparation time

(b) On-site time

(c) Travel time

(d) Off-site report preparation time

3.14 START-UP

A. Refer to Section 28 0000 for additional information and requirements.

3.15 DOCUMENTATION

A. Refer to Section 28 0000 for additional information and requirements.

3.16 CLEANING

A. Refer to Section 28 0000 for additional information and requirements.

3.17 ATTIC STOCK

A. Provide attic stock per manufacturers and Owner recommendations.

3.18 TRAINING

A. Refer to Section 28 0000 for additional information and requirements.

B. Contractor shall provide to Owner's designated representative(s) a minimum of one 1-hour on-site training session related to work under this section within time frame TBD days of substantial completion.

END OF SECTION 28 10 00

SECTION 28 20 00 - VIDEO SURVEILLANCE

PART 1 GENERAL

1.01 SCOPE

A. This section includes product and execution requirements for Video Surveillance. Unless noted otherwise, work under this section is subject to requirements of Section 28 0000.

1.02 DESCRIPTION

A. Expand the existing Video Surveillance system to be compliant with applicable codes and standards referenced herein and as indicated on drawings.

B. The Video Surveillance system shall include the following major components:

(1) Video Surveillance Cameras
(2) Media Converters
(3) Surge Suppressors
(4) Video Surveillance Cable

C. Video Surveillance shall be provided by Owner's incumbent vendor, Triple S Security Co. under subcontract to Contractor.

(1) Triple S Security Company
(a) Contact: Christian Tallmage
(b) Street Address: 2820 Cantrell Road, Little Rock AR 72202
(c) Telephone: 501.664.4599
(d) Email: Email: ctallmage@triplesinc.onmicrosoft.com

1.03 RELATED WORK

A. Related division 28 sections include:

(1) Section 28 1000 - General Electronic Safety and Security Requirements
(2) Section 28 1300 – Electronic Safety and Security

1.04 REQUIREMENTS OF REGULATORY AGENCIES

A. Refer to Section 28 0000 for additional information and requirements.

1.05 REFERENCES AND STANDARDS

A. Refer to Section 28 0000 for additional information and requirements.

1.06 DEFINITIONS

A. Refer to Section 28 0000 for additional information and requirements.

1.07 ABBREVIATIONS AND ACRONYMS

A. Refer to Section 28 0000 for additional information and requirements.

1.08 LISTING

A. Refer to Section 28 0000 for additional information and requirements.

1.09 SUBMITTALS

A. In addition to requirements listed in Section 28 0000, Submittals shall also include the following:

(1) Shop Drawings:
(a) Refer to Section 28 0000 for additional information and requirements.
(b) Submit a Video Surveillance Camera Schedule that includes for each camera information in Video Surveillance Camera Schedule on drawings, plus the following:
1) Unique alphanumeric identifier
2) Name and Architectural number of room in which camera is located
3) Number of plan on which camera is shown
4) Telecom room in which camera's cabling terminates and connects to Ethernet network
5) Camera type
6) Camera IP address
7) Camera subnet mask
8) Required PoE power, in watts
9) Intended field of view
10) Recorded resolution, in pixels

11) Recorded frame rate, in frames per second
12) Whether camera video will be recorded continuously or on motion or other video analytics or integration trigger
    1. Where recorded on motion, list anticipated percentage of time video will be recorded over the course of an average day
    2. Where recorded on trigger, list the video analytics or integration trigger type and anticipated percentage of time video will be recorded over the course of an average day
13) Compression standard used for camera video
14) Minimum duration of video retention, in days
15) Integrations implemented involving camera
16) Video analytics implemented for camera video
17) Functionality required for camera, including:
    1. Partial view masking
    2. Audio recorded with video
    3. Audio output at camera

(c) Calculations based on Application Software manufacturer's recommendations documenting Contractor-proposed total system storage capacity provides specified minimum video retention duration.

(2) Certificates and Inspections
(a) Refer to Section 28 0000 for additional information and requirements.

(3) Operation and Maintenance Manuals
(a) Refer to Section 28 0000 for additional information and requirements.
(b) Provide a still image from each installed video surveillance camera:
1) Obtained at full resolution at the time of final acceptance
2) Scaled to and printed on a standard 8-1/2" x 11" sheet, one image per sheet
3) Marked with text indicating camera's unique alphanumeric identifier and network address

(4) Record Documents
(a) Refer to Section 28 0000 for additional information and requirements.
(b) For each video surveillance camera, indicate the following:
1) Installed location of camera
2) Direction camera is aimed
3) Camera's field of view
    1. Indicate with isosceles triangle, with apex at camera and base at vertical plane to which camera is focused. Length of triangle base shall match horizontal width of field of view to which camera is focused.

1.10 JOB CONDITIONS

A. Refer to Section 28 0000 for additional information and requirements.

1.11 WORK BY OWNER

A. In addition to items listed in Section 28 0000, Owner will also provide:
(1) Existing Video Surveillance system Server(s) and Application Software
(2) Existing Video Surveillance system Network Storage Appliance(s)
(3) Existing Video Surveillance system Workstation(s) and Application Software

1.12 QUALITY ASSURANCE

A. Refer to Section 28 0000 for additional information and requirements.

1.13 GUARANTEE

A. Refer to Section 28 0000 for additional information and requirements.

PART 2 PRODUCTS

2.01 GENERAL

A. Refer to Section 28 0000 for additional information and requirements.

B. Unless noted otherwise, the following equipment and devices shall be the products of a single manufacturer and designed, manufactured, marketed, sold, and supported as an integrated system:
(1) Video Surveillance Cameras

2.02 VIDEO SURVEILLANCE SYSTEM APPLICATION SOFTWARE

A. Basis of Design

(1) Expansion of the existing University of Arkansas Security Management System (SMS) as required to provide adequate software and or licensing to include this new building.

2.03 VIDEO SURVEILLANCE SYSTEM SERVER HARDWARE

A. Server Hardware

(1) Provide adequate server hardware for the expansion of the existing SMS system to include required licensing and increased storage capacity.

2.04 VIDEO SURVEILLANCE SYSTEM NETWORK STORAGE APPLIANCE(S)

A. Network Storage Appliance(s):

(1) Provide adequate server hardware for the expansion of the existing SMS system to include required licensing and increased storage capacity.

2.05 VIDEO SURVEILLANCE SYSTEM WORKSTATION HARDWARE

A. Workstation Hardware

(1) Provide as required for system expansion.

2.06 VIDEO SURVEILLANCE CAMERAS

A. Cameras specified by Security Contractor

B. Camera quantities as shown on Technology Contact Documents

2.07 MEDIA CONVERTERS

A. Specified by Security Contractor

2.08 VIDEO SURVEILLANCE CABLE

A. General

(1) Refer to manufacturer's published product installation instructions for additional information and requirements. Wherever a discrepancy is identified between Project Documents and manufacturer's published product installation instructions, the more stringent requirement shall govern.

(2) Cable shall be plenum or riser rated as dictated by the environment in which the cable is installed.

(a) Refer to Mechanical drawings for additional information and requirements.

(3) Cable installed in wet or damp locations, including, but not limited to, in-slab and buried conduit, shall be rated for installation in wet locations.

(a) Provide (1) category 6A cable at each camera location. Refer to Contract Drawings

2.09 VIDEO SURVEILLANCE RACEWAYS AND BOXES

A. Refer to Section 26 0533 for additional information and requirements.

B. Device Back Boxes:

(1) Dimensions: Minimum 4" square, 2-1/8" deep

(2) Plaster Ring Size: Refer to device manufacturer's product data and installation instructions

C. Conduit:

(1) Minimum 1" trade size.

(2) No flexible conduit of any type.

(3) No conduit bodies or conduit outlet bodies of any type.

2.10 VIDEO SURVEILLANCE SURFACE RACEWAYS

A. Refer to 26 0533 for additional information and requirements.

B. Size device back box per applicable code, in accordance with device manufacturer's recommendations, and to match form factor of device.

C. Minimum raceway capacity equivalent to 1" trade size conduit.

PART 3 EXECUTION

3.01 CONFIGURATION AND PROGRAMMING COORDINATION MEETING

A. After Section 28 2000 shop drawings have been approved, Contractor shall arrange and conduct a configuration and programming coordination meeting to review and coordinate each of Video Surveillance device and equipment configuration and programming.

(1) At a minimum, attendees shall include: TBD Owner's request

3.02 GENERAL

A. Refer to Section 28 0000 for additional information and requirements.

3.03 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 28 0000 for additional information and requirements.

3.04 LOCATIONS OF WORK

A. Refer to Section 28 0000 for additional information and requirements.

3.05 FLOOR, WALL, CEILING, AND ROOF OPENINGS

A. Refer to Section 28 0000 for additional information and requirements.

3.06 EQUIPMENT ACCESS

A. Refer to Section 28 0000 for additional information and requirements.

3.07 EQUIPMENT SUPPORTS

A. Refer to Section 28 0000 for additional information and requirements.

3.08 SUPPORT PROTECTION

A. Refer to Section 28 0000 for additional information and requirements.

3.09 CABLE AND CONDUCTOR PROTECTION

A. Refer to Section 28 0000 for additional information and requirements.

3.10 HOUSEKEEPING PADS

A. Refer to Section 28 0000 for additional information and requirements.

3.11 INSTALLATION

A. Refer to Section 28 0000 for additional information and requirements.

B. General

(1) Integrate new work under this project into Owner's existing system.

C. Video Surveillance Cameras

(1) Coordinate rough-in requirements with Division 26 Contractor prior to the commencement of work on site.

(2) Coordinate locations with Owner and Division 26 Contractor prior to the commencement of work on site.

(3) Camera Mounting:

(a) Cameras and mounting accessories shall be rigidly attached to back boxes rigidly attached to structural members.

(b) Cameras installed in accessible ceiling tiles:

1) Shall be supported by a tile bridge or other approved means

2) Shall not be supported by the ceiling tile

3) Shall be equipped with a safety cable secured to camera housing and structural member above

(c) Mount exterior cameras with stainless steel fasteners.

(4) Provide media conversion for cameras whose cabling exceeds maximum allowable length per applicable standards.

(5) Provide surge suppressors for exterior cameras, including exterior cameras connected via media converters.

(a) Surge suppression not required for cameras mounted directly to side of building at least one story below roof line at exterior wall

(6) Cable, terminate, configure, program, test, adjust, and make completely ready for use.

(7) Field-coordinate field of view, aim, and focus with Owner prior to commencement of final testing.

(a) Prior to final testing, Contractor shall, at no cost to Owner, make minor adjustments to camera locations and placement to address unanticipated obstructions to the field of view and/or unanticipated spatial interference.

1) For the purposes of these adjustments, "minor" is defined as adjustments requiring relocation of up to six (6) feet from the location coordinated with the Owner during the Configuration and Programming Coordination Meeting.

(8) Where camera is mounted to a pole, column, or out-building, provide surge suppressor at point where cable enters building as specified above and at camera.

(9) Properly ground surge suppressors per applicable code and manufacturer's instructions. Refer to Section 27 0526 for additional information and requirements.

(10) Note locations of surge suppressors on As-Built Drawings and Record Drawings.

D. Video Surveillance Cable

(1) Provide 25-foot service loop in video surveillance camera cables.

(a) Locate service loop at first J-hook where device conduit terminates.

(b) Coil service loop in figure 8 configuration with minimum bend radius compliant with manufacturer's recommendations and applicable standards, and store neatly.

(c) Provide shorter service loop where necessary to ensure total installed cable length does not exceed 295 feet (8991.6 cm).

(2) Install in conduit from device location to [cable tray below nearest accessible floor or above nearest accessible ceiling.

(3) Install in pathways provided, or as designated on floor plans, and support from building structure.

(a) Where installed in free-air, support cables using J-hook type cable supports. Refer to Section 27 0528.29 - Hangers and Supports for Communications Systems for installation requirements.

1) J-hook fill capacities shall be per manufacturer's recommendations and shall consider diameter of cable type(s) being installed.

2) Route cable/hooks at right angles, parallel to construction.

(b) Where installed in Cable Tray, lay cables neatly in tray.

1) Do not tie.

2) Provide sufficient slack in cables to allow for unequal expansion coefficients of cable tray and cables. This requirement is in addition to slack required at cable tray expansion joints.

(4) Terminate video surveillance camera cables with jack, no faceplate, in camera back box.

(5) Identification:

(a) Label system device cabling with unique alphanumeric identifiers that include:

(b) Video surveillance camera location:

1) UARK labeling and identifications standards.

(c) Refer to Section 27 0553 for additional information and requirements.

E. Video Surveillance Raceways and Boxes

(1) Refer to Section 280000 for additional information and requirements.

(2) Conduits:

(a) At Contractor's option, Video Surveillance conduit home runs from system devices to Security Equipment Rooms may be consolidated in to larger conduits.

1) Where conduit home runs are consolidated, size larger conduits to provide conduit capacity equal to or greater than cumulative capacity of the smaller conduits being combined.

2) Prior to the commencement of work on site, prepare and submit for review shop drawings documenting proposed conduit consolidation, including proposed conduit sizing, junction boxes, and conduit routes coordinated with work by other trades.

3) Prior to rough-in, field-coordinate final routing of larger conduits on site with work by other trades.

F. Video Surveillance Surface Raceways

(1) Refer to 280000 for additional information and requirements.

G. Configuration and Programming

(1) Coordinate each aspect of configuration and programming with Owner.

(2) Coordinate IP address and other Ethernet networking requirements with Owner a minimum of six weeks prior to commencement of programming work.

3.12 INSPECTION AND TESTING

A. Refer to Section 28 0000 for additional information and requirements.

B. Demonstration

(1) After successful completion of testing and prior to final acceptance, demonstrate field of view, aim, focus, and each facet of operation of each video surveillance camera and each point of integration with equipment and/or devices of other building systems and/or equipment on site with Owner for Owner's approval. Where deficiencies are observed, repair or replace deficient work and/or materials at no additional cost to Owner and repeat demonstration until Owner approves work and/or materials.

(2) Coordinate demonstration schedule to align with overall project schedule and accommodate attendees' schedules.

(3) Coordinate attendance and participation in demonstration by at least one representative of Owner and each trade whose work is integrated with Video Surveillance.

(4) Document results of each facet of demonstration, including observed deficiencies, remediation, and re-demonstration results.

C. Verification Follow-Up Visits

(1) Contractor shall include in their bid a minimum of two (2) unique visits to the site to review and adjust field of view, aim, and focus of each video surveillance camera with Owner.

(2) Schedule of Visits:

(a) The first of these visits will occur within six (6) months of substantial completion, or at Owner's request, whichever comes first.

(b) The second of these visits will occur within twelve (12) months of substantial completion, or at Owner's request, whichever comes first.

(c) Contractor shall tentatively coordinate scheduling for both visits upon substantial completion of work on site, but before final acceptance of the project.

(3) At a minimum, Contractor shall provide for an average of twenty (20) minutes per video surveillance camera installed under this project or a total of eight (8) hours on site for each visit, whichever is longer.

(4) After each visit, Contractor shall prepare a report detailing observation of each camera's operation, discussion about each camera with Owner, and adjustments made.

(5) Contractor's bid shall include all labor costs associated with visits, to include:

(a) Off-site pre-preparation time

(b) On-site time

(c) Travel time

(d) Off-site report preparation time

3.13 START-UP

A. Refer to Section 28 0000 for additional information and requirements.

3.14 DOCUMENTATION

A. Refer to Section 28 0000 for additional information and requirements.

3.15 CLEANING

A. Refer to Section 28 0000 for additional information and requirements.

3.16 ATTIC STOCK

A. Provide attic stock per manufacturers and Owner's recommendations.

3.17 TRAINING

A. Refer to Section 28 0000 for additional information and requirements.

B. Contractor shall provide to Owner's designated representative(s) a minimum of one 4-hour on-site training session related to work under this section within time frame: TBD of days of substantial completion.

END OF SECTION 28 20 00

SECTION 28 46 10 - ADDRESSABLE FIRE DETECTION AND ALARM SYSTEMS

PART 1 GENERAL

1.01 RELATED WORK

A. Section 14 2400 - Hydraulic Elevators

B. Section 21 13 14 - Automatic Fire Sprinkler System

C. Section 23 09 93 - Control Sequences

D. Section 26 00 00 - General Electrical Requirements

E. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables

F. Section 26 05 26 - Grounding and Bonding for Electrical Systems

G. Section 26 05 33 - Raceway and Boxes for Electrical Systems

H. Section 26 05 53 - Electrical Systems Identification

1.02 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.03 DESCRIPTION

A. In general, work consists of:

(1) Furnish and install complete Multiplexed Fire Alarm System with one-way voice communication system as shown on plans and specified here-in.

(2) Engineer of Record:

(a) Contractor shall be Engineer of Record. Contractor shall produce stamped and sealed installation drawings, which are also referred to as shop drawings in this Section, based on design criteria listed in this Section and drawings furnished by Engineer. Contract drawings show intent of fire alarm systems as it relates to architecture, structure, and mechanical/electrical systems.

(3) System shall:

(a) Be an intelligent analog addressable system.

(b) Allow for loading and editing special instructions and operating sequences as required.

(c) Be capable of on-site programming to accommodate system expansion and facilitate changes in operation.

(d) Be wired, connected, and left in operating condition.

(e) Utilize independently addressable relay modules, control modules, monitor modules, audio amplifiers, and communications systems.

(f) Meet approval of applicable national, state, and local codes and AHJs.

(g) Be solid state, microprocessor based.

(h) Be UL listed for all intended uses.

(i) Be UL listed to UL 864. Be UL Listed for Releasing Service of fire suppression system devices.

(j) Be a Power Limited Fire Alarm system.

(k) Be UL listed UOJZ for complete system.

(l) Use addressable relay modules and monitor modules to interface with building automation system (BAS) for closing of smoke dampers upon reduction of air flow in duct work to velocities below detection level of duct detectors when fans are reduced in power or shut down.

(m) Use addressable input monitor modules to interface with fire pump(s) controller(s) for status monitoring.

(n) Use addressable output relay modules and addressable input monitor modules to interface with sprinkler system waterflow switches, valve supervisory switches, pressure switches, pre-action system control panels, aspirating smoke detection control panels, waterflow alarm indication devices.

(o) Use addressable output relay modules and addressable input monitor modules to interface with building security system door hardware devices at control panels and individual doors for control and releasing by fire alarm system.

(p) Use addressable output relay modules and addressable input monitor modules to interface with elevator equipment control panels for elevator recall functions.

(q) Interface with elevator equipment control panels for one-way voice communication system.

(4) System includes:

(a) Fire Alarm Control Panel(s)

(b) Remote Annunciator Panel(s)

(c) Multi-Channel audio, one-way voice communications system and controls

(d) Manual Stations
(e) Heat Detectors
(f) Smoke Detectors
(g) Duct Smoke Detector System
(h) Fire Pump Monitoring
(i) Sprinkler Valve Supervisory Monitoring
(j) Sprinkler System Waterflow Monitoring
(k) Notification Appliance Circuit Power Supplies and Batteries
(l) Transponder/Data Gathering/Remote Control Panels
(m) Relay Modules (Addressable Output Module Device)
(n) Control Modules (Addressable Output Module Device)
(o) Monitor Modules (Addressable Input Module Device)
(p) Audio Amplifiers for One-way Voice Communications System
(q) Visual Graphics Display Terminal(s)
(r) Alarm Notification Audible and/or Visual Devices
(s) Terminations and Labeling
(t) All necessary materials for complete operating systems
(u) Power supplies and batteries

(5) Software operations shall be stored in non-volatile programmable memory within fire alarm control panel. Loss of primary and secondary power shall not erase instructions stored in memory.

1.04 REFERENCE STANDARDS

A. IBC - International Building Code Year 2021
B. IFC - International Fire Code Year 2021
C. NECA 305 - Standard for Fire Alarm System Job Practices
D. NFPA 72 - National Fire Alarm and Signaling Code Year 2019
E. NFPA 70 - National Electrical Code, 2020
F. UL 268 - Smoke Detectors for Fire Protective Signaling Systems, Latest Edition
G. UL 497B - Protectors for Communications and Fire Alarm Circuits, Latest Edition
H. UL 521 - Heat Detectors for Fire Protective Signaling Systems, Latest Edition
I. UL 864 - Control Units for Fire Protective Signaling Systems, Latest Edition
J. UL 1480 - Speakers for Fire Protective Signaling Systems, Latest Edition
K. UL 1481 - Power Supplies for Fire Protective Signaling Systems, Latest Edition
L. UL 1711 - Amplifiers for Fire Protective Signaling Systems, Latest Edition

1.05 QUALIFICATIONS

A. Equipment shall be supplied by company specializing in fire alarm and smoke detection systems with 5 years documented experience.
B. Work shall be performed by licensed Contractor, regularly engaged in installation and servicing of fire alarm systems.
C. Contractor shall be located within 100 miles (160 km) of Project site.

1.06 DOCUMENT ACCESSIBILTY

A. Assemble the following documents to be stored in a document cabinet adjacent to the main fire alarm panel per NFPA 72 requirements:

(1) Record drawing/As-builts
(2) Fire alarm equipment technical data sheets
(3) Alternative means and methods, variances, appeals and approvals for this fire alarm system
(4) Any performance-based design documentation
(5) Risk analysis documentation
(6) Emergency response plan
(7) Evaluation documentation
(8) Software and firmware control documentation
(9) Emergency communication system documentation

1.07 SUBMITTALS

A. Comply with recommendations in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter in NFPA72.

B. Shop Drawings shall be prepared by persons with the following qualifications:

(1) Trained and certified by manufacturer in fire alarm design.

(2) NICET-certified fire-alarm technician, Level IV minimum .

C. All submitted drawings shall be created using computer drafting software, and shall be coordinated so that terminal numbering, circuit designation and equipment or device designations are the same on all drawings. All drawings must be submitted and approved by the engineer before ordering or fabrication starts. Approval will not waive any specification requirements unless specifically stated.

D. Submittals shall be organized as follows. (Electronic submittals shall utilize bookmarks instead of tabs.)

(1) Cover Sheet indicating name of project, name of supplier, name of installer and date of submittal preparation.

(2) The Table of Contents shall appear immediately behind the Cover Sheet, and shall contain a complete listing of all the tabs contained within the binder/booklet.

(3) Tabbed index sheets shall be inserted into each of the binders, such that each binder is clearly sub-divided into sections. _

(a) Tabbed sections shall be provided, at minimum, for the following, one section per building:

1) One section for manufacturer’s data sheets – divided into sub-sections for the following:

1. Panel Equipment (Panels, Panel Components/Modules, Printers, Annunciators, etc.)
2. Addressable Field Devices (Initiating and Relay/Control/Monitoring/Isolation)
3. Non-Addressable Field Devices (Initiating Devices, Relays, etc.)
4. Notification Appliances

E. The Contractor shall purchase no equipment for the system specified herein until the Owner has approved the project submittals in their entirety and has returned them to the Contractor It is the responsibility of the Contractor to meet the entire intent and functional performance detailed in these specifications. Approved submittals shall only allow the Contractor to proceed with the installation and shall not be construed to mean that the Contractor has satisfied the requirements of these specifications.

F. Submit the following to Engineer for review prior to ordering any equipment and prior to submittal to AHJ:

(1) Prepare submittals per IBC, NFPA 72, fire alarm submittal requirements.

(2) A complete equipment list of all components, including the following: Quantity, Manufacturer, Part Number, and Description. If the supplier uses different part numbers from those of the actual manufacturer, the actual manufacturer and part numbers as they appear – marked on the shipping box/packages, shall also be identified on this list.

(a) Each equipment List shall include a complete listing of the modules, components, and software included for each modular Fire Alarm Control Panel, Network Panel, Transponder Panel, Data Gathering Panel, Remote Panel or Annunciator. Such items shall be listed in a manner that clearly indicates that such items are parts of/components of a larger unit. Simply stating a single part number and description for such panels shall be unacceptable.

(b) Include a separate list for each section, with items grouped by system.

(c) List Spare Parts separately, and identify clearly as “Spare Equipment”.

(3) Manufacturer's product data sheets and equipment description for all system components. These data sheets shall be highlighted or suitably marked, so that included items and options are indicated. On data sheets that include multiple products, products that are not used shall be crossed out.

(4) Floor plans as follows:

(a) Scale shall match architectural floor plan scale.

(b) Indicate location of all devices, parts, and equipment.

(c) Notification device number (address), zone, and circuit shall be indicated on floor plans.

(d) Candela rating shall be indicated on all floor plans with notification devices shown

(e) Include all Panel location(s) on plan drawings.

(f) Locations of new Junction Boxes.

(g) Proposed routing of new raceways.

(h) Conduit and raceway sizes.

(i) Wire/cable type and size.

(j) Initiation, Control Module, Monitor Module, Relay Module Device Addresses

(5) Indicate audible device sound level output @ 10 ft.

(6) Diagrams as follows:

(a) Block diagrams showing layout and operation of entire system. Include description for all system operations.

(b) Separate riser drawing for each system. Each System Riser shall illustrate all fire alarm circuits and shall incorporate the following information, in a clear, concise format:

1) Point of origin of each circuit (usually a Panel, or a Module within a panel).

2) Circuit type and labeling.

3) Area served by each circuit.

4) Wire/cable type and size.

5) The following information for each Field Device:

1. Device Type.
2. Circuit(s) to which device is connected.
3. Locations of any End-Of-Line Resistor (EOLR) (and the circuit terminated by any such EOLR).

(7) Details as follows:

(a) Detailed layout and elevation of all control panels, annunciators, and visual graphics displays (as applicable).

(b) Voice Alarm signaling-service equipment rack or console layout, grounding schematic, sound amplifier power calculation, and single-line connection diagram.

(c) Component and module wiring diagrams intended to illustrate terminations and wiring connections to each typical Field Device (Detectors, Notification Appliances, etc.), and each typical panel component/module utilized within the system. This set of drawings shall only include diagrams for modules and components, which are actually used in the provided system(s).

(d) Include performance parameters and installation details for each detector, verifying that each detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.

(e) Calculations

1) Audio sound amplifier, strobe NAC power supply, and battery calculations showing current draws for every device and module during standby, alarm and trouble conditions.

2) Voltage drop calculations for Signaling Line Circuits (SLC)s, initiating circuits, audio circuits, and notification appliance circuits. This calculation should cover the “worst case” (longest and/or most heavily loaded circuits including loading of future devices using spare capacity) NAC(s) as installed within the facility. These calculations should mathematically prove that all devices on the circuit will receive acceptable power for proper operation. This calculation should follow a “spreadsheet” format, and should clearly indicate the following:

1. The name of the circuit.
2. Point of origin of the circuit.
3. Complete list of all devices served by the circuit, including location and type of each device
4. Alarm Current Draw for each device, at the applied voltage.
5. Applied Voltage (Based on anticipated battery voltage after specified stand-by & alarm operation).
6. Acceptable Operating Voltage for each type of device on circuit. Calculated Voltage at each device on circuit.

3) Standby battery power calculations.

1. Proof of 5 years documented experience and factory authorization to furnish and install equipment proposed.

(8) Include plans, sections, and elevations of heating, ventilating, and air-conditioning ducts, drawn to scale and coordinating installation of duct smoke detectors and access to them. Show critical dimensions that relate to placement and support of sampling tubes, detector housing, and remote status and alarm indicators. Locate detectors according to manufacturer's written recommendations.

(9) Prior to programming system, submit list of device addresses with location labeling as they will appear in 2-line, 40 character display of fire alarm panel and annunciator. List will be modified as needed by Owner and returned to Contractor for final programming.

G. Incomplete submittals will be rejected and returned without review.

H. Shop drawings and submittals shall be reviewed by Engineer prior to submission to AHJs for approval. Include sufficient time in project schedule to allow for reviews, resubmittals (as required) prior to submittal to AHJ.

I. Submission to Authority Having Jurisdiction (AHJ):

(1) Submittals to AHJ shall include all drawings and documentation required by code International Building Code Fire Alarm and Detection Systems and NFPA 72.

(2) After obtaining A/E approval, prepare the required fire alarm shop drawings, floor plans, and riser diagrams that will ultimately go to the AHJ in quantities and format as required by code and the AHJ.

(3) Contractor shall be responsible for providing additional devices, relocating devices, changing types of devices and/or any other modifications required by the AHJ in order to provide a complete and approved system.

(4) Approval is required prior to the start of construction. The Contractor shall prepare and submit the required documents in a timely fashion to meet this requirement. If the Contractor starts construction before approval is given by the AHJ, the Contractor is responsible for all additional fees required by the AHJ.

1.08 INSPECTIONS

A. Once the Permit Application form has been received, processed, and accepted by AHJ and proper permits issued, construction may begin.

B. Coordinate and provide for all inspections required by the AHJ.

1.09 OPERATION AND MAINTENANCE MANUAL

A. All operations and maintenance data shall comply with the submission and content requirements specified under section GENERAL REQUIREMENTS.

B. In addition to the general content specified under GENERAL REQUIREMENTS supply the following additional documentation:

(1) A material guide, which shall contain the replacement part numbers and description of all components used. If this information is included in an instruction section for any of the equipment, it will not be necessary to duplicate the list. In either case, the parts list shall be associated with its respective chassis, modules or kit wherein it is found. A total listing of parts without such grouping will not be acceptable.

(2) Catalog data or literature

(3) Manufacturer's operating instructions.

(4) Manufacturer's maintenance instructions

(5) Installation instructions

(6) Name, address and telephone number of source for parts (i.e. keys, guards, etc.) not supplied by the Fire Alarm Manufacturer

(7) Copies of all approved shop drawings.

(8) Upon completion of the project the Owner shall be provided with a hard copy printout of the system software database and an electronic version of the system program and database with all required passwords.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Multiplex Analog Addressable Fire Alarm Systems

(1) Edwards EST4

B. The materials, appliances, equipment and devices shall be tested and listed by a nationally recognized approvals agency for use as part of a protected premises protective signaling (fire alarm), access control, and smoke control system. The authorized representative of the manufacturer of the major equipment, such as control panels, shall be responsible for the satisfactory installation of the complete system.

C. The Contractor shall provide, from the acceptable manufacturer's current product lines, equipment and components, which comply, with the requirements of these Specifications. Equipment or components, which do not provide the performance and features required by these specifications are not acceptable, regardless of manufacturer.

D. Strict conformance to this specification is required to ensure that the installed and programmed system will function as designed and will accommodate the future requirements and operations of the building Owner. All specified operational features must be met without exception.

E. All control panel assemblies and field appliances connected to the system shall be provided by the same System Supplier and shall be designed and tested to ensure that the system operates as specified. All equipment and components shall be installed in strict compliance with the manufacturer's recommendations.

F. Equipment proposed to be supplied will be considered only if it meets all performance requirements identified in this specification. Any deviations of system performance will only be considered when the following requirements have been met:

(1) A complete description of proposed alternate system shall be submitted to the Owner for approval with three (3) copies of applicable working drawings not less than ten (10) calendar days prior to the scheduled date for submission of bids.

(2) The supplier of alternate equipment shall furnish evidence that the proposed alternate system performance is equal to or superior to- the system operation stated in the specification. Such evidence shall be submitted to the Owner, not less than ten (10) calendar days prior to the scheduled date for submission of bids.

(3) The supplier shall submit a point-by-point statement of compliance for all sections in this specification. The statement of compliance shall consist of a list of all paragraphs within these sections. Where the proposed system complies fully with the paragraph as written, placing the word "comply" opposite the paragraph number shall indicate such. Where the proposed system does not comply with the paragraph as written, and the supplier feels the proposed system will accomplish the intent of the paragraph, a full description of the function as well as a full narrative description of how its proposal will meet its intent shall be provided. Any submission that does not include a point-by-point statement of compliance as described herein shall be disqualified. Where a full description is not provided, it shall be assumed that the proposed system does not comply.

(4) The supplier of alternate equipment shall submit a list from the alternate manufacturer on the manufacturer's letterhead indicating the names and addresses of all authorized suppliers in the area. Proprietary products will not be considered.

(5) The acceptability of any alternate proposed system or manufacturer shall be the sole decision of the Owner or Owner's authorized representative.

G. The acceptability of any alternate proposed system or manufacturer shall be the sole decision of the Owner or Owner's authorized representative.

2.02 SYSTEM OPERATIONS

A. Alarm Initiation For Buildings One-Way Voice Based Systems or Horn Systems With Immediate Temporal-3 Based Evacuation

(1) Alarm Sequence of Operation: Actuation of automatic fire initiating device (smoke, heat, monitored pre-action system, aspirating smoke detection panel, or sprinkler waterflow) or manual initiating device, shall place system in alarm mode, which causes the following operations:

(a) Appropriate initiating device circuit red LED shall flash on Control Panel, and remote annunciator(s) until the alarm has been acknowledged.

1) Once acknowledged at Control panel or annunciator(s), this same LED shall latch on.

2) Subsequent alarm received after acknowledging shall flash subsequent zone alarm LED on Control Panel, and remote annunciator(s).

3) Acknowledgment of alarm shall not reset activated device.

4) Pulsing alarm tone shall occur within Control Panel and remote annunciators until event has been acknowledged.

(b) Indicate alarm initiating device type, location and address at the local fire alarm control panel.

(c) Indicate individual device alarm zone(s) at the respective fire alarm annunciators.

(d) Activate all strobes and audible devices (temporal-3 evacuation tone) throughout the building.

(e) Transmit alarm signal to UL Central Station via off site alarm communications transmission devices.

(f) Transmit signals by zone to associated smoke dampers fire alarm relay modules for activation of fire/smoke response as required and as defined on plans.

(g) Transmit signals by zone to associated door hold-open devices for door hold-open release on floor of alarm. WON Doors dividing occupancies will close upon any building alarm in either occupancy.

(h) Transmit signals to associated electric egress path and stairwell door lock relay modules for door lock release as defined on plans.

(i) Display point information and location at the visual graphics display terminals and printers.

(2) Trouble Sequence of Operation: System or circuit trouble places system in trouble mode, which causes the following system operations:

(a) Visual and audible trouble signal indicated by zone at the fire alarm control panel and remote annunciator(s).

(b) Indicate individual device type, location, with trouble at the fire alarm control panel and fire alarm annunciators.

(c) Manual acknowledge function at fire alarm control panel or remote annunciator(s) silences audible trouble alarm.

(d) Visual alarm is displayed until initiating failure or circuit trouble is cleared.

(e) Display point information and location at the visual graphics display terminals and printers.

(f) Transmit trouble signal to UL Central Station via off site alarm communications transmission devices.

(3) Supervisory Sequence of Operation: System or circuit supervisory signal places system in supervisory mode, which causes the following system operations:

(a) Visual and audible supervisory signal indicated by zone at the fire alarm control panel and remote annunciator(s).

(b) Indicate individual device supervisory device type, location, at the respective fire alarm control panel and remote annunciator(s).

(c) Manual acknowledge function at fire alarm control panel or remote annunciator(s) silences audible trouble alarm.

(d) Visual alarm is displayed until initiating failure or circuit supervisory signal is cleared.

(e) Display point information and location at the visual graphics display terminals and printers.

(f) Transmit supervisory signal to UL Central Station via off site alarm communications transmission devices.

(4) Non-Fire Input Sequence of Operation: System or circuit non-fire signal places system in non-fire operation mode, which causes the following system operations:

(a) Visual Other Event (Non-Fire) signal indicated by zone at the fire alarm control panel and remote annunciator(s).

(b) Indicate individual device Non-Fire device type, location at the fire alarm control panel and fire alarm annunciators.

(c) Manual acknowledge function at fire alarm control panel or remote annunciator(s) silences audible Non-Fire alarm.

(d) Visual alarm is displayed until Non-Fire Event is cleared.

(e) Display point information and location at the visual graphics display terminals and printers.

(f) Perform output function associated with Non-Fire event input such as monitoring of security or other systems noted to be transmitted to fire alarm system and generate corresponding output function from fire alarm, but not activate building fire alarm notification devices.

(5) System duct smoke detectors and sprinkler system valve supervisory switch monitoring shall be connected to the fire detection system.

(6) Device type shall be distinguishable for all types of initiation devices in the zone and displayed individually on the Fire Alarm Control Panel, and remote annunciators.

(7) Refer to drawings for additional sequence of fire alarm system operation under general alarm, and One-way voice evacuation alarm.

(8) System shall have single key to allow operator to display alarms, troubles, and supervisory service conditions including time and date of each occurrence.

(9) Alarm description shall be displayed on Fire Alarm Control Panel and Annunciators with an 80-character LCD display as follows:

(a) 40 characters for:

1) Point address and loop number

2) Type of device

3) Point status

(b) 40 characters for:

1) Custom location label

(c) Alarm audible-indicating devices shall sound in temporal-3 pattern until silenced by alarm silence switch at Control Panel and remote annunciator.

(d) Visual alarm indicating devices shall operate in continuous flashing pattern until system is reset.

(10) System shall have single key to allow operator to display alarms, troubles, and supervisory service conditions, including time and date of each occurrence.

B. Acknowledgement

(1) Two methods of acknowledgment for each abnormal condition shall be provided:

(a) Acknowledge one event at a time from an unacknowledged list of events.

(b) Pressing acknowledge button shall display first unacknowledged condition in list (either alarm, supervisory or trouble), and require another acknowledge button. Press to acknowledge only displayed point.

(2) After all points have been acknowledged, LEDs shall glow steadily and alarm will be silenced. Total number of alarms, supervisory and trouble conditions shall be displayed.

(3) Pressing appropriate acknowledge button shall acknowledge all points

(4) Acknowledge functions shall be behind locked door or pass-code protected.

C. Silencing

(1) Alarm audible indicating devices shall be silenced by operating alarm silence switch and fire alarm control panel or by use of key operated switch at remote annunciator(s).

(2) Strobes shall remain active until system is reset.

(3) Subsequent zone alarm shall reactivate alarm signals.

(4) If trouble conditions exist in system and "Trouble Silence" button has been pressed, audible trouble signal shall cease, but shall resound at timed intervals to act as reminder that fire alarm system is not in normal operating mode.

(5) Sprinkler system valve supervisory signals shall be non-silenceable.

D. Reset

(1) System Reset button shall return system to its normal state after an alarm condition has been remedied.

(2) Should an alarm condition continue to exist, system shall provide indication that resetting cannot be completed and shall remain in an abnormal state.

(3) Sonalert and Alarm LED shall remain activated.

(4) Display shall indicate total number of alarms and troubles present in system along with prompt to use ACK keys to review points.

(5) Points shall not require acknowledgment if they were previously acknowledged.

(6) Should Alarm Silence Inhibit function be active, system shall ignore all key presses. An indication of enabling and disabling inhibit state shall be provided as feedback to operator.

E. Supervision

(1) System shall independently supervise:

(a) Initiating device circuits.

(b) Signaling line circuits.

(c) Strobe Notification Appliance Circuits (NAC)s.

(d) One-way voice system speaker circuits and equipment.

(e) DACT and other fire alarm off-site communications devices.

(f) All network communications circuits.

(g) Independently supervise circuits for fire alarm speakers.

(h) Auxiliary manual controls. "Off normal" position of any switch shall cause an "off normal" system trouble.

(i) Auxiliary circuits for addressable relay modules. Blown fuse or open in circuit shall be visibly and audibly annunciated.

(j) Remote annunciator panel(s). Any ground, short, or open in the wiring to fire alarm Control Panel, as well as malfunction of the annunciator panel or remote-control panels/data gathering panels/transponders, etc. shall be annunciated at control panel.

(k) Incoming power. Power failure shall be audibly and visually indicated at Control Panel and remote annunciators. Green "power on" LED shall be displayed continuously while incoming power is present.

(l) System Modules for module placement. Should modules become disconnected, system trouble indicator shall illuminate and audible trouble signal shall sound.

(m) System batteries. Low battery condition or disconnection of battery shall be audibly and visually indicated at Control Panel and remote annunciators.

(n) System power supplies and battery chargers.

(o) All system devices as required by NFPA 72.

(2) Device activation shall be annunciated at Control Panel, and remote annunciator(s), and visual graphics display terminals.

(3) Independently supervised circuits shall include visible amber "Trouble" LED to indicate disarrangement conditions per circuit.

(4) Disarrangement conditions of any circuit shall not affect operation of other circuits.

(5) Alarm activation of any initiation circuit shall not prevent subsequent alarm operation of any other initiation circuit.

(6) System shall have provisions for disabling and enabling circuits individually for maintenance or testing purposes.

F. Power Requirements

(1) Provide separate power connections, batteries, battery chargers, system supervision, and monitoring of the Fire Alarm Detection System and One-Way Voice Communication System .

(2) Provide 120V power to each Fire Alarm Control Panel, NAC Panel, Transponder, Data Gathering Panels, Remote Control Panels, and peripheral device requiring 120V power.

(3) Provide 120 VAC power via dedicated branch circuit in NEC Article 700 panelboard.

(4) Provide branch circuit "breaker lock" to prevent accidentally de-energizing of power to fire alarm panel.

(5) Provide branch circuit breaker painted red and labeled "FIRE ALARM".

(6) Provide disconnect switch for AC power near panel or within Fire Alarm Control Panel itself. Switch shall be labeled "Fire Alarm Power Disconnect".

(7) Provide series connected power surge and transient protection for each branch circuit serving a fire alarm component.

(8) Provide back-up battery capacity to operate entire system in normal quiescent standby mode for period of 24 hours with 15 minutes of alarm operation at maximum connected load at end of standby period. Include spare capacity requirements in calculations.

(9) System shall automatically transfer to standby batteries upon power failure.

(a) Battery charging and recharging operations shall be automatic.

(b) Batteries shall be sealed lead-calcium.

(10) Provide power limited, filtered and regulated battery charger.

(a) Charger shall:

1) Be combination high rate/float maintenance type.

2) Charge fully discharged battery to 80% in 12 hours.

3) Be capable of fully recharging within 48 hours after single discharge.

4) Monitor for AC fail/disconnect, low/no battery, and high battery level.

5) Include switches and associated LEDs for high rate and AC disconnect.

6) Provide 5 amps of regulated 24VDC for peripheral devices requiring ± 5% regulation and 8 amps at 24VDC for standard peripheral devices.

7) Be compatible with lead acid batteries.

8) Meet all requirements of NFPA 72.

(11) External circuits requiring system operating power shall be 24VDC and shall be individually supervised and fused at Control Panel.

(12) Alarm current draw of entire fire-alarm system shall not exceed 80 percent of the power-supply module rating.

G. Smoke Detection Operation

(1) Smoke detector alarms shall be processed and reported immediately.

(2) Upon building completion, alarm verification shall be added to detector(s) as directed by project engineer. Provide fire alarm system capable of alarm verification mode.

(3) Fire Alarm Control Panel shall:

(a) Be capable of displaying number of times (tally) detector has gone into verification mode from the system history

(b) Download alarm set point to detector

(c) Determine condition of each detector by comparing detector's value to stored values.

(d) Maintain moving average of detectors' smoke chamber value to automatically compensate for dust and dirty conditions

(e) Continuously perform an automatic self-test routine on each detector

(f) Have capability of being programmed for pre-alarm or two-stage function

(g) Clear "detector dirty" trouble after detector has been removed from its base cleaned and replaced

(4) System shall maintain constant smoke obscuration sensitivity for each detector by compensating for environmental factors.

(5) Photoelectric detector's smoke obscuration sensitivity shall be adjustable to within 0.3% of either limit of UL window (0.5% to 4.0%) to compensate for any environment.

(6) System shall indicate when individual detector needs cleaning. When detector's average value reaches predetermined level, trouble MESSAGE shall be audible and visibly indicated at Control Panel. LED on detector base shall glow steady giving visible indication.

(7) For scheduling of maintenance, Control Panel shall generate MESSAGE indication for any detector approaching trouble condition due to dirt or contamination.

(8) Operator shall have capability to manually access the following information for each detector:

(a) Primary status

(b) Device type

(c) Present average value

(d) Present sensitivity value selected

(e) Detector range (normal, dirty, etc.)

(9) Values at Control Panel shall be in "percent of smoke obscuration" format, so that no interpretation is required by operator.

(10) Operator shall be able to manually control following for each detector:

(a) Enable or disable detector

(b) Establish alarm sensitivity

(c) Control detector's relay driver output

(11) It shall be possible to program Control Panel to automatically change sensitivity settings of each detector based on time-of-day and day-of-week. There shall be 3 sensitivity settings available for each detector.

H. Elevator Recall Operation

(1) Elevator recall function shall be as required by the IBC, IFC, and any referenced standards/codes such as ASME A17.1, requiring detectors in each elevator lobby, elevator shaft/hoistway, or elevator machine/control space for recall activation. Elevator recall function and activation of relay modules for recall functions shall be capable of adjustable time delay of from 0-30 seconds.

(2) Detectors shall be installed as indicated on plans in elevator lobbies, shafts/hoistway, and machine/control spaces separated by a minimum of 5’ and installed a maximum of 12’ from the centerline of any elevator within the lobby.

(3) When elevator lobby fire detectors are activated, it shall cause Phase I Emergency Recall Operation according to following sequence:

(a) If detectors are in a lobby on any floor other than main level of egress, all elevator cars serving that lobby shall be recalled to main level of egress.

(b) If detectors are in a lobby on main level of egress, all elevator cars serving that lobby shall be recalled to predetermined alternate recall level as determined by Owner and Authorities Having Jurisdiction.

(4) When elevator machine room or shaft/hoistway fire detectors are activated, it shall cause Phase I Emergency Recall Operation according to following sequence:

(a) All elevator cars with equipment in that machine room or elevator shaft/hoistway shall be recalled to main level of egress.

(5) Elevator shaft/hoistway, machine room, and lobby fire detectors shall annunciate individually at Fire Alarm Control Panel, and remote annunciator, and visual graphics display terminal on individual separate zones from all other devices.

(6) A relay module shall be provided to signal each individual elevator controller and group controller upon detection of fire detectors in each elevator machine room to activate elevator recall indicator “fire hat” in elevator car(s) with machinery located in the machine room where fire detectors have been activated. Activation of fire detectors in elevator machine rooms shall also active elevator recall to main level of egress.

(7) Relay modules shall be provided within 3’ of each individual elevator controller and group controller to actuate elevator recall operation. Individual relay modules shall be provided for each elevator car for main egress level recall, alternate egress level recall, and machine room “fire hat” operation.

(8) Upon reset of Fire Alarm Control Panel, elevators shall be allowed to resume normal operations. Manual reset of elevator controllers may be required.

I. Elevator Power Shunt Trip

(1) After elevator machine room or elevator shaft heat detector is activated, the elevator control panel shall activate shunt trip operator on breaker or switch supplying power to elevator, removing power from the elevator equipment.

(2) Specific elevator shaft zone shall be put into alarm and sound general fire alarm.

(3) Provide fire alarm monitor module to monitor presence of shunt trip voltage at shunt trip operator. Loss of shunt trip voltage shall be indicated as a Supervisory condition.

J. System Response

(1) Maximum elapsed time from sensing fire at initiating device until it is recorded at Control Panel and remote annunciator(s) shall not exceed 10 seconds, and not exceed 90 seconds for transmission and display of alarm at supervising station.

K. Sprinkler System Operation/Interface

(1) Activation of any standpipe or sprinkler system tamper switch shall activate system supervisory service audible signal and illuminate LED at Control Panel and remote annunciator(s).

(a) Control Panel shall provide differentiation between switch operation and opens and/or grounds on initiation circuit wiring.

(b) Pressing acknowledge key will silence audible signal while maintaining supervisory service LED "on" indicating off-normal condition.

(c) Restoring valve to normal position shall cause supervisory service audible signal to pulse indicating restoration to normal position.

(d) Acknowledge key shall silence audible signal.

(2) Activation of any standpipe or sprinkler system water flow switch shall activate system alarm audible signal and illuminate LED at Control Panel and remote annunciator(s).

(a) Pressing acknowledge key will not silence audible signal.

(b) Applicable alarm notification signals will continue to sound until the Alarm Silence key is activated, or the System Reset key is activated.

(3) Each sprinkler water flow and valve supervisory switch shall be annunciated individually at fire alarm control panel, annunciator, and visual graphics display terminal. Device and sprinkler zone identifier name shall be coordinated with Fire Protection Contractor.

L. Manual Evacuation (Drill) Operation

(1) Manual evacuation (drill) switch shall be provided to operate alarm indicating appliances without causing other control circuits to be activated.

(2) Should true alarm occur, alarm functions would occur.

M. LED and LCD Test Operation

(1) Activation of Lamp Test switch shall turn on all LED indicators, LCD display, and the local sounder and then return to previous condition.

N. System Diagnosis

(1) System shall include special software to detect, diagnose and report failures and isolate such failures to printed circuit board level.

O. Watch-Dog Timers

(1) System shall include independent "Watch-Dog" timers to detect and report failure of any microprocessor circuit, memory, or software.

P. Walk Test Operation

(1) Actuation of "Walk Test" switch/program at Control Panel shall activate "Walk Test" mode of system, which shall cause following to occur:

(a) Off-site fire alarm/supervisory/trouble transmission circuit connection shall be bypassed.

(b) Fire alarm control relay functions shall be bypassed, including door holder release and elevator recall or capture.

(c) Audio and visual circuits shall be bypassed.

(d) Control Panel shall show trouble condition.

(e) Alarm activation of initiation device shall cause audible signals to sound for 2 seconds.

(f) Control Panel shall automatically reset itself after signaling is complete.

(g) Momentary opening of initiating or indicating appliance circuit wiring shall cause audible signals to sound for 2 seconds indicating trouble condition.

(h) If system becomes inactive for period of longer than 5 minutes, Control Panel shall default to normal fire alarm functions.

(i) Activation of any initiation device shall be silently logged as an alarm condition in historical data file.

(2) Panel shall have capability of dividing system into distinctive walk test groups minimum of 8 groups.

Q. One-Way Voice Communications

(1) Automatic voice notification sequence shall be as follows:

(a) Audio alarm signal shall consist of optional alarm tone for minimum of 0 seconds and maximum of 10 seconds (length as directed by AHJ) followed by coded human voice digital signal indicating floor, zone, and device type in a numerical, coded format. Coded signal shall repeat a minimum of three times (or quantity as required by AHJ) and be configured to be able to sound until alarm silence switch at Fire Alarm Control Panel or the remote annunciator has been operated.

(b) Audio alarm operations of speaker circuit selection and alarm tone timing variations shall be activated by system software so that required future changes to evacuation sequence or re-arrangements of audio circuits can be facilitated by authorized personnel without additional components or rewiring.

(c) System shall be configured to allow for "All Call" and selective zone voice paging from the main Control Panel and remote annunciator panel(s).

(2) Selective Paging:

(a) Upon activation of any speaker manual control switch (es), optional alarm tone (minimum of 0 seconds and maximum of 10 seconds, length as directed by AHJ) shall sound over selected speakers. At end of this tone, operator shall be able to make announcements via push-to-talk paging microphone over pre-selected speakers.

(b) Strobes shall flash on all floors/zones or on selected floors/zones as selected by the user.

(c) Each floor, each stairwell and elevator car shall be separate selectable zones.

(3) All Call:

(a) Upon activation of "All Call" switch, optional alarm tone (minimum of 0 seconds and maximum of 10 seconds, length as directed by AHJ) shall sound over all speakers in system. At end of this tone, the operator shall be able to make announcements via push-to-talk paging microphone overall system speakers.

(b) Strobes shall flash in all areas or floors.

(c) System shall default to normal operations if the microphone becomes inactive for more than 1 minute.

R. Automatic Transfer Switch and Generator Monitoring

(1) Fire alarm control panel shall monitor the status and position of all building automatic transfer switches to indicate if switch is in the normal or emergency position.

(2) Fire alarm control panel shall monitor when generator as running.

(3) Fire alarm monitoring of transfer switches and generator shall be monitor only and not alarm, supervisory, or trouble.

S. Fire Pump Monitoring

(1) Fire alarm control panel shall monitor the status of the fire pump running.

(2) Fire alarm control panel shall monitor the following fire pump points as Supervisory:

(a) Loss of Phase

(b) Phase Reversal

(c) Pump on Generator or Alternate Source

(d) Pump Controller Trouble Alarm

(e) Alternate Source Switch or Circuit Breaker Open or Tripped

2.03 ENCLOSURE

A. Provide cabinets of sufficient size to accommodate equipment.

B. Cabinet shall be equipped with door, with lock and transparent door panel, providing tamper proof enclosure and allowing full view of various lights and controls.

2.04 FIRE ALARM CONTROL PANEL

A. Control Panel shall be modular, expandable with solid state, microprocessor-based electronics.

B. Control Panel shall provide the following features:

(1) Support intelligent (analog addressable) detection devices.

(2) Number of initiating device signaling line circuit (SLC) loops required for specified quantity of initiating devices plus 1 spare loop for each 3 active loops. Each active loop shall include 25% spare capacity.

(3) Number of audible notification device (horns or speaker) circuits required for quantity of horns or speakers in alarm, plus one (1) spare circuit for each 5 active circuits. Each active circuit shall include 20% spare capacity.

(4) Number of visual notification device (strobe) circuits required for specified quantity of strobes plus one (1) spare circuit for each 5 active circuits. Each active circuit shall include 20% spare capacity.

(5) 80-character liquid crystal display

(6) Printer interface

(7) History log file with minimum of 600 events

(8) Field programmable

(9) Drift compensation

(10) Sensitivity display in %

(11) Sensitivity adjustment

(12) Day/night sensitivity adjustment

(13) Auto detector test

(14) Alarm verification with tally counter

(15) Silent walk test

(16) Maintenance alerts

C. System shall provide ability to recall alarms and trouble conditions in chronological order.

D. Under normal condition viewing window shall display "System is Normal" message and current time and date.

E. When an abnormal condition occurs appropriate LED (Alarm, Supervisory or Trouble) shall flash.

F. Audible signal shall pulse for alarm conditions and sound steady for trouble and supervisory conditions.

G. Panel shall display the following information relative to abnormal condition of a point in system prior to acknowledgement:

(1) 40 characters for:

(a) Point address and loop number

(b) Type of device (i.e. smoke, pull station, water-flow)

(c) Point status (i.e. alarm, trouble)

(2) 40 characters for:

(a) Custom location label (i.e. 4th Floor - Room 444)

H. Keyboards or keypads shall not be required to operate the system during fire alarm conditions.

I. Following software functions shall be provided:

(1) Setting of time and date

(2) LED testing

(3) Alarm, trouble, and abnormal condition listing
(4) Enabling and disabling of each monitor point separately
(5) Activation and deactivation of each control point separately
(6) Changing operator access levels
(7) Walk Test enable
(8) Running diagnostic functions
(9) Displaying historical logs
(10) Point listing

J. Following hardware functions shall be provided:
(1) Acknowledge alarm or trouble
(2) Silence alarm or trouble
(3) Reset system after alarm
(4) Fire alarm/supervisory/trouble off-site transmission circuit disconnect/switch
(5) Provide manual evacuation (drill)
(6) Allow computer interface

2.05 REMOTE CONTROL, TRANSPONDER, OR DATA GATHERING PANELS

A. Remote control panels (also known as data gathering or transponder panels) may be used to provide and extend fire alarm system components such as SLCs, NACs, and communications to auxiliary devices such as printers, visual graphics display terminals, and other network components. All communication between Fire Alarm Control Panel and Remote Control Panels shall be digital communications on a supervised network riser and communications wiring system. Remote control panels shall be monitored and any failure in communication from Fire Alarm Control Panel shall be displayed audibly and visually at the Fire Alarm Control Panel.

B. Addressable devices shall transmit data to the Fire Alarm Control Panel through the SLC. An LED indicator shall be provided for the SLC in each Remote Control Panel and an additional LED shall indicate normal communications with the Fire Alarm Control Panel.

C. Failure of loss of communication of any Remote Control Panel shall not affect any devices or any other system component or network device which is not connected directly to the Remote Control Panel which has failed.

D. An open or short between the Fire Alarm Control Panel and Remote Control Panel shall be indicated as a trouble at the Fire Alarm Control Panel and Remote Annunciators.

E. Where multiple sections of Remote Control Panels are required, factory made interconnections shall be made with pre-made wiring harnesses installed at the factory such that no additional field wiring is required.

F. An open or short or other trouble condition on the Remote Control Panel shall be displayed on individual trouble indicator LEDs at the Fire Alarm Control Panel and Remote Annunciator and visual graphics display terminals. The visual trouble signal shall indicate devices and circuits affected by the trouble signal.

G. Remote Control Panels, amplifiers, NAC panels, and any other distributed system components shall be installed in 2 hour rated rooms only.

2.06 FIRE ALARM CONTROL PANEL STATUS INDICATORS AND DISPLAYS

A. Audible device shall sound during Alarm, Trouble or Supervisory conditions.

B. Audible device shall sound during each key-press.

C. Visual display shall distinguish between alarm, trouble and supervisory conditions.

D. Indicators and displays to be visible:
(1) One red system alarm LED
(2) One yellow supervisory service LED
(3) One yellow trouble LED
(4) Green "power on" LED
(5) Eighty-character LCD

E. Fire Alarm Control Panel shall provide:
(1) LCD display of each individual intelligent device name and identifier.
(2) When activated, red LED shall flash rapidly until acknowledged and remain lit constantly until fire alarm system is restored to normal operation.
(3) When device or zone is in trouble condition, yellow LED shall flash rapidly until acknowledged and remain lit constantly until fire alarm system is restored to normal operation.
(4) When device or zone is in supervisory condition, yellow LED shall flash rapidly until acknowledged and remain lit constantly until fire alarm system is restored to normal operation.

F. 2-line by 40-character LCD shall be backlit.

G. Cursor shall be visible on LCD when entering information.

H. Scrolling through menu options shall be in self-directing manner in which prompting messages shall direct user.

I. Controls shall be located behind an access door.

J. Status data to be available on display:

(1) Initiating device circuits
(2) Indicating device circuits
(3) Auxiliary relays
(4) Primary State of point
(5) Zone information
(6) Class "A" Status (if Class A used)
(7) Current priority of outputs
(8) Disable/Enable status
(9) Automatic/Manual Control Status of output points
(10) Acknowledge status

2.07 FIRE ALARM CONTROL PANEL CONTROLS

A. Controls (one switch per function per system) visible through front viewing window:

(1) Alarm Acknowledge key
(2) Trouble Acknowledge key
(3) Alarm Silence key
(4) System Reset key

B. Controls accessible with front door open:

(1) Keypad for data input and microprocessor control
(2) Manual evacuation (drill)
(3) Bypass audible and visible notification signal operation
(4) Fire alarm/supervisory/trouble off-site transmission circuit disconnect/switch
(5) One-Way Voice Communication System controls and microphone
(6) Elevator recall and shunt trip bypass
(7) Fan and damper shut down override/bypass switches
(8) Door holder release bypass

2.08 LED SUPERVISION

A. Slave module LEDs shall be supervised. When problem occurs, LCD shall display module and LED location.

2.09 ACCESS LEVELS

A. Provide 4 access levels with level 4 being highest level. Level 1 actions shall not require pass-code.

B. Pass-codes shall consist of up to 5 digits.

C. Pass-code digits entered shall be displayed as an X to indicate that digit has been accepted.

D. Key presses shall be acknowledged by local audible sound.

E. When correct pass-code is entered, system shall indicate to operator "Access Granted."

F. Access level shall be in effect until operator manually logs out or keypad has been inactive for 5 minutes.

G. Operator entering invalid code shall be notified with message "Incorrect Pass- Code" and shall be allowed three chances to enter valid code. After three unsuccessful tries, the message "Access Denied" shall be displayed.

H. Following keys/switches shall have associated access levels:

(1) Alarm Silence
(2) System Reset
(3) Set Time/Date
(4) Manual Control
(5) On/Off/Auto Control
(6) Disable/Enable
(7) Programming functions
(8) Clear Historical Alarm Log
(9) Clear Historical Trouble Log

(10) Walk Test

(11) Change Alarm Verification

I. Acknowledge keys shall require pass code access to acknowledge points. If operator presses an (ACK) key with insufficient access, an error message shall be displayed.

2.10 POINT LISTING

A. Point list menu includes:

(1) All points list by address

(2) Monitor point list

(3) Signal/speaker list

(4) Auxiliary control list

(5) Feedback point list

2.11 HISTORY LOGGING

A. System shall be capable of logging and storing the last 400 events (alarm and trouble) in history log. These events shall be stored in battery protected random access memory.

B. Following historical alarm log events shall be stored:

(1) Alarms

(2) Alarm Acknowledgment

(3) Alarm Silence

(4) System Reset

(5) Alarm Historical log cleared

C. Following historical trouble log events shall be stored:

(1) Trouble conditions

(2) Supervisory alarms

(3) Trouble acknowledgment

(4) Supervisory acknowledgment

(5) Alarm Verification tallies

(6) Walk Test results

(7) Trouble Historical log cleared

2.12 FIELD PROGRAMMING

A. System shall be fully programmable, configurable, and expandable in field and shall not require replacement of memory IC's.

B. Programming may be accomplished through Control Panel keyboard or keyboard at printer, or use of PC.

C. Programs shall be stored in non-volatile memory.

D. Programming or reprogramming shall be done by supplier at no charge until system is accepted by Owner.

2.13 TERMINAL/PRINTER INTERFACE

A. Control Panel shall be capable of operating remote monitors and/or printers.

B. Output shall be ASCII from RS-232-C connection with an adjustable baud rate.

C. Each RS-232-C port shall be capable of supporting and supervising up to 4 remote CRTs and Printers.

D. Data amplifiers shall be used to increase CRT or printer line distance.

2.14 INTELLIGENT NETWORK

A. Provide one intelligent device input Signaling Line Circuit (SLC) loop , per floor. Floors divided into zones per floor indicated on plans. Size loop for quantity of devices per zone with spare capacity for 25% future devices. Provide multiple SLC loops as required to meet spare capacity requirements.

B. System shall provide communications with intelligent initiating and control devices individually.

C. Devices shall be individually annunciated at control panel.

D. Annunciation shall include the following conditions for each point:

(1) Alarm

(2) Trouble

(3) Open

(4) Short

(5) Device missing/failed

E. Devices shall have capability of being disabled or enabled individually.

F. There shall be no limit to number of detectors, stations, or addressable modules, which may be activated or "in alarm" simultaneously.

G. Multiple intelligent devices shall be connected to a single pair of wires.

H. Communication format must be completely digital poll/response protocol to allow t-tapping of circuit wiring.

2.15 ONE-WAY VOICE COMMUNICATION SYSTEM

A. Provide central audio control module for:

(1) Alarm message/tone generation

(2) Main and remote microphone connections

(3) Mixer/pre-amplifier circuits

(4) Continuous supervision shall be provided for all circuits, amplifiers and modules.

(5) The voice communication system shall be eight (8) channel audio evacuation systems, to allow the ability to have eights simultaneous announcements/paging. The audio channels shall be design as such:

(a) Pre-Recorded Coded Tone and Messages

(b) General Alarm

(c) Manual Paging

(d) Elevator Message

(e) Stairwell Message

(f) Security/Weather Threat

(6) The system custom digital voice message shall provide a minimum of 100 minutes and be created as a .wav file format. All messages shall be able to be created on-site without any special tools or burning of memory chips. Provide as minimum one supervised audio amplifier per paging zone with spare amplifier. Actual amplifier size to be determined per devices installed and these specifications. The system software shall be capable of selecting the required audio source signal for amplification. To enhance system survivability, each audio amplifier shall automatically provide an internally generated local 3-3-3, 1000 Hz temporal pattern output upon loss of the audio signal from the one-way emergency audio control unit, during a general alarm condition.

(7) Audio amplifiers shall be power limited and protected from short circuits conditions on the audio circuit wiring. Each amplifier output shall be a supervised, dedicated, selectable 25/70 VRMS output.

(8) Provide a standby audio amplifier, per paging zone, that will automatically sense the failure of any primary amplifier installed in the same panel and replace the function of the failed amplifier.

B. Hand-held, push-to-talk microphone:

(1) Recessed in panel-mounted enclosure

(2) Dynamic communication type with frequency range of 200 Hz to 4000 Hz

(3) Equipped with self-winding 5 ft (1.5 m) coiled cable

(4) LED indicator shall be provided to indicate microphone push-to-talk button has been pressed and speaker circuits are ready for transmission.

(5) Supervised for disconnection.

C. One-Way Voice Communications System control switch module in Fire Alarm Control Panel:

(1) Provide manual access to audio operations personnel.

(2) Provide switches for individually selecting audio zones based on each floor, stairwell, and elevator car.

(3) Provide switches for individually selecting visual device (strobes) zones based on each floor.

(4) Provide LED indicators for indication of manually selected audio and visual zones.

(5) Provide output to system printer of zone(s) selected.

(6) Selection of floor audio zone shall activate visual device (strobes) for that floor.

(7) Include "All call" switch, "Aux Tone" switch and tone generator stop switch.

(8) Include “All call” switch for activating all visual devices on all floors.

(9) Switches and LED indicators shall be supervised for disarrangement on failure.

(10) Include a separate selector switch labeled “MANUAL” to defeat any automatically selected speaker and visual circuits and provide only for manual control of visual and audible circuits from the One-Way Voice Communications System Panel.

(11) Provide an emergency One-Way Voice Communication System with the following design features:

(a) An audio control unit with Microphone for One-Way Paging.

(b) Provide 3-position switch for each floor, stairwell, and elevator car, with "Voice", "Auto" and “EVAC” positions identified and two LED status indicators for each audio visual evacuation signaling "zone", one red and one yellow.

(c) Individual LEDs shall illuminate to indicate respectively:

1) Evacuation signals activated (red),
2) Trouble in audio (speaker) or visual (strobe) circuit(s) (yellow).

(12) Provide 2-position switch for “All-Call” to activate all the evacuation signaling zones, with "Voice" and "Auto" positions identified and two LED status indicators for each audio visual evacuation/smoke zone signaling "zone", one red and one yellow.

(a) Individual LEDs shall illuminate to indicate respectively:

1) Evacuation signals activated (red)
2) Trouble in audio (speaker) or visual (strobe) circuit(s) (yellow).

D. Self-contained speaker and switching arrangement shall provide testing of message(s) without disturbing occupants of the facility.

E. Provide custom audio messages, approved by Authority Having Jurisdiction.

F. Audio power amplifiers:

(1) Provide digital audio for the playing of digital audio files used as coded pre-recorded alarm.
(2) Be furnished with self-contained filtered 24 VDC power supply, transformer and amplifier monitoring circuits
(3) Provide 25VRMS and 70VRMS output with frequency response of 100 Hz to 7000 Hz
(4) Be constantly monitored
(5) Be provided with battery backup.
(6) Be current limited or disconnected from circuit should a short develop on speaker circuit
(7) Individual speaker circuits shall not be loaded more than 70%of rated amplifier power output.

G. Provide amplifiers and batteries to operate all system speakers at 1-watt tap minimum (or higher values as indicated on plans) simultaneously plus 33% reserve capacity.

H. Provide at least one back-up amplifier capable of automatically replacing any failed amplifier. Stand-by amplifier shall be rated at same output capacity as the largest amplifier in evacuation system.

I. Speaker and strobe circuits shall be zoned by floor or as noted on plans, with isolating module on each circuit.

J. The Fire Alarm System shall include back-up amplifiers within each Amplifier-Equipped FACP or Amplifier-Equipped Remote Equipment Cabinet. These back-up amplifiers shall be configured such that upon failure of any one Fire Alarm Audio Power Amplifier:

(1) A back-up amplifier shall be automatically routed into the signal path, such that the back-up amplifier shall functionally replace the failed amplifier. Back-up amplifier shall be at least as large in capacity as the largest amplifier at that FACP or remote equipment cabinet where amplifiers are located.
(2) A Trouble event shall be logged by the Fire Alarm System. This Trouble event shall indicate that an amplifier failure has occurred. If the system contains multiple amplifiers, the Trouble event message shall indicate which specific amplifier has failed.

K. Speaker and strobe circuits shall be zoned by smoke zones on each floor, speakers in each stairwell, and speakers in each elevator car. If floor is not subdivided into smoke zones then the entire floor shall be a zone. Each smoke zone on each floor, stairwell, and elevator car shall have an individually addressable zone for use on One-way voice communication system, selectable by pushbutton from One-way voice communications system control panel.

L. Upon selecting a zone or zones for one-way audible and visual device activation, the corresponding LED indicating each individual zone shall activate on the One-Way voice communications system panel.

M. Audio Evacuation Supervision:

(1) Each speaker circuit, amplifier, preamplifier, and power supply shall be supervised for component or circuit failure.
(2) A trouble light LED, per speaker zone, shall be provided in One-Way voice communications system panel.
(3) Detection of amplifier failure shall automatically cause substitution of stand-by amplifier and shall activate trouble light and audible signal at console and initiate trouble alarm on fire alarm system.
(4) Provide minimum of one speaker circuit for each floor, stairwell, elevator car and other area of distinct communication.

N. Manual Voice Paging Sequence

(1) System shall allow selective voice paging by speaker circuit.
(2) An "All Call" switch shall be provided to allow for activation of all speakers.
(3) An “All Call” switch shall be provided to allow for activation of all strobes.
(4) Manual operation shall be controlled at Fire Alarm Control Panel, or remote annunciator(s) microphone if provided.

O. Tones

(1) Main evacuating tone shall be NFPA 72 standard temporal code-three.

(2) Optional tones shall include:
(a) Hi/Lo
1) Free running tone with high frequency of 544 Hz and low frequency of 440 Hz
2) "On time" (Hi) shall be 100 milliseconds while the "off time" (Lo) is 400 milliseconds.
(b) Slow whoop
1) Slowly ascending tone from 200 to 830 Hz in 2.5 seconds
(3) One primary and one secondary tone generator shall be furnished.
(a) Automatic transfer to secondary unit should primary unit fail.
(b) Trouble signals shall indicate a failure of either primary or secondary unit.

2.16 REMOTE ANNUNCIATOR PANEL

A. Provide remote annunciators for the project as indicated on plans. Refer to floor plans for locations.

B. The remote annunciators at all locations shall contain a panel that shall display and house any equipment necessary for system operation for the Fire Detection System, Remote Annunciator, and One-Way Voice Communication System .

C. Provide 80-character LCD remote annunciator panel and individual LED lamp annunciator to indicate intelligent analog device name, floor, zone, and identifier.
(1) LED annunciators with individual indication of devices shall be provided as listed below.

D. The system shall be designed and equipped to receive, monitor, and annunciate signals from devices and circuits installed throughout the building.

E. Manufacturers' standard control switches shall be acceptable if they provide the required operation, including performance, supervision and position indication. If the manufacturers' standard switches do not comply with these requirements, fabrication of UL Listed custom manual controls acceptable to the Owner is required.

F. Receipt of alarm, trouble, and supervisory signals shall activate integral audible devices at the control panel(s) and at each remote annunciation device. The integral audible devices shall produce a sound output upon activation of not less than 85 dBA at 10 feet.

G. The fire detection and voice command panels shall contain the following system status indicators:
(1) Graphical backlit LCD display indicating system status and alarm, supervisory, and trouble conditions.

H. Provide an emergency One-Way Voice Communication System with the following design features:
(1) An audio control unit with Microphone for One-Way Paging.
(2) Provide 3-position switch for each floor, stairwell, and elevator car, with "Voice", "Auto" and “EVAC” positions identified and two LED status indicators for each audio visual evacuation signaling "zone", one red and one yellow.
(3) Individual LEDs shall illuminate to indicate respectively:
(4) Evacuation signals activated (red),
(5) Trouble in audio (speaker) or visual (strobe) circuit(s) (yellow).

I. Provide 2-position switch for “All-Call” to activate all the evacuation signaling zones, with "Voice" and "Auto" positions identified and two LED status indicators for each audio visual evacuation/smoke zone signaling "zone", one red and one yellow.
(1) Individual LEDs shall illuminate to indicate respectively:
(2) Evacuation signals activated (red)
(3) Trouble in audio (speaker) or visual (strobe) circuit(s) (yellow).

J. Instructions: Computer printout or typewritten instruction card mounted behind a plastic or glass cover in a stainless steel or aluminum frame. Include interpretation and describe appropriate response for displays and signals. Briefly describe the functional operation of the system under normal, alarm, and trouble conditions

K. Annunciator shall provide:
(a) LCD display of each individual intelligent device name and identifier.
(2) When activated, red LED shall flash rapidly until acknowledged and remain lit constantly until fire alarm system is restored to normal operation.
(a) When device or zone is in trouble condition, yellow LED shall flash rapidly until acknowledged and remain lit constantly until fire alarm system is restored to normal operation.
(3) When device or zone is in supervisory condition, yellow LED shall flash rapidly until acknowledged and remain lit constantly until fire alarm system is restored to normal operation.

L. Reset

(1) System reset at fire alarm annunciator panels shall be accomplished via password entry into annunciator via keypad. Provide printed password for system reset in Fire Department Knox Box located at Fire Department response point.

(2) Upon activation of system reset, a coded digital audio file with human voice recording shall be broadcast throughout the building indicating “Code Green” or other such code acceptable to the Authorities Having Jurisdiction that the fire alarm system has been reset.

M. Annunciator shall communicate to Control Panel over one shielded twisted pair cable and be supervised and powered from Control Panel.

N. Identifiers and names for all devices and zones indicated in control panel and remote annunciators shall be as approved by the AHJ.

O. Annunciator shall provide:

(1) Control push-button switches for; alarm silence, trouble silence, system reset and LED and LCD test.

(2) Tone Alert - Duplicates Control Panel tone alert during alarm and trouble conditions

(3) System trouble LED

(4) System alarm LED

(5) Power on LED

(6) 4 spare future programmable control switches for other functions.

(7) To accommodate and facilitate job site changes control switches shall have capability of being programmed on site to provide additional or nonstandard operations and functions.

P. Operating power shall be 24VDC and be fused at control panel.

Q. Wiring between annunciator panel and Control Panel shall be supervised for opens, grounds and shorts.

R. Under normal operating conditions, LCD shall indicate time, date and "SYSTEM IS NORMAL" label.

S. During abnormal conditions, LCD shall indicate type and number of abnormal conditions such as alarms, troubles, and supervisory services.

2.17 NOTIFICATION APPLIANCE CIRCUIT POWER SUPPLIES

A. The NAC power supply shall be independent unit that will provide power to visual strobe notification appliances. It shall be possible to configure the NAC panels to follow the main panel’s NAC or activate from intelligent synchronized modules. The booster NAC panels must be configurable to operate independently at any one of the following rates: continuous, synchronized, or 3-3-3 temporal. Fault conditions on the power supply shall not impede alarm activation of host NAC circuits or other power supplies. The NAC power supply must be able to provide concurrent power for notification devices, security devices, access control equipment and auxiliary devices such as door holders. All the NAC Power Supplies shall be synchronized. Batteries shall be provided per Part 2.

(1) Power supply shall be minimum of 10 amps and UL 864 Listed.

(2) Four independent 3amp NAC circuits. Each being configurable as auxiliary power.

(3) Power supply output shall be 24VDC.

B. All circuits shall be synchronized.

C. Strobe circuit loading shall be calculated at 75 cd tap for all devices, except in mechanical, interstitial spaces where circuit loading shall be calculated at 110 cd tap.

D. Provide NAC panel power supplies and batteries to provide power for all devices at calculated values plus 25% spare capacity.

E. Where they are used, “NAC Power Booster Panels” shall be individually supervised. Interconnecting NAC Booster Panels in a manner, which prevents identification of individual panel TROUBLE conditions, shall not be approved. NAC Booster Panels shall be wired to dedicated branch circuits.

F. Remote Control Panels, NAC panels, and any other distributed system components shall be installed in 2 hour rated rooms only.

2.18 MULTIPLEXED PERIPHERAL DEVICES

A. Devices shall be supervised for trouble conditions.

B. Failure of device shall not hinder operation of other system devices.

C. Device Identification

(1) Each intelligent device shall be identified by an address code.

(2) Location of end-of-line device shall be indicated on device that containing same.

(3) System must verify that proper type device is in place and matches software configuration.

D. Intelligent Detector Bases

(1) Either base or head shall contain electronic circuits that communicate detector's status (normal, alarm, sensitivity status, trouble) to Control Panel over two wires. Same two wires shall also provide power to base and detector.

(2) Contacts between base and head shall be of bifurcated type using spring-type, self-wiping contacts.

(3) Base shall have locking capability. Locking feature must be field removable when not required.

(4) Upon removal of detector's head, trouble signal shall be transmitted to Control Panel.

(5) Detector base shall be sealed against rear airflow entry.

(6) Detector base or head shall contain LED(s) that flash when detector is being scanned by Control Panel.

(7) LED(s) shall turn on steady when detector is in alarm condition.

(8) Removal of detector from base shall not affect operation of other devices on loop.

E. Intelligent Detector Heads - General

(1) Intelligent detector heads shall be low-profile type.

(2) Bases or detectors shall include a test mode for smoke detectors to transmit sensor analog detection percentage and verification mode to Fire Alarm Control Panel and printer.

(3) Heads shall be plug-in units, which mount to common base.

(4) Heads shall be 24 VDC type.

(5) Heads may be reset by actuating Control Panel reset switch.

(6) To minimize false alarms, voltage and RF transient suppression techniques shall be employed.

(7) Smoke detectors:

(a) Listed for sensitivity testing from Control Panel. Sensitivity test results shall be logged and downloaded to printer.

(b) Include an insect screen.

(c) Communicate actual smoke chamber values to Control Panel.

(d) Be provided with and covered with device manufacturer provided plastic cones after installation to maintain cleanliness. Cones shall be red for quick visual identification for removal at time of occupancy.

(8) Install smoke detectors on circuits with alarm verification possible. Only enable fire alarm verification mode when directed by project engineer after occupancy.

F. Intelligent Photoelectric Smoke Detectors

(1) Detectors:

(a) Contain no radioactive material

(b) Be of solid state photoelectric type and shall operate on light scattering photodiode principle using pulsed infrared LED light.

(c) Have sensitivity monitored to determine changes in environmental conditions. Value of smoke density for each detector shall be transmitted to Fire Alarm Control Panel.

(d) UL 268, 8th Edition multi-criteria based detectors.

G. Intelligent Heat Detectors

(1) Detectors shall:

(a) Be a combination rate-of-rise and fixed temperature 135°F (57°C) (unless noted otherwise on plans).

(b) Sense within temperature range of -32°F to 158°F (-35°C to 70°C). The control panel shall be capable of sensing either a set point of 135°F (57°C), or a rate-of-rise of 15°F (8.3°C) per minute for fire sensing.

H. Intelligent Duct Smoke Detectors:

(1) Duct detectors shall be of photoelectric type.

(2) Provide each duct detector with duct mount housing sampling tubes sized according to duct width in which detector is installed. Verify characteristics of ductwork with Mechanical Contractor prior to purchase and installation. Tubes 48” and shorter shall be supported at far end by support inside duct. Tubes longer than 48” shall be supported with strap hanger. Supports shall not cover tube sampling holes.

(3) Detectors shall be rated for temperature and air velocity in ductwork in which they are installed. Verify characteristics with Mechanical Contractor prior to purchase and installation.

(4) Duct Smoke Detectors: Installation shall comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct.

(5) It shall be possible to initiate duct detector alarm condition by using remote or local test switch.

(6) Provide remote test switch and alarm LED indicator for each duct smoke detector.

(7) It shall be possible to clean sampling tubes by access through duct housings front cover.

(8) Provide addressable output relay modules within 36” of motor controller or starter where fan motor control is noted on plans.

(9) Remote keyed test switch and LED alarm indicator for each duct detector shall be provided in nearest corridor and grouped together for all duct detectors located within 30' of each other. A black engraved label with white letters shall be affixed to each test switch/indicator to list air handler system associated with duct and closest room number/location of detector.

(10) In mechanical rooms, alarm LED indicators and test switches shall be grouped together so devices are readily visible and neatly organized.

(a) Mount adjacent to main mechanical room door.

(b) Each LED shall be labeled with detectors loop and address.

(c) Floor plan of room showing detectors and addresses shall be located adjacent to cover plate.

(d) Provide Plexiglas cover over plan.

(e) A black engraved label with white letters shall be affixed to each test switch/indicator to list air handler system associated with duct.

I. Manual Stations

(1) Manual stations:

(a) Double-action mechanism pull down type; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control unit.

(b) Activate building coded alarm condition when pulled.

(c) Be provided with a key operated mechanism to sound building fire alarm.

(d) Be constructed of high impact, red Lexan with raised white lettering and smooth high gloss finish. Recessed backbox mounted.

(e) Contain circuits that communicate station's status (alarm, normal) to Control Panel over 2 wires.

(f) Mechanically latch upon operation and remain so until manually reset. Stations, which use Allen wrenches or special tools to reset shall not be accepted.

(g) Station Reset: Key operated switch shall match the control panel key.

(h) Be fitted with screw terminals for field wire attachment.

(i) The manual pull station shall have an addressable intelligent module integral of the unit.

(j) Manual pull stations that initiated an alarm condition by opening the unit are not acceptable.

(2) Address shall be field programmable on station.

J. Interface Modules - General

(1) Interface Modules:

(a) Receive 24 VDC power from separate two wire circuit

(b) Available in either Class B or Class A supervision version

(c) Supervised and identified by Control Panel

(d) Capable of being programmed for its "address" location

(e) Compatible with addressable manual stations and intelligent detectors on same intelligent initiating circuit

(2) Class A wiring shall be looped back and connected to module.

(3) Class B wiring shall be supervised by an end-of-line device.

(4) Should interface module become non-operational or removed, trouble signal shall be transmitted to Control Panel.

(5) Interface module LED's shall be clearly visible on the face of the trim plate.

K. Interface Modules – Addressable Output Modules (Supervised Control and Relay Modules)

(1) Addressable Output Modules shall be supervised and used for AHU system interface, building automation system interface, smoke damper control, door security interface and other relay modules as indicated on plans.

(2) Addressable Output Control Modules shall be supervised and used for control of indicating appliances, and other internal fire alarm system functions.

(3) For signals, speakers, and other device control interface module shall provide double-pole/double-throw relay switching that can connect any of the following through 2 amp fuses:

(a) Zone of signals to power source

(b) Speakers to audio source

(c) Strobes to power supply

(d) Variety of controlled devices to appropriate controlling circuits.

(4) Interface addressable output relay modules shall:

(a) Communicate supervised wiring status (normal, trouble) to fire alarm control panel.

(b) Receive from fire alarm control panel command to transfer relay.

(c) Be provided with red LED which shall flash each time relay module communicates with fire alarm control panel polling.

(5) All relay modules shall be provided with minimum two sets of contacts rated for the intended connected load. One set of contacts shall be used for the intended control function and the other set used for secondary functions such as monitoring or confirmation of contact closure by the building automation system. Provide addressable control relay circuit modules shall provide two (2) form C dry relay contacts rated at 120Vac and 24Vdc @ 2 amps to control external appliances or equipment. The position of the relay contact shall be confirmed by the system firmware. The module shall be suitable for mounting on North American 2-1/2" (64 mm) deep 1-gang boxes and 1-1/2" (38 mm) deep 4” square boxes with 1-gang covers.

(6) Where loads connected to relay or control modules exceed standard contact ratings, provide additional relay with contact/voltage ratings sufficient for the connected load. Such sub-relays shall be driven by fire alarm addressable relay/control module and shall be listed for use in fire alarm systems.

L. Interface Modules – Addressable Input Monitor Modules (Supervised Monitor Modules)

(1) Interface Monitor Modules shall:

(a) Be suited for monitoring of waterflow, building automation system, automatic transfer switches, generator status, fire pump status, valve tamper, non-intelligent detectors and other functions indicated on plans.

(b) Addressable interface module shall be provided for interfacing normally open direct-contact devices to an intelligent initiating circuit.

(c) Provide power to and monitor status of zone consisting of conventional 2-wire smoke or heat detectors and N/O contact devices.

(d) Communicate zone's status (normal, alarm, trouble) to Control Panel.

(e) Be provided with red LED which shall flash each time relay module communicates with fire alarm control panel polling.

(2) Supervision of zone wiring shall be Class A or Class B as required by type of loop installed on.

(3) No t-taps of monitor module wiring shall be permitted.

2.19 AUDIBLE/VISUAL DEVICES

A. Combination Speaker/Strobe Devices

(1) Speakers, Strobes, and Speaker/Strobe devices shall be wall or ceiling mount as indicated on plans.

(2) Speakers:

(a) Operate on 25 VRMS circuit to match fire alarm system amplifiers

(b) Include separate wire leads for in/out wiring for each leg of associated signal circuit. T tappings of Class A signal device conductors shall not be acceptable.

(c) Be suitable for rear mounting behind audio-visual assemblies, which shall be flush or semi-flush mounted, with manufacturer back boxes and flush trim ring.

(d) Have field adjustable output taps, 4 taps minimum. 1/4W, 1/2W,1W, 2W.

(e) Provide minimum sound pressure level of 87 dBA (UL Listed Reverberant) at 10 ft (3 m) using 1-watt tap. 80dBA @ 1/4W, 84dBA @ 1/2W, 87dBA @ 1W, 90dBA @ 2W. All measurements at 3m (10’).

(f) Speakers located in mechanical rooms shall have 4 taps minimum with 8W (98dBA Reverberant at 10 ft (3 m) being the highest.

(g) Include a blocking capacitor for line supervision and screw terminal for in-out wiring.

(h) T tappings of Class A signal device conductors shall not be acceptable.

(3) Strobes shall be:

(a) Operate at 24VDC circuit separate from Horn or Speaker circuit.

(b) Multi-tap units with taps at 15, 30, 75, and 110 cd.

(c) Tapped at 15-candela peak power or as noted on drawings.

(d) Have flash synchronization module on circuit when more than one strobe is visible at a time from any location.

(e) T tappings of Class A signal device conductors shall not be acceptable.

(f) On separate supervised circuit from speaker circuit.

(4) Clear Lexan lens

(5) Shall have "FIRE" in red lettering visible from a 180° field of view on each side of wall mounted devices and 360° field of view on ceiling mounted devices.

(6) Have white semi flush housing for ceiling or wall mounted devices in finished areas.

(7) White baffle with surface mounted back box, furnished by speaker manufacturer, where installed in unfinished areas.

(8) Cast metal grille and back box where installed in mechanical/interstitial spaces.

B. Speaker Only Devices

(1) Speakers without strobe units:

(a) Include features for speakers listed under Combination Speaker/Strobe Devices.

(b) T tappings of Class A signal device conductors shall not be acceptable.

C. Strobe Only Devices

(1) Strobes without strobe units:

(a) Include features for strobes listed under Combination Speaker/Strobe Devices.

(b) Operate at 24VDC circuit separate from Horn or Speaker circuit.

(c) Multi-tap units with taps at 15, 30, 75, and 110 cd.

(d) Tapped at 15-candela peak power or as noted on drawings.

(e) Have flash synchronization module on circuit when more than one strobe is visible at a time from any location.

(f) T tappings of Class A signal device conductors shall not be acceptable.

(g) On separate supervised circuit from horn or speaker circuit.

2.20 CONVENTIONAL PERIPHERAL DEVICES

A. Sprinkler Waterflow Switches - Wet Systems

(1) To be furnished and installed by Fire Protection Contractor under Division 21. Devices shall be monitored by fire alarm system via addressable monitor module.

(2) To prevent false alarms, flow switch shall incorporate adjustable time delay mechanism between the paddle-operated stem and alarm initiating contacts.

(3) Tapped 1/2” (16 mm) conduit connection

B. Sprinkler Valve Tamper Switches - Wet Systems

(1) Sprinkler valve tamper switches shall be furnished and installed by Fire Protection Contractor under Division 21. Devices shall be monitored by fire alarm system via addressable monitor module. Supervisory signal.

(2) Switch shall be provided with either 1 or 2 sets of S.P.D.T. micro switches as required.

C. Two-Way Radio Firefighter System Radio Monitoring

(1) Provide addressable monitor modules for supervisory monitoring at locations indicated on plans for monitoring of two-way firefighter radio system.

(a) Donor antenna malfunction

(b) Active RF emitting device failure

(c) Low-Battery capacity indication

(d) System component failure

(e) Loss of normal power

(f) Failure of battery charger

D. Door Holders

(1) Magnetic door holders:

(a) Provided by the General Contractor. Refer to Door Hardware Specification.

(b) Capable of being surface, flush, or semi-flush mounted as required by wall construction. Provide flush or semi-flush mounting in finished spaces.

(2) Power for door holders shall be 24 VDC.

(3) Power for door holders shall be accounted for in battery calculations and power provided to door holders from the fire alarm battery system to maintain doors open during any power outage. Include all door holder power requirements in battery calculations

E. Fault Isolator Module

(1) Provide Fault Isolator Module (FIM) on initiating device circuits in following situations:

(a) Loop extends to another floor

(b) Loop extends to another building

(c) For each 25 devices on a loop

(2) Fault Isolator Module shall:

(a) Automatically re-connect isolated section of loop upon correction of fault conditions.

(b) Not require any address setting

(c) Operations shall be totally automatic. It shall not be necessary to replace or reset FIM after its normal operation.

(d) Include LED, which shall flash under normal operation and illuminate steady to indicate short circuit.

2.21 ISOLATED LOOP CIRCUIT PROTECTORS (ILCP)

A. Fire Alarm Control Panel shall include Isolated Loop Circuit Protector (ILCP) on circuits which extend beyond building. Circuits include, initiating device circuits, alarm notification appliance circuits, and signaling line circuits.

B. ILCP shall:

(1) Be located as close as practical to point where circuits leave or enter building.

(2) Have line-to-line response time of less than 1 nanosecond.

(3) Have #12 AWG grounding conductor with maximum length of 25 ft (7.6 m). It shall be run in straight line and connected to building grounding electrode system.

C. Spark gap devices or devices incorporated in or installed within control panel in lieu of ILCP are not acceptable.

2.22 DACT TRANSMITTER

A. Provide digital alarm communicator transmitter for fire alarm signal transmission to UL listed central station monitoring system.

(1) Performance Based Compliance

(a) Equipment provided shall monitor the integrity of the transmission technology and communication path between the protected premises and the central station.

1) Equipment relying on a single communications path shall be supervised at an interval of not more than 60 minutes. Failure to complete signal transmission shall be annunciated at the protected premises.

2) Equipment relying on multiple communications paths shall meet the following requirements:

1. Each path shall be supervised within not more than 6 hour intervals

2. The failure of any path shall be annunciated at the supervising station within not more than 6 hours.

3. The failure to complete a signal transmission shall be annunciated at the protected premises.

(2) DACT shall employ one telephone line and one of the following technologies:

(a) One-way private radio alarm system

(b) Two-way RF multiplex system

(c) Transmission means complying with performance requirements.

B. Transmitter shall transmit alarm, supervisory, and trouble conditions to monitoring system.

C. Fire Alarm Control Panel shall be provided with Alarm, Supervisory, and Trouble signals to communicate with DACT communications device.

2.23 DOCUMENTATION ACCESSIBILITY.

A. Provide a documentation cabinet at the system control unit or at another approved location at the protected premises.

(1) The documentation cabinet shall be sized so that it can contain all necessary documentation.

(2) Cabinet shall be a tamper proof hinged enclosure, equipped with locking door,

(3) All record documentation shall be stored in the cabinet included but not limited to:

(a) Record drawings (as-builts)

(b) Equipment technical data sheets

(c) Alternative means and methods, variances, appeals, and approvals, and so forth

(d) Performance-based design documentation

(e) Risk analysis documentation

(f) Emergency response plan

(g) Evaluation documentation

(h) Software and firmware control documentation

(4) Where the documentation cabinet is not in the same location as the system control unit, its location shall be identified at the system control unit.

(5) The documentation cabinet shall be prominently labeled SYSTEM RECORD DOCUMENTS.

(6) Emergency communications system and fire alarm system record documentation shall be permitted to be maintained together in the same documentation cabinet.

PART 3 EXECUTION

3.01 GENERAL

A. Set strobe intensity of all strobe at rating indicated on plans. Set all speaker intensities at 1W tap unless otherwise indicated on plans.

B. Circuits Requirements:

(1) Signaling Line Circuits for Risers, Audio Riser, Network Communications, Communications to transponder, data gathering, or remote control panels, and NAC Power Supply Signaling Line Circuit wiring.

(a) Class B

(2) Signaling Line Circuits for Intelligent Analog Addressable Loop Serving a Floor:
  (a) Class B
  (b) No more than 200 detectors or 200 relay or monitor modules installed on a loop.
(3) Audible Speaker Device Circuit Serving Each Zone:
  (a) Class B
(4) Strobe Notification Appliance Circuit Serving Each Zone:
  (a) Class B
  (b) Maximum circuit loading to 2 amps for visuals.
(5) Horn Notification Appliance Circuit Serving Each Zone:
  (a) Class B
  (b) Maximum circuit loading to 2 amps for audibles.

C. Installation shall be done in neat, workmanlike manner in accordance with manufacturer's recommendations.

D. Smoke detectors shall not be mounted until construction is completed.

3.02 RACEWAYS

A. Fire Alarm System Wiring shall be in conduit system separate from other building wiring. See Section 26 05 33 - Raceway and Boxes for Electrical Systems.

B. Fire alarm conduit shall be red along the entire length of each piece of conduit with red color applied at factory as a standard finish available on conduit from manufacturer.

C. All Class A and Class X wiring methods shall use a separate conduit pathway for outgoing and return path. Minimum separation shall be 48” for horizontal wiring and 12” for vertical wiring

D. Minimum 3/4” (21 mm) steel raceway.

E. Contractor shall size conduit and boxes by circular mil size of cable in conduit or box.

F. Surface access to existing alarm initiating circuits in public areas shall be via surface metal raceways (minimum equivalent to 3/4” (21 mm) conduit) and box extensions.

G. Existing conduit and surface metal raceway that are not 3/4” (21 mm) size may be reused if found to have adequate space for existing and new conductors and meet all other specification and code requirements.

3.03 CONDUCTORS

A. Cables and wires shall be provided per manufacturer shop drawings. Cables shall be copper with stranded or solid conductors. Provide grounded shielding on conductors as recommended by manufacturer to eliminate interference and to provide required system performance.

B. All wiring and installations of the systems specified in this specification shall be installed in accordance with all provisions of the National Electrical Code Article 760 and International Building Code and International Fire Code as adopted by the AHJ.

C. Wiring between contacts provided by devices being monitored by fire alarm system through monitor modules shall be provided and terminated by fire alarm Contractor.

D. Fire Alarm system wiring, visual strobe circuit wiring, and one-way voice communication system wiring shall be separately and individually zoned per smoke zones per floor indicated on fire alarm plans. Dedicated conduits and wiring per zone shall be provided.

E. All horizontal fire alarm system wiring, visual strobe circuit wiring, and one-way voice communication system wiring originating or traveling through a smoke zone other than the zone being served shall be installed in conduit with UL 2196 Listed 2 hour rated Fire Alarm cable circuit protective system listed for fire alarm wiring applications or other architectural or structural methods recognized by applicable versions of NFPA 72 for 2 hour protection of the wiring.

F. All vertical fire alarm system wiring, visual strobe circuit wiring, and one-way voice communication system and system riser wiring shall be installed in conduit in 2 hour rated construction shafts, enclosures, or spaces or rooms dedicated to 2 hour rated protection of electrical equipment and wiring. Where vertical fire alarm system wiring, visual strobe circuit wiring, and one way voice communication system and system risers are outside of 2 hour rated construction shafts, enclosures, or spaces or rooms dedicated to 2 hour rated protection of fire alarm equipment and wiring, the wiring shall be installed in conduit with UL 2196 Listed 2 hour rated Fire Alarm cable circuit protective system listed for fire alarm wiring applications. Cables shall be rated for use in risers.

G. Upon entering the smoke zone served on the floor, for the horizontal fire alarm system wiring, visual strobe circuit wiring, and one-way voice communication system wiring and conduit entering the smoke zone on the floor being served, standard insulation fire alarm wiring conductors in conduit may be provided for that portion of the wiring that remains entirely in the smoke zone after terminating on the first device in the smoke zone being served.

H. Conductors shall be color-coded. Coding shall be consistent throughout facility. Match existing building color code in existing buildings.

I. Green wire shall be used only for equipment ground.

J. Control Panel power wiring shall be #12 AWG.

K. Control Panel shall have #12 AWG equipment ground wire.

L. Where fire alarm circuits enter or leave building, additional transient 75 to 90 V gas tube protection shall be provided for each conductor.

M. Cable Detector Loops shall be twisted pair with shield jacket. Shield shall be connected to earth ground only at control panel.

N. Detector wiring shall not be in same conduit with 120/240 VAC wiring or other high current circuits.

O. T-taps or branch circuit connections allowed for Class B intelligent loop circuits.

P. Leave 8” (200 mm) wire tails at each device box and 36” (900 mm) wire tails at Control Panel and Remote Annunciator Panel(s).

Q. Cable for RS 232-c devices (CRT, PRINTER) shall be two, shielded twisted pair.

R. Cable for RS 485 devices (Remote Annunciators) shall be shielded-twisted pair for data signal.

S. Wiring of initiating device circuits, horn circuits, speaker circuits, and strobe circuits shall be #14 AWG minimum.

T. Fire alarm cable shall be held in place at device box by means of 2-screw connector, (do not use squeeze or crimp type connectors).

U. Splices or connections shall be made within approved junction boxes and with approved fittings.

V. Boxes shall be red and labeled "FIRE ALARM SYSTEM" by decal or other approved markings.

W. Speaker and strobe circuits shall have separate conductors, and shall operate independently of each other.

X. All wiring methods provided for cables and conduits requiring 2 hour protection shall be provided with the specific conduit, supports, hangers, boxes, materials, raceway couplings, connectors, and installation methods as required to obtain the UL listing for 2 hour protection. These products may differ from those provided for other DIVISION 26 or DIVISION 28 wiring but shall be provided to maintain 2 hour protection per UL.

3.04 DEVICE MOUNTING

A. Recommended mounting heights, and requirements are as follows:

(1) Fire Alarm Control Panels

(a) Mount control panel so visual indicators and controls at maximum 60” (1530 mm) above floor level.

(2) Remote Annunciators

(a) Mount panel so visual indicators and controls at maximum 60” (1530 mm) above floor level.

(b) Install multi-gang box as required by manufacturer, flush or surface mounted. Provide flush mounted in finished spaces. Surface mount only acceptable in unfinished spaces such as mechanical rooms or electrical rooms.

(3) Audio-Visual Devices

(a) Install wall mounted visual only and visual/audible devices flush, semi-flush or surface mount devices 80” (2030 mm) from bottom of device to finished floor and 6” minimum below finished ceiling. Verify with heights indicated on drawings. Semi-flush mounting shall be provided in finished spaces. Surface mount not allowed in finished spaces.

(b) Install wall mounted audible only flush, semi-flush, or surface mount devices 80” (2030 mm) from bottom of device to finished floor and 6” minimum below finished ceiling, verify with heights indicated on drawings. Semi-flush mounting shall be provided in finished spaces. Surface mount not allowed in finished spaces.

(c) Surface mount devices acceptable only in unfinished spaces such as mechanical rooms, electrical rooms, shell spaces.

(d) No devices protruding 4” (100 mm) or more shall be installed lower than 80” (2030 mm).

(e) Audio/visual devices may be installed on the ceilings in accordance with NFPA 72. Refer to plans for mounting locations.

(f) Use manufacturer recommended backboxes.

(g) For surface mounting, use manufacturer-supplied backboxes and trim plates.

(h) Mark each device with its circuit number.

(4) Manual Stations

(a) Manual stations shall be in unobstructed locations.

(b) For surface mounting, use manufacturers supplied backboxes and trim plates

(c) Mark unit’s address on inside and outside of housing.

(5) Heat and Smoke Detectors

(a) Location of detectors shown on plans is schematic only. Detectors must be located according to code requirements.

(b) Surface mounted detectors shall be installed using back boxes equal to base size. Standard octagon and square boxes are not acceptable.

(c) Detectors shall be located on the highest part of smooth ceiling so that edge of detector is no closer than 4” (100 mm) from sidewall.

(d) Ceilings with beams, joists or soffits that exceed 8” (200 mm) in depth require special planning and closer spacing.

(e) Mount detectors on sidewalls with top of detector no closer than 4” (100 mm) from ceiling and no further away than 12” (300 mm).

(f) Smoke detectors shall not be installed closer than 3 ft (1 m) from air supply diffusers.

(g) No detectors shall be installed in direct airflow.

(h) Mark zone number and ranking of each detector on its base.

(i) Mark address and loop number on each detector's base.

3.05 ADDITIONAL DEVICES

A. Per NFPA 72, in addition to smoke detectors illustrated on plans, provide a smoke detector located within 5’ of each fire alarm system control panel such as NAC panels, transponders, data gathering panel, remote control panels, power supplies, fire alarm control panel, remote annunciators, and all other electrical system components which comprise the system described in this specification.

B. Plan drawings do not show all devices, modules and components required to accomplish specified system operation. Provide all materials necessary for a fully functioning system.

C. Provide 2 additional alarm initiating devices of each type (smoke detector, heat detector, pull station) completely wired and programmed per floor. Devices and appliances to be located in the field by the engineer during the construction period.

D. Provide 2 additional notification appliances (of each type – strobe only, speaker only, combination speaker/strobe) completely wired and programmed per floor. Devices and appliances to be located in the field by the engineer during the construction period.

3.06 DEMOLITION

A. Existing equipment that is removed shall be inventoried and turned over to Owner

B. Upon inspection by Owner, Contractor shall dispose of equipment that is deemed useless to Owner.

C. Contractor shall remove abandoned devices and conduit not being reused.

3.07 IDENTIFICATION LABELS

A. Junction boxes shall be painted red and labeled "Fire Alarm.”

B. All wiring must be labeled with name of circuit and area being served by circuit. Provide labels within 6” of wiring termination within panels and enclosures.

(1) Labels shall be permanent, and be machine generated. Handwritten or non-permanent labels will not be accepted.

(2) Labels shall be self-laminating, white/transparent vinyl and be wrapped around each cable or cable sheath when grouped together in sheath.

(3) Flag type labels are not allowed.

(4) Labels shall be of adequate size to accommodate circumference of cable being labeled and properly self-laminate over full extent of printed area of label.

C. Label each initiating device using machine printed label to indicate device address. Provide label with black text on white background.

D. Label each notification device using machine printed label to indicate circuit supplying that device. Provide label with black text on white background. Label shall separately indicate strobe circuit and speaker circuit. Provide EOL label for devices that contain end of line resistors.

E. Adhesive type labels not permitted except for phase and wire identification.

F. Wiring color code shall be maintained throughout installation.

G. Green wire shall be used only for equipment ground.

3.08 MANUFACTURER'S SERVICES

A. Supervision of installation shall be provided by trained service technician from manufacturer of fire alarm equipment.

B. Technician shall be US certified and have had minimum of 2 years of service experience in fire alarm industry.

C. Technician's name shall appear on equipment submittals, and letter of certification from fire alarm manufacturer shall be sent to project engineer.

D. Manufacturer's service technician shall be responsible for following items:

(1) Pre-installation visit to job site to review equipment submittals and verify method by which system shall be wired.

(2) Make periodic job site visits to verify installation and wiring of system.

(3) Upon completion of wiring, final connections shall be made under supervision of technician.

(4) At time of final checkout, technician shall give operational instructions to Owner and/or his representative.

(5) Job site visits shall be dated and documented in writing and signed by Electrical Contractor.

(6) Discrepancy shall be noted on document and copy kept in system job folder, which shall be available to project Engineer any time during project.

3.09 TESTING

A. Manufacturer's authorized representative shall perform complete functional test of each system and submit written report to Contractor attesting to proper operation of completed system prior to final inspection.

B. Contractor shall test each device in system before system is considered substantially complete.

C. Completed fire alarm system shall be fully tested by Contractor in presence of Owner's representative and local Fire Marshal.

D. Upon completion of successful test, Contractor shall:

(1) Certify system to Owner in writing

(2) Complete NFPA 72 record of completion form

(3) Provide as-builts and O&M manuals

3.10 WARRANTY

A. Warrant completed fire alarm system wiring and equipment to be free from inherent mechanical and electrical defects for a period of 2 years from the date of substantial completion of project.

B. Post warranty period along with company’s name and telephone number inside fire alarm panel.

C. Warranty service for equipment shall be provided by system supplier's factory trained representative.

D. Warranty shall include parts, labor, and necessary travel.

E. Occupied facility shall not be without UL and NFPA approved and fully operational fire alarm system for period longer than 2 hours. Emergency response shall be provided within 2 hours of notification, to Contractor, of failure of system to perform operationally per UL and NFPA standards.

F. Non-emergency service calls shall be responded to within 24 hours of notification to Contractor.

G. Repairs and/or replacement shall be completed within 72 hours of time of notification. Other than emergency, actual repairs and/or replacement shall be provided during normal working hours, Monday through Friday, excluding holidays.

H. If repair and/or replacement cannot be made within prescribed time, other means and methods of protection shall be provided to ensure safety of building occupants during which time system is not in compliance with standards. This may involve up to and include hiring Owner approved qualified personnel to stand fire watch, at Contractor's expense.

3.11 TRAINING

A. Contractor shall provide minimum of 8 hour system operation training for Owner, Architect/Engineer, and fire department personnel.

B. Training session shall be at a time to be stipulated by Owner.

C. Training shall be completed prior to final inspection.

3.12 MAINTENANCE CONTRACT

A. Equipment manufacturer shall make available to Owner, maintenance contract proposal to provide minimum of 2 inspections and tests per year in compliance with NFPA-72 Codes.

3.13 SPARE PARTS

A. Contractor shall provide the following spare parts in quantities shown, with a minimum of 1/item:

Quantity	Type of Device Present
10%	Photoelectric smoke detectors
10%	Heat detectors
10%	Smoke and heat detector bases
10%	Addressable Input Monitor Modules

Quantity	Type of Device Present
10%	Addressable Output Control and Relay Modules
1%	Duct detectors with housing and sample tubes
1%	Speaker Units (each type)
1%	Speaker/strobe Units
1%	Strobe Units
1%	Manual Stations

PART 1 GENERAL

1.01 WORK INCLUDED

A. Clearing and grubbing site and street right-of-way.

B. Disposing of removed material

1.02 RELATED WORK

A. Section 31 2000 – Earth Moving.

1.03 SUBMITTALS

A. See Related Work

PART 2 PRODUCTS

A. No Products included

PART 3 EXECUTION

3.01 SITE PREPARATION & PROTECTION

A. Protection of Existing Improvements.

1. Provide protections necessary to prevent damage to existing improvements indicated to remain in place.
2. Protect improvements on adjoining properties.
3. Restore damaged improvements to their original condition, as acceptable to Architect/Engineer or other parties having jurisdiction.

B. Protection of Existing Trees and Vegetation:

1. Protect existing trees and other vegetation, indicated to remain in place, against unnecessary cutting, breaking or skinning of roots, skinning and bruising of bank, smothering of trees by stockpiling construction materials or excavated materials within drip line, excess foot or vehicular traffic, or parking of vehicles within drip line. Provide temporary guards to protect trees and vegetation to be left standing.
2. Water trees and other vegetation to remain within limits of contract work as required to maintain their health during course of construction operations.
3. Repair or replace trees and vegetation indicated to remain which are damaged by construction operations, in manner acceptable to the Architect/Engineer. Employ qualified tree surgeon/arborist to repair damage to trees and shrubs.

3.02 SITE CLEARING

A. General: clear construction areas of trees, vegetation, improvements, debris, or other obstructions interfering with installation of new construction. Remove such items elsewhere on site or premises as specifically indicated. Tree removals include the removal of root balls and roots.

B. Removal of Improvements: Remove above-grade and below-grade improvements necessary to permit construction, and other work as indicated.

C. Abandonment or removal of certain underground pipe or conduits may be shown on mechanical or electrical drawings, and is included under work of this section. Removal of all other abandoned underground piping or conduit interfering with construction is included under this section.

3.03 DISPOSAL OF WASTE MATERIALS

A. Burning is not permitted on Owner's property.

B. Remove cleared waste materials from Owner's property and dispose of at an off site location secured by the contractor.

END OF SECTION 31 11 00

SECTION 31 20 00 - EARTH MOVING

PART 1 GENERAL

1.01 WORK INCLUDED

A. Stripping and stockpiling surface layer of topsoil and organic matter in building and traffic areas and in all cut and fill areas.

B. Removing and disposing of material unsuitable for use in controlled fill.

C. Excavating site to required subgrade for controlled fill and grading site to required slopes.

D. Placing and compacting excavated material and borrow material to required density and at required subgrade and slope for structures, pavement areas, and other controlled fills.

1.02 RELATED WORK

A. Section 31 2216 – Fine Grading.

B. Section 33 0516 – Manholes and Structure.

1.03 REFERENCE STANDARDS

A. ASTM D422 – Particle Size Analysis of Soils.

B. ASTM D4318 – Test for Liquid Limit of Soils.

C. ASTM D4318 – Test for Plastic Limit of Soils.

D. ASTM D2216 – Method of Laboratory Determination of Water (Moisture) Content of Soil, Rock, and Soil Aggregate Mixtures.

E. ASTM D3017 – Moisture Content on Soil Aggregates in Place by Nuclear Methods (Shallow Depth).

F. ASTM D698 – Standard Test Method for Moisture Density, Relations of Soils, and Soil Aggregate Mixtures Using 5.5 lb Rammer and 12” Drop.

G. ASTM D1557 – Standard Test Methods for Moisture Density Relations of Soils and Soil Aggregate Using 10 lb. Rammer and 18” Drop.

H. ASTM D2922 – Density of Soil and Soil Aggregates in Place by Nuclear Method (Shallow Depth).

1.04 SUBMITTALS

A. See Related Work

1.05 SITE CONDITIONS

A. Establish positive surface drainage during and following clearing and grading activities using proper ditching and sloping methods.

B. Provide erosion control measures to prevent mud and slit from flowing onto adjacent property.

C. Erect sheeting, shoring, and bracing as necessary for protection of persons, utilities improvements, and excavations.

PART 2 PRODUCTS

2.01 SUITABLE MATERAILS FOR CONTROLLED FILL

A. On site excavated soils:

1. Unified Soils Classification Systems Soils.
    a. Class SC
    b. Class GC
    c. Class CL
2. Soils having Liquid Limit of less than 45, Plasticity Index (PI) of 20 or less.
3. Other soils approved by the Engineer.

B. Borrow Material:

1. Soils meeting the requirements of sub-paragraph A.1 of this Article.

C. Material meeting the requirements of selected material as described in Section 210 of the Arkansas State Highway Department’s Standards Specifications for Highway Construction, Edition of 2003.

2.02 UNSUITABLE MATERIAL FOR CONTROLLED FILL

A. All areas: Organic top soils, soils containing roots, vegetable matter, or trash, and silts (ML) and clays (CH), and cobbles and fractured rock more than 3 inches in greatest dimension.

PART 3 EXECUTION

3.01 SUBSURFACE INVESTIGATION

A. The Contractor is responsible for having a thorough knowledge of all Drawings, Specifications, General and Supplementary Conditions, existing site conditions, and other Contract Documents. Failure to acquaint himself with this knowledge does not relieve him of the responsibility for performing his work in a manner acceptable to the Owner. No additional compensation will be allowed because of conditions that occur due to failure by the Contractor to familiarize himself and all workers with this knowledge.

B. Protection of Existing Trees and Vegetation:

1. Protect existing trees and other vegetation, indicated to remain in place, against unnecessary cutting, breaking or skinning of roots, skinning and bruising of bank, smothering of trees by stockpiling construction materials or excavated materials within drip line, excess foot or vehicular traffic, or parking of vehicles within drip line. Provide temporary guards to protect trees and vegetation to be left standing.
2. Water trees and other vegetation to remain within limits of contract work as required to maintain their health during course of construction operations.
3. Repair or replace trees and vegetation indicated to remain which are damaged by construction operations, in manner acceptable to the Architect/Engineer. Employ qualified tree surgeon to repair damage to trees and shrubs.

3.02 PREPARATION

A. Complete clearing work, removing visible unsuitable materials from site.

B. Protect benchmarks, site corner pins and existing street paving from damage by equipment.

C. Stake the work:

D. Before starting the excavation, establish location and extent of underground utilities occurring in work area.

E. Notify utility companies of lines which are in the way of excavation.

F. Protect existing utility lines to remain which pass through the work area.

G. Protect utility services uncovered by excavation.

H. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions. Cooperate with Owner and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility owner.

I.Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies for shut-off of services if lines are active.

3.03 EXCAVATION PROCEDURES

A. Excavation General:

1. Strip topsoil in cut and fill areas to whatever depths encountered in a manner to prevent intermingling with underlying subsoil or other objectionable material. Remove and dispose of heavy growth of grass and surface debris from areas prior to stripping topsoil.
    a. Where trees are indicated to be left standing, stop topsoil stripping a sufficient distance to prevent damage to main root system.
2. Stockpile topsoil in storage piles in areas shown, or where directed. Construct storage piles to freely drain surface water. Cover storage piles if required to prevent wind-blown dust.
3. Remove soft or spongy material at the exposed sub-grade of cut and fill areas and replace with approved material and compact.
4. Use all suitable excavated material, as far as practicable, in the formation of controlled fills and fill slopes.
5. Keep all excavations dry by pumping or draining water from the Work.
6. In cut areas where fill is not required proof roll the areas with a loaded tandem axle dump truck or similar equipment to aid in identifying soft areas. Remove soft soils and replace with controlled fill. Scarify exposed sub-grade soils to a depth of at least 8 inches, adjust the soil mixture, and recompact to the same density as required for each layer of controlled fill.
7. Grade excavated slopes to a neat, smooth condition with no loose material or scars left on the surface.
8. Dispose of debris, excess topsoil, excess fill material and unsuitable material at an off site location secured by the contractor.

3.04 CONTROLLED FILL

A. After excavation and before fill placement, proof roll fill areas with a loaded tandem axle dump truck or similar equipment to aid in identifying soft areas. Remove soft areas and replace with controlled fill.

B. Scarify cleared surface in fill areas to a depth of at least 8 inches, adjust the soil mixture, and recompact to the same density as required for each layer of controlled fill.

C. Place fill material in lifts no greater than 8-inch loose-lift uniform thickness and compact to 95% MAX Dry Density as determined by the Modified Proctor Test, ASTM D1557.

1. Aerate material when too wet by manipulation with suitable equipment before compacting.
2. Add water when soil is too dry and mix with the material before compacting.

D. Complete excavation and controlled fill elevations to match finish grade, less the depth of topsoil specified for sodded and seeded areas in the landscape plan.

3.05 FIELD QUALITY CONTROL

A. Field density tests will be performed per ASTM D6938.

B. Frequency of Tests:

1. Tests shall be made every day fill is being placed and representative lifts tested.
2. At least one test per 2,500 sq. ft. under buildings and structural areas.
3. At least one test per 5,000 sq. ft. under paved areas.
4. At least one test per 10,000 sq. ft. in general areas.
5. Contractor to notify engineer when fill work is in progress.
6. Test locations will be selected at random by engineer with an effort made to select areas of questionable compaction.
7. Retesting required because of nonconformance to specified requirements shall be performed by the same agency on instruction from the engineer.
8. Retesting required because of nonconformance to specified requirements shall be paid for by the contractor. Payment for retesting or re-inspection will be charged to the contractor by deducting testing charges from the contact sum/price.

END OF SECTION 31 20 00

SECTION 31 22 16 - FINE GRADING

PART 1 GENERAL

1.01 WORK INCLUDED

A. Stripping and stockpiling surface layer of topsoil and organic matter in all cut and fill areas.

B. Excavating and grading open drainage ditches.

C. Placing and compacting excavated material or borrow material to required density and at required subgrade and slope for roadway embankment and other compacted fills.

D. Removing and disposing of excess excavated material.

1.02 RELATED WORK

A. Section 31 2000 – Earth Moving.

B. Section 33 0516 – Manholes and Structure.

1.03 SUBMITTALS

A. See Related Work

1.04 SITE CONDITIONS

A. Establish positive surface drainage during and following stripping, embankment construction, and roadway grading by proper ditching or slopping.

B. Provide measures to prevent mud and silt from flowing onto adjacent property.

C. Erect sheeting, shoring, and branching as necessary for protection of persons, improvements, and excavations.

PART 2 PRODUCTS

2.01 SUITABLE MATERIAL FOR COMPACTED EMBANKMENT

A. On site excavated soils:

1. Unified Soils Classification Systems Soils.
    a. Class SC
    b. Class GC
    c. Class CL
2. Soils having Liquid Limit of less than 45, Plasticity Index (PI) of 20 or less.
3. Other soils approved by the Engineer.

B. Borrow Material:

1. Soils meeting the requirements of sub-paragraph A.1 of this Article.

C. Material meeting the requirements of selected material as described in Section 210 of the Arkansas State Highway Department's Standards Specifications for Highway Construction, Edition of 2014.

2.02 UNSUITABLE MATERIAL FOR COMPACTED EMBANKMENT

A. All areas: Organic topsoil's, soils containing roots, vegetable matter, or trash, and cobbles and fractured rock more than 3 inches in greatest dimension.

PART 3 EXECUTION

3.01 PREPARATION

A. Remove visible unsuitable materials from the site before beginning stripping and site grading operation.

B. Notify Architect/Engineer when work is ready to be staked.

C. Notify the geotechnical engineer representing the Owner's selected testing laboratory at least 48 hours before planned time to begin placing embankment material.

3.02 EXCAVATION PROCEDURES

A. Excavation, General:

1. Strip topsoil in cut and fill areas to whatever depths encountered in a manner to prevent intermingling with underlying subsoil or other objectionable material. Remove and dispose of heavy growth of grass and surface debris from areas prior to stripping topsoil.
2. Where trees are indicated to be left standing, stop topsoil stripping a sufficient distance to prevent damage to main root system.
3. Stockpile topsoil in storage piles in areas shown, or where directed. Construct storage piles to freely drain surface water. Cover storage piles if required to prevent wind-blown dust.
4. Remove soft or spongy material at the exposed sub-grade of cut and fill areas and replace with approved material and compact.

5. Use all suitable excavated material, as far as practicable, in the formation of controlled fills and fill slopes.
6. Keep all excavations dry by pumping or draining water from the work site.
7. Grade excavated slopes to a neat, smooth condition with no loose material or scars left on the surface.
8. Protect existing asphalt paving and structures designed to remain from drainage by excavation and grading operations.
9. Dispose of debris, excess topsoil, excess fill material and unsuitable material at an off-site location secured by the contractor.

B. Excavation, roadway:

1. Excavate and grade to within ±0.1 foot of required subgrade elevations.
2. Grade back slopes to the slope shown on the Drawings.
3. Remove soft or spongy material at the exposed subgrade of cut and fill areas and replace with select material and compact to the same density as required for compacted fill. Identify soft areas by proof rolling with a loaded tandem axle dump truck or similar equipment.
4. DO not allow subsoil in roadbed area to become saturated. Maintain positive surface drainage during and following excavation, grading, and filling operations.
5. Where compacted fill is required, scarify stripped surface to a depth of at least 8 inches, adjust the soil moisture, and recompact to the same density as required for each layer of compacted fill.

3.03 COMPACTED EMBANKMENT

A. Start embankment full width of bottom of embankment cross-section and construct to specified grade over full width in uniform layers.

B. Place fill material in lifts no greater than 8 inch loose-lift uniform thickness and compact to a minimum of 95% of maximum dry density at or near optimum moisture content as determined by the Modified Compaction Procedures, ASTM D1557.

1. Add Water when soil is too dry and mix the material before compacting.
2. Aerate material when too wet by manipulation with suitable equipment before compacting.

C. Do not place next lift until the in-place density and moisture content of the preceding lift has been verified.

D. Geotechnical engineer will inspect and test soil for suitability for use in embankment and for need to perform additional “Proctors” as soil composition changes during progress of excavation. Do not compact layer of soil that geotechnical engineer has determined to be a “change in soil composition” until it has been determined to be suitable and a “Proctor” has been run.

E. Coordinate with the geotechnical engineer and provide the necessary assistance to perform the tests. Initial soil testing costs shall be paid for as outlined in the testing specification of the front-end documents. Should the tests be unsatisfactory, the Contractor shall be responsible for obtaining and paying for additional tests, which will be performed by an independent laboratory approved by Owner and Engineer.

F. Maintain stability of compacted embankment. Replace or repair portions which have eroded due to elements or to Contractor negligence.

G. Grade for slopes and other embankment areas not to be paved, to neat, smooth conditions with no loose material or scars left on surface. Fill and grade slopes to within three inches of finish grade elevations to allow for topsoil, sod and other landscaping.

3.04 PROTECTION

A. As soon as embankment is completed, proceed with riprap work and notify architect/Engineer that slopes are ready for erosion protection by landscaping contractor.

END OF SECTION 31 22 16

SECTION 31 23 16 - EXCAVATION

PART 1 GENERAL

1.01 WORK INCLUDED

A. Excavating rock encountered during trenching for utility lines and excavating for manholes by mechanical methods. Blasting is not allowed.

B. Disposing of excavated rock material.

1.02 RELATED WORK

A. Section 33 1100 – Water Utility Distribution Piping.

B. Section 33 3100 – Sanitary Utility Sewerage Piping.

C. Section 33 3900 - Sanitary Utility Sewerage Structures.

D. Section 33 0516 – Manholes and Structures.

1.03 SUBMITTALS

A. See Related Work

PART 2 PRODUCTS

2.01 MATERIALS

A. Definition of rock: All solid rock formation that, in the opinion of the Engineer, cannot be excavated by using power shovels or other power excavators which are of recognized manufacture and design, of adequate size and operated by qualified operators without continuous and systematic blasting, barring or wedging. It shall include boulders or pieces of detached rock exceeding one cubic yard in volume and solid rock formations which are interspersed with strata of clay or other material provided however that the solid rock constitutes at least 75% of the total volume of the particular formation. The conventional heavy-duty excavating equipment may be defined as a Caterpillar D-6 bulldozer with single tooth ripper, a Caterpillar 325 track excavator equipped with a single tooth ripper and rock teeth, or equipment of similar power and capability. Rock excavation volumes should be determined based on in-place measurements via cross sectioning. If excavation is to be unclassified, the contractor must be responsible for assessing rock excavation requirements.

PART 3 EXECUTION

3.01 INSPECTION

A. Verify site conditions and note irregularities affecting work of this section.

B. Beginning work of this section means acceptance of existing condition.

3.02 ROCK EXCAVATION – GENERAL

A. Excavate rock encountered in excavating for manholes and trenching for water and sewer lines.

B. De-watering: Provide temporary adequate de-watering equipment to keep excavations free of standing water during rock excavation.

3.03 ROCK EXCAVATION – MECHANICAL METHOD

A. Excavate for and remove rock by the mechanical method.

B. Cut away rock at excavation bottom to form level bearing.

C. Remove shaled layers to provide sound and unshattered base for subgrade levels.

D. Remove Excavated Material from Site.

END OF SECTION 31 23 16

SECTION 31 25 00 - EROSION AND SEDIMENTATION CONTROLS

PART 1 GENERAL

1.01 WORK INCLUDED

A. This work shall consist of temporary erosion control measures needed to control erosion and water pollution, through the use of berms, sediments basins, sediments dams, silt fences, silt dikes, and temporary seeding.

B. Temporary erosion control measures shall be performed promptly when problems occur or when potential problems are anticipated in certain areas in order to minimize soil erosion. The temporary erosion control measures shall be properly maintained until permanent erosion control features are functioning properly.

C. The Contractor shall comply with all Federal, State, and Local laws and regulations controlling pollutions of the environments. The Contractor shall take necessary precautions to prevent pollution of streams, lakes, ponds and reservoirs with fuel, oils, bitumens, chemicals, soil sedimentation or other harmful materials and to prevent pollution of the atmosphere from particulate gaseous matter.

1.02 RELATED WORK

A. Section 31 1100 –Clearing and Grubbing

B. Section 31 2000 – Earth Moving

1.03 SUBMITTALS

A. See Related work.

1.04 QUALITY ASSURANCE

A. Prior to start of the construction, the Contractor shall submit, to the Owner and Engineer, his schedule for temporary and permanent erosion control work based on the Engineer's erosion control base plan, as is applicable for clearing & grubbing, grading and trenching. The location of the project, type of soil, topography and proximity to watercourses shall be considered when imposing such limitations.

PART 2 PRODUCTS

2.01 FILTER FABRIC

A. The filter fabric for silt fence shall be as indicated on the drawings.

PART 3 EXECUTION

3.01 PERMITTING

A. The Contractor shall file the Notice of intent to discharge storm water associated with the planned construction activity in accordance with the State of Arkansas NPSES General Permit ARR10A000 48 hours before starting construction. The Contractor shall develop a Storm Water Pollution Prevention Plan (SWPPP) document for submittal to ADEQ.

B. The Contractor shall be responsible for preparing all required permit applications and payment of all permitting fees as may be necessary for this project.

3.02 EROSION CONTROL

A. The Contractor shall schedule and conduct his operations in such a manner as to insure good erosion control practices so as to minimize soil erosion and prevent the contamination of and depositing of sediment in adjacent streams or other water courses, lakes, ponds, and other areas of water impoundment. Temporary erosion control measures which will contribute to the control of erosion and sedimentation shall be carried out in conjunction with clearing & grubbing, grading, and trenching operations.

B. Permanent erosion control devices or measures shall consist of culvert pipe, terraces, gutters, bituminous curb, sectional drains, permanent slope drains, and the establishment of permanent vegetation (seeding), and when included in the contract they shall be incorporated in the construction with the least delay. Trenched areas shall be seeded as the excavation proceeds to the extent considered necessary by the Engineer as desirable or practicable.

C. The Contractor shall also conform to the following practices and controls:

1. When the material is trenched, erosion of the slopes shall be controlled both during and after completion of the work, that erosion will be minimized, and sediment will not enter streams, wetlands or other bodies of water. Haul roads shall be located and constructed in a manner that will keep sediment from entering streams.
2. Pollutants such as fuels, lubricants, bitumens, raw sewage and other harmful materials shall not be discharged into or near rivers, streams or impoundments or into natural or manmade channels leading thereto. Wash water or waste from concrete mixing operation shall not be allowed to enter live streams.
3. All applicable regulations of agencies and statutes relating to the prevention and abatement of pollution shall be complied within the performance of the contract.
4. Dust Control:

a. Implement dust control methods to control dust creation and movement on construction sites and roads and to prevent airborne sediment from reaching receiving streams or storm water conveyance systems, to reduce on-site and off-site damage, to prevent health hazards, and improve traffic safety.

b. Control blowing dust by suing one or more of the following methods:

1. Mulches bound with chemical binders.
2. Temporary vegetative cover.
3. Spray-on adhesives on mineral soils when not used by traffic.
4. Tillage to roughen surface and bring clods to surface.
5. Irrigation by water sprinkling.
6. Barriers using solid board fences, snow fences, burlap fences, crate walls, bales of hay, or similar material.

c. Implement dust control methods immediately when dust is observed blowing on Site.

D. All temporary erosion and sediment control structures shall be constructed in accordance with the Storm Water Pollution Prevention Plan. All temporary structures shall be maintained in proper operating condition during the construction period. The temporary structures shall be removed, and the site cleaned up only after the end of the construction activity and the seeding and fertilizing operation has been completed and the grass has been established.

E. The contractor shall follow the general guidelines for placement of erosion and sediment control as indicated on the Erosion Control Plan as part of his SWPPP. The Contractor shall add any required additional erosion and/or sediment control devices as necessary to control erosion and sediment on the project site. The contractor shall use the Engineer's erosion control plan to comply with the SWPPP and it shall include as a minimum the following items:

1. Time scheduling for the various phases of the work designed to limit the time between the clearing and the temporary seeding and fertilizing to a reasonable period of time.
2. Temporary erosion control measures shall be included in the plan in accordance with the temporary erosion control details as included on the Erosion Control Plan.
3. A time schedule shall be included in the plan detailing when each erosion control structure shown on the plans is to be constructed. Each structure should be constructed as soon as practical after access to the site has been achieved and prior to major grading operations.
4. Temporary erosion control structures shall be maintained to function satisfactorily and all sediment and debris removed and disposed of in a manner acceptable to the Engineer.

3.03 INSPECTION

A. The Contractor shall appoint a qualified person(s) to conduct regularly scheduled inspections during his contract. Inspections shall be conducted, with a minimum frequency of every seven (7) calendar days or within 24 hours following the end of at least a 0.5-inch (1/2 inch) rainfall event, whichever is earliest. During the inspection, the following areas (as a minimum) will be inspected:

1. Disturbed Areas – All areas of disturbed soil i.e., bare soil with no ground cover shall be inspected for signs of washing and erosion.
2. Material Storage Area – All central storage areas where materials/chemicals are stored for signs of spill, leaks and possible contamination.
3. Erosion and Sediment Control Measures – Inspect all erosion and sediment control measures for signs of wear, damage, remaining capacity level, usefulness, etc.
4. Discharge Locations – Immediately following, and possibly during a significant rainfall event, inspect all discharge locations to ascertain the effectiveness of the control measures.
5. Entrance/Exit Locations –Inspect all exit points from the site for evidence of vehicle tracking.

B. The inspector shall complete an inspection form for each inspection performed. As a minimum, the inspection form shall contain the following information:

1. Name and location of project.
2. Name and title of the inspector.
3. Date and time of the inspection.
4. Condition of each of the above locations.

3.04 MAINTENANCE OF ROADWAYS

A. The existing paved roadways adjacent to the permitted entrance locations shall be maintained in a clean and passable condition by the Contractor. When required or as requested by the Owner of the Engineer, the Contractor shall broom or wash the existing paved roadways to remove excess mud or dirt at the intersection

and for a reasonable length of the existing roadway beyond the intersection. The work shall not be paid for directly but shall be considered incidental to the other items of work and the cost included as a part of the work.

3.05 PAYMENT

A. Payment for the work in this section shall be included as part of the lump sum contract.

END OF SECTION 31 25 00

SECTION 31 63 29 – DRILLED CONCRETE PIERS AND SHAFTS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:

(1) Drilled Piers.
(2) All work normally related to the above or specified under the Section.

B. Related Sections:

(1) Section 013200 “Construction Progress Documentation” for recording preexisting conditions and drilled-pier progress.
(2) Section 015000 “Temporary Facilities and Controls.”
(3) Section 311000 “Site Clearing” for preparation of subgrade for drilled-pier operations including removal of vegetation, topsoil, debris, obstructions, and deleterious materials from ground surface.

C. Work installed but furnished under other Sections:

(1) Drilled Pier Reinforcing and Dowels: Furnished under Division 3, Section “Cast-in-Place Concrete.”
(2) Concrete for Drilled Pier: Furnished under Division 3, Section “Cast-in-Place Concrete.”
(3) Anchor Rods: Furnished under Division 3, Section for “Precast Concrete” and Division 5, Section for “Structural Steel.”

1.03 UNIT PRICES

A. Unit prices are included in Section 012200 “Unit Prices.”
B. Drilled Piers: Actual length of drilled piers in place and approved. Actual length may vary, to coincide with elevations where satisfactory bearing strata are encountered. Adjustments will be made on net variation of total quantities, based on design length for shafts.

(1) Base bids on indicated number of drilled piers and, for each pier, the design length from top elevation to bottom of shaft, and the diameter of shaft.
(2) Unit prices include labor, materials, tools, equipment, and incidentals required for excavation, trimming, shoring, casings, dewatering, reinforcement, concrete fill, and other items for complete drilled-pier installation.

C. Rock Measurement: Volume of rock actually removed, measured in original position, but not to exceed outside dimensions of drilled piers cast against rock. Unit prices for rock excavation include replacement with approved materials.
D. Trial Drilled Pier: Unit price as indicated for drilled pier, including backfilling.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated.
B. Design Mixtures: For each concrete mixture. Submit alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

(1) Indicate amounts of mixing water to be withheld for later addition at Project site.

C. Shop Drawings: For concrete reinforcement detailing fabricating, bending, supporting, and placing.
D. Qualification Data: For qualified Installer.
E. Welding certificates.
F. Material Certificates: For the following, from manufacturer:

(1) Cementitious materials.
(2) Admixtures.
(3) Steel reinforcement and accessories.

G. Material Test Reports: For the following, from a qualified testing agency, indicating compliance with requirements:

(1) Aggregates.

H. Field quality-control reports.
I. Other Informational Submittals:

(1) Record drawings.

J. Methods Statement: When ground surface elevation at time of drilling is more than 24 inches above top of drilled pier concrete elevation. See requirements herein.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer that has specialized in drilled-pier work.

(1) The Owner's testing and inspection agency shall be the project geotechnical engineer.

B. Testing Agency Qualifications: Qualified according to ASTM C1077, ASTM D3740, and ASTM E329 for testing indicated.
C. Welding Qualifications: Qualify procedures and personnel according to the following:

(1) AWS D1.1/D1.1M, "Structural Welding Code – Steel."
(2) AWS D1.4, "Structural Welding Code – Reinforcing Steel."

D. Drilled-Pier Standard: Comply with ACI 336.1, latest edition, unless modified in this Section.
E. Trial Drilled Pier: Construct trial drilled pier of diameter and depth and at location indicated or, if not indicated, of same diameter and depth as largest drilled piers, located at least three diameters clear of permanent drilled piers, to demonstrate Installer's construction methods, equipment, standards of workmanship, and tolerances.
(1) Install reinforcement, fill with concrete, remove temporary casings, and terminate trial drilled pier 24 inches below subgrade and leave in place.
(2) Install permanent casings, excavate bell, excavate rock socket, and place slurry, as required for permanent drilled piers.
(3) If Architect determines that trial drilled pier does not comply with requirements, excavate for and cast another until it is accepted.
F. Preinstallation Conference: Conduct conference at Project site.
(1) Review methods and procedures related to drilled piers including, but not limited to, the following:
(a) Review geotechnical report.
(b) Discuss existing utilities and subsurface conditions.
(c) Review coordination with temporary controls and protections.
(d) Review testing and inspection requirements.
(e) Discuss concrete placement method.
(f) Installation of reinforcing.
(g) Drilling, casing (if necessary), cleaning and dewatering (if necessary) drilled shafts.
(h) Ground elevation at time of drilling relative to top of drilled pier concrete elevation.
(i) Drilling slurry.

1.06 PROJECT CONDITIONS

A. Existing Utilities: Locate existing underground utilities before excavating drilled piers. If utilities are to remain in place, provide protection from damage during drilled-pier operations.
(1) Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, adapt drilling procedure if necessary to prevent damage to utilities. Cooperate with Owner and utility companies in keeping services and facilities in operation without interruption. Repair damaged utilities to satisfaction of utility owner.
B. Interruption of Existing Utilities: Do not interrupt any utility to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility according to requirements indicated:
(1) Notify Architect no fewer than two days in advance of proposed interruption of utility.
(2) Do not proceed with interruption of utility without Architect's written permission.
C. Project-Site Information: A geotechnical report has been prepared for this Project and is available for information only. The opinions expressed in this report are those of the geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by the geotechnical engineer. Owner will not be responsible for interpretations or conclusions drawn from this data.
(1) Make additional test borings and conduct other exploratory operations necessary for drilled piers.
(2) The geotechnical report is included elsewhere in the Project Manual.
(a) The boring log and accompanying report are believed to be accurate; however, neither the owner, architect, or structural engineer guarantees the information contained therein, nor do they guarantee the conditions indicated to exist at the locations of the test holes will prevail at other locations on the site.
D. Survey Work: Engage a qualified land surveyor or professional engineer to perform surveys, layouts, and measurements for drilled piers. Before excavating, lay out each drilled pier to lines and levels required. Record actual measurements of each drilled pier's location, shaft diameter, bottom and top elevations, deviations from specified tolerances, and other specified data.
(1) Record and maintain information pertinent to each drilled pier and cooperate with Owner's testing and inspecting agency to provide data for required reports.

PART 2 - PRODUCTS

2.01 STEEL REINFORCEMENT

A. Meet the requirements of Section 033000, "Cast-in-Place Concrete."
B. Reinforcing Bars: ASTM A615/A615M, Grade 60, deformed.

2.02 CONCRETE MATERIALS

A. Meet the requirements of Section 033000, "Cast-in-Place Concrete."

2.03 STEEL CASINGS

A. Steel Pipe Casings: ASTM A283/A283M, Grade C, or ASTM A36/A36M, carbon-steel plate, with joints full-penetration welded according to AWS D1.1/D1.1M.
B. Corrugated-Steel Pipe Casings: ASTM A929/A929M, steel sheet, zinc coated.
C. Liners: Comply with ACI 336.1.

2.04 SLURRY

A. Slurry: Pulverized bentonite, pulverized attapulgite, or polymers mixed with water to form stable colloidal suspension; complying with ACI 336.1 for density, viscosity, sand content, and pH.

2.05 CONCRETE MIXTURES

A. Prepare design mixtures for each type and strength of concrete, proportioned on the basis of laboratory trial mixture or field test data, or both, according to ACI 301.
B. Cementitious Materials: Limit percentage, by weight, of cementitious materials other than portland cement according to ACI 301 limits as if concrete were exposed to deicing chemicals.
C. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.
D. Proportion normal-weight concrete mixture as follows:
   (1) Compressive Strength (28 Days): 5000 psi.
   (2) Maximum Water-Cementitious Materials Ratio: 0.50.
   (3) Minimum Slump: Capable of maintaining the following slump until completion of placement:
      (a) 4 inches for dry, uncased, or permanent-cased drilling method.
      (b) 6 inches for temporary-casing drilling method.
      (c) 7 inches for slurry displacement method.
   (4) Air Content: Do not air entrain concrete.

2.06 FABRICATING REINFORCEMENT

A. Fabricate steel reinforcement according to CRSI's “Manual of Standard Practice.”

2.07 CONCRETE MIXING

A. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C94/C94M, and furnish batch ticket information.
   (1) When air temperature is between 85 and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

PART 3 - EXECUTION

3.01 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, vibration, and other hazards created by drilled-pier operations.
B. Ground surface at time of drilling shall preferably be within 24 inches of top of drilled pier. If ground surface at time of drilling is more than 24 inches above top of drilled pier elevation, contractor shall submit a methods statement explaining how top of concrete will be kept free of debris and how drilled pier and dowels will be protected from damage during subsequent excavation.

3.02 EXCAVATION

A. Construct drilled piers to indicated diameter and length with penetration into bearing material as indicated or directed by the on-site project geotechnical engineer. Use of permanent casing is not permitted.
B. Unclassified Excavation: Excavate to bearing elevations regardless of character of surface and subsurface conditions encountered. Unclassified excavated materials may include rock, soil materials, and obstructions.
   (1) Obstructions: Unclassified excavation may include removal of unanticipated boulders, concrete, masonry, or other subsurface obstructions. No changes in the Contract Sum or the Contract Time will be authorized for removal of obstructions.
C. Classified Excavation: Excavation is classified as standard excavation, special excavation, and obstruction removal and includes excavation to bearing elevations as follows:
   (1) Standard excavation includes excavation accomplished with conventional augers fitted with soil or rock teeth, drilling buckets, or underreaming tools attached to drilling equipment of size, power, torque, and downthrust necessary for the Work.
   (2) Special excavation includes excavation that requires special equipment or procedures above or below indicated depth of drilled piers where drilled-pier excavation equipment used in standard excavation, operating at maximum power, torque, and downthrust, cannot advance the shaft.
      (a) Special excavation requires use of special rock augers, core barrels, air tools, blasting, or other methods of hand excavation.
      (b) Earth seams, rock fragments, and voids included in rock excavation area will be considered rock for full volume of shaft from initial contact with rock.
   (3) Obstructions: Payment for removing unanticipated boulders, concrete, masonry, or other subsurface obstructions that cannot be removed by conventional augers fitted with soil or rock teeth, drilling buckets, or underreaming tools attached to drilling equipment of size, power, torque, and downthrust necessary for the Work will be according to Contract provisions for changes in the Work.
D. Prevent surface water from entering excavated shafts. Conduct water to site drainage facilities.
E. Excavate shafts for drilled piers to indicated elevations. Remove loose material from bottom of excavation.
   (1) Excavate bottom of drilled piers to level plane within 1:12 tolerance.
   (2) Remove water from excavated shafts before concreting.
   (3) Excavate rock sockets of dimensions indicated.
   (4) Cleaning and Dewatering: Shafts shall be thoroughly cleaned and dewatered prior to placing concrete. Pumps, in operating condition, shall be provided of proper type and capacity with sufficient hose to carry water away

from excavations. Shafts shall be dewatered such that no more than 3 inches of standing water remains at the time of concrete placement. If there is more than 3 inches of standing water in the shaft, then place concrete in shaft as indicted in “Wet Method” concrete placement procedures.

(5) If specified or directed by project geotechnical engineer cut series of grooves about perimeter of shaft to height from bottom of shaft, vertical spacing, and dimensions indicated. If specified or directed by project geotechnical engineer roughen sides of shaft.

F. Notify and allow project geotechnical engineer to inspect bottom of excavation. If unsuitable bearing stratum is encountered, make adjustments to drilled piers as determined by Architect.

(1) Do not excavate shafts deeper than elevations indicated unless approved by Architect.
(2) Payment for additional authorized excavation will be according to Contract provisions for changes in the Work.

G. End-Bearing Drilled Piers: Probe with auger to a depth below bearing elevation, equal to diameter of the bearing area of drilled pier. Determine whether voids, clay seams, or solution channels exist.

(1) Test first three drilled piers and one of every six drilled piers thereafter.
(2) Fill augur-probe holes with grout.

H. Excavate shafts for closely spaced drilled piers (those within 3 diameters center-to-center) and for drilled piers occurring in fragile or sand strata only after adjacent drilled piers are filled with concrete and allowed to set. Set is achieved when concrete reaches 500 psi compressive strength.

I. Slurry Displacement Method: Stabilize excavation with slurry maintained a minimum of 60 inches above ground-water level and above unstable soil strata to prevent caving or sloughing of shaft. Maintain slurry properties before concreting.

(1) Excavate and complete concreting of drilled pier on same day if possible, or redrill, clean, and test slurry in excavation before concreting.
(2) Clean bottom of each shaft before concreting.

J. The use of mud slurry (such as that made with on-site soils) to seal off water or lubricate temporary casings will be allowable only with the prior written approval of the project geotechnical & structural engineers.

K. Temporary Casings: Where necessary, install watertight steel casings of sufficient length and thickness to prevent soil collapse or water seepage into shaft; to withstand compressive, displacement, and withdrawal stresses; and to maintain stability of shaft walls. Casing inside diameter shall equal specified drilled pier diameter to within tolerances specified in ACI 336.1. Casing shall conform to ACI 336.1 requirements.

(1) Remove temporary casings, maintained in plumb position, during concrete placement and before initial set of concrete.

L. Tolerances: Construct drilled piers to remain within ACI 336.1 tolerances as amended below.

(1) Shaft Diameter Tolerance, in inches:

Specified Diameter	Undersize Tolerance	Oversize Tolerance
12"	0	+1
18" to 42"	-1	+1
48" to 96"	-2	+1

(2) Top Elevation Tolerance: Plus 0 inches, minus 2 inches.
(3) If tolerances are exceeded, provide corrective construction. Submit design and construction proposals to Architect for review before proceeding.

M. Entire shaft shall be excavated and completely filled with concrete within the same day.

3.03 PERMANENT STEEL CASINGS

A. Install steel casings of minimum wall thickness indicated and of diameter not less than diameter of drilled pier.

(1) Install casings as excavation proceeds, to maintain sidewall stability.
(2) Fabricate bottom edge of lowest casing section with cutting shoe capable of penetrating rock and achieving water seal.
(3) Connect casing sections by continuous penetration welds to form watertight, continuous casing.
(4) Remove and replace or repair casings that have been damaged during installation and that could impair strength or efficiency of drilled pier.
(5) Fill annular void between casing and shaft wall with grout.

B. Corrugated-Steel Casings: Provide corrugated-steel casings formed from zinc-coated steel sheet.

(1) Corrugated casings may be delivered in sections or panels of convenient length and field connected according to manufacturer's written instructions.

3.04 STEEL REINFORCEMENT

A. Comply with recommendations in CRSI's “Manual of Standard Practice” for fabricating, placing, and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy bond with concrete.

C. Fabricate and install reinforcing cages symmetrically about axis of shafts in a single unit. Place cage prior to concreting. One and two bar bundles in center of shaft may be placed after concreting if bars are inserted plumb and centered in shaft.

D. Accurately position, support, and secure reinforcement against displacement during concreting. Maintain minimum cover over reinforcement. Bottom 12" of shaft may be unreinforced.
E. Use templates to set dowels, anchor bolts, leveling plates, and other accessories furnished in work of other Sections. Provide blocking and holding devices to maintain required position during final concrete placement.
F. Protect exposed ends of extended reinforcement, dowels, or anchor bolts from mechanical damage and exposure to weather.

3.05 CONCRETE PLACEMENT

A. Place concrete in continuous operation and without segregation immediately after inspection and approval of shaft by the project geotechnical engineer. Owner's independent testing and inspecting agency.
   (1) Place concrete in one continuous operation without construction joints for full pier height.
B. Dry Method: Place concrete to fall vertically down the center of drilled pier without striking earth at sides of shaft.
   (1) Where concrete cannot be directed down shaft without striking earth at side of shaft, place concrete with chutes, tremies, or pumps.
   (2) Vibrate top 60 inches of concrete.
C. Wet Method: When dry method can not be used place concrete by pumping with end of pump hose at bottom of hole. Leave end of hose at bottom hole until entire shaft is full of concrete.
D. Slurry Displacement Method: Place concrete in slurry-filled shafts by tremie methods or pumping. Control placement operations to ensure that tremie or pump pipe is embedded no fewer than 60 inches into concrete and that flow of concrete is continuous from bottom to top of drilled pier.
E. Casing Removal: Pull temporary casing with a slow and smooth vertical motion maintaining a plumb position. Casing shall not be pulled until concrete has been placed to a minimum of five feet above external water, slurry, or unstable soil level. During pulling, maintain concrete level a minimum of five feet above external water, slurry, or unstable soil level. Vibrate top five feet of concrete after casing is removed.
F. Coordinate withdrawal of temporary casings with concrete placement to maintain at least a 60-inch head of concrete above bottom of casing.
   (1) Vibrate top 60 inches of concrete after withdrawal of temporary casing.
G. Screed concrete at cutoff elevation level and apply scoured, rough finish. Where cutoff elevation is above the ground elevation, form top section above grade and extend shaft to required elevation. Enlargement or “mushrooming” at the top of the pier is not permitted.
H. Protect concrete work, according to ACI 301, from frost, freezing, or low temperatures that could cause physical damage or reduced strength.
   (1) Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
   (2) Do not use calcium chloride, salt, or other mineral-containing antifreeze agents or chemical accelerators.
I. If hot-weather conditions exist that would seriously impair quality and strength of concrete, place concrete according to ACI 301 to maintain delivered temperature of concrete at no more than 90 deg F.
   (1) Place concrete immediately on delivery. Keep exposed concrete surfaces and formed shaft extensions moist by fog sprays, wet burlap, or other effective means for a minimum of seven days.

3.06 FIELD QUALITY CONTROL

A. Testing and Inspection: As indicated on drawings.

3.07 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Disposal: Remove surplus satisfactory soil and waste material, including unsatisfactory soil, trash, and debris, and legally dispose of it off Owner's property. Material removed during shaft drilling operations shall not be used for fill.

PART 1 GENERAL

1.01 WORK INCLUDED

A. Formwork, complete with required shoring, bracing and anchorage.

B. Control joints and expansion joints.

C. Concrete joints and expansion joints.

D. Cast-in-place concrete.

1.02 RELATED WORK

A. Section 01 4529 – Testing Laboratory Services.

B. Section 32 1373 – Concrete Paving Joint Sealants

C. Section 32 1376 - Sidewalks

D. Section 33 0516 – Manholes and Structures.

E. Section 33 4000 – Storm Drainage Utilities.

1.03 SUBMITTALS

A. See Related Work

1.04 QUALITY ASSURANCE

A. Perform cast-in-place concrete work in accordance with ACI 301, unless specified otherwise in this Project Manual.

B. Keep copy of ACI 301-99 in field office for duration of project.

C. Fly ash shall not be used in concrete with integral color.

1.05 TESTING AGENCY

A. Field testing of the concrete mix will be performed by an independent testing laboratory in accordance with Sections 01 4529.

B. Provide free access to work and cooperate with the appointed laboratory.

C. Tests of cement and aggregates may be performed to ensure conformance with requirements state herein.

1.06 REFERENCE STANDARDS

A. ACI-301-99, Specifications for Structural Concrete.

B. ACI Manual of Concrete Practice, Parts 1, 2, and 3.

1.07 ENVIRONMENTAL REQUIREMENTS

A. Allowable Concrete Mix Temperatures: ACI 301 -99 Section 4.2.2.7.

1. Cold Weather: Minimum 35 degrees F.
2. Hot Weather: Maximum 95 degrees F.

B. Do not place concrete during rain, sleet, or snow unless protection is provided.

C. Keep accurate thermometer in area where work is proceeding.

PART 2 PRODUCTS

2.01 CEMENT (ACI 301-99 Section 4.2).

A. Portland Cement: ASTM C150, Type 1.

B. Use one brand and type of cement throughout project unless otherwise specified.

2.02 ADMIXTURES (ACI 301-99 Section 4.2)

A. Add air-entraining agent as indicated in ACI 301-99 Section 4.2.1.4.

B. Use of accelerating admixtures such as salts, chemicals, or other foreign materials in cold weather will not be allowed. Use no other admixtures without prior approval of the Architect/Engineer.

C. Use of set – retarding admixtures during hot weather will not be allowed.

2.03 STRENGTH (ACI 301-99 Section 1.7.4)

A. Provide concrete of following strength: Compressive strength (28day): 3,500 psi, except where noted otherwise in the Contract Documents

2.04 AIR ENTRAINMENT (ACI 301-99 Section 4.2.1.4)

A. Add air-entraining agent to concrete mix for concrete work exposed to exterior.

2.05 SLUMP (ACI 301-99 Section 4.2.2.2)

A. Contractor shall provide slump cone and test slump for each load of concrete.

B. Minimum, slump for all concrete work: 3 inches.

C. Slump for consolidation by vibration: 4 inches maximum.

D. Slump for slabs and consolidation other than by vibration: 5 inches maximum.

2.06 PROPORTIONS

A. Selection of proportions for normal weight concrete: Method 1, Method 2, or Method 3, Contractor's Option.

B. Fine aggregate shall conform to the requirements of ASTM Specification C-33, latest edition, and shall consist of clean, fresh water sand graded uniformly to conform to Paragraph 4 of the above referenced Specification C-33.

C. Coarse aggregate shall conform to the requirements of ASTM Specification C-33, latest edition, using standard grading size 1 -1/2" to No. 4 of washed gravel or crushed stone meeting requirements above and soundness requirements of ASTM C-33.

D. Water: Clean and free of injurious amounts of oil, acids, alkalis, organic materials, or other deleterious substances.

2.07 REINFORCING STEEL (ACI 301-99 Section 3), where applicable.

A. Where shown on plans and details.

B. Reinforcing Steel: 60 ksi yield grade; deformed billet steel bars, ASTM A615; plain finish.

C. Welded Steel Wire Fabric: plain type, ASTM A 185; in coiled rolls, plain finish, 6x6-W1.4 x W1.4 or 6x6 – W2.9 X W2.9 as shown on the Drawings.

2.08 ACCESSORIES

A. Pre-molded expansion joint fillers: ASTM D1751, See plans and details for width / thickness of joint. Refer to ACI 301-99 Section 10.2.5.

2.09 CONCRETE MIX

A. Mix concrete in accordance with ASTM C94.

B. Mix concrete until there is a uniform distribution of the materials and the mass is homogeneous in consistency and colors. Continue mixing for at least 1 -1/2 minutes after all the ingredients are in the mixer.

PART 3 EXECUTION

3.01 GENERAL

A. Notify Architect/Engineer for inspection at least 24 hours before the planned time to pour concrete.

B. Inspection:

1. Ensure that excavation and formwork are completed and within the allowed tolerances.
2. Ensure that ice and excess water are removed, no frost is present, and that ground is not frozen.
3. Check that reinforcement is secured in place.
4. Verify that insulation, anchors, and other embedded items are secured in position.

C. Install concrete work in accordance with ACI 301-99 except as amended by this section.

3.02 FORMWORK (ACI 301-99 Section 2)

A. Obtain Architect/Engineer's review for use of earth forms. When using earth forms, hand-trim sides and bottoms, and remove loose dirt prior to placing concrete.

B. Tolerances for Formed Services: (Comply with ACI 301-99 Section 2)

3.03 FORM SURFACES PREPARATION (ACI 301-99 Section 2)

A. Apply form release agent on formwork in accordance with manufacturer's recommendations. Apply prior to placing reinforcing steel, anchoring devices and embedded parts. Do not apply form release agent where concrete surfaces will receive special finishes or applied coverings which are affected by agent.

3.04 FINISHING FORMED SURFACES

A. Formed Surfaces Finishes: Provide rough form finish (ACI 301-99 Section 2) at all surfaces not exposed to view. Provide smooth rubbed finished (ACI 301-99 Section 2) at all surfaces exposed to view.

3.05 REMOVAL OF FORMS (ACI 301-99 Section 2)

A. Do not remove forms, shores, and bracing until concrete has gained sufficient strength to carry its own weight, construction loads, and design loads which are liable to be imposed upon it. Verify strength of concrete by compressive test results.

3.06 PLACING REINFORCING

A. Reinforcing shall be unpainted and uncoated, free from rust or scale and shall be cleaned and straightened before being shaped and in position.

B. Position reinforcing accurately and tie securely.

C. Support foot reinforcing on support chairs or concrete grout at maximum 3 feet on center each way to insure proper depth from bottom.

D. Wire dowels to longitudinal bars and place top bars in perfect alignment by the use of wood templates placed 2 inches from the top of the form.

E. Support wire mesh on support chairs, or other approved means, at no greater than three feet on center way to hold reinforcing in the center of the slab or as shown on the drawings.

1. Do not depend on lifting mesh as concrete is being poured.
2. Lap sides and ends not less than one wire spacing in slabs on grade and not less than 12 inches in structural slabs.

F. Provide 3 inches of concrete between reinforcing and the ground, unless detailed otherwise, where concrete is poured against the ground.

G. If, after the removal of forms, concrete surfaces are to be in contact with the ground or exposed to the weather:

1. Bars larger than No.5: Protect with 2 inches of concrete.
2. No. 5 bars and smaller: Protect with 1 1/2 inches of concrete.

H. Concrete covering for any reinforcing at surfaces not exposed directly to the ground or weather: Protect with 1 -1/2 inches of concrete.

3.07 PLACING CONCRETE

A. Convey concrete from mixer to final position by method which will prevent separation or loss of material.

B. Maximum height of concrete free fall; 60 inches.

C. Regulate rate of placement so concrete remains plastic and flows into position.

D. Deposit concrete in continuous operation until panel or section is completed.

E. Do not use concrete that has set and do not re-temper or use concrete that has been mixed for more than 1½ hours.

3.08 CONSOLIDATING CONCRETE:

A. Use mechanical vibrating equipment for consolidation.

B. Vertically insert and remove hand-held vibrators at points 18 inches to 30 inches apart, inserting to within 6 inches of bottom of freshly poured concrete.

C. Do not use vibrators to transport concrete forms.

D. Minimum vibrators frequencies: 6000 impulses per minute.

E. Vibrate concrete minimum amount required for consolidation.

F. Keep spare vibrator on hand during concrete placing operation.

G. Make sure the concrete is thoroughly worked around the reinforcing, the embedded items, and into corners of forms.

3.09 SLABS (ACI 301-99 Section 5)

A. Finish concrete slab surfaces in accordance with ACI 301-99 Section 5:

1. Uniformly spread, screed, and float slabs. Do not use grate tampers or mesh rollers. Do not spread concrete by vibration.
2. Light broom finish exterior surfaces, expect exposed aggregate.

B. Sidewalks: Finish sidewalks in accordance with Section 32 13 76.

3.010 CURING

A. Cure Slabs: Use damp method as per ACI 301-99 Section 5.

B. Cure Walls above Grade: Use moisture-retaining covering as approved by Architect/Engineer in accordance with ACI 308.

3.011 WELDING (ACI 301-99 Section 3)

A. Welding Reinforcing Steel: Not allowed.

3.012 CONSTRUCTION JOINTS

A. Install control expansion joints in accordance with ACI 301-99 Section 5

B. Place expansion and contraction joints shown on plans. Where joints are not illustrated, provide control joints for every 100 SF of surface area and expansion joints for every 400 SF of surface area. Where possible, make joints coincide with joints in adjacent concrete.

C. Fit joints with filler of required profiles. Recess ¼ inch below finished concrete surface.

3.013 INSERTS, EMBEDDED PARTS AND OPENINGS

A. Provide formed openings where required for pipes, conduits, sleeves and other work to be embedded in and passing through concrete members.

B. Coordinate work of other sections and cooperate with trade involved in forming and setting openings, slots, recesses, chases, sleeves, bolts, anchors, and other inserts.

3.014 REPAIR OF SURFACE DEFECTS (ACI 301-99 Section 5.3.7)

A. Allow Architect/Engineer to inspect concrete surfaces immediately upon removal of forms.

B. Modify or replace concrete not conforming to required lines, detail, and elevation.

C. Repair or replace concrete not properly placed resulting in excessive honeycombing and other defects. Do not patch, repair, or replace exposed architectural concrete except upon express direction of Architect/Engineer.

3.015 FIELD QUALITY CONTROL

A. Four (4) concrete test cylinders will be taken by the testing laboratory for every 40 cu. yds., or fraction thereof, of concrete placed. Not less than one (1) set of test cylinders shall be taken for each day's pour.

B. One (1) additional test cylinder will be taken during cold weather concreting and be cured on job site under same conditions as concrete it represents.

C. One (1) slump test will be taken by the testing laboratory for each set of test cylinders taken and for each separate batch of concrete placed.

D. Compression test cylinders: Test cylinders shall be cast on the project site by a representative of the testing laboratory.

1. Make cylinders according to ASTM C31.
2. Make additional sets of test cylinders for curing under job conditions:
    a. When it is needed to determine when to remove forms.
    b. When to put a structure into service.
    c. When temperature extremes are expected during the curing test period.
3. Make test cylinders in the presence of Architect/Engineer.
4. Properly marked prepared test cylinders and fill out the card supplied by the testing laboratory with instructions on when to make test breaks and where to send the test results.
5. Transport in a protected condition, each set of prepared and marked test cylinders to the designated testing laboratory for curing and testing as soon as the cylinders can be transported without damage.

E. Compression Testing concrete Cylinders ASTM C-39: by commercial testing laboratory.

1. Cure cylinders in laboratory until time for testing.
2. Test each set of cylinders at 7 days and 28 days after pouring.
3. Tabulation of breakage schedule and action:

Specified strength of 3,500 psi at 28 days

	Test Break	Action
7 day	Less than 2400 psi	Contractor notify A/E
	2400-3500 psi	Break 28 day cylinder
	Over 3500 psi	Stop Testing
28 day	Less than 3500 psi	Contractor notify Architect, investigate reason for low break and report in writing to AE.

4. For testing cylinders for specified compressive strength other than 3,500 psi, see the Architect/Engineer.

F. In Case of Low Compression Test Results:

1. Architect/Engineer will have right to order change in the mix design, costs to be borne by the contractor.
2. Architect/Engineer will have right to order core tests of the concrete in accordance with SCI C42, or load tests of the structure, the cost to be borne by the Contractor for either test.

3.016 PROTECTION OF COMPLETED WORK

A. During curing period, protect the concrete from damaging mechanical disturbances, water flow, loading, shock, and vibration.

END OF SECTION 32 05 23

SECTION 32 05 24 - MONUMENT CONCRETE

PART 1 GENERAL

1.01 ENVIRONMENTAL CONSIDERATIONS: This project is designed and constructed with practices and procedures to meet the project's environmental considerations and goals. These considerations and goals are to establish a facility which is environmentally responsible, profitable, and a healthy place to live and work. To guide this process, this project is pursuing LEED Certified certification per the 2009 Green Building Design and Construction Reference Guide for New Construction. Compliance with all credits and prerequisites shown in the checklist attached to section 01 3514.01 is required. All team members will be required to perform some amount of associated documentation. Refer to Sections listed below for environmental considerations and goals, and applicable paragraphs of this specification section. The Contractor shall ensure that the requirements related to these considerations and goals, as defined in the Contract Documents, are implemented to the fullest extent.

1.02 WORK INCLUDED

A. Formwork, complete with required shoring, bracing and anchorage.

B. Control joints and expansion joints.

C. Concrete joints and expansion joints.

D. Cast-in-place concrete.

E. Work associated to Senior Walks.

1.03 RELATED WORK

A. Section 01 4529 – Testing Laboratory Services.

B. Section 32 1376 - Sidewalks

1.04 SUBMITTALS

A. Concrete mix design and strength test results for each specified strength.

1.05 QUALITY ASSURANCE

A. Perform cast-in-place concrete work in accordance with ACI 301, unless specified otherwise in this Project Manual.

B. Keep copy of ACI 301-99 in field office for duration of project.

1.06 TESTING AGENCY

A. Field testing of the concrete mix will be performed by an independent testing laboratory in accordance with Sections 01 4529.

B. Provide free access to work and cooperate with the appointed laboratory.

C. Tests of cement and aggregates may be performed to ensure conformance with requirements state herein.

1.07 REFERENCE STANDARDS

A. ACI-301-99, Specifications for Structural Concrete.

B. ACI Manual of Concrete Practice, Parts 1, 2, and 3.

1.08 ENVIRONMENTAL REQUIREMENTS

A. Allowable Concrete Mix Temperatures: ACI 301 -99 Section 4.2.2.7.

1. Cold Weather: Minimum 35 degrees F.
2. Hot Weather: Maximum 95 degrees F.

B. Do not place concrete during rain, sleet, or snow unless protection is provided.

C. Keep accurate thermometer in area where work is proceeding.

PART 2 PRODUCTS

2.01 CEMENT (ACI 301-99 Section 4.2).

A. Portland Cement: ASTM C150, Type 1.

B. Use on brand and type of cement throughout project unless otherwise specified.

2.02 ADMIXTURES (ACI 301-99 Section 4.2)

A. Add air-entraining agent as indicated in ACI 301-99 Section 4.2.1.4.

B. Use of accelerating admixtures such as salts, chemicals, or other foreign materials in cold weather will not be allowed. Use no other admixtures without prior approval of the Architect/Engineer.

C. Use of set – retarding admixtures during hot weather will not be allowed.

D. Class F fly ash may be used with approval from owner.

2.03 STRENGTH (ACI 301-99 Section 1.7.4)

A. Provide concrete of following strength: Compressive strength (28 day): 6,000 psi, except where noted otherwise in the Contract Documents

2.04 AIR ENTRAINMENT (ACI 301-99 Section 4.2.1.4)

A. Add air-entraining agent to concrete mix for concrete work exposed to exterior.

2.05 SLUMP (ACI 301-99 Section 4.2.2.2)

A. Contractor shall provide slump cone and test slump for each load of concrete.

B. Minimum, slump for all concrete work: 3 inches.

C. Slump for consolidation by vibration: 4 inches maximum.

D. Slump for slabs and consolidation other than by vibration: 5 inches maximum.

2.06 PROPORTIONS

A. Selection of proportions for normal weight concrete: Method 1, Method 2, or Method 3, Contractor's Option.

B. Fine aggregate shall conform to the requirements of ASTM Specification C-33, latest edition, and shall consist of clean, fresh water sand graded uniformly to conform to Paragraph 4 of the above referenced Specification C-33.

C. Coarse aggregate shall conform to the requirements of ASTM Specification C-33, latest edition, using standard grading size 1 -1/2" to No. 4 of washed gravel or crushed stone meeting requirements above and soundness requirements of ASTM C-33.

D. Water: Clean and free of injurious amounts of oil, acids, alkalis, organic materials, or other deleterious substances.

E. No aggregate that will affect the surface of the concrete will be allowed. Examples are that no chert can be within the mix.

2.07 REINFORCING STEEL (ACI 301-99 Section 3)

A. Reinforcing Steel: 60 ksi yield grade; deformed billet steel bars, ASTM A615; plain finish.

B. Welded Steel Wire Fabric: plain type, ASTM A 185; in coiled rolls, plain finish, 6x6-W1.4 x W1.4 or 6x6 – W2.9 X W2.9 as shown on the Drawings.

2.08 ACCESSORIES

A. Premolded expansion joint fillers: ASTM D1751, See plans and details for width / thickness of joint. Refer to ACI 301-99 Section 10.2.5.

2.09 CONCRETE MIX

A. Mix concrete in accordance with ASTM C94.

B. Mix concrete until there is a uniform distribution of the materials and the mass is homogeneous in consistency and colors. Continue mixing for at least 1 -1/2 minutes after all the ingredients are in the mixer.

PART 3 EXECUTION

3.01 GENERAL

A. Notify Architect/Engineer for inspection at least 24 hours before the planned time to pour concrete.

B. Inspection:

1. Ensure that excavation and formwork are completed and within the allowed tolerances.
2. Ensure that ice and excess water are removed, no frost is present, and that ground is not frozen.
3. Check that reinforcement is secured in place.
4. Verify that insulation, anchors, and other embedded items are secured in position.

C. Install concrete work in accordance with ACI 301-99 except as amended by this section.

3.02 FORMWORK (ACI 301-99 Section 2)

A. Obtain Architect/Engineer's review for use of earth forms. When using earth forms, hand-trim sides and bottoms, and remove loose dirt prior to placing concrete.

B. Tolerances for Formed Services: (Comply with ACI 301-99 Section 2)

3.03 FORM SURFACES PREPARATION (ACI 301-99 Section 2)

A. Apply form release agent on formwork in accordance with manufacturer's recommendations. Apply prior to placing reinforcing steel, anchoring devices and embedded parts. Do not apply form release agent where concrete surfaces will receive special finishes or applied coverings which are affected by agent.

3.04 FINISHING FORMED SURFACES

A. Formed Surfaces Finishes: Provide rough form finish (ACI 301-99 Section 2) at all surfaces not exposed to view. Provide smooth rubbed finished (ACI 301-99 Section 2) at all surfaces exposed to view.

3.05 REMOVAL OF FORMS (ACI 301-99 Section 2)

A. Do not remove forms, shores, and bracing until concrete has gained sufficient strength to carry its own weight, construction loads, and design loads which are liable to be imposed upon it. Verify strength of concrete by compressive test results.

3.06 PLACING REINFORCING

A. Reinforcing shall be unpainted and uncoated, free from rust or scale and shall be cleaned and straightened before being shaped and in position.

B. Position reinforcing accurately and tie securely.

C. Support foot reinforcing on support chairs or concrete grout at maximum 3 feet on center each way to insure proper depth from bottom.

D. Wire dowels to longitudinal bars and place top bars in perfect alignment by the use of wood templates placed 2 inches from the top of the form.

E. Support wire mesh on support chairs, or other approved means, at no greater than three feet on center way to hold reinforcing in the center of the slab or as shown on the drawings.

1. Do not depend on lifting mesh as concrete is being poured.
2. Lap sides and ends not less than one wire spacing in slabs on grade and not less than 12 inches in structural slabs.

F. Provide 3 inches of concrete between reinforcing and the ground, unless detailed otherwise, where concrete is poured against the ground.

G. If, after the removal of forms, concrete surfaces are to be in contact with the ground or exposed to the weather:

1. Bars larger than No.5: Protect with 2 inches of concrete.
2. No. 5 bars and smaller: Protect with 1 1/2 inches of concrete.

H. Concrete covering for any reinforcing at surfaces not exposed directly to the ground or weather: Protect with 1 -1/2 inches of concrete.

3.07 PLACING CONCRETE

A. Convey concrete from mixer to final position by method which will prevent separation or loss of material.

B. Maximum height of concrete free fall; 60 inches.

C. Regulate rate of placement so concrete remains plastic and flows into position.

D. Deposit concrete in continuous operation until panel or section is completed.

E. Do not use concrete that has set and do not re-temper or use concrete that has been mixed for more than 1½ hours.

3.08 CONSOLIDATING CONCRETE:

A. Use mechanical vibrating equipment for consolidation.

B. Vertically insert and remove hand-held vibrators at points 18 inches to 30 inches apart, inserting to within 6 inches of bottom of freshly poured concrete.

C. Do not use vibrators to transport concrete forms.

D. Minimum vibrators frequencies: 6000 impulses per minute.

E. Vibrate concrete minimum amount required for consolidation.

F. Keep spare vibrator on hand during concrete placing operation.

G. Make sure the concrete is thoroughly worked around the reinforcing, the embedded items, and into corners of forms.

3.09 SLABS (ACI 301-99 Section 5)

A. Finish concrete slab surfaces in accordance with ACI 301-99 Section 5:

1. Uniformly spread, screed, and float slabs. Do not use grate tampers or mesh rollers. Do not spread concrete by vibration.
2. See plans for type of finished surface.

B. Sidewalks: Finish sidewalks in accordance with Section 32 13 76.

3.010 CURING

A. Cure Slabs: Use damp method as per ACI 301-99 Section 5.

B. Cure Walls above Grade: Use moisture-retaining covering as approved by Architect/Engineer in accordance with ACI 308.

3.011 WELDING (ACI 301-99 Section 3)

A. Welding Reinforcing Steel: Not allowed.

3.012 CONSTRUCTION JOINTS

A. Install construction joints in accordance with ACI 301-99 Section 5

B. Place expansion at 30 feet intervals and contraction joints at 15 feet (maximum) intervals. Where possible, make joints coincide with joints in adjacent concrete.

C. Fit joints with filler of required profiles. Recess ¼ inch below finished concrete surface.

3.013 INSERTS, EMBEDDED PARTS AND OPENINGS

A. Provide formed openings where required for pipes, conduits, sleeves and other work to be embedded in and passing through concrete members.

B. Coordinate work of other sections and cooperate with trade involved in forming and setting openings, slots, recesses, chases, sleeves, bolts, anchors, and other inserts.

3.014 REPAIR OF SURFACE DEFECTS (ACI 301-99 Section 5.3.7)

A. Allow Architect/Engineer to inspect concrete surfaces immediately upon removal of forms.

B. Modify or replace concrete not conforming to required lines, detail, and elevation.

C. Repair or replace concrete not properly placed resulting in excessive honeycombing and other defects. Do not patch, repair, or replace exposed architectural concrete except upon express direction of Architect/Engineer.

3.015 FIELD QUALITY CONTROL

A. Four (4) concrete test cylinders will be taken by the testing laboratory for every 40 cu. yds., or fraction thereof, of concrete placed. Not less than one (1) set of test cylinders shall be taken for each day's pour.

B. One (1) additional test cylinder will be taken during cold weather concreting and be cured on job site under same conditions as concrete it represents.

C. One (1) slump test will be taken by the testing laboratory for each set of test cylinders taken and for each separate batch of concrete placed.

D. Compression test cylinders: Test cylinders shall be cast on the project site by a representative of the testing laboratory.

1. Make cylinders according to ASTM C31.
2. Make additional sets of test cylinders for curing under job conditions:
    a. When it is needed to determine when to remove forms.
    b. When to put a structure into service.
    c. When temperature extremes are expected during the curing test period.
3. Make test cylinders in the presence of Architect/Engineer.
4. Properly marked prepared test cylinders and fill out the card supplied by the testing laboratory with instructions on when to make test breaks and where to send the test results.
5. Transport in a protected condition, each set of prepared and marked test cylinders to the designated testing laboratory for curing and testing as soon as the cylinders can be transported without damage.

E. Compression Testing concrete Cylinders ASTM C-39: by commercial testing laboratory.

1. Cure cylinders in laboratory until time for testing.
2. Test each set of cylinders at 7 days and 28 days after pouring.
3. Tabulation of breakage schedule and action:

Specified strength of 6,000 psi at 28 days

	Test Break	Action
7 day	Less than 4200 psi	Contractor notify A/E
	4200-6000 psi	Break 28 day cylinder
	Over 6000 psi	Stop Testing
28 day	Less than 6000 psi	Contractor notify Architect, investigate reason for low break and report in writing to AE.

4. For testing cylinders for specified compressive strength other than 6,000 psi, see the Architect/Engineer.

F. In Case of Low Compression Test Results:

1. Architect/Engineer will have right to order change in the mix design, costs to be borne by the contractor.
2. Architect/Engineer will have right to order core tests of the concrete in accordance with SCI C42, or load tests of the structure, the cost to be borne by the Contractor for either test.

3.016 PROTECTION OF COMPLETED WORK

A. During curing period, protect the concrete from damaging mechanical disturbances, water flow, loading, shock, and vibration.

END OF SECTION 32 05 24

SECTION 32 12 00 - FLEXIBLE PAVEMENT

PART 1 GENERAL

1.01 WORK INCLUDED

A. Prepare subgrade to receive base course.

B. Provide compacted base course.

C. Prime base course and place asphaltic concrete hot mix (ACHM) binder course.

D. Tack base course and place ACHM surface course.

1.02 RELATED WORK

A. Section 31 2000 – Earth Moving.

B. Section 32 1613 – Concrete Curb and Gutter

C. Section 33 4000 – Storm Drainage Utilities

1.03 SUBMITTALS

A. See Related Work

1.04 REFERENCES

A. Arkansas Department of Transportation (ARDOT).

1. Standard Specifications for Highway Construction, Edition of 2014, hereafter referred to as “ARDOT Standard Specifications”.

PART 2 PRODUCTS

2.01 BASE COURSE MATERIALS

A. Crushed Stone: Class 7, meeting the requirements of Section 303 of the ARDOT Standard Specifications, or approved equal.

B. Prime Coat: Medium curing liquid asphalt, MC-30, or approved equal, meeting the requirements of Section 401 of the ARDOT Standard Specifications.

C. Tack Coat: Shall be applied as specified and meeting the requirements of Section 401 of the ARDOT Standard Specifications.

2.02 ASPHALT PAVEMENT MATERIALS

A. ACHM Surface Course:

1. PG 64-22 mix as described in Sections 407 and 409 of the ARDOT Standard Specifications.

2. The surface course shall be composed of a mixture of mineral aggregate and asphalt cement in the proportions by weight for the type mixture designated.

B. ACHM Binder Course:

1. PG 64-22 mix as described in Section 407 and 409 of the ARDOT Standard Specifications.

2. The binder course shall be composed of mixture of mineral aggregate and asphalt cement in the proportions by weight for the type mixture designated.

PART 3 EXECUTION

3.01 SUBGRADE PREPARATION

A. Ensure grading of the subgrade to the required elevation.

B. Scarify to a depth of six inches the subgrade where the base course is to be placed.

C. Water and thoroughly mix subgrade until optimum moisture content is obtained when deficiency of moisture content exists. When excess of moisture exists, rework and aerate subgrade until optimum moisture content is obtained.

D. Re-compact the subgrade to a minimum of 95% of the maximum dry density at or near the option moisture content as determined by ASTM D1557.

E. Before final rolling, shape the entire area to the required cross section, adding additional subsoil as required and compact the subgrade surface to the required density.

3.02 PLACEMENT OF BASE COURSE

A. Place the crushed stone base material over the prepared subgrade in accordance with the construction methods described in Section 303 of the ARDOT Standard Specifications.

B. Add water during compaction to bring the base course materials to optimum moisture content. When excess moisture exists, rework the base course materials until optimum moisture content is obtained.

C. Compact the base course to 100% of the maximum dry density as determined by ASTM D 1557.

3.03 PLACE PRIME AND TACK COAT

A. Apply the bituminous prime coat to the compacted base at the rate of 0.3 to 0.4 gallons per square yard. Apply the bituminous tack cost to the prepared base at the rate of 0.03 gallon to 0.10 gallon per square yard as designated by the Engineer.

B. Clean the base course surface and place the prime and tack coats in accordance with the requirements of Section 401 of the ARDOT Standard Specifications.

3.04 PLACING ACHM SURFACE COURSE

A. Construction Methods: Section 410, ARDOT Standard Specifications.

B. Temperature range mix.

1. When discharged from mixer: 285 degrees F to 325 degrees F.
2. When placed on base course: 275 degrees F. to 325 degrees F.

C. Temperature of air: Do not place ACHM when air temperature in the shade is below 40 degrees F.

D. Place asphalt pavement to compacted depth shown on Drawing.

E. Compact to required density, with approved rolling equipment. Start compaction as soon as pavement will bear equipment without checking or undue displacement.

F. Required density: 92% - 96% of maximum theoretical density.

G. Carry out compaction in three operations in pass sequence. Ensure each pass of roller overlaps previous passes to ensure smooth surface free of roller marks. Keep roller wheels sufficiently moist so as not to pick up material.

H. Perform hand tamping in areas not accessible to rolling equipment.

I. Ensure joints made during paving operations and at connection to existing pavement are straight, clean, vertical and free of broken or loose material. Construct joints to ensure a continuous bond between the courses and to obtain the required density. Provide all joints with the same texture as other sections of the course and meet the requirements for smoothness and grade.

J. Ensure surface of completed asphalt pavement is true to lines, profiles and elevations indicated, and is free from depressions exceeding ¼ inch when measured with a 10 foot straightedge.

K. Do not allow vehicular traffic on newly paved areas until surface has cooled to atmospheric temperature.

3.05 FIELD QUALITY CONTROL

A. Testing laboratory will make in-place tests of density and moisture content of the subgrade and the base course in accordance with ASTM D 6938.

B. Testing laboratory will make density tests of compacted asphalt paving in accordance with ASTM D 2950.

END OF SECTION – 32 12 00

SECTION 32 13 13 - CONCRETE PAVING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section includes the following:
   (1) Concrete Paving (Pedestrian)
   (2) Cast-in-place Concrete Slab base for Unit Paving

1.03 RELATED SECTIONS

A. Cast-in-place Concrete – Section 03 30 00

1.04 DEFINITIONS

A. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash, slag cement, and other pozzolans.
B. W/C Ratio: The ratio by weight of water to cementitious materials.

1.05 REFERENCE STANDARDS

A. Department of Transportation standard specifications for highway construction, latest edition

1.06 ACTION SUBMITTALS

A. Product Data: For each type of manufactured material and product indicated.
B. Design Mixtures: For each concrete paving mixture. Include alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.
C. Material Certificates: Signed by manufacturers, materials producer and Contractor, certifying that each of the following materials complies with, or exceeds, requirements specified herein:
   (1) Cementitious materials and aggregates.
   (2) Steel reinforcement and reinforcement accessories.

(3) Admixtures.
(4) Curing compounds.
(5) Applied finish materials.
(6) Bonding agent or adhesive.
(7) Joint fillers.

1.07 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed pavement work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
B. Manufacturer Qualifications: Manufacturer of ready-mixed concrete products complying with ASTM C 94 requirements for production facilities and equipment.
   (1) Manufacturer must be certified according to the National Ready Mix Concrete Association's Plant Certification Program.
C. Testing Agency Qualifications: Qualified according to ASTM C 1077 and ASTM E 329 for testing indicated.
   (1) Personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-1 or an equivalent certification program.
D. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant and each aggregate from one source.
E. ACI Publications: Comply with ACI 301, "Specification for Structural Concrete," unless modified by the requirements of the Contract Documents.
F. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixes.
G. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination"

1.08 FIELD CONDITIONS

A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.

PART 2 - PRODUCTS

2.01 CONCRETE, GENERAL

A. ACI Publications: Comply with ACI 301 (ACI 301M) unless otherwise indicated.

2.02 FORMS

A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel- type materials of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal while providing full-depth, continuous, straight, and smooth exposed surfaces.
   (1) Use flexible spring steel forms or uniformly curved laminated boards to form curves with a radius of 100 feet (30.5 m) or less. Do not use notched and bent forms.
B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and that will not impair subsequent treatments of concrete surfaces.

2.03 STEEL REINFORCEMENT

A. Plain-Steel Welded Wire Reinforcement: ASTM A1064, fabricated from as-drawn steel wire into flat sheets.
B. Reinforcing Bars: Deformed steel bars, ASTM A 615/A 615M, Grade 60
C. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized after fabrication and bending; with ASTM A 615/A 615M, Grade 60 (Grade 420) deformed bars.
D. Epoxy-Coated Reinforcing Bars: ASTM A 775/A 775M or ASTM A 934/A 934M; with ASTM A 615/A 615M, Grade 60 (Grade 420) deformed bars.
E. Steel Bar Mats: ASTM A 184/A 184M; with ASTM A 615/A 615M, Grade 60 (Grade 420) deformed bars; assembled with clips.
F. Tie Bars: ASTM A 615/A 615M, Grade 60 (Grade 420); deformed.
G. Joint Dowel Bars: A615/A615M, Grade 60, plain steel bars.
H. Plain Steel Wire: ASTM A 82
I. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded wire reinforcement, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice." Equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.

2.04 CONCRETE MATERIALS

A. Cementitious Materials: Use the following cementitious materials, of same type, brand, and source throughout Project:

(1) Cast-in-place Concrete Paving (Pedestrian),Cast-in-place Concrete Slab base for Unit Paving:

(a) Portland Cement conforming to ASTM C 150, Type 1 or 1A. Type III or IIIA (high early strength) may be used if specifically approved by Owner or Owner's Representative. Grey unless otherwise noted.

B. Normal-Weight Aggregates: ASTM C 33/C 33M, uniformly graded. Provide aggregates from a single source with documented service-record data of at least 10 years' satisfactory service in similar paving applications and service conditions using similar aggregates and cementitious materials.

(1) Maximum Coarse-Aggregate Size: 3/4 inch nominal.
(2) Minimum Coarse-Aggregate Size: No.4
(3) Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.

C. Air-Entraining Admixture: ASTM C 260/C 260M.
D. Chemical Admixtures: Admixtures certified by manufacturer to be compatible with other admixtures and to contain not more than 0.1 percent water-soluble chloride ions by mass of cementitious material.

(1) Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
(2) Retarding Admixture: ASTM C 494/C 494M, Type B.
(3) Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.

E. Water: Potable and complying with ASTM C 94/C 94M.

2.05 CURING MATERIALS

A. Absorptive Cover: AASHTO M 182, Class 3, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. (305 g/sq. m) dry or cotton mats.
B. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap- polyethylene sheet.
C. Water: Potable.
D. Evaporation Retarder: Waterborne, monomolecular, film forming, manufactured for application to fresh concrete.

(1) Manufacturers:

(a) BASF Corporation-Construction Systems
(b) Bon Tool Co.
(c) Brickform; a division of Solomon Colors
(d) ChemMasters, Inc
(e) Dayton Superior
(f) Euclid Chemical Company (The); an RPM company
(g) Kaufman Products, Inc

(h) Nox-Crete Products Group
(i) Right Pointe
(j) SpecChem, LLC
(k) TK Products
(l) Unitex by Dayton Superior
(m) Vexcon Chemicals Inc.
(n) W. R. Meadows, Inc

2.06 RELATED MATERIALS

A. Joint Fillers: ASTM D 1751, asphalt-saturated cellulosic fiber or ASTM D 1752, cork or self-expanding cork in preformed strips.
B. Bonding Agent: ASTM C 1059/C 1059M, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
C. Epoxy-Bonding Adhesive: ASTM C 881/C 881M, two-component epoxy resin capable of humid curing and bonding to damp surfaces; of class suitable for application temperature, of grade complying with requirements, and of the following types:

(1) Types I and II, nonload bearing, Types IV and V, load bearing, for bonding hardened or freshly mixed concrete to hardened concrete.

2.07 CONCRETE MIXTURES

A. Prepare design mixtures, proportioned according to ACI 301 (ACI 301M), for each type and strength of normal-weight concrete, and as determined by either laboratory trial mixtures or field experience.
   (1) Use a qualified independent testing agency for preparing and reporting proposed concrete design mixtures for the trial batch method.
   (2) When automatic machine placement is used, determine design mixtures and obtain laboratory test results that comply with or exceed requirements.

B. Cementitious Materials: Use fly ash, pozzolan, slag cement, and silica fume as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent. Limit percentage, by weight, of cementitious materials other than portland cement in concrete as follows:
   (1) Fly Ash or Pozzolan: 25 percent.
   (2) Slag Cement: 50 percent.
   (3) Combined Fly Ash or Pozzolan, and Slag Cement: 50 percent, with fly ash or pozzolan not exceeding 25 percent.

C. Add air-entraining admixture at manufacturer's prescribed rate to result in normal- weight concrete at point of placement having an air content as follows:
   (1) Air Content: As noted in Section E, below, for each mix type.

D. Chemical Admixtures: Use admixtures according to manufacturer's written instructions.

E. Concrete Mixtures: Normal-weight concrete
   (1) Cast-in-place Concrete Paving (Pedestrian),Cast-in-place Concrete Slab base for Unit Paving:
      (a) Compressive Strength (28 Days): 4,000 psi, minimum
      (b) Maximum W/C Ratio at Point of Placement: 0.48
      (c) Slump Limit: 4 inches, plus or minus 1 inch (25 mm), for concrete placed by other than slipform
      (d) Air Entrainment: 6 percent plus or minus 1-1/2 percent for 3/4 inch nominal maximum aggregate size.

2.08 CONCRETE MIXING

A. Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M and ASTM C 1116. Furnish batch certificates for each batch discharged and used in the Work.
   (1) When air temperature is between 85 and 90 deg F (30 and 32 deg C), reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F (32 deg C), reduce mixing and delivery time to 60 minutes.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine exposed subgrades and subbase surfaces for compliance with requirements for dimensional, grading, and elevation tolerances.

B. Proof-roll prepared subbase surface below concrete paving to identify soft pockets and areas of excess yielding.
   (1) Completely proof-roll subbase in one direction and repeat in perpendicular direction. Limit vehicle speed to 3 mph.
   (2) Proof-roll with a pneumatic-tired and loaded, 10-wheel, tandem-axle dump truck weighing not less than 15 tons.
   (3) Correct subbase with soft spots and areas of pumping or rutting exceeding depth of 1/2 inch according to the recommendation of the Geotechnical Engineer.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Proof roll prepared base material surface to check for unstable areas. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving.

B. Remove loose material from compacted base material surface to produce firm, smooth surface immediately before placing concrete.

C. Establish and maintain required lines, grades and elevations.

3.03 EDGE FORMS AND SCREED CONSTRUCTION

A. Set forms to required lines, grades and elevations, rigidly braced and secured in accordance with ACI 347.

B. Install sufficient quantity of forms to allow continuance of work; forms to remain in place a minimum of 24 hours after concrete placement and finishing operations.

C. Check completed formwork for grade and alignment to following tolerances:
   (1) Top of forms not more than 1/8-inch in 10 feet

(2) Vertical face on longitudinal axis, not more than 1/4-inch in 10 feet

D. Clean forms after each use and coat with form release agent as often as required to ensure separation from concrete without damage to concrete.

3.04 STEEL REINFORCEMENT INSTALLATION

A. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
B. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.
C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.
D. Install welded-wire reinforcement in lengths as long as practicable. Lap adjoining pieces at least one full mesh, and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.

3.05 JOINTS

A. General: Form construction, isolation, and contraction joints and tool edges true to line, with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline unless otherwise indicated.
   (1) When joining existing paving, place transverse joints to align with previously placed joints unless otherwise indicated.
B. Construction Joints: Set construction joints at side and end terminations of paving and at locations where paving operations are stopped for more than one-half hour unless paving terminates at isolation joints.
   (1) Continue steel reinforcement across construction joints unless otherwise indicated. Do not continue reinforcement through sides of paving strips unless otherwise indicated.
   (2) Provide tie bars at sides of paving strips where indicated.
   (3) Butt Joints: Use bonding agent at joint locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
   (4) Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.
C. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, other fixed objects, and where indicated.
   (1) Locate expansion joints at intervals of 50 feet unless otherwise indicated.
   (2) Extend joint fillers full width and depth of joint.
   (3) Terminate joint filler not less than 1/2 inch (13 mm) or more than 1 inch (25 mm) below finished surface if joint sealant is indicated.
   (4) Place top of joint filler flush with finished concrete surface if joint sealant is not indicated.
   (5) Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
   (6) During concrete placement, protect top edge of joint filler with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.
D. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated, but not less than at intervals of 15 feet where not otherwise indicated. Construct contraction joints for a depth equal to at least one-fourth of the concrete thickness, as follows, to match jointing of existing adjacent concrete paving:
   (1) Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch- (3-mm-) wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.
      (a) Tolerance: Ensure that sawed joints are within 3 inches (75 mm) either way from centers of dowels.
   (2) Doweled Contraction Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.
E. Edging: After initial floating, tool edges of paving, gutters, curbs, and joints in concrete with an edging tool to a 1/4-inch (6-mm) radius. Repeat tooling of edges after applying surface finishes. Eliminate edging-tool marks on concrete surfaces.

3.06 CONCRETE PLACEMENT

A. Before placing concrete, inspect and complete formwork installation, steel reinforcement, and items to be embedded or cast-in.
   (1) Notify Landscape Architect at least 5 days prior to placement to schedule final inspection prior to placement. Placement shall not proceed without Landscape Architect’s approval. Notify other trades to permit installation of their work.
B. Remove snow, ice, or frost from subbase surface and steel reinforcement before placing concrete. Do not place concrete on frozen surfaces.
C. Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Concrete shall not be placed around manholes or other structures until they are at required finish elevation and alignment.
D. Comply with ACI 301 (ACI 301M) requirements for measuring, mixing, transporting, and placing concrete.
E. Do not add water to concrete during delivery or at Project site. Do not add water to fresh concrete after testing.

F. Deposit and spread concrete in a continuous operation between transverse joints. Do not push or drag concrete into place or use vibrators to move concrete into place. If interrupted for more than 1/2 hour, place construction joint that corresponds to the established joint pattern.

G. Consolidate concrete according to ACI 301 (ACI 301M) by mechanical vibrating equipment supplemented by hand spading, rodding, or tamping.

(1) Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand spreading and consolidation. Consolidate with care to prevent dislocating reinforcement, dowels and joint devices.

H. Screed paving surface with a straightedge and strike off.

I. Commence initial floating using bull floats or darbies to impart an open-textured and uniform surface plane before excess moisture or bleedwater appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations or spreading surface treatments.

J. Do not operate equipment on concrete until pavement has attained 85 percent of its 28-day compressive strength.

K. Slip-Form Paving: Use design mixture for automatic machine placement. Produce paving to required thickness, lines, grades, finish, and jointing.

(1) Compact subbase and prepare subgrade of sufficient width to prevent displacement of slip-form paving machine during operations.

L. Cold-Weather Concrete Placement: Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing, or low temperatures. Comply with ACI 306.1 and the following:

(1) When air temperature has fallen to or is expected to fall below 40 deg F (4.4 deg C), uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 deg F (10 deg C) and not more than 80 deg F (27 deg C) at point of placement.
(2) Do not use frozen materials or materials containing ice or snow.
(3) Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in design mixtures.

M. Hot-Weather Concrete Placement: Comply with ACI 301 (ACI 301M) and as follows when hot-weather conditions exist:

(1) Cool ingredients before mixing to maintain concrete temperature below 90 deg F (32 deg C) at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated in total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
(2) Cover steel reinforcement with water-soaked burlap, so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
(3) Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

3.07 CONCRETE FINISHING

A. General: Do not add water to concrete surfaces during finishing operations.

B. Float Finish: Begin the second floating operation when bleedwater sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Test surface for trueness with 10 foot straightedge Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.

(1) Medium-to-Fine-Textured Broom Finish: Draw a soft-bristle broom across float-finished concrete surface, perpendicular to line of traffic, to provide a uniform, fine-line texture.
(2) Medium-to-Coarse-Textured Broom Finish: Provide a coarse finish by striating float-finished concrete surface 1/16 to 1/8 inch (1.6 to 3 mm) deep with a stiff-bristled broom, perpendicular to line of traffic.

3.08 DETECTABLE WARNING INSTALLATION

A. Blockouts: Form blockouts in concrete for installation of detectable paving units specified in Section 321726 "Tactile Warning Surfacing."

(1) Tolerance for Opening Size: Plus 1/4 inch

B. Cast-in-Place Detectable Warning Tiles: Form blockouts in concrete for installation of tiles specified in Section 321726 "Tactile Warning Surfacing." Screed surface of concrete where tiles are to be installed to elevation, so that edges of installed tiles will be flush with surrounding concrete paving. Embed tiles in fresh concrete to comply with Section 321726 "Tactile Warning Surfacing" immediately after screeding concrete surface.

C. Stamped Detectable Warnings: Install stamped detectable warnings as part of a continuous concrete paving placement and according to stamp-mat manufacturer's written instructions.

(1) Before using stamp mats, verify that the vent holes are unobstructed.
(2) Apply liquid release agent to the concrete surface and the stamp mat.
(3) Stamping: While initially finished concrete is plastic after application and final floating of pigmented mineral dry-shake hardener, accurately align and place stamp mats in sequence. Uniformly load, gently vibrate, and press mats into concrete to produce imprint pattern on concrete surface. Load and tamp mats directly perpendicular to the stamp-mat surface to prevent distortion in shape of domes. Press and tamp until mortar begins to come through all of the vent holes. Gently remove stamp mats.
(4) Trimming: After 24 hours, cut off the tips of mortar formed by the vent holes.

(5) Remove residual release agent according to manufacturer's written instructions, but no fewer than three days after stamping concrete. High- pressure-wash surface and joint patterns, taking care not to damage stamped concrete. Control, collect, and legally dispose of runoff.

3.09 CONCRETE PROTECTION AND CURING

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.
B. Comply with ACI 306.1 for cold-weather protection and follow recommendations in ACI 305R-20 for hot-weather protection during curing.
C. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h (1 kg/sq. m x h) before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete but before float finishing.
D. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.
E. Curing Methods: Cure concrete by moisture curing, moisture-retaining-cover curing, curing compound or a combination of these as follows:
   (1) Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:
      (a) Water.
      (b) Continuous water-fog spray.
      (c) Absorptive cover, water saturated and kept continuously wet. Cover concrete surfaces and edges with 12-inch (300-mm) lap over adjacent absorptive covers.
   (2) Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture- retaining cover, placed in widest practicable width, with sides and ends lapped at least 12 inches (300 mm), and sealed by waterproof tape or adhesive. Immediately repair any holes or tears occurring during installation or curing period, using cover material and waterproof tape.
   (3) Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating, and repair damage during curing period.

3.10 CLEANING AND ADJUSTING

A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.
B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.
C. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable paving as directed by Owner or Owner’s Representative.

3.11 PAVING TOLERANCES

A. Comply with tolerances in ACI 117 (ACI 117M) and as follows:
   (1) Elevation: 1/4 inch (19 mm).
   (2) Thickness: Plus 3/8 inch (10 mm), minus 1/4 inch (6 mm).
   (3) Surface: Gap below 10-feet- (3-m-) long; unleveled straightedge not to exceed 1/4 inch (13 mm).
   (4) Alignment of Tie-Bar End Relative to Line Perpendicular to Paving Edge: 1/2 inch per 12 inches (13 mm per 300 mm) of tie bar.
   (5) Lateral Alignment and Spacing of Dowels: 1 inch (25 mm).
   (6) Vertical Alignment of Dowels: 1/4 inch (6 mm).
   (7) Alignment of Dowel-Bar End Relative to Line Perpendicular to Paving Edge: 1/4 inch per 12 inches (6 mm per 300 mm) of dowel.
   (8) Joint Spacing: 3 inches (75 mm).
   (9) Contraction Joint Depth: Plus 1/4 inch (6 mm), no minus.
   (10) Joint Width: Plus 1/8 inch (3 mm), no minus.
   (11) Vertical position of welded wire fabric: 1/2 inch.

3.12 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
B. Testing Services: Testing and inspecting of composite samples of fresh concrete obtained according to ASTM C 172/C 172M shall be performed according to the following requirements:
   (1) Testing Frequency: Obtain at least one composite sample for each 100 cu. yd., 5000 sq. ft. or fraction thereof of each concrete mixture placed each day.
      (a) When frequency of testing will provide fewer than five compressive- strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.

(2) Slump: ASTM C 143/C 143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
(3) Air Content: ASTM C 231/C 231M, pressure method; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
(4) Concrete Temperature: ASTM C 1064/C 1064M; one test hourly when air temperature is 40 deg F (4.4 deg C) and below and when it is 80 deg F (27 deg C) and above, and one test for each composite sample.
(5) Compression Test Specimens: ASTM C 31/C 31M; cast and laboratory cure one set of five standard cylinder specimens for each composite sample.
(6) Compressive-Strength Tests: ASTM C 39/C 39M; one set for each day's pour of each concrete class exceeding 5 cubic yards, but less than 25 cubic yards, plus one set for each additional 50 cubic yards. Test one specimen at seven days and three specimens at twenty-eight days. One specimen to be broken at fourteen days or fifty-six days at the direction of the Landscape Architect or Owner's Representative.
(a) A compressive-strength test shall be the average compressive strength from three specimens obtained from same composite sample and tested at 28 days.
(7) Core pavement with the frequency and spacing as required by the Landscape Architect or Owner. Core shall be tested for thickness and quality of aggregate distribution. Patch core holes immediately with Portland cement concrete and finish to provide level surface as specified.

C. Strength of each concrete mixture will be satisfactory if average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi (3.4 MPa).
D. Test results shall be reported in writing to Landscape Architect, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
E. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Landscape Architect but will not be used as sole basis for approval or rejection of concrete.
F. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Landscape Architect.
G. Concrete paving will be considered defective if it does not pass tests and inspections.
H. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
I. Prepare test and inspection reports.

3.13 REPAIR AND PROTECTION

A. Remove and replace concrete paving that is broken, damaged, or defective or that does not comply with requirements in this Section. Remove work in complete sections from joint to joint unless otherwise approved by Landscape Architect.
B. Drill test cores, where directed by Landscape Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory paving areas with portland cement concrete bonded to paving with epoxy adhesive.
C. Protect concrete paving from damage. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.
D. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material. Sweep paving not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 32 13 13

SECTION 32 13 13 - CONCRETE PAVING

PART 1 GENERAL

1.01 WORK INCLUDED

A. Prepare subgrade to receive base course materials for traffic bearing drive.

B. Place and compact base course materials for drive.

C. Concrete drive complete with reinforcement.

1.02 RELATED WORK

A. Section 32 1373 – Concrete Paving Joint Sealants

B. Section 31 2000 - Earth Moving

C. Section 32 1376 - Sidewalks

D. Section 32 1613 - Concrete Curb & Gutters

1.03 SUBMITTAL

A. See Related Work

1.04 REFERENCES

A. ASTM C150- Portland Cement.

B. ASTM C94 – Ready Mixed Concrete.

C. ASTM A185 – Welded Steel Wire Fabric for Concrete Reinforcement.

D. ASTM A615 – Deformed and Plain Billet – Steel Bar for Concrete Reinforcement.

E. ASTM D1751 – Preformed Expansion Joint Filler for concrete Paving and Structural construction.

1.05 INSPECTION AND TESTING

A. Inspection and testing of concrete will be performed by a firm approved by the owner and paid for by the Contractor, in accordance with Section 01 4529.

B. Three (3) concrete test cylinders will be taken during cold weather concreting, and be cured on job site under same conditions as concrete it represents.

C. One (1) slump test will be taken for each set of test cylinders taken.

PART 2 PRODUCTS

2.01 FILL MATERIALS

A. Gravel Base: Angular crushed natural stone: free shale, clay and friable materials and debris.

2.02 CONCRETE MATERIALS

A. Portland Cement: ASTM C150; Normal –Type I. Materials for concrete paving shall conform to the requirements for Sections 32 0523–Concrete Work.

B. Fine and Coarse Aggregates: ASTM C33.

C. Water Clean and free from injurious amounts of oil, alkali, organic matter, or other deleterious material.

2.03 REINFORCEMENT

A. Reinforcing Steel: (60) yield strength; plain and deformed billet steel bars: ASTM A615; plain finish.

B. Welded Steel Wire Fabric: Plain type, ASTM, 6” x 6: W2.9x W2.9 size.

C. Tie Wire: Minimum 16 gage annealed type, or patented system acceptable to Architect/Engineer.

2.04 FORMWORK AND ACCESSORIES

A. Formwork: Matched, tight fitting and adequately stiffened to support weight of concrete without deflection detrimental to tolerances and appearance of concrete.

B. Joint Filler: Minimum ½-inch thick asphaltic impregnated fiberboard ASTM D1751.

C. Concrete Curing Compound: Chlorinated rubber type: clear color; ASTM C309.

2.05 CONCRETE MIX

A. Mix and proportion to produce minimum 3500 psi concrete at 28 days with maximum slump of 3 inches and 4 to 6 percent air entrainment.

B. Use accelerating admixtures in cold weather only when acceptable to Architect/Engineer. Use of admixtures shall not relax cold weather placement requirements. Do not use calcium chloride.

C. Use set-retarding admixtures during hot weather only when acceptable to Architect/Engineer.

PART 3 EXECUTION

3.01 PREPARATION OF SUBGRADE

A. Ensure rough grading has brought subgrade to required elevations.

B. Fill soft spots and hollows with additional fill.

3.02 PLACEMENT OF GRAVEL FILL AND SAND CUSHION

A. Place and level gravel fill over prepared subgrade to a compacted depth indicated on drawings true to lines and levels.

B. During concrete placement, keep base sufficiently moist to prevent excessive absorption of water from freshly placed concrete.

3.03 FORMING

A. Form vertical surfaces to full depth and securely position to required lines and levels. Ensure form ties are not placed so as to pass through concrete.

B. Arrange and assemble formwork to permit easy dismantling and stripping, and to prevent damage to concrete during formwork removal.

3.04 PLACING REINFORCEMENT

A. Reinforce concrete drives: Allow for minimum 1 -1/2 inch concrete cover.

B. Do not extend wire mesh reinforcing through expansion and contraction joints. Provide dowelled joints through expansion and contraction joints, with one end of dowels fitted with capping sleeve to allow free movement.

3.05 GENERAL

A. Notify Architect/Engineer for inspection at least 24 hours before the planned time to pour concrete.

B. Inspection:

1. Ensure that excavation and formwork are completed and within the allowed tolerances.
2. Ensure that ice and excess water are removed, no frost is present, and that ground is not frozen.
3. Check that reinforcement is secured in place.
4. Verify that insulation, anchors, and other embedded items are secured in position.

C. Install concrete work in accordance with ACI 301-99 except as amended by this section.

3.06 FORMING EXPANSION AND CONTRACTION JOINTS

A. Install control expansion joints in accordance with ACI 301-99 Section 5

B. Place expansion and contraction joints shown on plans. Where joints are not illustrated, provide control joints for every 100 SF of surface area and expansion joints for every 400 SF of surface area. Where possible, make joints coincide with joints in adjacent concrete.

C. Fit joints with filler of required profiles, set drives perpendicular to longitudinal axis of drives. Recess ¼ inch below finished concrete surface.

3.07 PLACING CONCRETE

A. Place concrete, screed and wood float surfaces to a smooth and uniform finish, free of open texturing and exposed aggregate.

B. Avoid working mortar to surface.

C. Make ¼-inch wide dummy joints as indicated on Drawings.

D. Round all edges, including edges of dummy and expansion and contraction joints, with ¼-inch radius edging tool.

E. Where paved surfaces are adjacent to walks, make concrete curbs and gutters integral with walks. Make expansion and contraction joints of curbs coincide with walk joints. Provide dummy joint at line between walks and curbs.

F. All drives, sidewalks, ramps, and stairs are to have a broom finish applied to the surfaces, unless otherwise noted.

G. Ensure finished surfaces do not vary from true lines, levels or grade by more than 1/8 inch in 10 feet when measured with straightedge.

H. Apply curing compound on finished surfaces immediately after placement. Apply in accordance with manufacturer's recommendations.

I. All expansion joints must be sealed with an approved joint sealant.

END OF SECTION 32 13 13

SECTION 32 13 73 - CONCRETE PAVING JOINT SEALANTS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contact, including General and Supplementary conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:

1. Cold-applied joint sealants.
2. Hot-applied joint sealants.

B. Related Work:

1. Section 32 1313 - Concrete Paving
2. Section 32 1376 – Sidewalks
3. Section 32 1613 – Concrete Curb & Gutter

1.03 PRECONSTRUCTION TESTING

A. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufactures, for testing indicated below, Samples of material that will contact of affect joint sealants.

1. Use ASTM C1087 to determine whether priming and other specific joint-preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
2. Submit no fewer than eight pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures including use of specially formulated primers.
5. Testing will no be required if joint-sealant manufactures submit joint-preparation data that are based on previous testing, not older than 24 months, of sealant products for compatibility with and adhesion to joint substrates and other materials matching those submitted.

1.04 SUBMITTALS

A. Product Data: For each joint-sealant product indicated.

B. Samples for Verification: For each kind and color of joint sealant required, provide samples with joint sealants in ½ inch wide joints formed between two 6-inch long strips of materials matching the appearance of exposed surfaces adjacent to joint sealants.

C. Pavement-Joint Sealants Schedule: Include the following information:

1. Joint-sealant application, joint location, and designation.
2. Joint-sealant manufacturer and product name.
3. Joint-sealant formulation.
4. Joint-sealant color.

D. Qualification Data: For qualified Installer.

E. Product Certificates: For each type of joint sealant and accessory, from manufacturer.

F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for joint sealants.

G. Preconstruction Compatibility and Adhesion Test Reports: From joint-sealant manufacturer, indicating the following:

1. Materials forming joint substrates and joint-sealant backings have been tested for compatibility with and adhesion to joint sealants.
2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this project.

B. Source Limitations: Obtain each type of joint sealant from single source from single manufacturer.

C. Product Testing: Testing joint sealants using a qualified agency.

1. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C1021 to conduct the testing indicated.

1.06 PROJECT CONDITIONS

A. Do not proceed with installation of joint sealants under the following conditions:

1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer.
2. When joint substrates are wet.
3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
4. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

PART 2 PRODUCTS

2.01 MATERIALS

A. Compatibility: Provide joint sealants, backing materials, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer based on testing and field experience.

B. Colors of Exposed Joints Sealants: As selected by Architect/Engineer from manufacturer's full range, and to be confirmed with submittal.

2.02 COLD-APPLIED JOINT SEALANTS

A. Single-Component, Nonsag, Silicone Joint Sealant for Concrete: ASTM D 5893, Type NS.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work, include, but are not limited to, the following:
    a. Crafco Inc., and ERGON company; RoadSaver Silicone.
    b. Dow Corning Corporation; 888.
    c. Pecora Corporation; 301 NS.

B. Single-Component, Self-Leveling, Silicone Joint Sealant for Concrete: ASTM D 5893, Type SL.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work, include, but are not limited to, the following:
    a. Crafco Inc., and ERGON company; RoadSaver Silicone SL.
    b. Dow Corning Corporation; 890-SL
    c. Pecora Corporation; 300 SL

C. Multicomponent, Pourable, Traffic-Grade, Erethane Joint Sealant for Concrete: ASTM C 920, Type M. Grade P, Class 25, for Use T.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
    a. Pecora Corporation; Urespan NR-200.

2.03 HOT-APPLIED JOINT SEALANTS

A. Hot-Applied, Single-Component Joint Sealant for Concrete: ASTM D 3406.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
    a. Crafco Inc., an ERGON company; Superseal444/777.

B. Hot-Applied, Single-Component Joint Sealant for Concrete and Asphalt: ASTM D 6690, Types I, II, and III.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
    a. Meadows, W.R., Inc. Sealtight 3405.
    b. Right Pointe; D-3405 Hot Applied Sealant.

2.04 JOINT– SEALANT BACKER MATERIALS

A. General: Provide joint-sealant backer materials that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by joint-sealant manufacturer based on field experience and laboratory testing.

B. Round Backer roads for Cold-Applied Joint Sealants: ASTM D 5249, Type 3, of diameter and density required to control sealant depth and prevent bottom-side adhesion of sealant.

C. Round Backer Roads for Cold-Applied Joint Sealant.

D. Backer Strips for Cold and Hot –Applied Joint Sealants: ASTM D 5249; Type 2; of thickness and width required to control joint-sealant depth, prevent bottom-side adhesion of sealant, and fill remainder of joint opening under sealant.

2.05 PRIMERS

A. Primers: Product recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions.

B. Joint Priming: Prime joint substrates where indicated or where recommended in writing by joint-sealant manufacturer, based on preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of join-sealant bond; do not allow spillage or migration onto adjoining surfaces.

3.03 INSTALLATION OF JOINT SEALANTS

A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated unless more stringent requirements apply.

B. Joint-Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Install joint-sealant backings of kind indicated to support joint sealant during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

1. Do not leave gaps between ends of joint-sealant backings.
2. Do not stretch, twist, puncture, or tear joint-sealant backings.
3. Remove absorbent joint-sealant backings that have become wet before sealant application and replace them with dry materials.

D. Install joint sealants using proven techniques that comply with the following and at the same time backings are installed:

1. Place joint sealants so they directly contact and fully wet joint substrates.
2. Completely fill recesses in each joint configuration.
3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

E. Tooling of Nosag Joint Sealants: Immediately after joint-sealant application and before skinning or curing begins, tools sealants according to the following requirements to form smooth, uniform beads of configuration indicated: to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint:

1. Remove excess joint sealant from surfaces adjacent to joints.
2. Use tooling agents that are approved in writing by joint-sealant manufacturer and that do not discolor sealants or adjacent surfaces.

F. Provide joint configuration to comply with joint-sealant manufacturer's written instructions unless otherwise indicated.

3.04 CLEANING

A. Clean off excess joint sealant or sealant smears adjacent to joints as the Work progresses, by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.05 PROTECTION

A. Protect joint sealants, during and after curing period, from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately and replace with joints sealant so installations in repaired areas are indistinguishable from the original work.

END OF SECTION 32 13 73

SECTION 32 13 76 - SIDEWALKS

PART 1 GENERAL

1.01 WORK INCLUDED

A. Providing concrete sidewalk where shown on Drawings.

B. Providing concrete handicap ramps where shown on Drawings.

1.02 RELATED WORK

A. Section 31 2000 – Earth Moving.

B. Section 32 0523 – Cement and Concrete for Exterior Improvements.

C. Section 32 1373 – Concrete Paving Joint Sealants.

1.03 SUBMITTALS

A. See Related Work

1.04 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM):

1. ASTM D 1751, Specifications for Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types).

PART 2 PRODUCTS

2.01 CONCRETE

A. General: Materials for use in sidewalk construction shall conform to the requirements for Section 32 0523, and shall be 3500 psi concrete.

2.02 WORK INCLUDED

A. The joint filler for all expansion joints shall be manufactured according to ASTM D 1751 and shall be elastic waterproof pre-molded compound that will not become soft and push out in hot weather, nor hard and brittle and chip out in cold weather. The strips shall be ½" in thickness except where shown otherwise on the Drawings; their width shall at least equal the full thickness of the slab; and their length shall at least equal the width of the slab at the joint.

2.03 FORMS

A. Forms shall be steel or 2" nominal thickness lumber true to proper dimensions, smooth, sufficiently braced to resist springing out of shape, and accurately set to proper lines and grades. Used forms shall be free of dirt and mortar. Cross forms shall be ¼" steel of the full width and depth of the concrete work and left in place until the wearing surface has been floated and has obtained its initial set.

2.04 CURING COMPOUND

A. Liquid membrane forming curing compound conforming to AASHTO M 148, Type 2, white pigmented (all-resin base).

2.05 SURFACE TREATMENT

A. Scofield Repello FPS surface treatment for water and stain repellency to concrete surfaces.

PART 3 EXECUTION

3.01 GRADING AND SUBGRADING

A. Prepare subgrade for walks by excavating or filling to a depth below the top of an intended pavement equal to the thickness of the finished walk and in exact conformity to the grade approved by the Engineer. Remove vegetative matter or material that will not compact properly and replace with suitable material. Place all fill required to bring the subgrade to the proper level in thin layers not exceeding 4 inches deep, and thoroughly ram, tamp or roll until it has been made compact and solid. Bring subgrade to true grade in a uniformly firm condition before placing the concrete. Do not place concrete on the subgrade until the Engineer has inspected and approved both grade and condition of subgrade.

3.02 GENERAL

A. Notify Architect/Engineer for inspection at least 24 hours before the planned time to pour concrete.

B. Inspection:

1. Ensure that excavation and formwork are completed and within the allowed tolerances.
2. Ensure that ice and excess water are removed, no frost is present, and that ground is not frozen.
3. Check that reinforcement is secured in place.
4. Verify that insulation, anchors, and other embedded items are secured in position.

C. Install concrete work in accordance with ACI 301-99 except as amended by this section.

3.03 SETTING FORMS

A. Stake forms and hold to the established lines and grades. Provide minimum 1/8" per foot fall away from structures or as shown on the drawings.

3.04 TREATMENT

A. Wet wood and coat metal forms with oil, soft soap, or whitewash before depositing any material against them. Remove all mortar and dirt from forms that have been previously used.

3.05 MARKINGS

A. Cut surface of concrete walks into flags by marking with an edging tool having a radius of ¼". Make flags not longer than 6 feet on any side nor longer than the width of the sidewalk. Round the slabs on all surface edges, including the cross markings between flags, to a radius of ¼".

3.06 JOINTS

A. Provide an expansion joint ½" in thickness, extending full depth of the concrete and with filler as herein specified, at intervals of not more than 15 feet, or as shown on plans. Provide a similar joint ½" in thickness in each walkway at intersection of walkways. Also provide an expansion joint ½" in thickness at each intersection of sidewalk and street curb and at such other points as may be designated by the Engineer. Separate sidewalk from abutting structures by ½" expansion joints. Place expansion joints ½" in thickness extending full depth of the concrete in a square outline around each object in sidewalks, such as fire hydrants, utility poles light standards, etc.

B. All expansion joints must be sealed with an approved joint sealant.

3.07 PLACING CONCRETE

A. Place concrete only on a moist subgrade and not adjacent to or around utility structures until such structures have been set to the proper grade.

B. Transport from the mixer and place by such a means as will not cause segregation of materials or loss of ingredients. Deposit successive batches in one layer by a continuous operation, completing individual sections to the required depth and width. Do not use concrete that has taken its initial set. Fill forms and bring the concrete to the established grade by means of a strike board or straight edge. Thoroughly tamp concrete until mortar is flushed to the surface sufficiently to finish and mark the surface.

C. Spade and/or vibrate the concrete so that it will flow together and completely fill all void spaces especially along forms (including cross forms of joints) to prevent honeycombing and shall be struck off and tamped in an approved manner, until dense surface is obtained, free from porous or rough spots and at the required sections and grade.

D. Use method of placing the various sections so as to produce a straight clean-out joint between them, in order to make each section and independent unit. Do not use any concrete in excess of that needed to complete a section at the stopping of work.

E. Do not pour concrete when temperature is below 35 degrees Fahrenheit, and do not place concrete on frozen subgrade. Take all necessary precautions to prevent damage to concrete in excess of that needed to complete a section at the stopping of work.

F. At all times during construction period, maintain proper drainage, by natural flow or pumping as required, so that water will drain away from excavated areas. Do not allow water to stand in any excavations, or elsewhere, to be covered by concrete. Provide and maintain in proper working order all necessary pumping and other equipment required to maintain drainage.

3.08 FINISH

A. After the concrete has been brought to the established grade by means of a strike board and tamped to bring the mortar to surface, float to a true even surface and finish with steel trowel. After the trowel finish has taken its initial set, brush surface lightly at right angles to center line of sidewalk with a soft bristle brush.

B. Do not apply heat to the concrete surface to hasten its hardening.

3.09 CURING AND PROTECTION:

A. As soon as the concrete has hardened sufficiently to prevent damage, apply specified liquid membrane-forming curing compound in accordance with manufacturer's written instructions.

B. Protect the freshly finished concrete from hot sun and drying winds until the curing compound is applied. Do not allow the concrete surface to be damaged or pitted by raindrops. Provide and use, when necessary, sufficient tarpaulins to completely cover all sections that have been placed within the proceeding twelve hours. Erect and maintain suitable barriers to protect the concrete. Repair any section damaged from traffic or other causes occurring prior to its official acceptance. Before the sidewalk is opened to traffic, remove and dispose of the covering.

C. Apply surface treatment to all concrete surfaces per manufacturer's requirements.

3.10 FREEZING TEMPERATURE

A. If at any time during the progress of the work, the temperature is predicted to drop below 35 degrees Fahrenheit within 24 hours after placement, heat the water and aggregates and take precautions to protect the work from freezing for at least five days.

END OF SECTION 32 13 76

SECTION 32 14 00 - UNIT PAVING

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

A. Work of this Section, as shown or specified, shall be in accordance with the requirements of the Contract Documents.

1.02 SECTION INCLUDES

A. The Work of this Section includes all labor, materials, equipment, and services necessary to complete the unit paving as shown on the drawings and/or specified herein, including but not necessarily limited to the following:

(1) Pedestrian asphalt unit pavers on sand setting bed over concrete sub-slab.
(2) Granite cobblestone pavers on mortar setting bed over concrete sub-slab.
(3) Detectable warning pavers.
(4) Sand setting bed over concrete sub-slab.
(5) Mortar setting bed.
(6) Metal edge restraints for unit pavers.

1.03 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.04 PREINSTALLATION TRAINING MEETINGS

A. Preinstallation Training Conference: Contractor and installer shall conduct Preinstallation training meeting with Laticrete.

1.05 ACTION SUBMITTALS

A. Product Data: For the following:

(1) Asphalt Pavers
(2) Granite cobblestone pavers.
(3) Detectable warning pavers.
(4) Mortar and grout materials.
(5) Setting bed materials.
(6) Polymeric sand for joints.
(7) Mortar joints.
(8) Metal edge restraints.

B. Samples for Initial Selection: For the following:

(1) Each type of unit paver indicated.
(2) Joint materials involving color selection.

C. Submittal Drawings:

(1) Show stone paving layout and patterns.
(2) Show special stone shapes.

D. Samples for Verification: Submit full size sample sets of paving units to indicate color and shape selections. Final Color selection will be made by the Landscape Architect and the Owner from manufacturers available colors. Include Samples of joint materials.

E. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

F. Sustainability Submittals: Complete provided Product Data Reporting Form in spec section 01 81 13 and provide the following:

(1) Solar Reflectance Index: Provide manufacturer's documentation / test report for the initial SR rating value complying with gray cement concrete of 0.26 and white cement concrete of 0.70.

1.06 INFORMATIONAL SUBMITTALS

A. Material Certificates: For unit pavers. Include statements of material properties indicating compliance with requirements, including compliance with standards. Provide for each type and size of unit.

B. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for unit pavers, indicating compliance with requirements.

1.07 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed unit paver installations similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
B. Mockups: Build mockups of each type of unit paving in the location and of the size indicated or, if not indicated, build mockups where directed by Landscape Architect and not less than 10 by 10 feet. The mock-up shall illustrate various paver conditions and patterns on the design. Construction methods and materials shall be in accordance with these specifications Include each typical edge and perimeter condition.
C. This mock-up will serve to determine exact jointing at intersections, the surcharge of the bedding sand layer, edge restraint, paver cutting, dimensions, joint sizes, lines, laying pattern(s), color(s), and texture of the job. This area shall be the standard from which the work will be judged. Designated method for removal of cementitious residues and addition of sealers shall be executed on approximately ½ of the mock-up area prior to submittal of mock-up for acceptance.
    (1) Approved mockups may become part of the completed work if undisturbed at time of substantial completion.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Protect unit pavers and aggregate during storage and construction against soiling or contamination from earth and other materials.
B. Cover pavers with plastic or use other packaging materials that will prevent rust marks from steel strapping.
C. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.
D. All grout, bonding agent, and mortar bedding layer materials must be delivered in original, unopened containers with the manufacturer's name, labels, product identification, and batch numbers. Damaged material must be documented, reported to the manufacturer, and removed from site.
E. Store all grout, bonding agent, and mortar bedding layer materials off the ground and avoid excessive heat, rain, or freezing temperatures until ready for use.
F. Sand shall be covered with waterproof covering to prevent exposure to rainfall or removal by wind. The covering shall be secured in place.
G. Store liquids in tightly closed containers protected from freezing.
H. Protect the materials from deterioration during storage.
I. Stockpile aggregates to minimize segregation.

1.09 PROJECT CONDITIONS

A. Cold-Weather Protection: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen subgrade or setting beds. Remove and replace unit paver work damaged by frost or freezing.
B. Weather Limitations for bedding and jointing of Sandstone pavers: Comply with the following requirements:
    (1) Temperature readings of the ambient and substrate temperature must be taken and recorded before and during application.
    (2) Do not apply if the surface below 41 deg F or over 86 deg F.
    (3) Product should not be applied in rain.

PART 2 - PRODUCTS

2.01 SUSTAINABILITY PERFORMANCE REQUIREMENTS

A. Solar Reflectance Index: Provide documentation for the initial SR rating value.

2.02 MANUFACTURERS

A. Source Limitations: Obtain each type of unit paver, joint material, and setting material from single source with resources to provide materials and products of consistent quality in appearance and physical properties.
B. Subject to compliance with requirements, provide products by one of the following:

2.03 ASPHALT PAVERS

A. Asphalt-Block Pavers: Solid units made from asphalt cement complying with ASTM D312, Type III; inorganic stone dust or cement filler; and coarse aggregate, consisting of clean, hard, unweathered stone crushed into angular particles varying size.
B. Manufacturer: Hanover Architectural Products, 240 Bender Road, Hanover, PA 17331
http://www.hanoverpavers.com
    (1) Size: 5" x 12" commercial asphalt block.
    (2) Paver Thickness: 3" (pedestrian and vehicular).
    (3) Finish: Ground Finish.
    (4) Color: Matrix #10 – A80010 matrix.

2.04 GRANITE COBBLESTONE PAVERS

A. Cobblestone blocks shall be new or used granite. The blocks shall be sound and durable, reasonably uniform in quality and texture throughout, free from shale, excess mica, seams, scaling or evidence of disintegration. Match

Landscape Architect's samples for color, finish, and other stone characteristics relating to aesthetic effects. The blocks shall be the following types, located as indicated on the plans:

(1) 4" x 4" x 4" cobblestone, Carbon grey/black, split face sides with split face finish top 1/ 2- 1/4 inch joint max. All blocks shall have one reasonably smooth split face with no projections or depression over 1/4". Cutting of blocks to meet the pattern requirements will be permitted subject to the approval of the Landscape Architect.

2.05 DETECTABLE WARNING PAVERS

A. For Straight Section:

(1) Manufacturer: Hanover; 12" x 12" detectable warning paver.
(2) Material: Concrete, ASTM C936, ASTM C67.
(3) Dimensions: 11.75 long x 11.75 wide x 3" thick.
(4) Finish: Tudor Finish.
(5) Color: Charcoal.

B. For Curved Section:

(1) Manufacturer: Pavestone; "Holland Stone" Series, 4" x 8" x 3" detectable warning paver.
(2) Material: Concrete, ASTM C936, ASTM C67.
(3) Dimensions: 3-7/8 wide x 7-13/16" long x 3" thick.
(4) Finish: Shotblast Finish.
(5) Color: Charcoal Black.

2.06 ACCESSORY MATERIALS

A. Materials for asphalt paver setting bed and joints:

(1) Sand for Leveling Course: Sound, sharp, washed, natural sand complying with gradation requirements in ASTM C 33 for fine aggregate. Do not use stone dust or mason sand for Leveling Course. Provide gradations as follows:

(a) Sieve Size Percent Passing:

(i) 3/8 in. (9.5 mm) 100.
(ii) No. 4 (4.75 mm) 95 to 100.
(iii) No. 8 (2.36 mm) 85 to 100.
(iv) No. 16 (1.18 mm) 50 to 85.
(v) No. 30 (0.600 mm) 25 to 60.
(vi) No. 50 (0.300 mm) 10 to 30.
(vii) No. 100 (0.150 mm) 2 to 10.
(viii) No. 200 (0.075 mm) 0 to 1.

(2) Sand for Joints: Polymeric Sand:

(a) Description: Dry mix, containing polymeric binding agent, activated with water.
(b) Manufacturer: Techniseal; www.techniseal.com
(c) Product: JS-2: Techniseal "HP" Polymeric Jointing Sand.
(d) Joint Sand Colors: As selected by Landscape Architect from manufacturer's full range.

B. Materials

(1) Portland Cement: ASTM C 150, Type 1; white.
(2) Hydrated Lime: ASTM C 207, Type S.
(3) Aggregate for Cement Setting Beds: Sand as recommended in ASTM C 398, uniformly graded from coarse to fine, with 100% passing the No. 4 sieve and not more than 5% passing the No. 100 sieve.
(4) Water: Potable, clear and free of deleterious materials which would impair the quality of the mortar.

C. Reinforced mesh where required shall be 2" x 2" x 16 ga. welded galvanized reinforcing mesh.
D. Sealant and related materials shall conform to the following:

(1) For joint filler provide closed cell extruded neoprene gasket conforming to ASTM C 509, grade 4, black.
(2) Sealant: Two (2) part self-leveling polyurethane sealant complying with ASTM C 920, Type M, Class 25, Grade P&NS, equal to Sikaflex-2c NS/SL made by Sika Chemical Co., or approved equal made by Tremco or Pecora. Color of sealant as selected by the Landscape Architect.
(3) Back-up rod shall be "Ethafoam" or approved equal.
(4) Prime joints using primer recommended by sealant manufacturer.

E. Stainless Steel for Lifting Plugs and Drains: AISI Type 302/304 non-magnetic, conforming to ASTM A 167.
F. Metal Edge Angle and Edge Restrains at Planting: See details on plans.

2.07 FABRICATION

A. All stonework shall be executed by masons skilled in the trade. All stone shall be well-cured and seasoned before cutting. Cut stone units with bed, unless otherwise approved by the Landscape Architect.
B. Stone shall be accurately cut to sizes, shapes, profiles and dimensions. There shall be no deviation from jointing.
C. Exposed surfaces and edges of stone units shall be free from cracks, broken corners, chipped edges, scratches, or other defects affecting appearance. Patching or filling not permitted.
D. The use of stone with chipped edges or faces shall not be permitted.

E. Cut stone units full and true on faces, reveals, beds, joint and top, to the full dimensions required by drawings. All edges shall be straight and true with sharp and true arises. All stone shall fit together accurately.
F. Make faces of stone units in same plane flush at joints. All finished surfaces shall be true in line and face.
G. Sawn surfaces and edges shall be cleaned of all rust stains and iron particles.
H. Cut stone to allow for uniform 1/4" wide joints.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas indicated to receive paving, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Sweep or clean substrates to remove dirt, dust, debris, and loose particles.
B. Proof-roll prepared subgrade according to requirements in Section 321313 "Concrete Paving" to identify soft pockets and areas of excess yielding. Proceed with unit paver installation only after deficient subgrades have been corrected and are ready to receive subbase and base course for unit pavers.

3.03 INSTALLATION, GENERAL

A. Do not use unit pavers with chips, cracks, voids, discolorations, and other defects that might be visible or cause staining in finished work.
B. Mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.
C. Cut unit pavers with motor-driven masonry saw equipment to provide clean, sharp, unchipped edges. Cut units to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting is not acceptable.
D. Joint Pattern:
   (1) Asphalt Pavers: Running bond.
   (2) Granite Cobblestone Pavers: Running bond.
   (3) Detectable Warning Pavers: as indicated on drawings.
   (4) Fill gaps around utility boxes, vertical elements, edge restraints, etc. with paver units cut to fit. Make edge cuts without cracking or chipping the paver units. Provide a joint width of 1/16 inch to 1/8 inch between cut edges of paver and adjacent structure.
E. Tolerances: Do not exceed 1/32-inch unit-to-unit offset from flush (lippage) nor 1/8 inch in 10 feet from level, or indicated slope, for finished surface of paving.
F. Provide edge restraints as indicated. Install edge restraints before placing unit pavers.
   (1) Install edge restraints to comply with manufacturer's written instructions. Install stakes at intervals required to hold edge restraints in place during and after unit paver installation.
   (2) For metal edge restraints with top edge exposed, drive stakes at least 1 inch (25 mm) below top edge
G. Joint Sand:
   (1) Verify that pavers are completely dry.
   (2) Spread Polymeric sand and fill joints completely.
   (3) Sweep surface clean of sand prior to compaction to avoid staining.
   (4) Compact pavers and add more sand if necessary until joints are completely filled to a minimum depth of 1.25 inches.
   (5) Remove excess dust with leaf blower.
   (6) Polymeric Sand Wetting:
      (a) Perform wetting in three or more applications of water.
      (b) Do not flood pavement or generate runoff.
      (c) First application of water shall be in a fine mist; Do not displace sand. Wait 5 to 10 minutes.
      (d) Subsequent applications of water: Dampen surface in 5 to 10 minute intervals to gradually soak joints to a complete depth. Spot check joints by emptying sand to the bottom of a joint.
      (e) Allow joints to dry at least 24 hours before allowing traffic on pavers.
      (f) If there is a risk of rain within 24 hours, protect pavement with waterproof cover.

3.04 SAND SETTING-BED PAVER APPLICATIONS

A. Place leveling course and screed to a thickness of 1 to 1-1/2 inches, taking care that moisture content re-mains constant and density is loose and constant until pavers are set and compacted.
B. Compact sand laying course using vibrating vehicular equipment until no densification is achieved with additional passes of the vibrating equipment.
C. Screed and level a final seating layer of the sand laying course over the compacted layer of sand laying course to achieve the thicknesses and grades specified on the Drawings after final compaction.

D. Do not disturb the sand laying course once it is compacted, screeded and leveled. If the sand laying course is disturbed due to exposure to construction traffic, foot traffic, the environment, or by other means, re-compact and reshape it until it meets the requirements of this Section.
E. Treat leveling base with soil sterilizer to inhibit growth of grass and weeds.
F. Set pavers with a minimum joint width of 1/16 inch and a maximum of 1/8 inch, being careful not to disturb leveling base. If pavers have spacer bars, place pavers hand tight against spacer bars. Use string lines to keep straight lines. Fill gaps between units that exceed 3/8 inch with pieces cut to fit from full-size unit pavers.
   (1) When installation is performed with mechanical equipment, use only unit pavers with spacer bars on sides of each unit.
G. Vibrate pavers into leveling course with a low-amplitude plate vibrator capable of 3500 to 5000-lbf com-paction force at 80 to 90 Hz. Use vibrator with neoprene mat on face of plate, or other means as needed, to prevent cracking and chipping of pavers. Perform at least three passes across paving with vibrator.
   (1) Compact pavers when there is sufficient surface to accommodate operation of vibrator, leaving at least 36 inches of uncompacted pavers adjacent to temporary edges.
   (2) Before ending each day's work, compact installed concrete pavers except for 36-inch width of un-compacted pavers adjacent to temporary edges (laying faces).
   (3) As work progresses to perimeter of installation, compact installed pavers that are adjacent to permanent edges unless they are within 36 inches of laying face.
   (4) Before ending each day's work and when rain interrupts work, cover pavers that have not been compacted and cover leveling course on which pavers have not compacted and cover leveling course on which pavers have not been placed with non-staining plastic sheets to protect them from rain.
H. Spread dry polymeric sand evenly on surface of dry pavers and fill joints immediately with a push broom after vibrating pavers into leveling course. Fill joints completely, down to the full joint depth. Avoid sweeping over long distances to preserve the integrity of the sand. Do not install polymeric sand when pavers or joint conditions are wet or slightly damp as this will result in premature activation of the joint material.
   (1) Run a plate compactor over the entire surface to fully compact the joints. Repeat step H & H.1 until joints are completely full. Joints must be filled up to the bottom of the paver chamfer, or 1/8" be-low the top of the pavers.
   (2) Where a plate compactor cannot be used, proceed with a manual compaction: hammer vigorously each corner as well as the contour of each slab with a rubber mallet.
I. Remove all sand residue from the surface of paver field with a leaf blower, prior to wetting the surface. Keep the leaf blower at sufficient distance and power to maintain proper joint filling requirements. Ensure surface is completely free of sand, prior to wetting.
J. Activate the sand with water. Set spray nozzle to "shower" or "heavy mist" to avoid displacement of joint material. Start wetting from the bottom of the slope. Wet a 200 square foot section for approximately 30 seconds without displacing the sand. Wait a few seconds and wet the same section again for another 30 seconds or until joints are saturated. Do not allow joint to dry completely between initial and subsequent wetting. Avoid runoff and foaming.
   (1) Immediately move on to an adjacent 200 square foot sections and repeat process J until the entire paver field has been wetted. Avoid excess flooding on the surface, which could cause unwanted run-off.
   (2) On textured pavers, use the blower to blow excess water off the surface and into the joints.
K. Do not allow traffic on installed pavers until joint material has dried completely after initial wetting. It is recommended to keep all traffic off of installed pavers for 24-48 hours to ensure proper curing.

3.05 MORTAR SETTING BED APPLICATIONS
A. Application
   (1) Preparation of Subbase: Clean concrete subbase to remove dirt, dust, debris, film or curing compound, and loose particles. Saturate concrete subbase with clean water several hours before placing setting bed. About one hour prior to placing setting bed, remove surface water.
B. Setting
   (1) The prepared mortar shall be spread to the desired thickness. The mortar shall be rodded and compacted with a steel trowel.
   (2) Before placing the stone on a green or wet screed bed, a slurry coat shall be applied to the mortar bed using a flat trowel. Thickness of the bond coat shall be approximately 1/16". In addition, a skim coat shall be applied to the back of each stone, just prior to placing on the bed.
   (3) Stone shall be placed in the wet slurry coat before the surface dries. Uniform joints shall be maintained with a nominal width of 1/4".
   (4) After each piece is laid, it shall be beat in with a wooden block or rubber mallet to level the surface and embed the stone. Bearing shall be done before mortar takes initial set.
C. Mortar Joints: For paving, joints are 1/4" wide typically. After all stone units have been set and setting bed is thoroughly cured, brush all 1/4" wide joints clean. Thoroughly wet raked out portion of joints and then fill solid with joint mortar of approved color to match stone. Mortar shall be placed relatively dry and tooled in layers. Finished profile shall be slightly recessed. Grouting of joints as done in tile work is not permitted. Every effort must be made to keep mortar off stone face including applying masking tape to prevent staining of adjacent stone surfaces in continuous strips in alignment with joint edge. Remove tape immediately upon grout having achieved its finish set.
D. Joint Treatment for Joints to Receive Sealant

(1) All exterior control joints as noted on the drawings and all joints in base work shall receive back-up fillers and sealant as specified herein.
(2) General: Install all sealant in strict accordance with manufacturer's recommendations as approved by the Landscape Architect.
    (a) Apply sealant under pressure with a hand or power actuated gun or other appropriate means. Guns shall have nozzle of proper size and provide sufficient pressure to completely fill joints as detailed. Neatly point or tool all joints to provide the contour as indicated on the drawings.
    (b) For application of sealant when air temperature is below 40 deg. F., consult sealant manufacturer for recommendations.
(3) Preparation: Thoroughly clean all joints, removing all foreign matter such as dust, oil, grease, water, surface dirt and frost. Sealant must be applied to the base surface. Previously applied paint or film must be entirely removed.
(4) Application
    (a) Install back-up material and joint filler, of type and size specified, using a blunt instrument so as not to puncture the surface skin, at proper depth in joint to provide sealant dimensions as detailed. Provide back-up material of suitable size and shape so that, when compressed (25 to 50%) it will fit in joints as required. Sealant shall not be applied without back-up materials, and, if necessary, bond breaker strip. When using back-up of rod stock, roll the material into the joint to avoid lengthwise stretching. Rod stock shall not be twisted or braided.
    (b) Apply masking tape, where required, to prevent staining of adjacent stone surfaces, in continuous strips in alignment with joint edge. Remove tape immediately after joints have been sealed and tooled as directed.
    (c) Prime surfaces of all stone to receive sealant.
    (d) Apply, tool and finish sealant as required. When tooling light colored sealants, use dry tool or tooling solution recommended by sealant manufacturer.
    (e) Clean adjacent surfaces free of sealant or soiling resulting from this work as work progresses. Use solvent or cleaning agent as recommended by sealant manufacturer. All finished work shall be left in a neat, clean condition.
    (f) Sealants shall be applied in such a manner as to completely fill the joint.
    (g) All sealants shall be tooled to insure complete filling of the joint to eliminate air pockets and voids and to insure positive adhesion of the sealant with the bonding surfaces.
    (h) All joints shall be neatly finished.

3.06 REPAIR, POINTING, CLEANING AND PROTECTION

A. Remove and replace unit pavers that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units as intended. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment and with no evidence of replacement.
B. Cleaning: Remove excess grout and/or polymeric sand from exposed paver surfaces; wash and scrub clean per manufacturer recommendations.
C. Pointing: During tooling of joints, enlarge voids or holes and completely fill with mortar or grout. Point up joints at sealant joints to provide a neat, uniform appearance, properly prepared for sealant application.

END OF SECTION 32 14 00

SECTION 32 15 42 - STONE FINES SURFACING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

(1) Exposed stone fines surfacing with stabilizer additive.

1.02 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

(1) Review stone fines surfacing mix design and examine procedures for ensuring quality of materials, mixing and placement. Require representatives of each entity directly concerned with stone fines surfacing to attend, including the following:

(a) Contractor's superintendent.
(b) Stone fines surfacing Installer.

1.03 ACTION SUBMITTALS

A. Product Data: For each product specified. Include technical data and tested physical and performance properties.
B. Sieve Analyses: For stone fines materials, according to ASTM C 136.
C. Samples for Initial Selection: For stone fines materials, showing range of color and other appearance characteristics available for selection.
D. Samples for Verification: For the following:

(1) Surfacing Materials: 5 lb (2.5 kg) of each type of exposed surfacing material required, in sealed plastic bags labeled with gradation and source. Sample shall be typical of the lot of material to be delivered and installed on the site; provide an accurate indication of color, texture, and size range of the material.

E. Sustainability Submittals: Complete provided Product Data Reporting Form in spec section 01 81 13 and provide the following:

(1) Solar Reflectance Index: Provide manufacturer's documentation / test report for the initial SR rating value complying with gray cement concrete of 0.26 and white cement concrete of 0.70.

1.04 INFORMATIONAL SUBMITTALS

A. Qualification Data: For firms and persons specified in the "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
B. Material Certificates: For surfacing material. Include statements of material properties indicating compliance with requirements, including compliance with standards. Provide for each type and size of surfacing material.

1.05 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match and are from the same production runs as products installed and that are packaged with protective covering for storage and identified with labels describing contents.

(1) Stone Fines Surfacing: 10 percent of quantity of stone fines materials installed, in the form of 50- lb. bags.
(2) Stabilizer Additive: 10 percent of quantity of binder material installed, but not less than four 5-gallon containers.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer who has completed stabilized stone fines surfacing similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance
B. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

(1) Build mockups of each type of stone fines surfacing in the location and of the size indicated or, if not indicated, build mockups where directed by Landscape Architect and not less than 10 by 10 feet. Include base course and each typical edge and perimeter condition.
(2) Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Landscape Architect specifically approves such deviations in writing.
(3) Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Store stone fines materials where grading and other required characteristics can be maintained and contamination can be avoided.
B. Deliver stabilizer additive materials to mixing location in original packages with seals unbroken and bearing manufacturer's labels containing brand name and type of material, date of manufacture, and directions for storage.
C. Store stabilizer additive materials in a clean, dry, protected location and within temperature range required by manufacturer. Protect stored materials from direct sunlight.
D. Protect and cover stone fines and related materials during storage and construction to prevent wetting by rain, snow or water and against contamination by earth and other materials or substances.

1.08 PROJECT CONDITIONS

A. Environmental Limitations: Apply materials only when substrate conditions and weather are within acceptable ranges as specified by the manufacturer.
B. Cold-Weather Protection: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen base. Remove and reconstruct stone fines surfacing work damaged by frost or freezing.

PART 2 - PRODUCTS

2.01 SUSTAINABILITY PERFORMANCE REQUIREMENTS

A. Solar Reflectance Index: Provide documentation for the initial SR rating value.

2.02 STONE FINES SURFACING MATERIALS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Kafka Granite LLC, Mosinee WI (kafkagranite.com, 800-852-7415); Stabilized Pathway Aggregate.
   (1) Color: Midnight Blue
B. General: Use materials and gradations that have performed satisfactorily in previous installations.
C. Source Limitations: Obtain each type of surfacing material from single source that has resources to provide materials and products of consistent quality in appearance and physical properties.
D. Stone Fines Surface Course Materials: Crushed aggregate consisting of sound, angular, durable particles, with the following gradation according to ASTM C 136:

Sieve Designation	Range of Percent Passing
3/8 inch	100
No. 4	80-100
No. 8	65-90
No. 16	40-65
No. 30	25-55
No. 50	15-35
No. 100	10-20
No. 200	5-15

2.03 STABILIZATION MATERIALS

A. Stabilizer Binder: 1-component liquid rock dust stabilizer, designed to be applied to crushed aggregate fines to produce water-permeable, erosion-resistant stabilized stone fines surfacing for pedestrian traffic.

   (1) Basis-of-Design Product: Subject to compliance with requirements, provide Romex® D7000 Rock Dust Stabilizer. Romex North America (romexhardscapes.com, 1-844-722-3760).

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that subgrade is in suitable condition for installation of stone fines and binder application.
B. Verify that compacted subbase material and base course are dry and ready to support stone fines surfacing and imposed loads.
C. Verify that gradients and elevations of base are correct, and that base course has been finished to a tolerance of 1/4 inch in 10 feet.
D. Notify Landscape Architect in writing of any unsatisfactory conditions. Do not begin stone fines surfacing installation until these conditions have been satisfactorily corrected.

3.02 PREPARATION, GENERAL

A. Protect adjacent surfaces, plants, and structures to prevent damage or contamination during placement and compaction of stone fines surfacing.
B. Coordinate installation of stone fines surfacing with adjacent construction including paving and site furnishings.
C. Immediately before placing stone fines materials, remove loose and deleterious material from substrate surfaces. Ensure that prepared subgrade is ready to receive stone fines mixture.
   (1) Pre-soak base to assist in bonding of stone fines surfacing materials.

3.03 INSTALLATION, GENERAL

A. Mix stone fines surfacing materials from several containers or batches to produce uniform blend of colors and textures.
B. Provide crowns in areas of stone fines surfacing with slopes of 2 percent or less.
   (1) Slope surfaces not less than 1 percent to drain away from structures.
C. Coordinate application of stone fines surfacing with installation of edge restraints. Sequence the Work so stone fines surfacing materials are placed after installation of edge restraint assemblies has been completed.
D. Install stone fines surfacing so top surface is flush with adjacent material or edge restraints unless otherwise indicated.

3.04 SUBSTRATE PREPARATION

A. Compact soil subgrade uniformly to at least 95 percent of ASTM D 1557 modified Proctor density.
B. Place aggregate base course as specified by tamping with plate vibrator, and screed to depth indicated.
   (1) Compact base course uniformly to at least 95 percent of ASTM D 1557 modified Proctor density.
   (2) Incorporate indicated crowns and cross-slopes into compacted base course, as applicable.

3.05 STONE FINES PLACEMENT

A. Surface Course Installation: After mixing to produce a uniform blend, spread approved stone fines mixture in a moist condition. Uniformly cover base course to a compacted depth indicated.
   (1) Use a paving machine, box Gannon™ or similarly equipped tractor/loader, or other method recommended by the manufacturer/supplier for placing stone fines in large areas. Spread the loose and uncompacted aggregate over the compacted base material.
   (2) Roll immediately after placement, using a double or singe static steel-wheel drum roller, or equivalent, weighing not more than 1 ton, and compact the surface course mixture to a density of 95 percent at optimum moisture content according to ASTM D 1557.
      (a) Do not use vibratory equipment for compacting stone fines surface course.
      (b) Hand roll areas not accessible with power roller to same density.
B. Stabilizer Application:
   (1) Pour the 1-component liquid rock dust stabilizer into a watering can with an inclined spray attachment and distribute evenly over the stone fines surface.
   (2) Allow 10-15 minutes for absorption. Then use a plate compactor or hand tamper to create a smooth surface.
   (3) Apply stabilizer at a rate of approximately 85 square feet per 5.2 gallon/20-litre container in two coats, apply approximately 60% of the liquid stabilizer on the first coat, compact then add the second coat in the following 1-2 hours after the first coat.
   (4) Protect the treated area from rain for 48 hours, ensuring air circulation under the rain protection.
   (5) After hardening lightly apply a third coat of liquid stabilizer using a sprayer, watering can, or roller for added strength of stabilized stone fines surfacing.
C. Finish Course Tolerance: Finish and measure surface so gap at any point between stone fines surface and an unleveled, freestanding, 10-foot-long straightedge resting on 2 high spots and placed anywhere on the surface does not exceed 1/4 inch.

3.06 ADJUSTING AND PROTECTION

A. Remove and replace stabilized stone fines surfacing that is damaged, defective or does not comply with specified requirements.
B. After final rolling, do not permit pedestrian or vehicular traffic on stone fines surfacing until it has fully cured, a minimum of 24-72 hours.
C. Erect barricades and warning signs as required to protect newly installed stone fines surfacing areas from traffic. Maintain barricades until time of Substantial Completion unless otherwise directed.

D. Ensure that a continuous grade is maintained along the stabilized stone fines surfacing, and that no areas form where water might collect or puddle. Correct deficiencies and maintain stone fines surfacing for remainder of construction period.

END OF SECTION 32 15 42

SECTION 32 16 13 - CONCRETE CURB AND GUTTER

PART 1 GENERAL

1.01 WORK INCLUDED

A. Construct cast-in-place combination curb and gutter.

1.02 RELATED WORK

A. Section 31 2000 – Earth Moving.

B. Section 32 1376 – Sidewalks.

C. Section 32 0523 – Cement & Concrete for exterior improvements.

D. Section 32 1373- Concrete Paving Joint Sealants.

1.03 SUBMITTALS

A. See Related Work

1.04 QUALITY ASSURANCE

A. Perform cast-in-place concrete in accordance with ACI 301 and Section 32 0523.

1. Standard Specifications for Highway construction, Edition of 2014, hereafter referred to as “AHTD Standard Specifications”.

PART 2 PRODUCTS

2.01 MATERIALS

A. Ready Mixed concrete: ASTM C94 and Articles 2.01 through 2.06 of Section 32 0523.

B. Curing Compound: ASTM C309.

C. Pre-formed expansion joint fillers: ASTM D1751-18.

1. Thickness: ½ inch.

PART 3 EXECUTION

3.01 SUBGRADE PREPARATION

A. Grade subgrade and compact in same manner and to same density as specified in Section 31 2000 controlled fill.

3.02 GENERAL

A. Notify Architect/Engineer for inspection at least 24 hours before the planned time to pour concrete.

B. Inspection:

1. Ensure that excavation and formwork are completed and within the allowed tolerances.
2. Ensure that ice and excess water are removed, no frost is present, and that ground is not frozen.
3. Check that reinforcement is secured in place.
4. Verify that insulation, anchors, and other embedded items are secured in position.

C. Install concrete work in accordance with ACI 301-20 except as amended by this section.

3.03 INSTALLATION

A. Cast-in-place Concrete: Refer to Section 32 0523

1. See standard Detail Drawings for Curb and Gutter, and for Handicap Ramp.
2. Prepare subgrade in accordance with Section 31 2000.
3. Set forms to line and grade.
4. Install forms over full length of curb.
5. Form contraction joints at maximum 10 feet spacing using steel templates, division plates or sawcuts.
6. Remove templates or plates as soon as concrete has hardened sufficiently to retain its shape.
7. Install preformed expansion joint fillers at maximum 40 feet spacing, at curb returns, and behind curb at abutment to sidewalks and other structures.
8. Place top of expansion joint material ¼ inch below curb surface.
9. Place concrete in position without separation of concrete materials.
10. Consolidate concrete with mechanical vibrators.
11. Round face of curbs at top with finishing tool of correct radius.
12. Finish exposed surfaces with wood float followed by light brushing with broom.
13. Apply curing material and cure for seven days.

B. Repair of surface defects: Comply with requirements of Section 32 0523.
C. Field Quality Control: Comply with requirements of Section 32 0523.
D. Protection of Completed Work: Comply with requirements of Section 32 0523.

END OF SECTION 32 16 13

SECTION 32 17 23 - PAVEMENT MARKINGS

PART 1 GENERAL

1.01 WORK INCLUDED

A. Providing pavement markings as shown on Drawings.

1.02 REFERENCE STANDARDS

A. Federal Specifications (FS):

1. TT-P-115E Paint, Traffic, Highway, White and Yellow.
2. TT-P-1952B Paint, Traffic, and Airfield Marking, Water Emulsion Base.

B. Federal Standard (Fed. Std.)

1. No 141B Paint, Varnish, Lacquer, and related materials.

C. Arkansas Department of Transportation (ArDOT)

1. Standard Specifications for Highway Construction, 2014 Edition

1.03 SUBMITTALS

A. Submit a test report showing either that the proposed batch meets all specified requirements or that a previous batch manufactured using the same formulation as that used in manufacturing the proposed batch for the following properties required in the material specification: weight per gallon, viscosity, fineness of grind, drying time, and gradation. Testing procedures and reports shall be as specified in paragraph 5 of Method 1031.2 of Fed. Std.141.

1.04 DELIVERY, HANDLING AND STORAGE

A. Deliver material in sealed containers that plainly show the designated name, formula or specification number, batch number, color, date of manufacture, manufacturer's name, formulation number and directions, all of which shall be plainly labeled at time of use.

B. Furnish paint in containers not larger than five gallons.

C. Store paint on project site. Store emulsion paints to prevent freezing.

1.05 SITE CONDITIONS

A. Unless other wise recommended by the paint manufacturer apply pavement markings material only when the ambient temperature is between 40 and 95 degrees F.

PART 2 PRODUCTS

2.01 MATERIALS

A. Parking:

1. Manufactured according to FS TT-P-115E, FS TT-P-1952B or ArDOT Standards Specification Section 718,719, or 720.
2. Symbol Color: White.
3. Handicapped Access Aisles on Asphalt Paving: Color, White
4. Handicapped Access Aisles on Concrete Paving: Color, ADA Blue
5. Paint shall be homogeneous, easily stirred to smooth consistency, and shall show no hard settlement or other objectionable characteristics during a storage period of six months.
6. Note: Verify colors with owner prior to painting.

B. Roadway:

1. Manufactured according to ArDOT Standard Specifications Section 719 or 720.
2. Color:
    a. Separating traffic traveling in opposite directions: Yellow
    b. Left edge of roadways: Yellow
    c. Separating two-way left turn lanes and reversible lanes from other lanes: Yellow
    d. All other applications: White
    e. Pre-molded striping and symbols as shown and called for on plans.

PART 3 EXECUTION

3.01 SURFACE PREPARATION

A. Allow new pavement surfaces to cure for a period of not less than 30 days before application of markings materials.

B. Thoroughly clean all surfaces to be marked before application of paint. Remove dust, dirt, and other granular surface deposits by sweeping, blowing with compressed air, rinsing with water or a combination of these methods as required.

C. Completely remove rubber deposits, surface laitance, existing paint markings, and other coatings adhering to the pavement with scrapers, wire brushes, sandblasting, approved chemicals, or mechanical abrasion as directed.

D. Where oil or grease are present on old pavements to be marked, scrub affected areas with several applications of trisodium phosphate solution or other approved detergent or degreaser, and rinse thoroughly after each application. After cleaning, seal, seal oil-soaked areas with cut shellac to prevent bleeding through the new paint.

3.02 EQUIPMENT

A. General: Use only approved machines, tools, and equipment. Maintain equipment in satisfactory operating condition. Han-operated push type machines of a type commonly used for application of paint to pavement surfaces will be acceptable for marking small street and parking areas. Use applicator machine equipped with the necessary paint tanks and spraying nozzles. Equipment shall be capable of applying paint uniformly at coverage specified. Provide sandblasting equipment as required for cleaning surfaces to be painted. Use hand-operated spray guns for use in areas where push-type machines cannot be used.

B. Sandblasting Equipment: Sandblasting equipment shall include an air compressor, hoses, and nozzles of proper size and capacity as required for cleaning surfaces to be painted. The compressor shall be capable of furnishing not less than 150 c.f.m of air at a pressure of not less than 90 psi at the nozzle for each nozzle used.

C. During concrete placement, keep base sufficiently moist to prevent excessive absorption of water from freshly placed concrete.

3.03 APPLICATION

A. Rate of Application: Apply two (2) coats of paint at manufacturer's recommended rate with total maximum of 320 lineal feet per gallon per coat with 4" wide stripe. Apply with mechanical equipment to produce uniform straight edges. At sidewalk curbs, use a straightedge to ensure a uniform, clean, and straight stripe.

B. Paint: Apply paint in stripes of specified width to clean, dry surfaces, unless otherwise approved, only when air and pavement temperature is above 40 F and less than 95 F. Maintain paint temperature within these limits. Apply paint pneumatically with approved equipment at rate of coverage specified herein. Provide guide lines and templates as necessary to control paint application. Take special precautions in marking numbers, letters, and symbols. Sharply outline all edges of markings. Maintain the maximum drying time requirements of the paint specifications to prevent undue softening of bitument, and pickup, displacement, or discoloration by tires of traffic. If there is a deficiency in drying of the markings, discontinue painting operations until cause of the slow drying is determined and corrected.

3.04 PROTECTION

A. Prevent damage to newly painted surfaces by either placing small markers along newly painted lines or controlling traffic to keep vehicles away from area of newly painted lines.

END OF SECTION 32 17 23

SECTION 32 33 00 - SITE FURNISHINGS

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

A. Work of this Section, as shown or specified, shall be in accordance with the requirements of the Contract Documents.

1.02 SECTION INCLUDES

A. The Work of this Section includes all labor, materials, equipment, and services necessary to complete the site furnishings as shown on the drawings and/or specified herein, including, but not necessarily limited to, the following:

(1) Trash and recycling receptacles.
(2) Bicycle racks.
(3) Tables and chairs.
(4) Adirondack chairs.
(5) Pedestrian pole lights.

1.03 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed installation of site furnishings similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated. Submit Manufacturer's standard catalog data sheets and standard product details as required for installation and integration with other work.
B. Sample for Initial Selection: For units with factory-applied finishes.
C. Shop Drawings: Submit shop drawings to show component parts, fabrication, installation, and dimensions for all items in this section, including manufacturer's instructions for footings and anchorages.
D. Manufacturer's recommended installation procedures.

1.05 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
B. Trash Receptacle Inner Containers: Five full-size units for each size indicated, but no fewer than two units.

1.06 CLOSEOUT SUBMITTALS

A. Maintenance Data: For site furnishings to include in maintenance manuals.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Upon receipt at the job site, all materials shall be checked to ensure that no damage occurred during shipping or handling.
B. Materials shall be stored in such a manner to ensure proper ventilation and drainage, and to protect against damage, weather, vandalism and theft.

PART 2 - PRODUCTS

2.01 TRASH RECEPTACLES

A. Trash Receptacles with polyethylene liner complying with University of Arkansas Campus Standards.

(1) Manufacturer: Landscape Forms, 431 Lawndale Avenue, Kalamazoo, MI 49048; http://www.landscapeforms.com
(2) Product: Petosky Litter Receptacle.
(3) Material: Cold-rolled Steel body / Spun Steel lid.
(4) Capacity: 30 gallons.
(5) Color: Stone (Panguard II polyester powder coat).

2.02 RECYCLING RECEPTACLES

A. Recycling Receptacles with polyethylene liner with 5" dia. opening complying with University of Arkansas Campus Standards.

(1) Manufacturer: Landscape Forms, 431 Lawndale Avenue, Kalamazoo, MI 49048; http://www.landscapeforms.com
(2) Product: Petosky Litter Receptacle.
(3) Material: Cold-rolled Steel body / Spun Steel lid.
(4) Capacity: 30 gallons.
(5) Color: Ivy (Panguard II polyester powder coat).

(6) Graphic/Sign: Sign 09 recycling logo for aluminum cans and plastic bottles.

2.03 BICYCLE RACKS

A. Bicycle Racks made of CorTen steel mounted below grade complying with University of Arkansas Campus Standards.

(1) Manufacturer: STREETLIFE America LLC, Philadelphia, PA, US Tel 1-215-247-0148; usa@streetlife.com
(2) Product: Strip Bicycle Rack BP-70-IGM (in ground mount) & BP-70-CT (surface mount).
(3) Dimension: As shown on the drawings. Custom mounting requirements described in drawings.
(4) Material: untreated CorTen steel, ca. 1 cm thick weathered pre-delivery.
(5) Including horizontal black synthetic (PE/PP) protection strip fitted at the top.
(6) Delivery: Assembled.
(7) Installation: below grade/surface mount as concrete ready.

2.04 TABLES AND CHAIRS

A. Movable tables complying with University of Arkansas Campus Standards.

(1) Table Manufacturer: Fermob USA, 1610 Redi Rd. Cumming, GA 30040 https://www.fermobusa.com/
(2) Product: Luxembourg 32x32” Table (4 Legs), freestanding.
(3) Material: Aluminum
(4) Color: Titanium (Panguard II polyester powder coat).Rosemary

B. Movable chairs complying with University of Arkansas Campus Standards.

(1) Manufacturer: Fermob USA, 1610 Redi Rd. Cumming, GA 30040 https://www.fermobusa.com/
(2) Product: Luxembourg Armchair; freestanding.
(3) Material: Aluminum
(4) Color: Rosemary

C. Adirondack chairs complying with University of Arkansas Campus Standards.

(1) Manufacturer: Rejuvenation, Williams-Sanoma https://www.rejuvenation.com
(2) Product: Vaughn Teak Outdoor Adirondack Chair
(3) Material: Teak
(4) Color: Natural Teak

2.05 LIGHTS

A. Pedestrian pole light complying with University of Arkansas Campus ‘Contemporary’ Standards.

(1) Manufacturer: BEGA, 1000 BEGA Way, Carpinteria, CA 93013 https://www.bega-us.com/
(2) Product: 3"-5" OD tapered aluminum pole with round hinged base model 1308HR.
(3) Height: 13'-8".
(4) Base: 12-5/8" diameter.
(5) Material: Aluminum.
(6) Color: Old BEGA Black.
(7) Luminaire: 77120LED.
(8) Material: Aluminum.
(9) Color: Old BEGA Black.
(10) LED Color Temperature: 2700K.

B. Crosswalk pole lights complying with University of Arkansas Campus Standards.

(1) Manufacturer: BEGA, 1000 BEGA Way, Carpinteria, CA 93013 https://www.bega-us.com/
(2) Product: 3"-5" OD tapered aluminum pole with round hinged base model 1908HR.
(3) Height: 19'-8".
(4) Base: 12-5/8" diameter.
(5) Material: Aluminum.
(6) Color: Old BEGA Black.
(7) Luminaire: B84249 Crosswalk Service BEGA Twin Head.
(8) Material: Aluminum.
(9) Color: Old BEGA Black.
(10) LED Color Temperature: 2700K.

PART 3 - EXECUTION

3.01 INSPECTION

A. Examine the areas and conditions where site furnishings are to be installed and correct any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions are corrected to permit proper installation of the work.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.
B. Prepare surface as needed to perform installation per manufacturer's recommendation.

3.03 INSTALLATION, GENERAL

A. Comply with manufacturer's written installation instructions unless more stringent requirements are indicated. Complete field assembly of site furnishings where required.
B. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.
C. Install site furnishings level, plumb, true, and securely anchored or positioned at locations indicated on Drawings.

3.04 INSTALLATION

A. Bicycle Racks: Bolt base plates to concrete slab or footing on stable compacted surface using two (2) 5/8" x 6" stainless steel anchor bolts. Bolt heads shall be flush with surface of the plate.
B. Coordinate as required with other trades to assure proper and adequate provision in the work of those trades for interface with the work of this Section.
C. Install the work of this Section in strict accordance with the original design, the approved Shop Drawings, pertinent requirements of governmental agencies having jurisdiction, and the manufacturer's recommended installation procedures.

END OF SECTION 32 33 00

SECTION 32 57 30 - SITE DECORATIVE METAL RAILINGS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section includes the following:

(1) Custom painted galvanized handrail.

1.03 PERFORMANCE STANDARDS FOR RAILINGS (UNLESS GREATER REQUIRED BY CODE)

A. Railing assemblies shall be designed and installed to resist the simultaneous application of a lateral force of 50 PLF and a vertical load of 100 PLF, both applied to the top of the railing. Railings shall resist a total lateral force and total vertical load of at least 200 lbs. each.

B. Submit calculations and drawings signed and sealed by a Professional Engineer licensed in the State of Arkansas indicating that railing system can meet these performance criteria.

1.04 SUBMITTALS

A. Product Data: Submit manufacturer's, fabricator's and finisher's specifications and installation instructions for products used in ornamental metal work, including finishing materials and methods.

B. Samples: For each type of exposed finish required, prepared on 12" x 12" samples of metal of same thickness and material indicated for the Work.

C. Shop Drawings: Submit for all items of work of this Section, as enumerated under paragraph 1.02, showing locations, layouts, materials, thicknesses, finishes, dimensions, construction, relation to adjoining construction, erection details, profiles, jointing and all other details to fully illustrate the work of this Section.

D. Contractor Licensed Engineer Submittal: For installed products indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

E. Mockups: Provide mockup of railings as directed by the Landscape Architect.

F. Sustainability Submittals: Complete provided Product Data Reporting Form in spec section 01 81 13 and provide the following:

G. Recycled Content: Provide recycled content information. Highlight post-consumer and pre-consumer quantities. Provide material costs excluding labor itemized.

1.05 QUALITY ASSURANCE

A. General: Work of this section shall be fabricated and installed by an experienced fabricator or manufacturer who has been engaged in work of equivalent scope and fabrication standards for at least five (5) years. Materials, methods of fabrication, fitting, assembly, bracing, supporting, fastening, operating devices, and erection shall be in accordance with drawings, specifications, and approved shop drawings, and be of highest quality practices of the industry, using new and clean materials as specified, having structural properties sufficient to safely sustain or withstand stresses and strains to which materials and assembled work will be subjected. All work shall be accurately and neatly fabricated, assembled, and erected.

B. Field Measurements: Take field measurements prior to preparation of shop drawings and fabrication, where possible, to ensure proper fitting of the work. However, do not delay job progress; allow for adjustments and fitting where taking of field measurements before fabrication might delay the work.

C. Shop Assembly: Insofar as practicable, fitting and assembly of work shall be done in shop. Work that cannot be permanently shop assembled, shall be completely assembled, marked and disassembled in shop before shipment to insure proper assembly in field. Shop assemble work in largest practical sizes to minimize field work. It is the responsibility of the Contractor for this work to assure himself that the shop fabricated items will properly fit the field condition. In the event that shop fabricated items do not fit the field condition, the item shall be returned to the shop for correction.

PART 2 - PRODUCTS

2.01 SUSTAINABILITY PERFORMANCE REQUIREMENTS

A. Recycled Content: Provide materials with a minimum of 25% recycled or reused content.

2.02 MANUFACTURER

A. Handrail - Contemporary: Galvanized steel.

(1) Refer to Drawing L620.

2.03 MATERIALS

A. Provide materials that have been selected for their surface flatness, smoothness, and freedom from surface blemishes where exposed to view in the finished unit. Surfaces exposed to view that exhibit pitting, seam marks, roller marks, oil-canning, stains, discolorations, or other imperfections on the finished units will not be acceptable.

B. Steel and Iron: Provide steel and iron in the form indicated, complying with the following requirements:

(1) Tubing: Cold-formed, ASTM A 500; or hot-rolled, ASTM A 501.
(2) Steel Plates, Shapes and Bars: ASTM A 36.
(3) Gray Iron Castings: ASTM A 48, Class 30.
(4) Malleable Iron Castings: ASTM A 47, grade as recommended by fabricator for type of use indicated.
(5) Steel Rods: ASTM A 108.
(6) Steel (Carbon) for Concealed Supports Only

(a) Structural Shapes: ASTM A 36.
(b) Plates (for forming or bending cold): ASTM A 283, Grade C.
(c) Steel Sheets: ASTM A 366, Grade 1.

(7) Shop prime with rust inhibitive primer equal to Series 88 Azeron made by Tnemec, or approved equal made by Benjamin Moore or Sherwin Williams.

C. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of the metal to be welded, and as required for color match, strength and compatibility in the fabricated items.

D. Fasteners: Furnish basic metal and alloy, matching finished color and texture as the metal being fastened, unless otherwise indicated. Provide Phillips flat-head screws for exposed fasteners, unless otherwise indicated.

E. Anchors and Inserts: Either furnish inserts to be set in concrete or masonry work, or provide other anchoring devices as required for the installation of ornamental metal items. Provide toothed steel or lead shield expansion bolt devices for drilled-in-place anchors. Provide galvanized or cadmium-coated anchors and inserts for exterior installations.

(1) Provide units with exposed surfaces matching the texture and finish of the metal item anchored.

F. Bituminous Paint: SSPC-Paint 12 (cold-applied asphalt mastic).

G. Cast-in-Place and Preinstalled Anchors: Anchors fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete.

H. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

(1) Provide at base to avoid water collection and rusting.

2.04 FABRICATION

A. Cutting: Cut metal by sawing, shearing or blanking. Flame cutting will be permitted only if cut edges are ground back to clean, smooth edges. Make cuts accurate, clean, sharp, square and free of burrs, without deforming adjacent surfaces or metals.

B. Holes: Drill or cleanly punch holes (do not burn), so that holes will be accurate, clean, neat and sharp without deforming adjacent surfaces or metals.

C. Connections

(1) Make connections with tight joints, capable of developing full strength of member, flush unless indicated otherwise, formed to exclude water where exposed to water. Locate joints where indicated on drawings. Provide connections to allow for thermal movement of metal at locations and by methods approved by Landscape Architect. For work exposed to view, use concealed fasteners (unless welded or other connections indicated) with joints accurately fitted, flush and rigidly secured with hairline contacts.
(2) Welding: Welding shall be in accordance with recommendations of the American Welding Society and shall be done with electrodes and/or methods recommended by the manufacturers of the metals being welded. Welds shall be continuous, except where spot welding is specifically permitted. Welds exposed to view shall be ground flush and dressed smooth with and to match finish of adjoining surfaces so that joint will not be visible; undercut metal edges where welds are required to be ground flush and dressed smooth. All welds on or behind surfaces which will be exposed to view shall be done so that finished surface will be free of imperfections such as pits, runs, splatter, cracks, warping, dimpling, depressions or other forms of distortion or discoloration. Remove weld splatter and welding oxides from all welded surfaces.

D. Built-In Work: Furnish anchor bolts, inserts, plates and any other anchorage devices, and all other items for architectural metal work to be built into concrete, masonry, or work of other trades, with necessary templates and instructions, and in ample time to facilitate proper placing and installation.

E. Supplementary Parts: Provide as necessary to complete each item of work, even though such supplementary parts are not shown or specified.

F. Coordination: Accurately cut, fit, drill and tap work of this Section to accommodate and fit work of other trades. Furnish or obtain, as applicable, templates and drawings to or from applicable trades for proper coordination of this work.

G. Exposed Work: In addition to requirements specified herein or shown on drawings, all surfaces exposed to view shall be clean, and free from dirt, stains, grease, scratches, distortions, waves, dents, buckles, tool marks, burrs and other defects which mar appearance of finished work. Ornamental metal work exposed to view shall be straight and true to line or curve, smooth arises and angles as sharp as practicable, miters formed in true alignment, profiles accurately intersecting, and with joints carefully matched to produce continuity of line and design. Exposed

fastenings, where permitted, shall be of the same material, color and finish as the metal to which applied, unless otherwise indicated, and shall be of the smallest practicable size.

H. Materials used shall be of such strength, thickness and alloy that they are capable of meeting all standards and descriptions specified herein and as detailed on drawings.

2.05 SHOP FINISHING

A. General

(1) Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations, except as otherwise indicated.
(2) Provide colors or color matches as indicated on selected samples.
(3) Protect mechanical finishes on exposed surfaces from damage by application of strippable temporary protective covering prior to shipment.
(4) Corrosion Protection: Coat concealed surfaces which will be in contact with concrete, masonry, wood or dissimilar metals, in exterior work and work to be built into exterior and below grade walls and decks, with a heavy coat of bituminous paint. Do not extend coating onto exposed surfaces.

B. Steel and Iron Finishes

(1) Painted Hot-Dip Galvanized Finish

(a) Hot-Dip Galvanizing: For steel exposed to the elements, weather or corrosive environments and other steel indicated to be galvanized, provide coating for iron and steel fabrications applied by the hot-dip process. Galvanizing bath shall contain special high-grade zinc.

(i) Basis of design: Duragalv®
(ii) Comply with ASTM A 123 for fabricated products and ASTM A 153 for hardware.
(iii) If required, plug vent and drain holes that are exposed in the finished Work, unless indicated to remain as weep holes after galvanizing and grind smooth.
(iv) Galvanized surface shall be prepared per SSPC SP2 or SP3 to provide a smooth surface removing all runs, drips, or sags.
(v) Galvanizing shall exhibit a rugosity (smoothness) of 16-25 microns or less when measured by a profilometer. This pertains to those elements that are less than 24 pounds per running foot.
(vi) Galvanized surfaces, that are to receive coatings, must be blasted per SSPC SP 16. The use of iron, steel shot, and aluminum oxide grit as a blast medium, and power wire brushes are not permitted.
(vii) For galvanized railings, provide hot-dip galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.

(b) Factory-Applied Primer over Galvanized Steel: Provide factory-applied polyamide epoxy prime coat over hot-dipped galvanized steel.

(i) Basis of design: Primergalv®.
(ii) Primer shall be certified OTC/VOC compliant at less than 2.8 lbs./gal. and conform to EPA and local requirements.
(iii) Apply the primer at the galvanizer's facility within 12 hours after galvanizing. Application must be in a controlled environment meeting applicable conditions as required by the coating manufacturer. Primer shall have a one-year re-coat window for application of finish coat.
(iv) Primer shall be applied at 2-6 mils DFT and meet or exceed the following performance criteria as stipulated by the coating manufacturer:

1. Abrasion Resistance: ASTM D 4060 (CS17 Wheel, 1,000 grams load) 1 kg load, 200 mg loss.
2. Adhesion: ASTM D 4541, 1050 psi.
3. Corrosion Weathering: ASTM D 5894, 13 cycles, 4,368 hours, 10 per ASTM D 714 for blistering; 7 per ASTM D 610 for rusting.
4. Direct Impact Resistance: ASTM D 2794, 160 in. lbs.
5. Flexibility: ASTM D 522, 180 degrees bend, 1 inch mandrel, Passes.
6. Pencil Hardness: ASTM D 3363, 3H.
7. Moisture Condensation Resistance: ASTM D 4585, 100 degrees F, 2000 hours, Passes no cracking or delamination.
8. Dry Heat Resistance: ASTM D 2485, 250 degrees F.
9. Accelerated Weathering: QUV- ASTM D 4587 QUV A 5000 Hours, Passes.
10. Salt Fog Resistance: ASTM B 117, 5,600 hours No cracking or delamination.

(c) Topcoat: Provide factory-applied high-performance 2nd generation aliphatic acrylic urethane coating in specified color and gloss range matching approved samples.

(i) Basis of design: Colorgalv® 10. Topcoat shall be certified OTC/VOC compliant and conform to EPA and local requirements.

1. Color: Sherwin Williams "UofA Advanced Bronzetone" or as approved by Landscape Architect.

2. Custom formula:

Custom: Advance Bronzetone

CCE* Color Cast	OZ	32	64	128
W1 White	-	42	-	1
B1 Black	6	36	-	1
R2 Maroon	-	26	-	1
Y3 Deep Gold	2	14	1	-

Custom Manual Match
BRONZETONE

(ii) Topcoat shall be applied over the primer at the galvanizer's facility. Topcoat shall be applied in a controlled environment meeting applicable conditions and recoat times as required by the coating manufacturer.

(iii) Topcoat will be applied at 2-3 mils DFT and must meet or exceed the criteria for the following categories as stipulated by the coating's manufacturer:

1. Abrasion Resistance: ASTM D 4060, CS17 Wheel, 1,000 cycles 1kg load; 154 mg loss.
2. Adhesion: ASTM D 4541; 1,766 psi.
3. Direct Impact Resistance: ASTM D 2794; 176 in. pounds.
4. Dry Heat Resistance: ASTM D 2485; 250 degrees F (121 C).
5. Salt Fog Resistance: ASTM B 117 9,000 hours; Rating 10 per ASTM D714 for blistering, Rating 10 per ASTM D 610 for Rusting.
6. Flexibility: ASTM D 522, 180 degrees bend, 1/8-inch mandrel; Passes.
7. Pencil Hardness: ASTM D 3363; HB.
8. Moisture Condensation Resistance: ASTM D 4585, 100 degrees F 38 C, 4000 hours; No rusting, blistering, or delaminating.
9. Corrosion Weathering: ASTM D 5894, 33 Cycles, 12,531 Hours; Rating 10 Per ASTM D 714 for blistering. Rating 10 Per ASTM D 610 for Rusting.
10. Thermal Cycling: ASTM D 2246, 10 cycles; Excellent.

(d) Warranty:

(i) Provide galvanizer's warranty that materials will be free from 10 percent or more visible rust for 20 years.

(ii) Gloss and color warranty shall be 10 years in accordance with the following performance specifications:

1. Fade: Defined as a loss of gloss not to exceed 35 units of gloss, which shall be measured in accordance with ASTM D 523-89 with 60 degrees geometry.
2. Color shift: Not to exceed 15 DE CIE LAB units for whites and light colors. Dark colors not to exceed 25 DE CIE LAB units measured by ASTM D 2244 (yellows, oranges, and reds are excluded).

2.06 PROTECTION

A. Provide necessary protection to all exposed surfaces of architectural metal work, so as to prevent damage, staining, discoloration, abrasion, etc., to these surfaces from time of shipment from factory to acceptance of work of this project. Protection shall be provided by wrappings, strippable coatings, or other means. After installation, remove protective paper or strippable coating and clean exposed surfaces, and then provide additional temporary protection to protect architectural metal work from damage during subsequent construction activities. Surfaces which are damaged, stained, discolored, abraded etc., shall be rejected and replaced with new materials, at no cost to the Owner.

2.07 STEEL FRAMING, BRACING, SUPPORTS AND REINFORCEMENTS

A. Steel framing, plate reinforcing, supplementary steel framing or reinforcing, bracket assemblies, and the like required for the support, framing, reinforcing, bracing, etc., of work of this Section shall be of such sizes and shapes as indicated on the drawings, or as required to suit the conditions, and shall be provided with all necessary supports and accessory items such as inserts, hangers, braces, struts, clip angles, anchors, bolts, nuts, welds, etc., as required to properly and rigidly fasten, anchor or attach work of this Section in place and to the concrete, masonry and other connecting and adjoining work.

2.08 DECORATIVE HANDRAILS AND RAILINGS

A. Welded Connections: Fabricate handrails and railings for connecting members by welding. Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following:

(1) Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
(2) Obtain fusion without undercut or overlap.
(3) Remove flux immediately.

(4) At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
(5) Form changes in direction of railing members by radius bends.
(6) Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain profile of member throughout entire bend without buckling, twisting, or otherwise deforming exposed surfaces of handrail and railing components.
(7) Provide wall returns at ends of wall-mounted handrails, close ends of returns.
(8) Close exposed ends of handrail and railing members with prefabricated end fittings.
(9) Brackets, Flanges, Fittings, and Anchors: Provide brackets, flanges, miscellaneous fittings, and anchors to interconnect handrail and railing members to other work, unless otherwise indicated.
    (a) Furnish inserts and other anchorage devices for connecting handrails and railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by handrails and railings. Coordinate anchorage devices with supporting structure.
    (b) For railing posts set in concrete, provide preset sleeves of steel, not less than 6 inches long and inside dimensions not less than 1/2 inch greater than outside dimensions of post, with steel plate forming bottom closure.

PART 3 - EXECUTION

3.01 INSTALLATION

A. General: Install work of this Section square, plumb, straight, true to line or radius, accurately fitted and located, with flush, tight hairline joints (except as otherwise indicated or to allow for thermal movement), with provisions for other trades, with provisions to allow for thermal movement, and with attachment devices as required for secure and rigid installation. It is the responsibility of the Contractor to assure himself that shop fabricated architectural metal items will properly fit the field condition. In cases where the shop fabricated architectural metal items do not fit the field condition, the item shall be returned to the shop for correction.
B. Attachments
    (1) Unless otherwise indicated, work to be built into concrete or masonry shall be anchored with shop welded on galvanized steel strap anchors; work to be attached to concrete or masonry shall be anchored by bolts into embedded inserts or expansion shields; work attached to structural steel shall be anchored by welds or bolts; work attached to metals other than structural steel shall be anchored by bolts or screws. Power actuated fasteners not permitted unless approved by Landscape Architect. Provide all supplementary parts necessary to complete each item of work of this Section.
    (2) All attachment devices shall be of type, size and spacing to suit condition and as approved by Landscape Architect. Provide shims, slotted holes, or other means necessary for leveling, plumbing and other required adjustments. Attachment devices for work exposed to view shall be concealed, unless indicated otherwise. Where bolts or screws are permitted in work exposed to view, they shall be oval head and counter sunk, unless otherwise noted, with projecting end cut off flush with nuts or adjacent material, and shall match adjacent surfaces.
    (3) Do all necessary drilling, tapping, cutting or other preparations of surrounding construction in the field accurately, neatly, and as necessary for the attachment and support of work of this Section, but obtain Landscape Architect's approval prior to such preparation to work of others.
C. Tolerances: All work of this Section shall be plumb, square, level, true to radius and correctly aligned within the following limitations:
    (1) Offset from true horizontal, vertical and design location shall not exceed 1/16" per ten (10) feet of length for any component, not cumulative.
    (2) Maximum offset from true alignment between abutting components shall not exceed 1/32".
D. Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units at Contractor's option.
E. Restore protective coverings which have been damaged during shipment or installation of the work. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at the same location.
F. Retain protective coverings intact and remove simultaneously from similarly finished items to preclude non-uniform oxidation and discoloration.
G. Field Welding: Comply with AWS Code for the procedures of manual shielded metal-arc welding, the appearance and quality of welds made, and the methods used in correcting welding work.

3.02 CLEANING

A. Clean steel by washing thoroughly with clean water and soap and rinsing with clean water.

3.03 PROTECTION

A. Protect finishes of ornamental metal from damage during construction period with temporary protective coverings approved by ornamental metal fabricator. Remove protective covering at the time of Substantial Completion.
B. Restore finishes damaged during construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

3.04 APPLICATION OF FACTORY APPLIED HOT-DIPPED GALVANIZED COATINGS

A. Galvanizing Application: Galvanize materials in accordance with specified standards and this specification. The dry kettle process shall be used to eliminate any flux inclusions on the surface of the galvanized material. The use of the wet kettle process is prohibited.

B. Prior to Galvanizing: The steel shall be immersed in a flux solution (zinc ammonium chloride). The flux tank must be 12 to 14 Baumé density and contain less than 0.4 percent iron.

(1) To provide the galvanized surface required, the following procedures shall be implemented:

(a) A monitoring recorder shall be utilized and inspected regularly to observe any variances in the galvanizing bath temperature.

(b) The pickling tanks shall contain hydrochloric acid with an iron content less than 12 percent and zinc content less than 3 percent. Titrations shall be taken weekly at a minimum.

(c) All chemicals and zinc shall be tested at least once a week to determine compliance with ASTM standards. All testing shall be done using atomic absorption spectrometry or x-ray fluorescence (XRF) equipment at a lab in the galvanizing facility.

C. Installation: Comply with fabricator's and galvanizer's requirements for installation of materials and fabrications, including use of nylon slings or padded cables for handling factory-coated materials.

D. Touch-Up and Repair: For damaged and field-welded metal coated surfaces, clean welds, bolted connections, and abraded areas the following procedures must be used.

(1) For galvanized surfaces, apply organic zinc repair paint complying with requirements of ASTM A 780, modified to 95 percent zinc in dry film. Galvanizing repair paint shall have 95 percent zinc by weight. Basis of design is ZIRP by Duncan Galvanizing. Thickness of applied galvanizing repair paint shall be not less than coating thickness required by ASTM A 123 or A 153 as applicable.

(2) For factory-applied finish coatings, field-touch-up shall be performed by qualified applicators with experience in the application of high-performance industrial coatings. All coating manufacturer’s requirements for mixing, application and environmental conditions must be followed. Touch-up shall be performed so that the repair is not visible from a distance of 6 feet. A touch-up repair kit and repair procedures shall be provided to the Owner for each type of factory-applied finish upon request.

END OF SECTION 32 57 30

SECTION 32 91 13 - SOIL PREPARATION

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

A. Work of this Section, as shown or specified, shall be in accordance with the requirements of the Contract Documents.

1.02 SECTION INCLUDES

A. The Work of this Section includes all labor, materials, equipment, and services necessary to complete the soil preparation as shown on the drawings and/or specified herein, including but not necessarily limited to the following:

(1) Planting soils specified by composition of the mixes.

1.03 DEFINITIONS

A. AAPFCO: Association of American Plant Food Control Officials.
B. Backfill: The earth used to replace or the act of replacing earth in an excavation. This can be amended or unamended soil as indicated.
C. CEC: Cation exchange capacity.
D. Compost: The product resulting from the controlled biological decomposition of organic material that has been sanitized through the generation of heat and stabilized to the point that it is beneficial to plant growth.
E. Duff Layer: A surface layer of soil, typical of forested areas, that is composed of mostly decayed leaves, twigs, and detritus.
F. Finish Grade: Elevation of finished surface of planting soil.
G. Imported Soil: Soil that is transported to Project site for use.
H. Layered Soil Assembly: A designed series of planting soils, layered on each other, that together produce an environment for plant growth.
I. Manufactured Soil: Soil produced by blending soils, sand, stabilized organic soil amendments, and other materials to produce planting soil.
J. NAPT: North American Proficiency Testing Program. An SSSA program to assist soil-, plant-, and water-testing laboratories through interlaboratory sample exchanges and statistical evaluation of analytical data.
K. Organic Matter: The total of organic materials in soil exclusive of undecayed plant and animal tissues, their partial decomposition products, and the soil biomass; also called "humus" or "soil organic matter."
L. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified as specified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.
M. RCRA Metals: Hazardous metals identified by the EPA under the Resource Conservation and Recovery Act.
N. SSSA: Soil Science Society of America.
O. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.
P. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than 1 percent organic matter and few soil organisms.
Q. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil"; but in disturbed areas such as urban environments, the surface soil can be subsoil.
R. USCC: U.S. Composting Council.

1.04 SUBMITTALS

A. Product Data

(1) Include recommendations for application and use.
(2) Include test data substantiating that products comply with requirements.
(3) Include sieve analyses for aggregate materials.
(4) Material Certificates: For each type of imported soil and soil amendment and fertilizer before delivery to the site, according to the following:

B. Samples: For each bulk-supplied material, 1 quart volume of each in sealed containers labeled with content, source, and date obtained. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of composition, color, and texture.
C. Qualification Data: For each testing agency.
D. Preconstruction Test Reports: For preconstruction soil analyses specified in "Preconstruction Testing" Article.
E. Field quality-control reports.

1.05 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent, state-operated, or university-operated laboratory; experienced in soil science, soil testing, and plant nutrition; with the experience and capability to conduct the testing indicated; and that specializes in types of tests to be performed.

1.06 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Engage a qualified testing agency to perform preconstruction soil analyses on existing, on-site soil and imported soil.
   (1) Notify Landscape Architect seven days in advance of the dates and times when laboratory samples will be taken.

B. Preconstruction Soil Analyses: For each unamended soil type, perform testing on soil samples and furnish soil analysis and a written report containing soil-amendment and fertilizer recommendations by a qualified testing agency performing the testing according to "Soil-Sampling Requirements" and "Testing Requirements" articles.
   (1) Have testing agency identify and label samples and test reports according to sample collection and labeling requirements.
   (2) Qualified Testing Agency: Wallace Laboratories, 365 Coral Circle, El Segundo, CA 80245; Tel 310-615-0116, Attn: Mr. Garn Wallace, Ph D.

1.07 SOIL-SAMPLING REQUIREMENTS

A. General: Extract soil samples according to requirements in this article.
B. Sample Collection and Labeling: Have samples taken and labeled by soil scientist (CPSS) certified by SSSA, soil classifier (CPSC) certified by SSSA, soil scientist (RPSS) registered by the National Society of Consulting Soil Scientists or state-certified, -licensed, or -registered soil scientist under the direction of the testing agency.
C. Number and Location of Samples: Minimum of eight representative soil samples from varied locations, where directed by Landscape Architect for each soil to be used or amended for landscaping purposes.
D. Procedures and Depth of Samples: According to USDA-NRCS's "Field Book for Describing and Sampling Soils."
E. Division of Samples: Split each sample into two, equal parts. Send half to the testing agency and half to Owner for its records.
F. Labeling: Label each sample with the date, location keyed to a site plan or other location system, visible soil condition, and sampling depth.

1.08 TESTING REQUIREMENTS

A. General: Perform tests on soil samples according to requirements in this article.
B. Physical Testing:
   (1) Soil Texture: Soil-particle, size-distribution analysis by one of the following methods according to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods":
      (a) Sieving Method: Report sand-gradation percentages for very coarse, coarse, medium, fine, and very fine sand; and fragment-gradation (gravel) percentages for fine, medium, and coarse fragments; according to USDA sand and fragment sizes.
      (b) Hydrometer Method: Report percentages of sand, silt, and clay.
   (2) Total Porosity: Calculate using particle density and bulk density according to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods."
   (3) Water Retention: According to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods."
   (4) Saturated Hydraulic Conductivity: According to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods"; at 85% compaction according to ASTM D 698 (Standard Proctor).
C. Chemical Testing:
   (1) CEC: Analysis by sodium saturation at pH 7 according to SSSA's "Methods of Soil Analysis - Part 3- Chemical Methods."
   (2) Clay Mineralogy: Analysis and estimated percentage of expandable clay minerals using CEC by ammonium saturation at pH 7 according to SSSA's "Methods of Soil Analysis - Part 1- Physical and Mineralogical Methods."
   (3) Phytotoxicity: Test for plant-available concentrations of phytotoxic minerals including aluminum, arsenic, barium, cadmium, chlorides, chromium, cobalt, copper, lead, lithium, mercury, nickel, selenium, silver, sodium, strontium, tin, titanium, vanadium, and zinc.
D. Fertility Testing: Soil-fertility analysis according to standard laboratory protocol of SSSA NAPT NEC-67, including the following:
   (1) Percentage of organic matter.
   (2) CEC, calcium percent of CEC, and magnesium percent of CEC.
   (3) Soil reaction (acidity/alkalinity pH value).
   (4) Buffered acidity or alkalinity.
   (5) Nitrogen ppm.
   (6) Phosphorous ppm.
   (7) Potassium ppm.
   (8) Manganese ppm.
   (9) Manganese-availability ppm.
   (10) Zinc ppm.
   (11) Zinc availability ppm.
   (12) Copper ppm.
   (13) Sodium ppm and sodium absorption ratio.
   (14) Soluble-salts ppm.

(15) Presence and quantities of problem materials including salts and metals cited in the Standard protocol. If such problem materials are present, provide additional recommendations for corrective action.
(16) Other deleterious materials, including their characteristics and content of each.

E. Organic-Matter Content: Analysis using loss-by-ignition method according to SSSA's "Methods of Soil Analysis - Part 3- Chemical Methods."
F. Recommendations: Based on the test results, state recommendations for soil treatments and soil amendments to be incorporated to produce satisfactory planting soil suitable for healthy, viable plants indicated. Include, at a minimum, recommendations for nitrogen, phosphorous, and potassium fertilization, and for micronutrients.

(1) Fertilizers and Soil Amendment Rates: State recommendations in weight per 1000 sq. ft. for 6-inch depth of soil.
(2) Soil Reaction: State the recommended liming rates for raising pH or sulfur for lowering pH according to the buffered acidity or buffered alkalinity in weight per 1000 sq. ft. for 6-inch depth of soil.

1.09 DELIVERY, STORAGE AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and compliance with state and Federal laws if applicable.
B. Bulk Materials

(1) Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
(2) Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
(3) Do not move or handle materials when they are wet or frozen.
(4) Accompany each delivery of bulk fertilizers and soil amendments with appropriate certificates.

PART 2 - PRODUCTS

2.01 TOPSOIL

A. Provide screened topsoil which is fertile, friable, natural loam, surface soil, reasonably free of subsoil, clay, lumps, brush, weeds and other litter, and free of roots, stumps, stones larger than 1/2” inches in any dimension and other extraneous or toxic matter harmful to plant growth.

(1) Obtain topsoil from local sources or from areas having similar soil characteristics to that found at project site. Obtain topsoil only from naturally, well-drained sites where topsoil occurs in a depth of not less than 4 inches; do not obtain from bogs or marshes.

2.02 SOIL AMENDMENTS

A. "Back to Earth" Cotton Burr Blend Premium Compost complying with University of Arkansas Campus Standard.
B. Lime: Natural dolomitic limestone containing not less than 85% of total carbonates with a minimum of 30% magnesium carbonates, ground so that not less than 90% passes a 10-mesh sieve and not less than 50% passes a 100-mesh sieve.
C. Aluminum Sulfate: Commercial grade.
D. Peat Humus: FS-Q-P-166 decomposed peat with no identifiable fibers and with pH range suitable for intended use.
E. Bonemeal: Commercial, raw, finely ground; 4% nitrogen and 20% phosphoric acid.
F. Superphosphate: Soluble mixture of treated minerals: 20% available phosphoric acid.
G. Sand: Clean, washed sand, free of toxic materials.
H. Perlite: Conforming to National Bureau of Standards PS 23.
I. Vermiculite: Horticultural grade, free of toxic substances.
J. Sawdust: Rotted sawdust, free of chips, stones, sticks, soil or toxic substances and with 7.5 lbs. nitrogen uniformly mixed into each cubic yard of sawdust.
K. Manure: Well-rotted, unbleached stable or cattle manure containing not more than 25% by volume of straw, sawdust or other bedding materials and containing no chemicals or ingredients harmful to plants.
L. Commercial Fertilizer: Complete fertilizer and neutral character, with some elements derived from organic sources and containing following percentages of available plant nutrients:

(1) For trees and shrubs, provide fertilizer with not less than 5% total nitrogen, 10% available phosphoric acid and 5% suitable potash.
(2) For lawns, provide fertilizer with percentage of nitrogen required to provide not less than 1 pound of actual nitrogen per 1000 square feet of lawn area and not less than 4% phosphoric acid and 2% potassium. Provide nitrogen in a form that will be available to lawn during initial period of growth; at least 50% of nitrogen to be organic form.

PART 3 - EXECUTION

3.01 GENERAL

A. Place planting soil and fertilizers according to requirements in Section 329300 "Plants."
B. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in planting soil.

C. Proceed with placement only after unsatisfactory conditions have been corrected.

3.02 PLACING AND MIXING PLANTING SOIL OVER EXPOSED SUBGRADE

A. General: Apply and mix unamended soil with amendments on-site to produce required planting soil. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.
B. Subgrade Preparation: Till subgrade to a minimum depth indicated on the drawings. Remove stones larger than 2 inches in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
   (1) Apply, add soil amendments, and mix approximately half the thickness of unamended soil over prepared, loosened subgrade according to "Mixing" Paragraph below. Mix thoroughly into top 4 inches of subgrade. Spread remainder of planting soil.
C. Mixing: Spread unamended soil to total depth indicated on the drawings, but not less than required to meet finish grades after mixing with amendments and natural settlement. Do not spread if soil or subgrade is frozen, muddy, or excessively wet.
   (1) Amendments: Apply soil amendments and fertilizer, if required, evenly on surface, and thoroughly blend them with unamended soil to produce planting soil.
      (a) Mix lime and sulfur with dry soil before mixing fertilizer.
      (b) Mix fertilizer with planting soil no more than seven days before planting.
D. Compaction: Compact each blended lift of planting soil to 75 to 82 percent of maximum Standard Proctor density according to ASTM D 698 and tested in-place except where a different compaction value is indicated on Drawings.
E. Finish Grading: Grade planting soil to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.03 BLENDING PLANTING SOIL IN PLACE

A. General: Mix amendments with in-place, unamended soil to produce required planting soil. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.
B. Preparation: Till unamended, existing soil in planting areas to a minimum depth of 4 inches. Remove stones larger than 2 inches in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
C. Mixing: Apply soil amendments and fertilizer, if required, evenly on surface, and thoroughly blend them into full depth of unamended, in-place soil to produce planting soil.
   (1) Mix lime and sulfur with dry soil before mixing fertilizer.
   (2) Mix fertilizer with planting soil no more than seven days before planting.
D. Compaction: Compact blended planting soil to 75 to 82 percent of maximum Standard Proctor density according to ASTM D 698.
E. Finish Grading: Grade planting soil to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.04 APPLYING COMPOST TO SURFACE OF PLANTING SOIL

A. Application: Apply compost component of planting-soil mix to surface of in-place planting soil. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.
B. Finish Grading: Grade surface to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.05 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
B. Perform the following test:
   (1) Compaction: Test planting-soil compaction after placing each lift and at completion using a densitometer or soil-compaction meter calibrated to a reference test value based on laboratory testing according to ASTM D 698. Space tests at no less than one for each 1000 sq. ft. of in-place soil or part thereof.
C. Soil will be considered defective if it does not pass tests.
D. Prepare test reports.
E. Label each sample and test report with the date, location keyed to a site plan or other location system, visible conditions when and where sample was taken, and sampling depth.

3.06 PROTECTION

A. Protect areas of in-place soil from additional compaction, disturbance, and contamination. Prohibit the following practices within these areas except as required to perform planting operations:
   (1) Storage of construction materials, debris, or excavated material.
   (2) Parking vehicles or equipment.
   (3) Vehicle traffic.
   (4) Foot traffic.
   (5) Erection of sheds or structures.

(6) Impoundment of water.
(7) Excavation or other digging unless otherwise indicated.

B. If planting soil or subgrade is over compacted, disturbed, or contaminated by foreign or deleterious materials or liquids, remove the planting soil and contamination; restore the subgrade as directed by Architect and replace contaminated planting soil with new planting soil.

3.07 CLEANING

A. Protect areas adjacent to planting-soil preparation and placement areas from contamination. Keep adjacent paving and construction clean and work area in an orderly condition.
B. Remove surplus soil and waste material including excess subsoil, unsuitable materials, trash, and debris and legally dispose of them off Owner's property unless otherwise indicated.
   (1) Dispose of excess subsoil and unsuitable materials as directed by Owner.

END OF SECTION 32 91 13

SECTION 32 92 00 - TURF AND GRASSES

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

A. Work of this Section, as shown or specified, shall be in accordance with the requirements of the Contract Documents.

1.02 SECTION INCLUDES

A. The Work of this Section includes all labor, materials, equipment, and services necessary to complete the turf and grasses as shown on the drawings and/or specified herein, including but not necessarily limited to the following:
   (1) Sodding of lawn areas.
   (2) Protecting and maintaining all sodded areas until Substantial Completion.

1.03 RELATED SECTIONS

A. Plants - Section 329300, for trees, shrubs, ground covers, and other plants.

1.04 INFORMATION SUBMITTALS

A. Certification: Submit certificates of inspection as required by governmental authorities and manufacturer's or vendor's certified analysis for soil amendments and fertilizer materials. Submit other data substantiating that materials comply with specified requirements.
B. Qualification Data: For landscape Installer.
C. Product Certificates: For fertilizers, from manufacturer.
D. Pesticides and Herbicides: Product label and manufacturer's application instructions specific to Project.

1.05 CLOSEOUT SUBMITTALS

A. Maintenance Instructions: Submit typewritten instructions recommending procedures to be established by Owner for maintenance of turf during a calendar year. Submit prior to expiration of required maintenance period(s).

1.06 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape installer whose work has resulted in successful turf establishment.
   (1) Professional Membership: Installer shall be a member in good standing of either the National Association of Landscape Professionals or AmericanHort.
   (2) Experience: Five years' experience in turf installation, in addition to requirements in Section 01400 "Quality Control."
   (3) Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
   (4) Personnel Certifications: Installer's field supervisor shall have certification in one of the following categories from the National Association of Landscape Professionals:
      (a) Landscape Industry Certified Technician - Exterior.
      (b) Landscape Industry Certified Lawn Care Manager.
      (c) Landscape Industry Certified Lawn Care Technician.
   (5) Pesticide Applicator: State licensed, commercial.
B. Topsoil: Before delivery of topsoil, furnish Landscape Architect with written statement giving location of properties from which topsoil is to be obtained.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws, as applicable.
B. Sod: Harvest, deliver, store, and handle sod according to requirements in "Specifications for Turfgrass Sod Materials" and "Specifications for Turfgrass Sod Transplanting and Installation" sections in TPI's "Guideline Specifications to Turfgrass Sodding." Deliver sod within 24 hours of harvesting and in time for planting promptly. Protect sod from breakage and drying.
C. Bulk Materials
   (1) Do not dump or store bulk materials near structures, utilities, walkways, and pavements, or on existing turf areas or plants.
   (2) Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
   (3) Accompany each delivery of bulk materials with appropriate certificates.

1.08 PROJECT CONDITIONS

A. Proceed with and complete landscape work as rapidly as portions of site become available, working within seasonal limitations for each kind of landscape work required.
B. Utilities: Determine location of underground utilities and perform work in a manner that will avoid possible damage. Hand excavate, as required. Maintain grade stakes set by others until removal is mutually agreed upon by parties concerned.
C. Excavation: When conditions detrimental to plant growth are encountered, such as rubble fill, adverse drainage conditions, or obstructions, correct conditions before planting.
D. Coordination with Lawns: Plant trees and shrubs after final grades are established and prior to planting of lawns, unless otherwise acceptable to Landscape Architect. If planting of trees and shrubs occurs after lawn work, protect lawn areas and promptly repair damage to lawns resulting from planting operations.

1.09 WARRANTY

A. Special Warranty: Installer agrees to repair or replace turf and grass and accessories that fail in materials, workmanship, or growth within specified warranty period.
   (1) Failures include, but are not limited to, the following:
      (a) Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner.
      (b) Structural failures.
   (2) Warranty Periods: From date of Substantial Completion.
      (a) Turf and Grasses: 12 months.
   (3) Include the following remedial actions as a minimum:
      (a) Immediately remove dead turf and grass and replace unless required to plant in the succeeding planting season.
      (b) Provide extended warranty for period equal to original warranty period, for replaced turf and grass material.

PART 2 - PRODUCTS

2.01 WATER

A. Water: Potable, clean, fresh and free from harmful materials. Water shall be furnished by Contractor. All hoses and other irrigation equipment required for the Work shall be furnished by the Contractor.

2.02 SOD

A. Sod, type as indicated on plans, composed of either field grown grass or approved nursery grown grass; a densely rooted growth of grass substantially free from noxious weeds and undesirable grasses.
B. Sufficiently thick to secure a dense stand of live grass. Live, fresh, uninjured at the time of placing, with a soil mat of sufficient thickness adhering firmly to the roots to withstand all necessary handling.
C. Cut in uniform strips using approved cutting devices. Unless otherwise indicated on the Drawings, sod strips shall be 1 foot or 2 foot in width.
D. Sod shall be free from noxious weeds, annual grasses, moss, large stones, tree roots, or other materials harmful to growth, or that will interfere with future mowing or other maintenance of the sodded areas.
E. Sod shall be thick, well developed, machine cut strips 3/4-inch thick, from an approved sod farm. Individual sod pieces shall be cut to a uniform size with square corners. Standard sections shall be strong enough to support their own weight when held vertically. Each piece shall be uniformly moist, and not excessively dry or wet.

2.03 FERTILIZERS

A. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
   (1) Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.
B. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
   (1) Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.
C. Pesticides
   (1) General: Pesticide, registered and approved by the EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.
   (2) Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.
   (3) Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.

2.04 EROSION-CONTROL MATERIALS

A. Erosion-Control Blankets: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a natural fiber mesh. Include manufacturer's recommended steel wire staples.

2.05 PROTECTIVE FENCING

A. All newly sodded areas shall be continuously protected from being disturbed. Where such areas will be subject to pedestrian, animal or vehicular traffic, erect and maintain the following fence: standard construction protection fencing. Sod protection fencing to be maintained until successful establishment of full lawn area.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas to be planted for compliance with requirements and other conditions affecting installation and performance of the Work.
   (1) Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
   (2) Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
   (3) Uniformly moisten excessively dry soil that is not workable or which is dusty.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Landscape Architect and replace with new planting soil.

3.02 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.03 TURF AREA PREPARATION

A. General: Prepare planting area for soil placement and mix planting soil according to Section 329113 "Soil Preparation."

B. Placing Planting Soil: Place and mix planting soil in place over exposed subgrade.
   (1) Reduce elevation of planting soil to allow for soil thickness of sod.
      (a) Moisten prepared area before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.
      (b) Before planting, obtain Landscape Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.04 PREPARATION FOR EROSION-CONTROL MATERIALS

A. Prepare area as specified in "Turf Area Preparation" Article.

B. For erosion-control blanket or mesh, install from top of slope, working downward, and as recommended by material manufacturer for site conditions. Fasten as recommended by material manufacturer.

C. Moisten prepared area before planting if surface is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

3.05 SODDING

A. Lay sod within 24 hours of harvesting unless a suitable preservation method is accepted by Landscape Architect prior to delivery time. Do not lay sod if dormant or if ground is frozen or muddy.

B. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to soil or sod during installation. Tamp and roll lightly to ensure contact with soil, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.
   (1) Lay sod across slopes exceeding 1:3.
   (2) Anchor sod on slopes exceeding 1:6 with wood pegs or steel staples spaced as recommended by sod manufacturer but not less than two anchors per sod strip to prevent slippage.

C. Saturate sod with fine water spray within two hours of planting. During first week after planting, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches (38 mm) below sod.

3.06 TURF MAINTENANCE

A. General: Maintain and establish turf by watering, fertilizing, weeding, mowing, trimming, replanting, and performing other operations as required to establish healthy, viable turf. Roll, regrade, and replant bare or eroded areas and remulch to produce a uniformly smooth turf. Provide materials and installation the same as those used in the original installation.
B. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace materials and turf damaged or lost in areas of subsidence.
C. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch and anchor as required to prevent displacement.
D. Apply treatments as required to keep turf and soil free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards.
E. Watering: Install and maintain permanent piping, hoses, and turf-watering equipment to convey water from sources and to keep turf uniformly moist to a depth of 4 inches (100 mm) per the contract documents.
   (1) Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.
F. Water turf with fine spray at a minimum rate of 1 inch (25 mm) per week unless rainfall precipitation is adequate.
G. Mow turf as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than one-third of grass height. Remove no more than one-third of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet.

3.07 SATISFACTORY TURF

A. Turf installations shall meet the following criteria as determined by Landscape Architect:
B. Satisfactory Sodded Turf: At end of maintenance period, a healthy, well-rooted, even-colored, viable turf has been established, free of weeds, open joints, bare areas, and surface irregularities.
C. Use specified materials to reestablish turf that does not comply with requirements, and continue maintenance until turf is satisfactory.

3.08 CLEAN-UP AND PROTECTION

A. Promptly remove soil and debris created by turf work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.
B. Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of them off Owner's property.
C. Erect temporary fencing or barricades and warning signs as required to protect newly planted areas from traffic. Maintain fencing and barricades throughout initial maintenance period and remove after plantings are established.
D. Remove nondegradable erosion-control measures after grass establishment period.

3.09 MAINTENANCE SERVICE

A. Turf Maintenance Service: Provide full maintenance by skilled employees of landscape Installer. Maintain as required in "Turf Maintenance" Article. Begin maintenance immediately after each area is planted and continue until acceptable turf is established, but for not less than the following periods:
   (1) Sodded Turf: 12 months from date of Substantial Completion.

3.10 INSPECTION AND ACCEPTANCE

A. When landscape work is completed, including maintenance, Landscape Architect will, upon request, make an inspection to determine acceptability.
   (1) Landscape work may be inspected for acceptance in parts agreeable to Landscape Architect, provided work offered for inspection is complete, including maintenance.
B. Where inspected landscape work does not comply with requirements, replace rejected work and continue specified maintenance until reinspected by Landscape Architect and found to be acceptable. Remove rejected plants and materials promptly from project site.

END OF SECTION 32 92 00

SECTION 32 93 00 - PLANTS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section includes:

(1) Plants.
(2) Tree-watering devices.

1.03 RELATED SECTIONS

A. Soil Preparation - Section 329113.
B. Turf and Grasses - Section 329200.

1.04 REFERENCES

A. Industry Organizations: Where abbreviations and acronyms are used in Specifications or other Contract Documents, they shall mean the recognized name of the entities in the following list. This information is subject to change and is believed to be accurate as of the date of the Contract Documents.

(1) ANLA: American Nursery & Landscape Association (americanhort.org).
(2) ANSI - American National Standards Institute (ansi.org).
(3) AOAC: AOAC International (aoac.org).
(4) ASTM - ASTM International (astm.org).

B. Industry Standards and Publications: Comply with the following standards and documents, based on the publication date in effect as of date of the Contract Documents unless otherwise indicated, including amendments:

(1) ANSI A300, American National Standards for Tree Care Operations.
(2) ANSI Z60.1, American Standard for Nursery Stock.
(3) ANLA Horticultural Standards.
(4) Hortus Third, The Staff of the L.H. Bailey Hortorium. 1976, MacMillan Publishing Co., New York.
(5) Standardized Plant Names, American Joint Committee on Horticultural Nomenclature,1942 edition.
(6) International Society of Arboriculture.

1.05 DEFINITIONS

A. Backfill: The earth used to replace or the act of replacing earth in an excavation.
B. Balled and Burlapped Stock: Plants dug with firm, natural balls of earth in which they were grown, with a ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required and sufficient to encompass the fibrous root feeding system necessary for the healthy development of the plant; wrapped with untreated biodegradable 8-oz. burlap, tied, rigidly supported, and drum laced with twine with the root flare visible at the surface of the ball as recommended by ANSI Z60.1.
C. Bare-Root Stock: Plants with a well-branched, fibrous-root system developed by transplanting or root pruning, with soil or growing medium removed, and with not less than the minimum root spread according to ANSI Z60.1 for type and size of plant required.
D. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container, with a well- established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for type and size of plant required.
E. Finish Grade: Elevation of finished surface of planting soil.
F. Organic Matter: the fraction of soil that consists of plant or animal tissue in various states of decomposition.
G. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. Pesticides include insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. They also include substances or mixtures intended for use as a plant regulator, defoliant, or desiccant. Some sources classify herbicides separately from pesticides.
H. Pests: Living organisms that occur where they are not desired or that cause damage to plants, animals, or people. Pests include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.
I. Planting Area: Areas to be planted.
J. Planting Soil: See Section 329113.
K. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, shrubs, vines, ground covers, ornamental grasses, bulbs, corms, tubers, or herbaceous vegetation.
L. Root Flare: Also called "trunk flare." The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.
M. Stem Girdling Roots: Roots that encircle the stems (trunks) of trees below the soil surface.

N. Subgrade: The surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

1.06 COORDINATION

A. Coordination with Turf Areas (Lawns): Plant trees, shrubs, and other plants after finish grades are established and before planting turf areas unless otherwise indicated.
B. When planting trees, shrubs, and other plants after planting turf areas, protect turf areas, and promptly repair damage caused by planting operations.

1.07 ACTION SUBMITTALS

A. Product Data: For each type of product.
   (1) Plant Materials: Include quantities, sizes, quality, and sources for plant materials.
      (a) Submit in the form of a plant list indicating proposed nursery source for each type of plant.
   (2) Plant Photographs: Include color photographs for each type of container-grown stock in digital 3- by format of each required species and size of plant material as it will be furnished to Project. Take photographs from an angle depicting true size and condition of the typical plant to be furnished. Include a scale rod or other measuring device in each photograph. For species where more than 20 plants are required, include a minimum of 3 photographs showing the average plant, the best quality plant, and the worst quality plant to be furnished. Identify each photograph with the full scientific name of the plant, plant size, and name of the growing nursery.
   (3) Slow-Release, Tree-Watering Device.
   (4) Edging Materials and Accessories: to verify color selected.
B. Samples for Initial Selection: For each of the following:
   (1) Organic Mulch: 1-pint (0.5-L) volume of each organic mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of color, texture, and organic makeup.
C. Soil Test Report: See Section 329113.
D. Although the report(s) may contain the laboratory's comments or recommendations to the Landscape Architect regarding amendment requirements or procedures, the report shall not be interpreted to prescribe or dictate procedures or quantities of soil materials for the work of this Contract.
E. Soil Supplier: See Section 329113.

1.08 INFORMATIONAL SUBMITTALS

A. Qualification Data: For landscape Installer. Include list of at least three similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.
B. Product Certificates: For each type of manufactured product, from manufacturer, and complying with the following:
   (1) Manufacturer's certified analysis of standard products.
   (2) Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.
C. Pesticides and Herbicides: Product label and manufacturer's application instructions specific to Project.
D. Sample Warranty: For special warranty.

1.09 CLOSEOUT SUBMITTALS

A. Maintenance Data: Recommended procedures to be established by Owner for maintenance of plants during a calendar year. Submit before expiration of required maintenance periods.

1.10 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape installer whose work has resulted in successful establishment of plants.
   (1) Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
   (2) Experience: Five years' experience in landscape installation in addition to requirements in Section 014500 "Quality Requirements."
   (3) Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
   (4) Personnel Certifications: Installer's field supervisor shall have certification in all of the following categories from the Professional Landcare Network:
      (a) Landscape Industry Certified Technician - Exterior.
      (b) Landscape Industry Certified Interior.
      (c) Landscape Industry Certified Horticultural Technician.
B. Soil-Testing Laboratory Qualifications: See Section 329113.
C. Topsoil Analysis: See Section 329113.
D. Pesticide Applicator: State licensed, commercial.

E. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI Z60.1.
F. Measurements: Measure according to ANSI Z60.1. Do not prune to obtain required sizes.
   (1) Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container-grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements 6 inches (150 mm) above the root flare for trees up to 4-inch (100-mm) caliper size, and 12 inches (300 mm) above the root flare for larger sizes.
G. Plant Material Observation: Landscape Architect will tag plant material at place of growth before plants are prepared for transplanting. All trees selected for use in the Project will be tagged, and representative shrubs and ground covers will be tagged. Retain tags placed on plants by Landscape Architect until the Work has been completed and accepted.
   (1) Landscape Architect may also observe plants further for condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and may reject unsatisfactory or defective material at any time during progress of work. Remove rejected plants immediately from Project site.
   (2) Notify Landscape Architect in writing not less than 28 days in advance of delivery of plant materials to site, and request inspection of plants at the nursery.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws if applicable.
B. Bulk Materials:
   (1) Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
   (2) Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
   (3) Accompany each delivery of bulk materials with appropriate certificates.
C. Deliver bare-root stock plants within 36 hours of digging. Immediately after digging up bare-root stock, pack root system in wet straw, hay, or other suitable material to keep root system moist until planting. Transport in covered, temperature-controlled vehicles, and keep plants cool and protected from sun and wind at all times.
D. Do not prune trees and shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.
E. Handle planting stock by root ball.
F. Apply antidesiccant to trees and shrubs using power spray to provide an adequate film over trunks (before wrapping), branches, stems, twigs, and foliage to protect during digging, handling, and transportation.
   (1) If deciduous trees or shrubs are moved in full leaf, spray with antidesiccant at nursery before moving and again two weeks after planting.
G. Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation, including wind-drying and desiccation of branches, leaves and buds.
H. Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.
   (1) Set balled stock upright and plumb on firm ground and cover ball with soil, sawdust, fibrous moisture-retention medium or other acceptable material.
   (2) Do not remove container-grown stock from containers before time of planting.
   (3) Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly wet condition.
   (4) During the growing season, water stored plant material and keep root balls moist with an automatic drip irrigation system to prevent drying out. Do not move trees if root balls are saturated. Mist plants several times a day as necessary to reduce transpiration in sunny or windy locations.
   (5) During the dormant season and cold weather, insulate root balls and protect against damage caused by freezing, wind, and ice.
   (6) During the storage period, inspect plants for pests and diseases and have them evaluated and treated by an arborist certified in the state where the project is located.
   (7) Perform inspection and maintenance of plants for entire duration of storage period.
   (8) Do not store plants more than 28 days without written acceptance from Landscape Architect.

1.12 FIELD CONDITIONS

A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.
B. Planting Restrictions: Plant during one of the following periods for types of plants indicated. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion.

(1) Deciduous Plants, Container-Grown: March 15 through June 15 for Spring planting season; September 15 through November 15 for Fall planting season.
(2) Deciduous Plants, Balled and Burlapped: March 15 through June 15 for Spring planting season; October 1 through November 30 for Fall planting season.
(3) Evergreen Plants: March 30 through June 1 for Spring planting season; October 1 through November 30 for Fall planting season.

C. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.

1.13 WARRANTY

A. Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.
(1) Failures include, but are not limited to, the following:
(a) Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner.
(b) Structural failures including plantings falling or blowing over.
(c) Faulty performance of tree stabilization, edgings and tree grates.
(d) Deterioration of metals, metal finishes, and other materials beyond normal weathering.
(2) Warranty Periods: From date of Substantial Completion.
(a) Trees, Shrubs, and Ornamental Grasses: 12 months.
(b) Ground Covers Perennials, and Other Plants: 12 months.
(3) Include the following remedial actions as a minimum:
(a) Immediately remove dead plants and replace unless required to plant in the succeeding planting season.
(b) Replace plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
(c) A limit of one replacement of each plant is required except for losses or replacements due to failure to comply with requirements.
(d) Provide extended warranty for period equal to original warranty period, for replaced plant material.

PART 2 - PRODUCTS

2.01 PLANT MATERIAL

A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant List, Plant Schedule, or Plant Legend indicated on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.
(1) Trees with damaged, crooked, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); crossing trunks; cut-off limbs more than 3/4 inch (19 mm) in diameter; or with stem girdling roots are unacceptable.
(2) Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.
(a) Provide trees of height not less than size designated, measured from the crown of the roots to the tip of the top branch.
(b) Provide trees with a single trunk, except where multi-stem trees are indicated, growing from a single, unmutilated crown of roots. Trees with double-leaders or twin heads are unacceptable.
(c) Tree trunks with any part that is conspicuously crooked compared with normal trees of the same variety are unacceptable.
(d) Provide trees with trunks free from sunscald, frost cracks, and wounds resulting from abrasions, fire or other causes; and without evidence of fresh scars or damage from handling. Pruning wounds are acceptable only when they show vigorous bark on all edges.

B. Provide plants of sizes, grades, and ball or container sizes complying with ANSI Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to Architect, with a proportionate increase in size of roots or balls.
C. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which begins at root flare according to ANSI Z60.1. Root flare shall be visible before planting.
D. Labeling: Label each tree and shrub of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant.
E. If formal arrangements or consecutive order of plants is indicated on Drawings, select stock for uniform height and spread, and number the labels to assure symmetry in planting.
F. Shade Trees: Single-stem trees with straight trunk, well-balanced crown, and intact leader, of height and caliper indicated, complying with ANSI Z60.1 for type of trees required.
(1) Provide balled and burlapped trees.

(2) Branching Height: One-half of tree height.

G. Deciduous Shrubs: Shrubs with not less than the minimum number of canes required by and measured according to ANSI Z60.1 for type, shape, and height of shrub.
   (1) Shrub sizes indicated are sizes after pruning.
   (2) Provide balled and burlapped or container-grown shrubs.

H. Broadleaf Evergreens: Normal-quality, well-balanced, broadleaf evergreens, of type, height, spread, and shape required, complying with ANSI Z60.1.
   (1) Provide balled and burlapped or container-grown shrubs.

I. Ground Cover: Provide ground cover of species indicated, in pots or similar containers, with well- established root systems reaching to sides of container to maintain a firm ball, but without excessive root growth encircling the container; and complying with ANSI Z60.1 in sizes and species as shown on Drawings.

J. Ornamental Grasses: Provide healthy, disease-free plants of species and variety shown or listed, with well-established root systems reaching to sides of the container to maintain a firm ball, but not with excessive root growth encircling the container.

2.02 INORGANIC SOIL AMENDMENTS

A. See Section 329113.

2.03 ORGANIC SOIL AMENDMENTS

A. See Section 329113.

2.04 PLANTING SOIL MIX

A. See Section 329113.

2.05 FERTILIZERS

A. Planting Tablets: Tightly compressed chip-type, long-lasting, slow-release, commercial-grade planting fertilizer in tablet form. Tablets shall break down with soil bacteria, converting nutrients into a form that can be absorbed by plant roots.
   (1) Size: 5-gram tablets.
   (2) Nutrient Composition: 20 percent nitrogen, 10 percent phosphorous, and 5 percent potassium, by weight plus micronutrients.

B. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
   (1) Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.

2.06 MULCHES

A. Organic Mulch: Free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of one of the following:
   (1) Type: Triple shredded hardwood.
   (2) Size Range: 3 inches (76 mm) maximum, 1/2 inch (13 mm) minimum.
   (3) Color: Natural.

2.07 PESTICIDES

A. General: Pesticide registered and approved by the EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

B. Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.

C. Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.

2.08 TREE-WATERING DEVICES

A. Slow-Release Watering Device: Standard product manufactured for drip irrigation of plants and emptying its water contents over two to three weeks; manufactured from UV-light-stabilized nylon-reinforced polyethylene sheet, PVC, or HDPE plastic.

B. Color: As selected by Landscape Architect from manufacturer's full range

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas to receive plants, with Installer present, for compliance with requirements and conditions affecting installation and performance of the Work.

(1) Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
(2) Verify that plants and vehicles loaded with plants can travel to planting locations with adequate overhead clearance.
(3) Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
(4) Uniformly moisten excessively dry soil that is not workable or which is dusty.

B. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Landscape Architect and replace with new planting soil.
C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.
B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.
C. Plant Installation Observation: Landscape Architect will schedule visits to Project site to coincide with installation of plant materials, for the purpose of overseeing placement and arrangement of approximately 10 percent of specimen trees and of other plants to the extent determined by Landscape Architect.

(1) Notify Landscape Architect in writing not less than 7 days in advance of starting installation of plant materials at Project site.
(2) Lay out individual tree and shrub locations and areas for multiple plantings. Stake locations, outline areas, adjust locations when requested, and obtain Landscape Architect's acceptance of layout before excavating or planting. Make minor adjustments as required.
(3) Lay out plants at locations directed by Landscape Architect. Stake locations of individual trees and shrubs and outline areas for multiple plantings.

3.03 PLANTING AREA ESTABLISHMENT

A. General: Prepare planting area for soil placement and mix planting soil according to Section 329113 "Soil Preparation."
B. Placing Planting Soil: Place and mix planting soil in-place over exposed subgrade.

(1) Before planting, obtain Landscape Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.04 EXCAVATION FOR TREES AND SHRUBS

A. Planting Pits and Trenches: Excavate circular planting pits.

(1) Excavate planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are unacceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.
(2) Excavate approximately three times as wide as ball diameter for balled and burlapped stock.
(3) Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.
(4) If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.
(5) Maintain angles of repose of adjacent materials to ensure stability. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
(6) Maintain supervision of excavations during working hours.
(7) Keep excavations covered or otherwise protected when unattended by Installer's personnel.

B. Backfill Soil: See Section 329113.
C. Obstructions: Notify Landscape Architect if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.

(1) Hardpan Layer: Drill 6-inch- (150-mm-) diameter holes, 24 inches (600 mm) apart, into free-draining strata or to a depth of 10 feet (3 m), whichever is less, and backfill with free-draining material.

D. Drainage: Notify Landscape Architect if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.

3.05 TREE AND SHRUB PLANTING

A. Inspection: At time of planting, verify that root flare is visible at top of root ball according to ANSI Z60.1. If root flare is not visible, remove soil in a level manner from the root ball to where the top- most root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.
B. Roots: Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.
C. Balled and Burlapped Stock: Move plant stock with root systems as solid units with root balls intact during entire operation and firmly wrapped with burlap. Set each plant plumb and in center of planting pit or trench with root flare in relationship to adjacent finish grades as indicated on Drawings.
    (1) Backfill: Planting soil as specified in Section 329113.
    (2) After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
    (3) Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
    (4) Place planting tablets equally distributed around each planting pit when pit is approximately one-half filled. Place tablets beside the root ball about 1 inch (25 mm) from root tips; do not place tablets in bottom of the hole.
        (a) Quantity: As directed by Landscape Architect and complying with manufacturer's recommendations.
    (5) Continue backfilling process. Water again after placing and tamping final layer of soil.
D. Container-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare in relationship to adjacent finish grades as indicated on Drawings.
    (1) Backfill: Planting soil as specified.
    (2) Carefully remove root ball from container without damaging root ball or plant.
    (3) Backfill around root ball as indicated on Drawings.
    (4) Place planting tablets equally distributed around each planting pit when pit is approximately one- half filled. Place tablets beside the root ball about 1 inch (25 mm) from root tips; do not place tablets in bottom of the hole.
        (a) Quantity: As directed by Landscape Architect and complying with manufacturer's recommendations.
    (5) Continue backfilling process. Water again after placing and tamping final layer of soil.

3.06 TREE AND SHRUB PRUNING

A. Remove only dead, dying, or broken branches. Do not prune for shape. Consult Landscape Architect before proceeding with pruning.
B. Do not apply pruning paint to wounds.

3.07 GROUND COVER AND PLANT PLANTING

A. Set out and space ground cover and plants other than trees, shrubs, and vines as indicated on Drawings in even rows with triangular spacing.
B. Use specified planting soil for backfill.
C. Dig holes large enough to allow spreading of roots.
D. For rooted cutting plants supplied in flats, plant each in a manner that minimally disturbs the root system but to a depth not less than two nodes.
E. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.
F. Water thoroughly after planting, taking care not to cover plant crowns with wet soil.
G. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.08 PLANTING AREA MULCHING

A. Mulch backfilled surfaces of planting areas and other areas indicated.
B. Organic Mulch in Planting Areas: Apply 2-inch (50-mm) average thickness of organic mulch over whole surface of planting area, and finish level with adjacent finish grades. Do not place mulch within 3 inches (75 mm) of trunks or stems.

3.09 PLANT MAINTENANCE

A. Maintain plantings beginning immediately after plants are installed by performing, without limitation, pruning, cultivating, watering, weeding, removing fallen leaves, fertilizing, mulching, restoring planting saucers and mulch, keeping mulch beds weed-free, adjusting and repairing tree-stabilization devices including tightening and adjusting guy wires, stakes, and deadmen to keep trees in vertical position, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings and to promote and maintain healthy plant growth.
B. Fill in, as necessary, soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.
C. Watering: Flood plants during the construction and maintenance periods at least twice each week. If present and operational, coordinate programming of irrigation system to meet watering needs. If irrigation system is not operational, provide hand watering as needed to maintain healthy growth. At each watering, thoroughly saturate the soil around each tree and shrub. If sufficient moisture is retained in the soil as determined by the Owner, the required watering may be reduced. Provide not less than 20 gallons of water for each watering of each tree.

(1) Install and maintain temporary piping, hoses, and plant-watering equipment to convey water from sources and to provide adequate watering of plants. Provide water tank trucks or similar portable water supply if water service is insufficient.

D. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated pest management practices when possible to minimize use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

3.10 PESTICIDE APPLICATION

A. Do not apply pesticides without prior approval from Landscape Architect for treatment of pest infestation.
B. Apply pesticides and other chemical products and biological control agents according to authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.
C. Pre-Emergent Herbicides (Selective and Nonselective): Apply to tree, shrub, and ground-cover areas according to manufacturer's written recommendations. Do not apply to seeded areas.
D. Post-Emergent Herbicides (Selective and Nonselective): Apply only as necessary to treat already- germinated weeds and according to manufacturer's written recommendations.

3.11 REPAIR AND REPLACEMENT

A. General: Repair or replace existing or new trees and other plants that are damaged by construction operations, in a manner approved by Landscape Architect.
   (1) Submit details of proposed pruning and repairs.
   (2) Perform repairs of damaged trunks, branches, and roots within 24 hours, if approved.
   (3) Replace trees and other plants that cannot be repaired and restored to full-growth status, as determined by Landscape Architect.
B. Remove and replace trees that are more than 25 percent dead or in an unhealthy condition before the end of the corrections period or are damaged during construction operations that Landscape Architect determines are incapable of restoring to normal growth pattern.
   (1) Provide new trees of same size as those being replaced.
   (2) Species of Replacement Trees: Same species being replaced, or species selected by Landscape Architect.

3.12 CLEANING AND PROTECTION

A. During planting, keep adjacent paving and construction clean and work area in an orderly condition. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.
B. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.
C. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.
D. After installation and before Substantial Completion, remove nursery tags, nursery stakes, tie tape, labels, wire, burlap, and other debris from plant material, planting areas, and Project site.
E. At time of Substantial Completion, verify that tree-watering devices are in good working order and leave them in place. Replace improperly functioning devices.

3.13 MAINTENANCE SERVICE

A. Maintenance Service for Trees and Shrubs: Provide maintenance by skilled employees of landscape Installer. Maintain as required in "Plant Maintenance" Article. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established, but for not less than maintenance period below:
   (1) Maintenance Period: 12 months from date of Substantial Completion.
B. Maintenance Service for Ground Cover and Other Plants: Provide maintenance by skilled employees of landscape Installer. Maintain as required in "Plant Maintenance" Article. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established, but for not less than maintenance period below:
   (1) Maintenance Period: 12 months from date of Substantial Completion.

END OF SECTION 32 93 00

SECTION 32 94 13 - METAL EDGING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Metal edging for the following:

(1) Edge restraints for stone fines surfacing areas, with stakes for embedding in grade.
(2) Edge restraints for unit paving areas, continuous angle or flat anchored to slab.
(3) Edge restraints for planting areas, with stakes for embedding in grade.
(4) Edge restraints for river cobble at planting areas, with stakes for embedding in grade.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.
B. Samples for Verification: For edging materials and accessories, as follows:

(1) Metal Edging: Full-size edge restraint, not less than 24 inches (610 mm) long.
(2) Anchoring Devices: Full-size unit of each type.

1.03 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: A qualified Installer whose work has resulted in successful installations of metal edging of the types and applications specified for this Project.
B. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

(1) Build mockups for metal edging as part of paving mockups specified in Section 321400 "Unit Paving." and Section 321542 "Stone Fines Surfacing."
(2) Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
(3) Preinstallation Conference: Conduct conference at Project site

PART 2 - PRODUCTS

2.01 METAL EDGINGS

A. Anchored Steel Edging for Unit Paving: A36 hot dipped galvanized angle steel.

(1) Asphalt Paver Edging Size: 3”x5”x1/4” thick unequal angle steel.
(2) Linear Cobblestone Paver Edging Size: 3”x5”x1/4” thick unequal angle steel.
(3) Radial Cobblestone Paver Edging Size: 8”x3/16” thick flat steel.
(4) Anchors: 3/8” diameter x 2-1/4” hot dipped galvanized expansion anchor.

B. Staked Steel Edging: Standard commercial-steel edging, rolled edge, fabricated in sections of standard lengths, with loops stamped from or welded to face of sections to receive stakes.

(1) Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(a) Border Concepts, Inc.
(b) Collier Metal Specialties, Inc.
(c) Russell, J. D. Company (The).
(d) Sure-Loc Edging Corporation.

(2) Edging Size: 3/16 inch (6.35 mm) wide by 4 inches (127 mm) deep.
(3) Stakes: Tapered steel, a minimum of 15 inches (380 mm) long.
(4) Accessories: Standard tapered ends, corners, and splicers.
(5) Finish: Standard paint.
(6) Paint Color: Black.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas to receive metal edging for compliance with requirements and conditions affecting installation and performance.
B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 EDGING INSTALLATION

A. Provide edge restraints as indicated. Install edge restraints before placing unit pavers, stone fines surfacing, river cobbles, planting soil or mulch in planting areas.

(1) Install edge restraints to comply with manufacturer's written instructions. Install stakes or bolts as indicated, at intervals required to hold edge restraints in place during and after installation.

B. Staked Steel Edging: Install steel edging where indicated according to manufacturer's written instructions. Anchor with steel stakes spaced approximately 30 inches (760 mm) apart, but not fewer than three stakes per section, driven below top elevation of edging.

C. Anchored Steel Edging: Install steel edging where indicated according to details and anchor manufacturer’s recommendations.

D. Radius Bends: Formed on site to radiuses indicated.

END OF SECTION 32 94 13

DIVISION 33 – UTILITIES

SECTION 33 40 01 – STORM DRAINAGE UTILITIES (WITH CMP)

SECTION 33 4000 - STORM DRAINAGE UTILITIES

PART 1 GENERAL

1.01 WORK INCLUDED

A. Pipe culverts.

B. Concrete curb inlet structures and junction boxes.

C. Connection to existing concrete drainage structures.

D. Pipe material noted on plans may not be substituted by any other material.

1.02 RELATED WORK

A. Section 31 2000 – Earth Moving

B. Section 32 0523 – Cement and Concrete for Exterior Improvements.

C. Section 32 1613 – Concrete Curb and Gutters.

D. Section 33 0516 – Manhole and Structures.

1.03 SUBMITTALS

A. See Related Work

PART 2 PRODUCTS

2.01 PIPE CULVERTS

A. Reinforced Concrete Pipe (RCP): ASTM C76-78, Class III.
   1. Material: Concrete and reinforcing steel.
   2. Shape: Circular.
   3. Sizes: As shown on Drawings.

B. Joint Material:
   1. Cold-applied preformed plastic gasket type sealant conforming to Federal Specification SS-5-00210.
   2. Primer: As specified by the manufacturer.

C. Polymer Coated Corrugated smooth interior Steel Pipe (CMP): AASHTO M36 and AASHTO M218:
   1. Material: Steel (polymeric pre-coated galvanized type B 10mil both sides).
   2. Type: Corrugated w / ¾" x ¾" x 7½ " external ribs in accordance w/ ASTM A760.
   3. Sizes: As shown on Drawings.

D. Corrugated Polyethylene Pipe (CPEP): AASHTO M 294 or ASTM F 2648 for LEED Projects.
   1. Material: Virgin Polyethylene compounds, uniformly pigmented, with no cracks or creases. The pipe shall have a minimum pipe stiffness at five percent deflection as follows when tested in accordance with M 294 or F 2648:

Diameter (in)	Pipe Stiffness (psi)
12	45
15	42
18	40
24	34
30	28
36	22

   2. Type: "S" – Full circular cross-section with an outer corrugated wall and a smooth inner wall.
   3. Sizes: As shown on drawings.

E. Couplings for CPEP
   1. Couplings shall be corrugated to match the pipe corrugations and shall provide sufficient longitudinal strength to preserve pipe alignment and prevent separation at the joints. Couplings shall be bell and spigot, split collar, or screw–on collar.

2.02 CURB INLET STRUCTURE AND JUNCTION BOX

A. Concrete and reinforcing steel:
   1. Refer to Standard Detail.
   2. Refer to Section 32 0523 and ACI 301.

B. Manhole rings and covers: ASTM A48, Class 30A, Type II Traffic safe.
   1. Material: Cast Iron, solid cover.
   2. Size 24-inch diameter with ring depth equal to concrete thickness.

2.03 BEDDING AND BACKFILL MATERIALS

A. Select Backfill Materials: soil excavated from trench or sub-soil from site that is free of rocks larger than 1-1 ½ inches in greatest dimension, and free from frozen soil, large clumps of soil, muddy soil, organic matter and foreign materials.

B. Class I Bedding Material: Angular, graded stone, ¼ inch to 1½ inch size.

PART 3 EXECUTION

3.01 CONCRETE PIPE CULVERT INSTALLATION

A. Excavate and backfill the trench in accordance with the provision of Section 33 05 16

B. Grade the bottom of the trench to provide a firm bedding surface of uniform density along the entire length of the pipe.
C. Shape the bottom of the trench to conform to the bottom one quarter of the outside diameter of the circular pipe.
D. Lay the pipe beginning at the downstream end with the groove end of the pipe placed facing upstream.
E. Join pipe using specified cold applied preformed plastic joint sealant. Clean the pipe joint surface and prime, if recommended by the manufacture, brush on and allow to dry. Remove protective wrapping from one side of the rope. Lay rope strip side up on the surface of the pipe joint and press the strip firmly to surface of pipe joint end-to-end continuing around the entire circumference of the joint. Remove the remaining protective wrapping and force pipe into connection until material fills the joint space.
F. To insure an even and well-filled joint, accomplish the final joining of the pipe by either pushing or pulling by mechanical means each joint of the pipe as it is laid.
G. In cold weather, either warm the joint material in a hot water bath, or by other approved methods, to the extent required to keep the material pliable for placement without breaking or cracking, or use butyl rubber type joint sealant.
H. In areas not under pavement of structure “Slice-in” the bedding material under the haunches of the pipe with and then hand tamp or mechanical tamp the backfill up to the horizontal centerline of the pipe.
I. Under pavement and structures, compact the backfill on the sides of the pipe to the required densities specified in Section 31 2000 using mechanical tamps with the top 12 inches of subgrade compacted to 95% of the soils Modified Proctor maximum dry density at or near the optimum moisture content.

3.02 CORRUGATED POLYETHLENE PIPE CULVERT INSTALLATION

A. Excavate subsoil to depth and grade line as required for proper installation of the culvert pipe. Keep trench as narrow as possible but sufficiently wide to permit tamping under the haunches and installation of connecting band when sections are joined. Keep sidewalls as vertical as possible, at least to an elevation above the top of the pipe.
B. Grade bottom of trench to provide a firm bedding surface of uniform density along the entire length of the pipe. Remove rock or soft, unstable material encountered at the excavated grade line to a minimum depth of 6 inches and replace with Class I bedding material.
C. Shape bottom of trench to conform to bottom one quarter of the outside diameter of the circular pipe and up to the widest part of arch pipe, allowing a uniform blanket of loose material to cover the shaped bedding to a depth sufficient to allow the corrugations to be filled with the material.
D. Place corrugated metal pipe on bedding with longitudinal laps or seems, if any, at the sides. To assemble sections of pipe, place corrugated connecting band around or under the first pipe, then lay the second pipe section with the corrugations matching and the adjacent ends butting together. Keep dirt and gravel out of joint so that corrugations fit snugly. Fasten bolts on band tightly and uniformly.
E. Place backfill material in 4 inch layer haunches alternately on both sides of pipe, using Class I bedding material. Slice-in with a shovel under the haunches to eliminate voids. Using select backfill material, place material in 6 inch lifts alternately on each side of pipe up to widest part at arch pipe, and using hand tamps or mechanical tampers, compact each lift to a minimum of 90% of optimum density for the material as determined by Modified Proctor procedures, ASTM D-1557. If Class I bedding material is used, place the material in such manner as to eliminate voids and consolidate and interlock the material to form a stable side support for the pipe.
F. In locations not in traffic areas, hand place select backfill to a level 12 inches above the top of the pipe in such manner as to minimize voids, unless otherwise noted on the plans. Backfill up to surrounding ground surface or finished subgrade with subsoil containing no rocks or boulders large thank 6 inches in greatest dimension within 12 inches of the subgrade. Leave top of backfill slightly mounded to allow for settlement.
G. Under traffic areas, backfill trench from horizontal centerline of pipe up to top of subgrade using either select backfill material or Class I bedding material. If select backfill material is used, place material in 6 inch lifts and compact with mechanical tamps. Compact each layer to within 24 inches of subgrade to 90% of optimum density for the material as determined by Modified Proctor procedures, ASTM D-1557. Compact the remaining 24 inches to subgrade to 95% of optimum density using the same procedures. If Class I bedding material is used, place the material in such manner as to minimize voids and interlock the material to form a stable fill that will support the pavement structure and subsequent traffic loads.
H. Patch cut edges and surface-damaged areas with specified patching material to restore protection to metal surface originally provided by polymer coating.

3.03 CONCRETE STRUCTURES INSTALLATION

A. Forming concrete, placing reinforcing steel and placing and curing concrete: Refer to Section 32 05 23 and ACI 301.
B. Excavation and Backfill: Refer to Section 33 0516.

3.04 EXISTING STRUCTURE MODIFICATION

A. Remove top and throat of existing curb inlet.
B. Remove loose and damaged concrete material.
C. Dispose of removed material including cast iron ring and cover.
D. Cut and tie reinforcing steel to new steel as detailed on Drawings.
E. Form new top and provide new cast iron ring and cover.
F. Place steel as detailed on Drawings and place concrete to modify structure into a junction box.
G. Patch inside face of wall to achieve smooth surface.

Executive Summary

This is a report of findings of the Geotechnical Investigation for the Dillard Hall development to be located on the campus of the University of Arkansas in Fayetteville, Arkansas. This report includes detailed information on subsurface conditions and existing surface materials in addition to providing recommendations for the site development, structure foundations, and project pavements. The significant findings listed below should not be used separately from the further discussion provided in the body of this report.

- MCE conducted a Geotechnical Investigation consisting of 11 project borings.
    - Materials resulting in auger refusal were encountered within all of the project borings, excluding B-10, at depths ranging from approximately 10.0 to 25.0 feet below the existing surface elevations.
    - Perched groundwater was encountered by project borings B-01 and B-06 at a depth of approximately 14.0 feet below the existing surface elevations.
- Surface materials (Stratum I) encountered during this investigation consisted of topsoil, asphalt underlain by aggregate, and concrete pavement materials
- The materials that make up Stratum II consist of Sandy Lean Clay (CL).
- The materials that make up Stratum III consist of Clayey Sand with Gravel (SC), Clayey Gravel with Sand (GC), and Silty Gravel with Sand (GM).
- The materials that make up Stratum IV consist of weathered sandstone materials.
- The materials that make up Stratum V consist of highly weathered to weathered shale materials.
- The materials that make up Stratum VI consist of competent sandstone and shale materials.
- It is recommended that all existing organics, pavements, and otherwise deleterious materials be removed from the site prior to construction. MCE recommends that the Contractor anticipates a minimum of 12 inches of initial stripping to be necessary across the site in order to fully remove the existing Stratum I materials.
- It is expected that up to 16 feet of fill will be required to achieve the planned finished grades on the west side of Dillard Hall, near the Level 2 walkout. The Design Team should be aware of the potential settlement that may occur due to this quantity of fill.
    - Properly placed, moisture-conditioned select fill placed in accordance with the recommendations outlined in *Section 10.10* may undergo long-term consolidation of up to one (1) percent of the overall fill height.
    - Methods such as preloading/surcharging the placed select fill may be utilized to accelerate the settlement within the deep fill areas. These should be coordinated between MCE and the Contractor prior to the start of construction to ensure that the appropriate parameters are utilized, if desired.

- Based on the provided information and the encountered subsurface conditions, it is recommended that the Design Team consider the use of a shallow foundation system composed of continuous and spread footings for the support of the academic building.
    - These shallow foundation elements are recommended to bear directly on native Stratum IV weathered sandstone materials. Should site grades not allow for the direct bearing on these sandstone materials, then either CLSM, otherwise referred to as “flowable fill”, or an aggregate base course material be utilized between the Stratum IV materials and the bottom of foundation elevations.
    - It is recommended that the foundation elements bearing on suitable in-situ Stratum IV materials or imported aggregate/CLSM materials placed on suitable in-situ Stratum IV materials may utilize a safe net allowable bearing capacity of 3,800 psf for continuous footings and 4,000 psf for spread footings.
- It is recommended that a shallow foundation system consisting of spread footings will be suitable for the support of the Pergola/Canopy area.
    - The shallow foundations are recommended to bear directly on suitable Stratum III materials or on a minimum of one (1) foot of properly-placed select fill.
    - It is recommended that spread footings bearing on properly placed select fill or “suitable” native subgrade may utilize a safe net allowable bearing capacity of 2,300 psf.
- It is recommended that a shallow foundation system consisting of continuous footings will be suitable for the support of the trash tunnel.
    - The shallow foundations are recommended to either bear on suitable Stratum II/III/IV materials or on imported select fill placed on suitable in-situ materials.
    - Where the existing utility tunnel is present, it may be necessary to utilize No. 57 stone (or an approved alternative), wrapped in a separation geotextile between the ceiling of the utility tunnel and the floor of the trash tunnel.
- As an alternative to the shallow foundation system, it is recommended that the Design Team consider the use of a drilled pier foundation system for the support of the Dillard Hall academic building.
    - If utilized, this drilled pier foundation system shall be designed for end-bearing and must be founded into the encountered competent shale materials (Stratum VI).
    - The drilled piers should be founded a minimum of one (1) pier diameter (1L:1D), or a minimum of five (5) feet, into the competent shale material, whichever is greater. The exact length of the rock sockets may be lengthened based on the final loading conditions. Adequate end-bearing material should be encountered prior to beginning the recommended rock socket length.
    - The competent shale materials may utilize a safe allowable end bearing capacity of 50 kips per square foot (ksf) for design purposes.
- Slab-on-grade construction may be utilized for the academic building, the pergola, and the trash tunnel structures, provided a minimum of four (4)-inch cushion of sand, crushed stone, or gravel is placed below the slab areas with a vapor barrier directly below the concrete.
- It is expected that the planned access drive will primarily be utilized for heavy truck traffic, such as garbage trucks. As such, it is recommended that the Contractor budget for the placement of a minimum of two (2) feet of imported select fill below the project pavement dimensions.
- **Construction materials testing and special inspection services are to be provided by MCE to provide consistency with the recommendations in this report and the documentation of those recommendations being implemented during construction.**

1.0 Introduction

McClelland Consulting Engineers, LLC, an ESP Company (MCE) conducted a Geotechnical Investigation for the planned Mandy and Bill Dillard II Hall (Dillard Hall) building project located in Fayetteville, Arkansas. The investigation was requested by Mr. Andrew Watkins, Construction Project Manager, and authorized by Ms. Kristen Knight, Senior Director of Construction, Planning, and Design, both with the University of Arkansas – Facilities Management, with the intention of exploring the subsurface soil conditions within the planned structure dimensions to provide recommendations for the site development and structure foundations.

2.0 Existing Site Description

The project site is located on the south side of the University of Arkansas campus, in the northwest quadrant of the intersection of Harmon Avenue and W. Fairview Street. The site encompasses approximately two (2) acres of the following Washington County Parcels: 765-11631-000, 765-11632-000, 765-11633-000, 765-10790-000, 765-10789-000, and 765-11630-000, all of which are owned by the University of Arkansas.

The project site primarily exists as a greenspace, with an existing motor-bike parking lot and access drive along the western boundary. Sidewalks are present along the north, eastern, and southern boundaries. Based on historical imagery from Google Earth, the site was previously utilized as a student and faculty parking lot and was later used as a laydown yard during the construction of the adjacent campus buildings. Topographically, the project site exhibits a downward slope from the west to east, with maximum grade differentials estimated to be on the order of 29 feet.

Site conditions at the time of this investigation may be referenced in Figure 1 below.

Figure 1: Existing Site Conditions
Left: From Project Boring B-05; Oriented Southwest
Middle: From Project Boring B-05; Oriented Northeast
Right: Towards Project Boring B-07; Oriented Northeast

3.0 Project Scope

The Dillard Hall academic building is planned to be a four (4) – story structure with a mezzanine between Levels 1 and 2. The structure is expected to have a footprint of approximately 26,000 square feet (SF).

Based on discussions with the Design Team, the maximum anticipated column dead load for the project is 600 kips, and the maximum anticipated column dead plus live load is 925 kips. The building is anticipated to be constructed primarily of steel HSS and wide-flange beam and column framing with steel braced frames supporting four (4) slab-on-metal-deck floors and a slab-on-metal-deck roof. A slab-on-grade is planned to be constructed at the ground level.

Additionally, it is understood that a trash tunnel will connect the mezzanine to Willard J. Walker Hall; this tunnel is planned to be constructed of reinforced concrete slabs and walls. A pergola/canopy is also planned to be constructed under this scope of work directly north of the Donald W. Reynolds Center for Enterprise Development building. This lightly-loaded pergola/canopy is anticipated to be timber-framed with a slab-on-grade. Although final loading conditions were not provided as of the issuance of this report, maximum column loads for the canopy are expected to not exceed 25 kips.

Civil site and pavement improvements are expected to include new pedestrian walkways, a new access drive east of Dillard Hall, drainage features, and general utility infrastructure. Final site grades are planned to range from near existing to as much as 11 feet of fill in areas surrounding the structure.

4.0 Field Investigation

Based on the understood project scope, MCE conducted a Geotechnical Investigation consisting of 11 project borings. Boring Layouts are provided for reference in Appendix A on Plates 1 and 2.

4.1 Project Borings and Field Investigation

The project borings were conducted using a CME-45B truck-mounted and Diedrich D-50 Turbo track-mounted drill rigs utilizing 4.5-inch diameter solid-stem augers and 6.5-inch hollow-stem augers, respectively. Soil samples were obtained at the depths indicated on the boring logs with the use of a two (2) inch diameter split-spoon sampler. The split-spoon sampler was driven by blows from a 140-pound automatic hammer dropped from a fixed height of 30 inches. The number of blows required to drive the split-spoon sampler the final 12 inches of an 18-inch drive, or portion thereof, is referred to as the Standard Penetration value, N, and is recorded on the boring logs in units of blows-per-foot.

Water-based rock coring techniques were utilized to advance into the underlying rock formation once auger-drilling techniques were no longer feasible or reasonable, given the subsurface conditions. Rock core samples were collected utilized NQ2-size tooling with a diamond-impregnated bit.

Final drilled depths are shown as the depths achieved by the split-spoon sampler or rock core tooling, whichever is relevant to the boring location.

In addition to Standard Penetration Testing (SPT), the field tests performed included visual soil/rock classifications groundwater observations, and percent recovery (REC) and rock quality designation (RQD) values of the recovered rock samples.

The project boring locations were strategically laid out in an effort to target the planned project features while providing the subsurface data necessary for the Geotechnical recommendations. Project borings B-01 through B-09 were all conducted within the understood building footprint, with a planned target depth of 50.0 feet below the existing surface elevation or advancing a minimum of 10 feet into the underlying rock formation; whichever occurred first. Project borings B-10 and B-11 were conducted within the planned pergola/canopy and Level 1 entry, respectively, with target depths of 10.0 feet below the existing surface elevations, or until auger refusal materials were encountered; whichever occurred first.

The visual soil and rock classifications are given on the boring logs, which can be referenced in Appendix B on Plates 3 through 20; a key to the terms and symbols on the boring logs is provided on Plate 21. Table 1 on the following page provides details of the project borings.

Table 1: Project Boring Locations & Field Investigation Details

Boring ID	Targeted Development Feature	Existing Surface Elevations (feet)	Target Depth (feet)	Auger Refusal Depth (feet)	Total Depth Investigated (feet)	End of Boring Elevation (feet)
B-01	Dillard Hall Academic Building	1,419.41	50.0	15.0	25.0	1,394.41
B-02	Dillard Hall Academic Building	1,418.17	50.0	15.0	25.0	1,393.17
B-03	Dillard Hall Academic Building	1,419.92	50.0	10.0	25.0	1,394.92
B-04	Dillard Hall Academic Building	1,418.06	50.0	15.0	25.0	1,393.06
B-05	Dillard Hall Academic Building	1,414.04	50.0	10.0	20.0	1,394.04
B-06	Dillard Hall Academic Building	1,420.20	50.0	15.0	25.0	1,395.20
B-07	Dillard Hall Academic Building	1,422.04	50.0	15.0	25.0	1,397.04
B-08	Dillard Hall Academic Building	1,422.22	50.0	25.0	34.0	1,388.22
B-09	Dillard Hall Academic Building	1,418.58	50.0	10.0	20.0	1,398.58
B-10	Pergola/Canopy Area	1,432.58	10.0	N/A	10.0	1,422.58
B-11	Level 1 Entry Area	1,406.08	10.0	5.0	5.0	1,401.08

NOTES: The existing surface elevations shown in Table 1 are based on topographic survey data obtained by MCE personnel.
The corresponding end of boring elevations are based on this data, as well as measurements taken at the time of the investigation.

4.2 Encountered Groundwater Conditions

At the time of the investigation, perched groundwater was encountered by project borings B-01 and B-06 at depths of approximately 14.0 feet below the existing surface elevations (perched groundwater encountered at elevations of approximately 1,405.41 feet and 1,406.20 feet, respectively). Installation and periodic measurement of monitoring wells may be required to establish seasonal piezometric surfaces below the project site.

Although this perched water was only encountered in two (2) project boring locations, the presence of relatively shallow shale and sandstone (rock) materials presents the possibility of encountering perched water throughout the project dimensions. As a result of the low permeability created by these subsurface materials, groundwater has the potential to collect “perched” condition during and after precipitation events. Any groundwater or perched water must be removed prior to the placement of fill or construction materials, if encountered during construction.

To help reduce the potential for issues related to groundwater, it is recommended that earthwork operations take place during typically dry portions of the calendar year (June through September). However, earthwork operations should expect typical dewatering measures to be required to maintain a desirable construction schedule.

Due to the site location in relation to the surround topography, as well as the conditions encountered during this investigation, it is recommended that a perimeter drainage system be implemented to properly remove any subsurface water from the structure dimensions. Project grading should be designed to properly discharge any surface water that may develop following precipitation events.

4.3 Encountered Auger Refusal Materials

Auger refusal is generally defined as the point at which a boring encounters material through which it can no longer be advanced using traditional auger drilling techniques. Refusal is somewhat subjective and is dependent on the type of drilling equipment used and the down pressures exerted by the drill rig.

At the time of this investigation, materials resulting in auger refusal were encountered within project borings B-01 through B-09 and B-11 at depths ranging from approximately 10.0 to 25.0 feet below the existing surface elevations (auger refusal encountered at elevations ranging from approximately 1,397.22 feet to 1,409.92 feet).

In addition to these auger refusal materials, hard weathered sandstone and shale materials were encountered beginning at depths ranging from approximately 0.33 to 8.5 feet below the existing surface elevations (elevations ranging from approximately 1,405.75 feet to 1,418.54 feet). Based on the provided site grading information, it is expected that these materials will be encountered during the initial building footprint excavation. Where encountered, the Contractor should budget for the use of rock-removal techniques, as further described in *Section 10.2.1.* The consistency of these weathered sandstone materials may vary considerably across the project site.

Subsurface (fence) diagrams have been provided in Appendix D outlining the encountered subsurface strata in relation to the expected first floor finished-floor elevation (FFE).

Additional information pertaining to the local geology and how it affects the project site can be found in the *Local Geology of the Project Site* section of this report (*Section 7.0*).

5.0 Laboratory Analysis

Laboratory tests were performed on the soil and rock samples recovered from the borings. The laboratory tests were conducted to determine the engineering properties of the project subsurface strata. The tests performed on the samples collected from the borings included moisture content, Atterberg Limits, sieve analyses, and unconfined compression tests. The results of laboratory testing for the project borings are provided on the boring logs and in the Laboratory Testing Results in Appendix C.

Table 2 below shows the relevant test method specifications utilized on the project.

Table 2: Laboratory Test Method Specifications

Test Designation	Test Method
ASTM D2488	Standard Practice for Description and Identification of Soils (Visual)
ASTM D2487	Standard Practice for Classification of Soils for Engineering Purpose (USCS)
ASTM D2216	Standard Test Method for Lab Determination of Water Content of Soil
ASTM D6913	Standard Test Method for Particle-Size Distribution of Soils Using Sieve Analysis
ASTM D4318	Standard Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
ASTM D7012	Standard Test Methods for Compressive Strength and Elastic Moduli of Intact Rock Core Specimens under Varying States of Stress and Temperature

6.0 On-Site Soil Conditions

The following sections provide information regarding on-site conditions at the project location. This information includes descriptions of the existing soil types, imagery showing the approximate location of the existing soil types, and details about the local geology.

6.1 United States Department of Agriculture (USDA) Soil Types and Map

The following soil types exist in the project area according to current USDA soil maps, with the description from the Natural Resources Conservation Service (NRCS). The project site is located in Washington County in Northwest Arkansas. The soil types that exist in the project area according to current USDA soil maps are briefly detailed in Table 3 on the following page.

Table 3: USDA Local Soil Types

USDA Soil Type	USDA Symbol	USDA Descriptions
Enders-Leesburg Complex	ErF	A soil complex is a mapping unit containing two (2) or more distinct soil types that are so intricately mixed geographically that they cannot be separated at standard mapping scales. The Enders series consists of deep, well-drained, very slowly permeable soils that formed in loamy and clayey residuum from shale, or interbedded shale and sandstone. These soils are on nearly level to moderately steep upland mountaintops and ridges and gently sloping to very steep mountain side slopes and foot slopes. Slopes range from one (1) to 65 percent. The Leesburg series consists of very deep, well-drained, moderately permeable soils that formed in loamy alluvium or colluvium underlain by sandstone, shale, or limestone. These soils are on nearly level to very steep side slopes, toe slopes, or terraces.
Fayetteville Fine Sandy Loam	FaC2	The Fayetteville series consists of deep, well-drained, moderately permeable soils that formed in residuum or colluvium from slightly calcareous sandstone. These nearly level to steep soils are on uplands of the Boston Mountains. Slopes range from three (3) to 40 percent.

Figure 2 below provides imagery of the approximate site location and how it relates to the existing soil types.

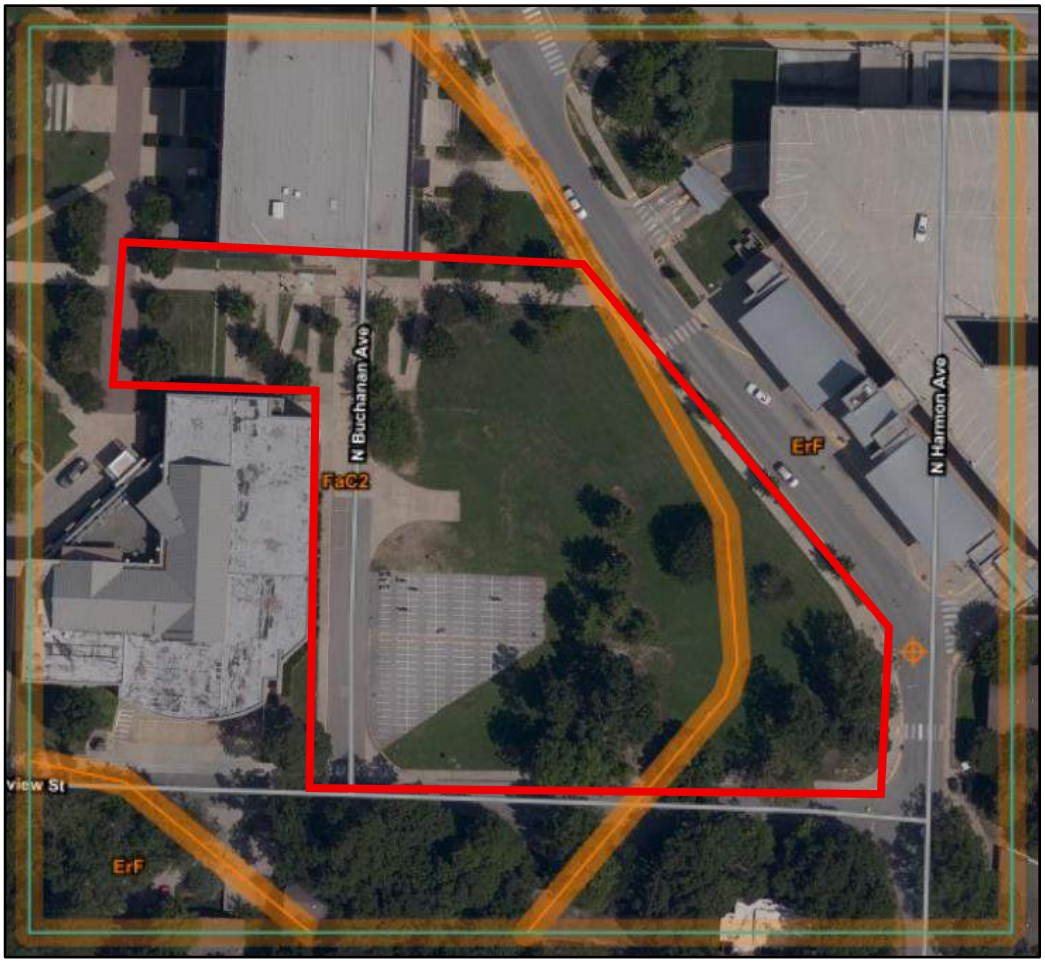

Figure 2: USDA Soil Survey Report Image
The image was produced by the United States Department of Agriculture.
The red outline represents the approximate project extent.

7.0 Local Geology of the Project Site

According to maps and literature published by the United States Geological Survey (USGS) and the Arkansas Geological Survey (AGS), the project site is underlain by the Early Pennsylvanian Age Cane Hill Member of the Hale Formation, as well as the Middle Pennsylvanian Age Prairie Grove Member of the Hale Formation and the Bloyd Shale. It should be noted that a fault line is currently mapped as spanning from the southwest to the northeast, approximately 0.10 miles southeast of the project site. Additional information about this fault system is provided in *Section 7.4.*

Brief descriptions from the *Stratigraphic Summary of Arkansas – Information Circular 36 (IC-36)* of the local geologic formations and conditions are provided below and on the following page.

7.1 Cane Hill Member of the Hale Formation

The Hale Formation is made up of two (2) members: a lower Cane Hill Member and an upper Prairie Grove Member. The Cane Hill Member is typically composed of dark gray silty shale interbedded with siltstone and thin-bedded fine-grained sandstone. Some lithologies are locally calcareous. Isolated thick to massively bedded sandstones sometimes occur in the section. Fossils are principally found associated with the calcareous units and include various mollusks, brachiopods, and other groups. The lower contact of the Cane Hill marks the Mississippian-Pennsylvanian boundary in north Arkansas.

7.2 Prairie Grove Member of the Hale Formation

The Prairie Grove Member is composed of thin to massive, often crossbedded, frequently pitted (“honeycomb weathering”), light gray to dark brown, limy sandstone or variously sandy limestone with lenses of relatively pure, crinoidal, highly fossiliferous limestone and oolitic limestone. Prairie Grove outcrops frequently have a mottled appearance when fresh. Fossils are common but generally fragmental. The fossil fauna includes crinoids, bryozoans, brachiopods, algae, corals, trilobites, mollusks, and microfossils. The lower contact of the Prairie Grove is considered unconformable. The Hale (Cane Hill) rests with pronounced unconformity upon older strata. The reported thickness of the Hale ranges from a few feet to more than 300 feet.

7.3 Bloyd Shale Formation

The Bloyd Formation consists of (in ascending order): the Brentwood Limestone Member, the Woolsey Member, Dye Shale Member, Kessler Limestone Member, and the Trace Creek Shale Member (considered a part of the Atoka Formation by many modern workers).

The Brentwood is a sequence of limestones separated by thick intervals of dark shale. The normal sequence usually has two (2) to four (4) limestone intervals; however, east of the type region, the unit becomes more sandy.

The Woolsey is composed of terrestrial sediments comprised of dark gray, fissile shale often interbedded with thin siltstones. A thin coal bed, called the Baldwin Coal, occurs at or near the top of the Woolsey. To the east of Washington County, the Woolsey is replaced by a thick, fine- to medium-grained, cross-bedded sandstone facies commonly referred to as the Middle Bloyd Sandstone. This unit frequently contains quartz granules and is a common bluff-former.

The Middle Bloyd Sandstone is normally mapped as part of the Dye Shale. The marine deposited Dye Shale Member is predominantly a dark-gray shale with scattered calcareous concretions. Where underlain by the Woolsey, the Dye frequently has a bed of calcareous sandstone with scattered clay pebbles and quartz granules, called the caprock, at its base.

The Kessler Limestone Member is either a single unit of limestone or a sequence of limestone and shale interbedded. The limestones are bioclastic and oolitic and contain abundant oncoliths, traces of clay-pebble conglomerate, and minor amounts of calcareous sandstone. The Kessler seems to be absent east of central Madison County.

The Trace Creek Shale Member is composed of dark-gray shales with some thin beds of sandstone. The sandstone beds become thicker and more common toward the top of the unit. Fossils of most common invertebrate phyla are known mostly from the limestones and calcareous sandstones of the Bloyd. The base of the Bloyd is considered conformable, but unconformities are recognized at the base of the Dye and at the base of the Trace Creek. Typical thicknesses reported for the Bloyd range between 175 and 200 feet.

7.4 Structural Geology of the Project Site

It should be noted that the project site is in close proximity to a known fault or fault zone; the Fayetteville Fault. The Fayetteville Fault is a known “normal fault” with its downthrown side on the southeast. This fault or fault system trends from the southwest to the northeast. Modern literature indicates that the Fayetteville Fault is not currently active.

Figure 3 below provides a visual of the local geologic formations in relation to the project site. The heavier black lines trending southwest to northeast represent the Fayetteville Fault.

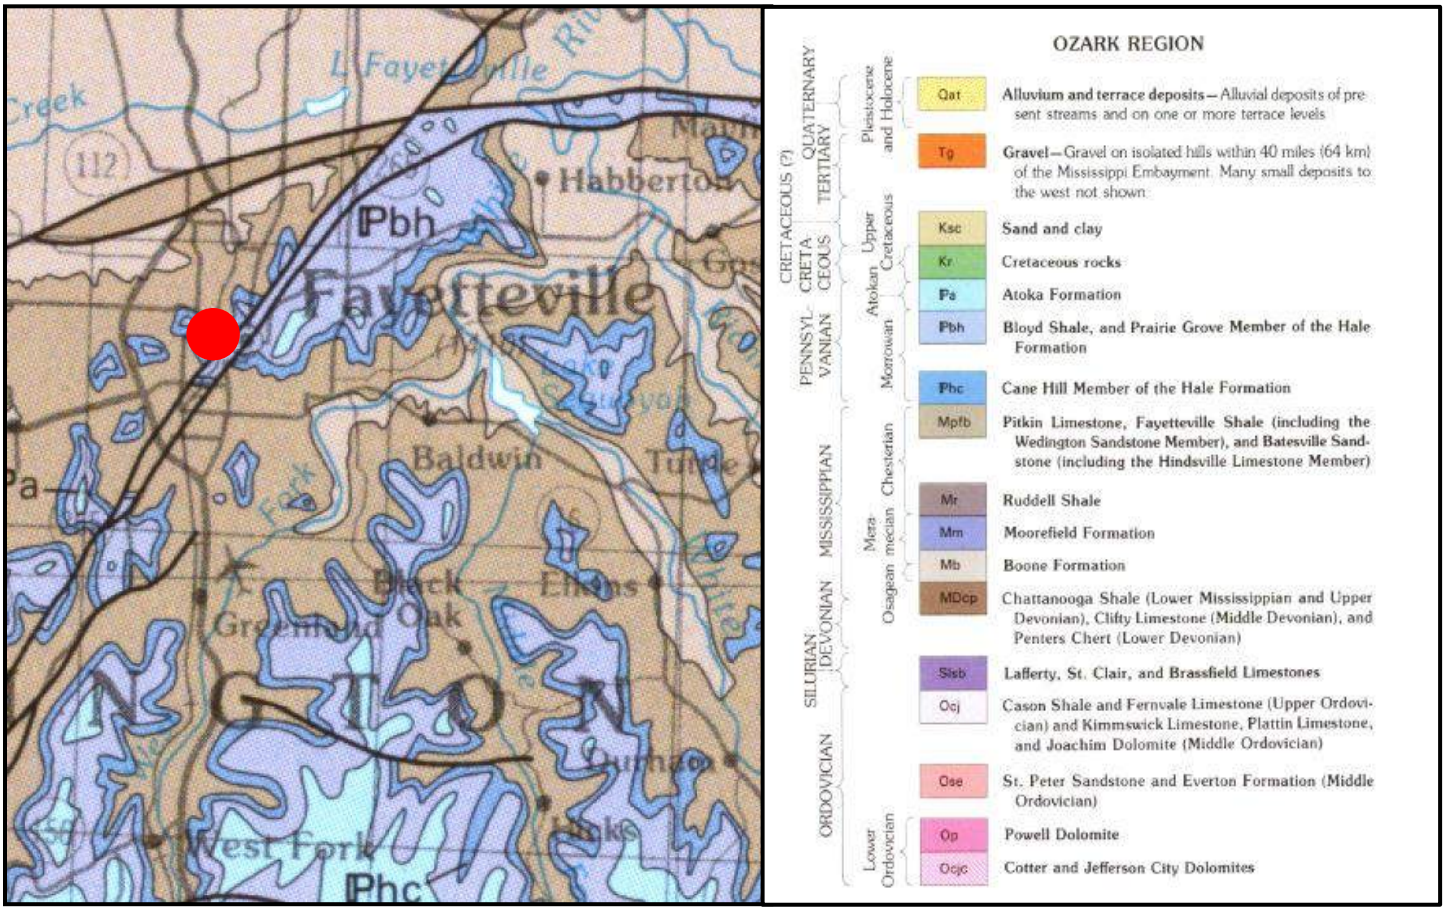

Figure 3: Image from the Geologic Map of Arkansas
The red dot represents the approximate location of the project site

8.0 Seismic Site Classification & Liquefaction Considerations

The project site is recommended to be assigned as a Risk Category III according to Table 1604.5 of the 2021 International Building Code (IBC). The site seismic classification determination may utilize the values in Table 4 on the following page, with reference to Section 1613 of the 2021 IBC and the American Society of Civil Engineers (ASCE) Standard 7-16, based on a Site Class C for the soil profile within the project area.

Table 4: ASCE Seismic Design Values

Seismic Values					
S_s	0.16	S_{DS}	0.139	I_e	1.25

9.0 On-Site Soil Stratum Summary

This summary is based on a collection of field notes and field-testing values recorded during the on-site investigation, notes recorded during the laboratory analysis, and results from the laboratory testing. The encountered subsurface soil conditions are summarized below and on the following page.

9.1 Stratum I – Surface Materials

The materials that make up Stratum I consisted of topsoil materials across a majority of the project site (B-01 through B-05, B-09 through B-11), with thicknesses ranging from approximately four (4) to six (6) inches. Flexible asphalt pavements underlain by aggregate base materials were encountered in the existing motorbike parking lot (B-06 and B-07). The asphalt was observed to have thicknesses ranging from approximately four (4) to five (5) inches, while the underlying aggregate had a thickness of approximately two (2) inches. Concrete pavement was encountered in an existing access drive (B-08) with a thickness of approximately six (6) inches.

These thicknesses are only valid for the project boring locations and could fluctuate in the unexplored portions of the project site.

9.2 Stratum II – Fine-Grained Subgrade Materials

The materials that make up Stratum II consist of Sandy Lean Clay (CL). These materials were encountered in various shades of reddish-brown and brown.

Table 5 below organizes the consistency, moisture content, and plasticity properties of the Stratum II soils.

Table 5: Stratum II Materials – Classification Data

Property	Stratum II – CL Materials
Consistency Values	Medium Stiff to Hard
N-Values	Five (5) to 25
Natural Soil Moisture Content (%)	12 to 16
Liquid Limit (LL)	23
Plasticity Index (PI)	Eight (8)
Plasticity Characteristics	Low
Fine Fraction of Total Mass (%)	52
Volumetric Change Potential	Low to Moderate Due to Moisture Content Variation

9.3 Stratum III – Coarse-Grained Subgrade Materials

The materials that make up Stratum III consist of Clayey Sand with Gravel (SC), Clayey Gravel with Sand (GC), and Silty Gravel with Sand (GM). These materials were encountered in various shades of reddish-brown and brown and contained varying amounts and gradations of gravel, sand, and fines.

Table 6 below organizes the consistency, moisture content, and plasticity properties of the Stratum III soils.

Table 6: Stratum III Materials – Classification Data

Property	Stratum III – SC Materials	Stratum III – GC Materials	Stratum III – GM Materials
Consistency Values	Medium Dense to Very Dense	Loose to Very Dense	Loose
N-Values	12 to Greater than 50	Eight (8) to Greater than 50	Seven (7)
Natural Soil Moisture Content (%)	Five (5) to 22	10 to 22	Four (4)
Liquid Limit (LL)	27 to 29	26 to 41	VC*
Plasticity Index (PI)	11 to 15	14 to 20	VC*
Plasticity Characteristics	Low to Moderate	Low to Moderate	Negligible
Fine Fraction of Total Mass (%)	18 to 41	26 to 29	VC*
Volumetric Change Potential	Low to Moderate Due to Moisture Content Variation	Low Due to Moisture Content Variation	Negligible

*VC Indicates that a Visual Classification was Performed; As such, the Material Property was not Measured.

9.4 Stratum IV – Weathered Sandstone

The materials that make up Stratum IV consist of Weathered Sandstone materials. Through both visual and laboratory analyses, these materials were observed to generally classify as a Silty Sand (SM), Silty Sand with Gravel (SM), and Silty Gravel with Sand (GM) in accordance with the Unified Soil Classification System (USCS). These materials were generally encountered as light brown in color. These weathered sandstone materials are expected to result in difficult excavation conditions during construction.

Table 7 below organizes the consistency, moisture content, and plasticity properties of the Stratum IV materials.

Table 7: Stratum IV Materials – Classification Data

Property	Stratum IV – Weathered Sandstone Materials
Consistency Values	Moderately Hard to Hard
N-Values	23 to Greater than 50
Natural Soil Moisture Content (%)	Six (6) to 17
Liquid Limit (LL)	CND*
Plasticity Index (PI)	NP
Plasticity Characteristics	Negligible
Fine Fraction of Total Mass (%)	14
Volumetric Change Potential	Negligible Due to Moisture Content Variation

*CND Indicates that the Material Property Could not be Determined due to a Lack of Soil Plasticity

9.5 Stratum V – Highly Weathered to Weathered Shale Materials

Stratum V materials consisted of highly weathered and weathered shale materials. Through both visual and laboratory analysis, these materials were observed to generally classify as Lean Clay with Sand (CL) in accordance with the USCS. These materials were generally observed to increase in consistency in correlation to depth within the boreholes. The highly weathered and weathered shale materials were encountered in various shades of brown and gray and contained varying quantities and gradations of sand and gravel.

Table 8: Stratum V Materials – Classification Data

Property	Stratum IV – Highly Weathered to Weathered Shale Materials
Consistency Values	Soft to Hard
N-Values	46 to Greater than 50
Natural Soil Moisture Content (%)	11 to 14
Liquid Limit (LL)	36 to 37
Plasticity Index (PI)	17 to 19
Plasticity Characteristics	Low
Fine Fraction of Total Mass (%)	75 to 86
Volumetric Change Potential	Moderate Due to Moisture Content Variation

9.6 Stratum VI – Competent Rock Materials

The materials that make up Stratum VI consist of competent rock materials, identified during this investigation as competent sandstone and shale materials, indicative of the underlying the Early Pennsylvanian Age Cane Hill Member of the Hale Formation, as well as the Middle Pennsylvanian Age Prairie Grove Member of the Hale Formation and the Bloyd Shale. The consistency of these materials was determined to range from moderately hard to hard.

As previously discussed, rock core samples were collected using a two (2) inch diameter NQ2-size core barrel within the planned footprint of Dillard Hall.

The rock core samples collected were measured in the field to determine the percent recovery (REC) and percent of rock quality designation (RQD); these samples were subjected to further laboratory testing to determine the unit weight, and ultimate compressive strength. The results of these analyses are provided in Table 9 on the following page.

Table 9: Rock Core Data

Boring ID	Core Run	Depth (feet)	Description of Material	Recovery (%)	RQD (%)	Recorded Specimen ID and Depth Taken (feet)	Unit Weight (pcf)	Ultimate Compressive Strength (tsf)
B-01	1	15.0 to 20.0	Sandstone to Weathered Shale	94	44	C1 - 16.0	145.3	404.6
	2	20.0 to 25.0	Weathered Shale to Shale	100	70	-	-	-
B-02	1	15.0 to 20.0	Sandstone to Weathered Shale	98	45	-	-	-
	2	20.0 to 25.0	Shale	97	70	C2 - 24.0	158.6	57.7
B-03	1	10.0 to 15.0	Sandstone	60	41	C3 - 10.0	137.2	101.8
	2	15.0 to 20.0	Sandstone to Weathered Shale	75	35	-	-	-
	3	20.0 to 25.0	Weathered Shale to Shale	98	62	-	-	-
B-04	1	15.0 to 20.0	Weathered Shale to Shale	93	19	-	-	-
	2	20.0 to 25.0	Shale	85	35	C4 - 24.0	158.2	106.8
B-05	1	10.0 to 15.0	Weathered Shale to Shale	100	62	-	-	-
	2	15.0 to 20.0	Shale	98	42	C5 - 19.0	157.9	97.9
B-06	1	15.0 to 20.0	Weathered Shale to Shale	82	23	-	-	-
	2	20.0 to 25.0	Shale	90	48	-	-	-
B-07	1	15.0 to 20.0	Weathered Shale to Shale	97	41	C6 - 16.0	153.7	53.8
	2	20.0 to 25.0	Shale	98	67	C7 - 24.0	159.4	62.8
B-08	1	25.0 to 29.0	Shale	100	65	C8 - 25.0	156.7	66.6
	2	29.0 to 34.0	Shale	87	36	-	-	-
	3	34.0 to 35.0	Shale	25	25	-	-	-
B-09	1	10.0 to 15.0	Sandstone to Weathered Shale	77	47	C9 - 13.0	151.4	325.2
	2	15.0 to 20.0	Weathered Shale to Shale	93	71	C10 -19.0	162.3	92.8

10.0 Engineer's Analysis and Recommendations

As previously described, Dillard Hall is planned to be a four (4) story structure with a mezzanine between Levels 1 and 2 and a footprint of approximately 26,000 SF. The ground level is planned to feature a slab-on-grade, while the subsequent levels and roof are each planned to be slab-on-metal-deck. Maximum column loads for the structure are expected to be on the order of 925 kips. Structure framing is planned to primarily feature steel HSS and wide-flange beam and columns, with steel braced frames.

A trash tunnel is planned to connect the mezzanine level with Willard J. Walker Hall in the north; this tunnel is expected to be located near the existing surface elevations of the site and will be constructed of reinforced concrete slabs and walls.

Included in this project scope is a pergola/canopy structure that is to be constructed directly north of the Donald W. Reynolds Center for Enterprise Development building. This pergola is expected to feature a concrete slab-on-grade. Final loading conditions for this structure are not expected to exceed 25 kips.

Additional site improvements are anticipated to include new pedestrian walkways, a new access drive east of Dillard Hall, drainage features, and general utility infrastructure. Final site grades are planned to range from near existing to as much as 11 feet of fill in areas surrounding the structure.

The purpose of this investigation was to obtain sufficient subsurface information from which to provide the necessary geotechnical recommendations and considerations for the planned project structure. Additional considerations for project pavements and tunnel have been included within this report at the request of the Design Team. Those recommendations and considerations are presented in the following sub-sections of this report.

10.1 Initial Site Preparation

As described in *Section 9.1,* topsoil materials were encountered at the surface across a majority of the project site, with thicknesses ranging from approximately four (4) to six (6) inches. Flexible asphalt pavements underlain by aggregate base materials were encountered in the existing motorbike parking lot, with total pavement section thicknesses ranging from approximately six (6) to seven (7) inches. Concrete pavement was encountered in an existing access drive with a thickness of approximately six (6) inches.

Additionally, it should be noted that asphalt and concrete pavements are present within the eastern-boundary access drive and the pedestrian walkways on the north side of the Dillard Hall footprint. The thicknesses of these pavements are not known; as they were not encountered within any of the project borings. However, it is expected that the overall thicknesses of these sections will be less than 12 inches.

It is recommended that all existing organics, pavements, and otherwise deleterious materials be removed from the site prior to construction. **MCE recommends that the Contractor anticipates a minimum of 12 inches of initial stripping to be necessary across the site in order to fully remove the existing surface materials.**

10.2 Site Grading Considerations

Based on the provided documentation, it is anticipated that cuts on the order of nine (9) feet and fills on the order of 16 feet will be required to achieve the finished site elevations associated with the academic building structure and surrounding pavement areas. It is understood that the structure has a planned FFE of 1,413 feet for the lower level (first-floor), with a walkout towards Harmon Avenue, and a planned FFE of 1,433 feet for the second floor, with a walkout towards the Donald W. Reynolds Center for Enterprise Development.

Based on the findings of this investigation, subgrade materials considered suitable for the placement of shallow foundations within the academic building consist of the referenced moderately hard to hard Stratum IV Weathered Sandstone. The subgrade materials considered suitable for the placement of shallow foundations within the pergola/canopy and for the civil site improvements generally consist of the referenced Stratum II and III materials.

A brief summary of expected depths of suitable subgrade materials is provided on the following page:

- Within the footprint dimensions of the Dillard Hall Academic Building and its features, it is expected that suitable subgrade materials will generally be present at or above the planned FFE of the lower level.
    - Due to the existing site grades, the use of imported fill materials is expected to be required below the structural elements. Conventional select fill is not recommended for use in this scenario; rather, the use of either aggregate base or controlled low-strength material (CLSM) should be considered. This is further outlined in *Section 10.5* for the consideration of the Project Team.
    - Difficult excavation conditions are expected to be present within the structure footprint as a result of the encountered Stratum IV materials. These are further described in *Section 10.2.1.*
- Within the pergola/canopy and civil site improvements, it is expected that subgrade materials in suitable condition for the placement of imported select fill or the direct placement of shallow foundations associated with the canopy will be present immediately following initial site stripping and grading.

The suitability of the in-situ materials should be evaluated by the Geotechnical Engineer or his/her designated representative at the time of construction to ensure that the recommendations contained herein remain consistent with the site conditions.

Specific care should be taken by the Contractor to prevent excessive saturation of subgrade materials exposed during site stripping and excavations as the in-situ soils and underlying shale materials are susceptible to reduced shear strengths when exposed to increased moisture and/or freezing conditions. This can be achieved by providing positive drainage during construction and covering with select fill or otherwise specified material soon after exposure, where applicable.

As previously noted, it is expected that up to 16 feet of fill will be required to achieve the planned finished grades on the west side of Dillard Hall, near the Level 2 walkout. The trash tunnel is largely expected to be constructed within this fill material, at or above existing surface elevations. The Design Team should be aware of the potential settlement that may occur due to this quantity of fill. Properly placed, moisture-conditioned select fill placed in accordance with the recommendations outlined in *Section 10.10* may undergo long-term consolidation of up to one (1) percent of the overall fill height. With a planned quantity of 16 vertical feet of fill, this would result in a potential of up to 1.92 inches of settlement.

Methods such as preloading/surcharging the placed select fill may be utilized to accelerate the settlement within the deep fill areas. These should be coordinated between MCE and the Contractor prior to the start of construction to ensure that the appropriate parameters are utilized, if desired.

10.2.1 Rock Construction Considerations

For the purposes of this project, "Rock Excavation" is defined as any material that cannot be excavated or removed using the following equipment performance benchmarks:

- Mass Grading
  Materials that cannot be effectively loosened or displaced by a Caterpillar D-8 dozer (or industry equivalent) equipped with a single-shank ripper in good working condition.
- Trenching/Confined Areas
  Materials that cannot be removed by a Caterpillar 330B tracked excavator (or equivalent) equipped with specialized rock teeth.

Based on the materials encountered during this subsurface investigation, materials necessitating specialized rock removal techniques, such as pneumatic breaking or heavy ripping, are expected to impact the planned construction operations. In particular, these are expected to be required within the structure footprint to excavate the required quantity of Stratum IV Weathered Sandstone materials.

As a conservative measure, it is recommended that the Contractor budget for rock excavation to be required to remove these materials beginning at first-encounter. However, it is expected that much of these materials may be removed in a mass-grading setting utilizing the equipment described above. Blasting is not expected to be required to remove the Stratum IV materials from the project site.

A geophysical rippability study was considered in order to provide more definite parameters and expectations for the removal of these materials. However, based on previous experience with similar sandstone materials, these studies may not provide an accurate representation of the true "rippability" of these materials.

The Contractor should expect the consistency of these Stratum IV materials to vary considerably across the site, with some requiring hammer-hoe attachments to fully remove, and others being removed through the use of conventional rock teeth on a Caterpillar 330B or equivalent.

10.2.2 Temporary Slopes During Construction

Excavations should be performed in accordance with the requirements outlined by the *Occupational Safety and Health Administration (OSHA) 1926 – Subpart P – Appendix B*. Excavated slopes during construction with depths less than 20 feet should be benched or sloped to provide the minimum horizontal-to-vertical (H:V) ratios as noted in Table 10 below.

Table 10: Temporary Slopes During Construction

On-site Soil Stratum	Material Description	OSHA Soil Type	Maximum Allowable Slopes (H:V)
Stratum II	Fine-Grained Subgrade Materials	Type B Soils	1:1 (45˚)
Stratum III	Coarse-Grained Subgrade Materials	Type C Soils	$1^1/_2$:1 (34˚)
Stratum IV	Weathered Sandstone Materials	Type B Soils	1:1 (45˚)
Stratum V	Highly/Weathered Shale Materials	Type B Soils	1:1 (45˚)
Stratum VI	Competent Sandstone/Shale Materials	Stable Rock	Vertical (90˚)

Note: OSHA Soil Type assignments should be considered preliminary and should be verified at the time of construction, if applicable, by an OSHA-competent person.
Prolonged exposure of any encountered materials to the environment and/or increased moisture conditions may require additional shoring measures. Stratum IV and V materials should not be considered Stable Rock due to their weathered nature and potential for deterioration upon exposure to moisture.

Sloping or benching of excavations greater than 20 feet deep shall be designed by a licensed Professional Engineer (PE) prior to excavation. Construction slopes steeper than recommended may be unstable, particularly when introduced to moisture increases during precipitation events.

If excavation efforts require deep vertical trenching (deeper than five (5) feet), and the minimum allowable slope ratio is not achievable, then the Contractor must establish a comprehensive Shoring Plan. That Shoring Plan should be reviewed and stamped by a license PE prior to excavation. As noted above, **these OSHA Soil Type assignments should be considered preliminary and should be verified at the time of construction by an OSHA competent person, when applicable.**

10.3 Subgrade Verification Method

Following stripping and initial excavation/grading, the subgrade materials across the development area should be initially evaluated by the Geotechnical Engineer or his/her designated representative. All subgrade materials should be proof-rolled with a tandem-axle fully-loaded dump truck weighing approximately 60,000 pounds, or equivalent construction equipment. The proof-rolling should be observed by the Geotechnical Engineer or his/her designated representative to verify and document stable subgrade conditions. Alternate means of subgrade verification may be conducted should proof-rolling not be feasible within excavation or undercut dimensions. The implemented means of verification should be under the direction of the Geotechnical Engineer. Any soft and/or yielding subgrade areas encountered should be repaired by undercutting and backfilling with select fill material. These materials should then be subsequently evaluated by the Geotechnical Engineer or his/her representative for approval. **It is highly recommended that the structure footprint be evaluated immediately preceding any additional site grading to reduce unnecessary undercut.**

10.4 General Foundation Recommendations

All foundations associated with the planned academic building development should be sized to meet three (3) conditions:

- Bearing Capacity (Ultimate & Allowable)
  The maximum stresses imposed on the foundation strata should not exceed the allowable bearing pressures as determined by the shear strength properties of the in-situ soils. The allowable bearing pressures outlined in this report incorporate an appropriate factor of safety against general shear failure.
- Settlement & Serviceability Limits
  The design of the foundation system must limit both total and differential settlement to magnitudes that will neither damage nor impair the use of the structure.
- Lateral Stability & Seismic Resilience
  The foundation system must provide sufficient resistance to lateral and overturning forces under the most critical load conditions, including earthquake loadings.

These geotechnical performance factors, alongside local construction considerations such as the encountered subsurface materials and the potential for perched water tables, have served as the technical basis for the recommendations detailed in this report.

It should be noted that considerations and recommendations for the use of both shallow foundations and deep foundations (drilled piers) have been provided for the support of Dillard Hall. It is recommended that the structure bear on one (1) foundation type, as opposed to a combination of the two (2), to reduce the potential for differential settlement beyond the values outlined in this report.

10.5 Shallow Foundation Recommendations

Based on the provided information, current project scope, and encountered subgrade materials, considerations for the use of shallow foundation systems have been provided for the consideration of the Design Team, as it relates to the academic building, the planned pergola/canopy, and the trash tunnel walls. Those recommendations and considerations are provided in the following subsections.

10.5.1 Dillard Hall

Based on the provided information and the encountered subsurface conditions, it is recommended that the Design Team consider the use of a shallow foundation system composed of continuous and individual (spread) footings for the support of the Dillard Hall academic building. If utilized, these shallow foundation elements are recommended to bear directly on native Stratum IV weathered sandstone materials. Should site grades not allow for the direct bearing on these sandstone materials, then either CLSM, otherwise referred to as “flowable fill”, or an aggregate base course material be utilized between the Stratum IV materials and the bottom of foundation elevations.

For the purposes of this report, the aggregate base course is expected to be an ARDOT Class 7 material, compacted to a minimum of 98% of the modified proctor value (ASTM D1557), within two (2) percent of the optimum moisture. Any material utilized for this purpose, CLSM or aggregate base, should be submitted to the Geotechnical Engineer for review and approval prior to use.

It is expected that excavations for these shallow foundation elements may require the use of hammer hoe attachments. Depending on the condition of the bottom of footing excavations, CLSM may need to be placed to ensure a smooth, level surface from which the foundations may be constructed. Further coordination is encouraged between MCE and the Contractor on these items prior to construction.

It is recommended that the foundation elements bearing on suitable in-situ Stratum IV materials or imported aggregate/CLSM materials placed on suitable in-situ Stratum IV materials, as described above, may utilize a safe net allowable bearing capacity of 3,800 pounds per square foot (psf) for continuous footings and 4,000 psf for spread footings.

The allowable bearing capacities provide a minimum factor of safety of three (3) and were calculated using a minimum footing width of three (3) feet, a minimum footing thickness of two (2) feet, and a minimum footing depth of two (2) feet below exterior ground elevations, which is adequate to protect against frost heave in the project area.

The total long-term foundation settlement for footings bearing on suitable conditions, as described in this section with the assumed dimensions and loading is anticipated to be less than ¾-inch. The maximum differential settlement between footings is anticipated to be on the order of ½-inch between individual footings or along a 40-foot span for continuous footings.

10.5.2 Pergola/Canopy

It is recommended that a shallow foundation system consisting of individual (spread) footings will be suitable for the support of the Pergola/Canopy area. The shallow foundations are recommended to bear directly on suitable Stratum III materials or on a minimum of one (1) foot of newly placed, properly compacted, and moisture-conditioned select fill material meeting the criteria outlined in the Select Fill Material section (*Section 10.10*). Suitable native materials are expected to be present immediately following initial site stripping and grading.

MCE recommends that the Contract ran allowance for the placement of a minimum of one (1) foot of select fill beneath the pergola footings, to be utilized in the event that the exposed subgrade conditions at the time of construction vary from those encountered during this investigation.

It is recommended that spread footings bearing on properly placed select fill or “suitable” native subgrade may utilize a safe net allowable bearing capacity of 2,300 psf. Suitable in-situ subgrade materials should be exposed prior to the placement of any select fill material beneath structure foundation elements.

The total long-term foundation settlement for footings bearing on properly placed select fill material or on suitable in-situ materials with the assumed dimensions and loading is anticipated to be approximately ¾-inch. The maximum differential settlement between footings is anticipated to be on the order of ½-inch between individual footings.

10.5.3 Trash Tunnel

It should be noted that the original investigation was not targeted at providing recommendations for the planned trash tunnel extending from Dillard Hall to Willard J. Walker Hall. As such, the recommendations contained herein are based on the project boring locations conducted near the understood tunnel alignment.

Based on the information provided by the Design Team, it is understood that the trash tunnel is planned to be constructed of a eight (8) – foot tall concrete walls, a slab-on-grade floor, and an elevated structural slab for the roof. Loading conditions for each wall are expected to range from approximately 3.1 kips per linear foot (klf) to approximately 4.7 klf (Dead Load plus Live Load), based on information provided by the Structural Design Team.

The provided grading information indicates that the tunnel is planned to bear near the surface of the existing site grades and will follow above the alignment of a portion of an existing utility tunnel .

It is recommended that a shallow foundation system consisting of continuous footings will be suitable for the support of the trash tunnel. The shallow foundations are recommended to either bear on suitable Stratum II/III/IV materials or on imported select fill placed on suitable in-situ materials.

Where the existing utility tunnel is present, it may be prudent to utilize No. 57 stone (or an approved alternative), wrapped in a separation geotextile between the ceiling of the utility tunnel and the floor of the trash tunnel. The use of a material such as No. 57 stone or similar will limit the necessary compaction effort above the utility tunnel in an effort to reduce the potential for damage to this element. Further coordination should occur between MCE and the Contractor to ensure the appropriate materials are implemented under this scope item. MCE is not responsible for ensuring that any loads placed on the existing utility tunnel will not damage or otherwise create issues related to this feature.

As the tunnel alignment was not directly targeted under this scope of work, the net allowable bearing capacity recommended herein for design must be confirmed at the time of construction by the Geotechnical Engineer or his/her representative. It is recommended that the foundation elements bearing on properly placed select fill or on suitable native subgrade may utilize a safe net allowable bearing capacity of 2,000 psf for continuous footings.

Suitable in-situ subgrade materials should be exposed prior to the placement of any select fill material beneath structure foundation elements.

The total long-term foundation settlement for footings bearing on properly placed select fill material or on suitable in-situ materials with the assumed dimensions and loading is anticipated to be approximately ¾-inch. The maximum differential settlement between footings is anticipated to be on the order of ½-inch between individual footings.

10.6 Foundation Recommendations – Drilled Piers

As an alternative to the initially-recommended shallow foundation system, it is recommended that the Design Team consider the use of a drilled pier foundation system for the support of the Dillard Hall academic building. If utilized, this **drilled pier foundation system shall be designed for end-bearing must be founded into the encountered competent shale materials (Stratum VI).** The sandstone materials encountered during this investigation are not expected to be of an adequate thickness to allow for the appropriate bearing of the drilled piers.

The drilled piers should be founded a minimum of one (1) pier diameter (1L:1D), or a minimum of five (5) feet, into the competent shale material, whichever is greater. The exact length of the rock sockets may be lengthened based on the final loading conditions. Adequate end-bearing material should be encountered prior to beginning the recommended rock socket length.

This material, herein referred to as 'competent,' may utilize a safe allowable end bearing capacity of 50 kips per square foot (ksf) for design purposes. The anticipated depth of competent shale materials may be referenced in Table 11 below.

Table 11: Estimated Depth to Competent Rock

Boring ID	Existing Surface Elevations (ft)	Est. Depth to Competent Rock (ft)	Est. Elevation of Competent Rock (ft)
B-01	1,419.41	21.0	1,398.41
B-02	1,418.17	20.0	1,398.17
B-03	1,419.92	22.0	1,397.92
B-04	1,418.06	24.0	1,394.06
B-05	1,414.04	16.0	1,398.04
B-06	1,420.20	18.0	1,402.20
B-07	1,422.04	22.0	1,400.04
B-08	1,422.22	25.0	1,397.22
B-09	1,418.58	16.0	1,402.58

NOTES: The existing surface elevations shown in Table 11 are based on topographic survey data obtained by MCE personnel. The corresponding estimated depth to competent rock and relevant elevations are based on this data, as well as measurements taken at the time of the investigation.

The use of surface casing and drilling slurries is not recommended as the primary means of maintaining drilled shaft integrity. Based on the anticipated lower-level FFE, it is expected that drilled piers will largely be constructed beginning within the Stratum IV weathered sandstone and extending through the Stratum V, into Stratum VI, materials. As such, the use of casing is not expected to be necessary to maintain the integrity of the drilled shaft. However, temporary casing may be necessary, should shaft construction occur during or immediately following precipitation events.

Should any perched water be encountered during drilling operations, this groundwater will have the potential to undermine the integrity of the drilled shafts.

The drilled piers should be designed for end-bearing support. As previously noted, the final drilled pier design may utilize a net allowable end-bearing capacity of 50 ksf for the competent shale material, based on the data recorded during this investigation and the known characteristics of the rock formation in the project area. The provided allowable end-bearing pressure provides a minimum factor of safety of 2.0 with regard to the encountered rock material.

Drilled piers should have a minimum length-to-diameter ratio of 3L:1D. A short-term increase in allowable loadings during seismic and wind events is not recommended at this time.

The recommended bearing stratum should be verified by the inspection of probe holes drilled beyond bottom-of-pier elevations. The recommendation for verification through probing is based on the project scope and loading. The probe holes should be drilled beyond the bottom of the foundations (rock socket) to an additional depth of twice the individual pier diameter (2L:1D) or an additional five (5) feet into the competent rock, whichever is greater. The ultimate foundation depth should be sure to include the full rock socket length below any encountered voids, fractured, weathered, or dissolution zones (low-consistency rock). Probing verification would then need to be performed below the extended drilled pier bearing elevation, as previously described. The actual number of probe holes conducted may vary at the discretion of MCE based on the on-site results of probing operations.

Prior to the placement of concrete at each pier location, the Contractor should make a reasonable effort to remove all water and other deleterious materials from the drilled pier excavation. In addition to potentially reducing the provided bearing capacities of the referenced shale material, the increased water-to-cement ratio (W/C) may reduce the compressive strength of the concrete as well as the overall strength of the pier foundation. In the event that groundwater cannot be adequately removed using conventional pumping methods, alternative means such as the tremie method should be utilized to displace the existing groundwater during concrete placement.

Concrete should be placed directly down the center of the drilled pier under pressure provided by a pump truck or other means, uninterrupted by reinforcing bars or tie wires.

Drilled piers should not be positioned within one (1) pier diameter of each other end-to-end. For piers within three (3) pier diameters end-to-end, it is recommended that a minimum of three (3) days of concrete curing occur prior to rock coring. Alternatively, piers within this condition may be constructed consecutively, provided that measures such as shoring are available if required. Further, when installing multiple piers within this proximity, it is recommended that these piers have similar bearing depths, regardless of size or loading conditions; further coordination is recommended on a case-by-case basis and may be directed by the results of the performed probing operations.

Drilled piers in an uplift condition may utilize an allowable uplift skin friction value of 500 pounds per square foot (psf) for the overburden soils (Stratum II and Stratum III), 1,500 psf for weathered sandstone and shale (Stratum IV and Stratum V), and 3,000 psf for the competent shale materials (Stratum VI). ***Skin friction calculations should negate the top two (2) feet of the drilled pier length, regardless of the subgrade material at this depth*.** It is recommended that drilled piers be designed to derive their downward compressive capacity from end bearing only. Skin friction should not be utilized in determining the allowable downward compressive capacity due. To provide consistent foundation performance, all drilled piers should bear in competent shale at a consistent end-bearing elevation or stratum.

Total and/or differential foundation settlement under the structure supported by a drilled pier foundation system can be anticipated to be negligible to one-eighth ($^1/_8$) – inch, based on the provided loading conditions.

The shale formation does have the potential for a significant loss in shear strength if it is left exposed to the elements. **For these reasons, drilled pier dimensions should not be left unsupported for extended periods of time prior to concrete placement, including overnight. Drilled piers shall be poured the same day they are drilled.**

It is recommended that the Contractor expect rock drilling to be necessary to install the drilled piers. In particular, this may be required to advance through the weathered sandstone and sandstone materials.

A table with the requested inputs for L-Pile analysis has been provided for reference in Appendix F.

10.7 Structure Slab-on-Grade

Slab-on-grade (SOG) construction may be utilized for the academic building, the pergola, and the trash tunnel structures, provided a minimum of four (4)-inch cushion of sand, crushed stone, or gravel is placed below the slab areas with a vapor barrier directly below the concrete.

Within each structure, it is recommended that a minimum of one (1) foot of newly placed, properly compacted, and moisture-conditioned select fill or aggregate base material is placed below the planned slab-on-grade in order to provide consistent, suitable under-slab conditions.

As discussed in *Section 10.5.3,* this use of select fill may be revised to include crushed stone (No. 57 or No. 67 stone) below the trash tunnel slab-on-grade in order to limit the compaction effort applied immediately above the existing utility tunnel.

Suitable materials shall be exposed beneath the structure footprints prior to the placement of select fill or aggregate base. These materials should then be placed and compacted in standard lifts until the finished subgrade elevation is achieved. As previously noted, the entireties of the slab subgrade areas are recommended to be verified for stability during construction through proof-rolling operations.

10.8 Lateral Earth Pressures

Based on the understood scope of work, multiple below-grade site retaining elements will be implemented as part of the scope of work. These elements are expected to include basement walls within Dillard Hall, the sidewalls of the trash tunnel, and typical site retaining walls.

The earth-retaining wall elements should be designed to resist the minimum equivalent fluid weights provided in Table 12 below. The recommended minimum factor of safety against sliding and overturning is 1.5 and 2.0, respectively.

Table 12 assumes a drained-condition to be present for each retaining structure. To achieve a drained condition, the retaining structure should be backfilled using a perimeter drainage system or a gravity trench drain system graded to daylight for the release of any hydrostatic pressure that may develop. Alternative means of drainage may be required if daylighting is not an option, those alternate means would need to be discussed and approved by the Design Team.

The values provided in Table 12 for No. 57 or No. 67 crushed stone gravel assume a 1H:1V maximum backfill slope from the heel of the retaining wall foundation. If a vertical “chimney drained” is provided by the No. 57 or No. 67 stone, then the values for on-site soils should be used based on proximity and relevancy to the material behind the gravel.

Table 12: Estimated Lateral Earth Pressures – Drained Condition

Soil/Backfill Type	Moist Unit Weight (lbs/ft^3)	Friction Angle φ (^{0})	Equivalent Fluid Pressure (lbs/ft^3)		
			Active	Passive	At-Rest
On-site Stratum II Materials	110	22	50	242	69
On-site Stratum III Materials	125	28	45	346	66
Select Fill Material (GC or GM)	120	28	43	332	64
No. 57 or No. 67 Stone	95	35	26	351	41

A coefficient of friction of 0.40 may be used provided the retaining structure is supported on a minimum of four (4) inches of placed and compacted Class 7 Base Course material. A friction value of 0.35 may be used provided the retaining structures are supported directly on select fill material or on-site soils.

10.9 Project Pavement Recommendations

As with the trash tunnel, this investigation did not originally target the project pavement improvements. As such, the recommendations contained herein are based on nearby project borings but were not necessarily conducted in the alignment of the planned access drive. Site grading for the project pavements should initially consist of stripping all Stratum I surface materials, followed by proof-rolling as previously described. Subgrade preparation and proof rolling should follow the same procedure as described in the *Subgrade Verification* section of this report. Based on the data obtained from this investigation, suitable subgrade materials are generally anticipated to be encountered within the upper one (1) foot below the existing surface elevations.

It is expected that the planned access drive will primarily be utilized for heavy truck traffic, such as garbage trucks. As such, it is recommended that the Contractor budget for the placement of a minimum of two (2) feet of imported select fill below the project pavement dimensions. The placement of this select fill and undercut necessary within the access drive should be directed by the Geotechnical Engineer or his/her representative at the time of construction.

Thickened lifts or "bridging" lifts may be utilized to establish stable subgrade conditions within the pavement areas, should unstable subsurface conditions be encountered during construction. Bridging lifts should only be implemented under the direction of the Geotechnical Engineer. The top eight (8) inches of any thickened lift should be compacted and tested per project specifications. A minimum of one (1) standard lift should be placed above any thickened lift utilized beneath pavement areas. **Bridging lifts should not be utilized within the structure(s) footprint or beneath any structure-related elements.**

10.9.1 Minimum Pavement Section Recommendations

The pavement recommendations provided in this section are based on stable in-situ materials or properly-placed, moisture-conditioned select fill materials placed above in-situ materials, verified for stability through proof-rolling. The minimum pavement sections are recommended to be as shown in Tables 13 and 14 below.

For the recommendations provided in Tables 13 and 14, light-duty pavements are considered to be those pavements with low-volume traffic areas such as pedestrian sidewalks, parking, and staging areas for passenger cars.

The standard-duty pavements are recommended as performing similarly to a typical city street pavement section with a residential classification. Heavy-duty pavement recommendations are intended to apply to areas subjected to heavy-truck traffic.

Table 13: Minimum Project Pavement Sections – Asphalt

Pavement Type	Pavement Materials	Light Duty	Standard Duty	Heavy Duty
Asphalt Pavement	ACHM Surface Course (1/2")	3"	3"	2"
	ACHM Binder Course (1")	N/A	N/A	3"
	Class 7 Base Course (95% MPD)	6"	8"	12"

Table 14: Minimum Project Pavement Sections – Concrete

Pavement Type	Pavement Materials	Light Duty	Standard Duty	Heavy Duty
Concrete Pavement	Portland Cement Concrete	5"	6"	8"
	Class 7 Base Course (95% MPD)	6"	8"	8"

The pavement sections provided in Tables 13 and 14 should be viewed as minimums and can be increased through the design process by the project Civil Engineer if warranted.

For the purposes of this report, the concrete pavements are assumed to be jointed plain concrete pavements (JPCP), i.e. unreinforced concrete, with a minimum compressive strength of 4,000 pounds per square inch (psi).

10.10 Select Fill Material

Select fill material utilized on this project should consist of locally available silty or clayey chert gravel and must be free of organics. Approved materials must conform to the USCS as a GM or GC material and meet the following physical criteria:

- Plasticity Index (PI): 35 or less
- Liquid Limit (LL): 45 or less
- Gradation: Minimum of 40% retained on the ¾-inch sieve; maximum of 30% passing the No. 200 sieve.

Any material utilized as select fill in the deep fill areas (greater than five (5) feet) should have a maximum dry density of at least 92.0 pounds per cubic foot (pcf), based on the Standard Proctor Test (ASTM D698). ***Variations to these criteria may be evaluated on a case-by-case basis. Any material proposed for use as select fill on the project must be reviewed and approved by the Geotechnical Engineer prior to placement.***

All fill and backfill should be placed in horizontal lifts not exceeding eight (8) inches compacted. When placing fill next to existing slopes, the slope face should be stripped of all vegetation and the face "benched" to allow the placement of the horizontal lifts and bonding to the slope face. Table 15 below provides the recommended compaction parameters for select fill and Class 7 base course to be used on the project.

MCE anticipates that due to the mass excavator requirements within the project site that on-site material may be processed for re-use as select fill on the project. Bulk samples of any material planned to be utilized as select fill material should be submitted to the Geotechnical Engineer for further analysis and approval.

Table 15: Compaction Requirements

Material Type	Test Standard	Minimum Dry Density (%)	Optimum Moisture Range (%)
Select Fill (Typ.)	ASTM D698 / AASHTO T99	98	-2% to +2%
Select Fill (Aggregate in Building Pad)	ASTM D1557 / AASHTO T180	98	-2% to +2%
Base Course	ASTM D1557 / AASHTO T180	95	Near Optimum

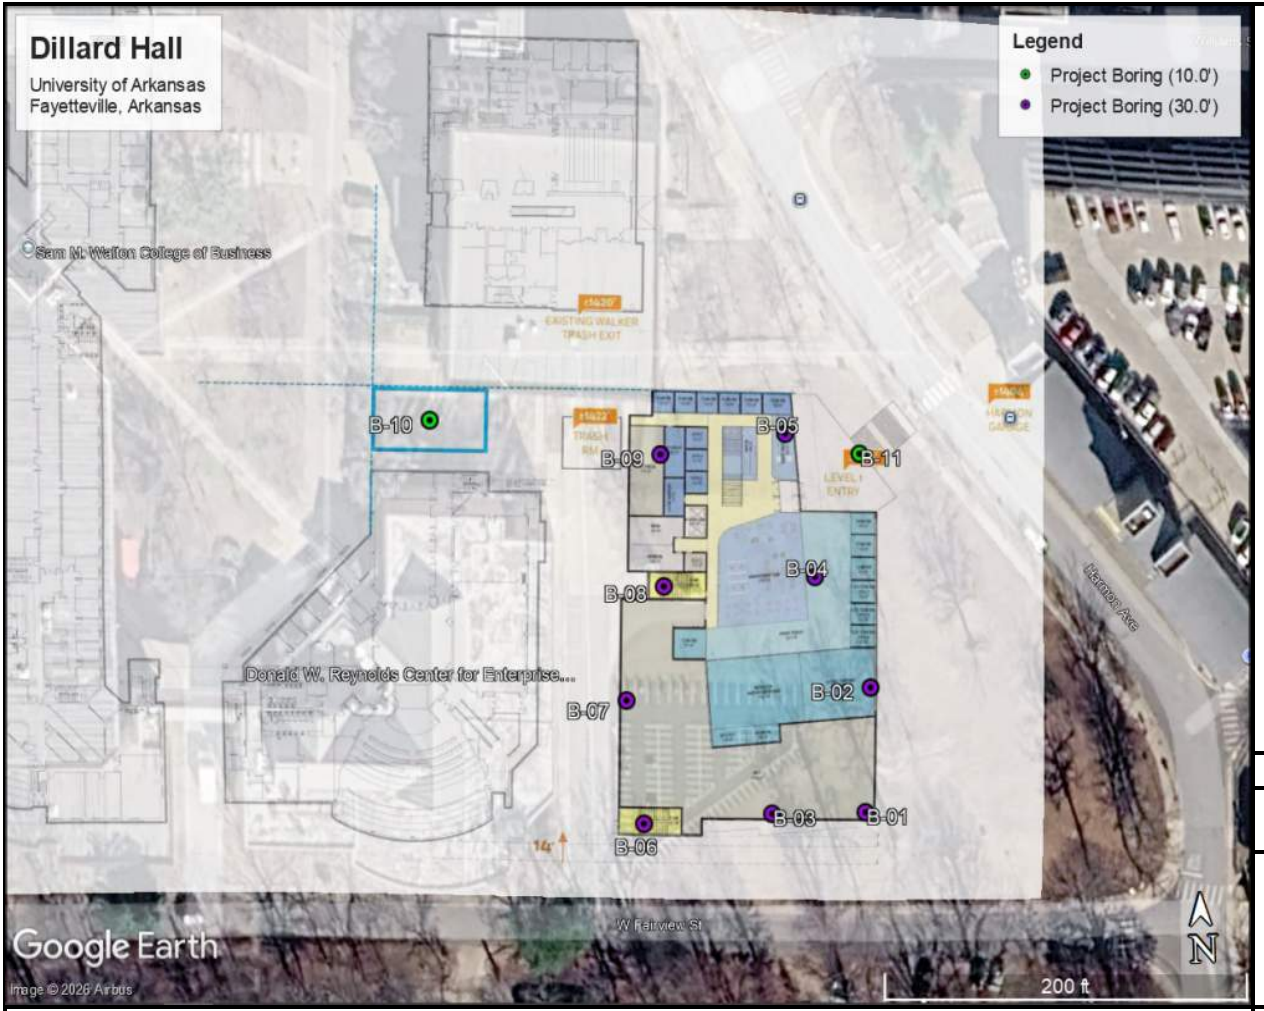
11.0 Construction Materials Testing and Special Inspections

Construction materials testing and special inspection services are to be provided by MCE to provide consistency with the recommendations in this report and the documentation of those recommendations being implemented during construction.

Testing of the earthwork, concrete, structure, and other phases should be conducted and documented during construction to assure the Owner and Engineer that the construction complies with the specifications. Field verification of earthwork operations will be required to confirm the recommendations contained herein.

Additionally, all trenching and excavations should be conducted following the current Arkansas State Law and Occupational Safety and Health Administration (OSHA) guidelines and requirements.

12.0 Limitations and Reserved Rights



The recommendations and conclusions made in this report are based on the assumption that the subsoil conditions do not deviate appreciably from those disclosed in the subsurface exploration. Should significant subsoil variations or undesirable conditions be encountered during construction operations that are not described herein, the Geotechnical Engineer reserves the right to inspect these conditions to reevaluate this report. A review of the final construction plans and specifications by this office is encouraged to ensure compliance with the intent of these recommendations.

SOIL CLASSIFICATION CHART PER ASTM D 2488

PRIMARY DIVISIONS			SECONDARY DIVISIONS	
			GROUP SYMBOL	GROUP NAME
COARSE-GRAINED SOILS more than 50% retained on No. 200 sieve	GRAVEL more than 50% of coarse fraction retained on No. 4 sieve	CLEAN GRAVEL less than 5% fines	GW	well-graded GRAVEL
			GP	poorly-graded GRAVEL
		GRAVEL with DUAL CLASSIFICATIONS 5% to 12% fines	GW-GM	well-graded GRAVEL with silt
			GP-GM	poorly-graded GRAVEL with silt
			GW-GC	well-graded GRAVEL with clay
			GP-GC	poorly-graded GRAVEL with clay
		GRAVEL with FINES more than 12% fines	GM	silty GRAVEL
			GC	clayey GRAVEL
			GC-GM	silty, clayey GRAVEL
	SAND 50% or more of coarse fraction retained on No. 4 sieve	CLEAN SAND less than 5% fines	SW	well-graded SAND
			SP	poorly-graded SAND
		SAND with DUAL CLASSIFICATIONS 5% to 12% fines	SW-SM	well-graded SAND with silt
			SP-SM	poorly-graded SAND with silt
			SW-SC	well-graded SAND with clay
			SP-SC	poorly-graded SAND with clay
		SAND with FINES more than 12% fines	SM	silty SAND
			SC	clayey SAND
			SC-SM	silty, clayey SAND
FINE-GRAINED SOILS 50% or more passes No. 200 sieve	SILT and CLAY liquid limit less than 50%	INORGANIC	CL	lean CLAY
			ML	SILT
			CL-ML	silty CLAY
		ORGANIC	OL (PI > 4)	organic CLAY
			OL (PI < 4)	organic CLAY
	SILT and CLAY liquid limit 50% or more	INORGANIC	CH	fat CLAY
			MH	elastic SILT
		ORGANIC	OH (plots on or above 'A'-line)	organic CLAY
			OH (plots below 'A'-line)	organic SILT
	Highly Organic Soils		PT	Peat

GRAIN SIZE

DESCRIPTION		SIEVE SIZE	GRAIN SIZE	APPROXIMATE SIZE
Boulders		> 12"	> 12"	Larger than basketball-sized
Cobbles		3 - 12"	3 - 12"	Fist-sized to basketball-sized
Gravel	Coarse	3/4 - 3"	3/4 - 3"	Thumb-sized to fist-sized
	Fine	#4 - 3/4"	0.19 - 0.75"	Pea-sized to thumb-sized
Sand	Coarse	#10 - #4	0.079 - 0.19"	Rock-salt-sized to pea-sized
	Medium	#40 - #10	0.017 - 0.079"	Sugar-sized to rock-salt-sized
	Fine	#200 - #40	0.0029 - 0.017"	Flour-sized to sugar-sized
Fines		Passing #200	< 0.0029"	Flour-sized and smaller

PLASTICITY CHART

APPARENT DENSITY - COARSE-GRAINED SOIL

APPARENT DENSITY	SPOOLING CABLE OR CATHEAD		AUTOMATIC TRIP HAMMER	
	SPT (blows/foot)	MODIFIED SPLIT BARREL (blows/foot)	SPT (blows/foot)	MODIFIED SPLIT BARREL (blows/foot)
Very Loose	≤ 4	≤ 8	≤ 3	≤ 5
Loose	5 - 10	9 - 21	3 - 8	6 - 14
Medium Dense	11 - 30	22 - 63	8 - 23	15 - 42
Dense	31 - 50	64 - 105	23 - 38	43 - 70
Very Dense	> 50	> 105	> 38	> 70

CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	SPOOLING CABLE OR CATHEAD		AUTOMATIC TRIP HAMMER

Boring Number: B-05

Comments:	Rock Descriptions:	Rock Coring Information:
Weathered Shale Transition to Shale at 12.0’ within B-05.	Weathered Shale – Gray; Horizontal Bedding; Soft to Moderately Hard Shale – Dark Gray; Horizontal Bedding; Moderately Hard to Hard	Run #1: REC = 100% RQD = 62% Run #2: REC = 98% RQD = 42%

DESIGNED TO SERVE
an ESP COMPANY

1580 E. Stearns Street
Fayetteville, Arkansas 72703
(479) 443.2377
mce.us.com

Project Name: Dillard Hall
Project Number: 26-3843
Date Drilled/Cored: 05/21/2026

Rock Core Sample: Run #1 and #2
Rock Core Depths: 15.0’ – 25.0’
Boring Number: B-06

Comments:	Rock Descriptions:	Rock Coring Information:
Highly Weathered Shale Transition to Weathered Shale at 15.0’, Weathered Shale to Shale transition at 16.33’ within B-06.	Weathered Shale: Gray; Horizontal Bedding; Soft to Moderately Hard Shale – Dark Gray; Horizontal Bedding; Moderately Hard	Run #1: REC = 82% RQD = 23% Run #2: REC = 90% RQD = 48%

APPENDIX F:
L-PILE INPUTS

SOIL INPUT DATA FOR "LPILE"										
SOIL STRATA FROM SOILS BORINGS										
LPILE SOIL P-Y CURVE MODEL[1]	*Soft Clay (Matlock)*	*Stiff Clay with Free Water (Reese)*	*Stiff Clay w/o Free Water (Reese)*	*Sand (Reese)*	*Strong Rock (Vuggy Limestone)*	*Silt (cemented c-phi)*	*API Sand (O'Neill)*	*Weak Rock (Reese)*	*Liquefiable Sand*	*Stiff Clay w/o Free Water Using k*
EFFECTIVE UNIT WEIGHT[1] (pci)	*XX*	*XX*	115 pcf	120 pcf	*XX*	*XX*	*XX*	137 pcf	*XX*	*XX*
UN-DRAINED COHESION[1], c (psi)	*XX*	*XX*	14.0			*XX*				*XX*
FRICTION ANGLE[1] (degree)				28		*XX*	*XX*			
P-Y MODULUS[1], k (pci)		*XX*		225		*XX*	*XX*			*XX*
STRAIN FACTOR[1], ε_{50} (in/in)	*XX*	*XX*	0.006			*XX*				*XX*
YOUNG'S MODULUS[1], E_r (psi)								96,305 psi*		
UNIAXIAL COMPRESSIVE STRENGTH[1] (psi)					*XX*			745 psi		
ROCK QUALITY DESIGNATION[1], RQD (%)								40%		
WEAK ROCK PARAMETER[1], k_{rm}								0.0005		
VARIATION OF SUBGRADE MODULUS WITH DEPTH[2], K_h (tons/ft3)										
ADJUSTMENT FOR DEPTH[2]										
ADJUSTMENT FOR DIAMETER[2]										
ADJUSTMENT FOR SPACING OF TRAILING PIER										

1. Used for input to "LPILE" to generate P-Y curves.

2. Horizontal modulus of sub-grade reaction for user-input linear p-y curves. Adjustments are for depth for pier diameters greater than 12".

3. Required parameters for LPile soil P-Y curve model indicated by 'XX.'

*NOTE: Initial Modulus of Rock Mass calculated per Eq. 25 in Chapter 11 of Practical Rock Engineering, Hoek, 2008, with Geologic Strength Index (GSI) estimated per Table 6 of the same document.

Desired format for "LPILE" information to be included in the soils report, see attached.
